*Dedicated to all*
*past and present contributors*
*and*
*supporters of Toronto Notes*
*who have made the production of the 2020 edition possible!*

The *Toronto Notes for Medical Students* is dedicated to helping fund many charitable endeavours and medical student initiatives at the University of Toronto's Faculty of Medicine and beyond. Programs that have received *Toronto Notes for Medical Students* funding include:

**Community Affairs Projects**
- Saturday Program for Inner City High School and Grade 8 students
- St. Felix Mentorship Program for Inner City children
- Parkdale Mentorship Program for Grade 10-12 students
- WoodGreen Community Centre
- Let's Talk Science
- Growing Up Healthy

**Annual Faculty Showcase Events**
- Daffydil, in support of the Canadian Cancer Society
- Earthtones Benefit Concert
- Convocation and Ceremonies

**Scholarships and Bursaries**
- Nishant Fozdar Memorial Award
- Graduating Medical Class Scholarships and Bursaries

**Medical School Clubs**
- Books with Wings
- Women in Medicine
- University of Toronto International Health Program
- Complementary and Alternative Medicine
- Peer Support for Students
- History of Medicine Society
- Faculty of Medicine Yearbook

**Other Events**
- Save a Child's Heart
- Australian Medical School Association Conference
- Medical Student Research Day
- Ontario Medical Students Weekend (OMSW)
- OMSA's Medical Student Education Research Grant (MSERG)

**Note:**

Many of you have wondered about the *Toronto Notes* logo, which is based on the rod of Asclepius, the Greek god of medicine. The rod of Asclepius consists of a single serpent entwined around a staff. This icon symbolizes both rebirth, by way of a snake shedding its skin, and also authority, by way of the staff.

In ancient Greek mythology, Asclepius was the son of Apollo and a skilled practitioner of medicine who learned the medical arts from the centaur Chiron. Asclepius' healing abilities were so great that he was said to be able to bring back people from the dead. These powers displeased the gods, who punished Asclepius by placing him in the sky as the constellation Orphiuchus.

The rod of Asclepius is at times confused with the caduceus, or wand, of Hermes, a staff entwined with two serpents and often depicted with wings. The caduceus is often used as a symbol of medicine or medical professionals, but there is little historical basis for this symbolism.

As you may have guessed, our logo uses the rod of Asclepius that is modified to also resemble the CN Tower – our way of recognizing the university and community in which we have been privileged to learn the art and science of medicine.

Thomas O'Brien, MD
Class of 2009, M.D. Program, University of Toronto

# Preface – From the Editors

Dear Readers,

As the Editors-in-Chief of *Toronto Notes 2020*, we are proud to present this updated edition.

Toronto Notes began humbly in 1985 from a set of student notes circulated among medical students at the University of Toronto. Over time, Toronto Notes has grown into one of the premier study resources for generations of medical trainees. This rich history solidified our commitment to publish a comprehensive study resource for medical students engaged in clinical rotations and studying for both the Canadian MCCQE Part 1 and the USMLE Step 2.

For the past 36 years, we have remained committed to our original vision. The 2020 edition of Toronto Notes contains significant improvements including:

1. For the first time, Toronto Notes is offered as a 3 book set. We hope this makes our premier study resource more portable for our readers.
2. An improved interactive e-book with high-quality colour images.
3. The clinical handbook is now combined with STAT notes, making it the perfect resource for all of your clinical rotations. The updated handbook also contains a new quick-reference pharmacology table that provides a succinct overview of common drugs, routes of administration, and usage information.
4. Our updated website has been redesigned to complement your studies. Visit us online for our newly updated Colour Atlas, our Radiology Imaging Database, practice review questions, and more.

*Toronto Notes 2020* is produced by Toronto Notes for Medical Students Inc., which is a non-profit organization supporting various charity organizations in Toronto and beyond. This year, Toronto Notes for Medical Students has supported organizations including medical school clubs, community outreach groups, student bursaries and scholarships, and the Canadian Cancer Society. We would like to thank you for supporting these initiatives through your purchase of *Toronto Notes 2020*.

We want to highlight the exceptional work of our team, composed of over 150 medical students, medical illustrators, and faculty members at the University of Toronto Faculty of Medicine. Without the tireless effort expended by these individuals, the production of *Toronto Notes 2020* would not have been possible. In particular, we would like to highlight the amazing work of our executive team, all of whom made personal sacrifices in balancing their clinical and academic duties with the responsibilities asked of them: our production managers, Megan Drupals and Matthaeus Ware, our associate editors, Vanessa Sheng, Jia Tanwani, Calvin Diep, Jagan Sivakumaran, Danielle Jeong, and Nivethan Vela, our EBM editors, Melissa Allwood, Milica Milakovic, Michael Elfassy, Kimia Sheikholeslami, Khizar Karim, and Ryan Wang, our clinical handbook editors, Priya Dhir, Helen Genis, and Meghan Kerr, and our communication managers, Courtney Francis and Shane Natalwalla. Lastly, we would like to thank our partners at Type & Graphics Inc., particularly Enrica Aguilera, for their assistance during the production of *Toronto Notes 2020*.

We hope that *Toronto Notes 2020* enhances your medical knowledge and allows you to perform better on both your clinical rotations and licensing exams. On behalf of the *Toronto Notes 2020* team, we wish you success in your studies and academic endeavours.

Sincerely,

**Sara Mirali**, *BSc (Hons), MD/PhD Candidate* and
**Ayesh Seneviratne**, *MSc, MD/PhD Candidate*
*Editors-in-Chief, Toronto Notes 2020*
*MD Program, University of Toronto*

# Acknowledgements

We would like to acknowledge the exceptional work of all previous Toronto Notes (formerly MCCQE Notes) Editors-in-Chief and their editorial teams. The 36th edition of this text was made possible with their contributions.

# How to Use This Book

This book has been designed to remain as one book or to be taken apart into smaller booklets. Identify the beginning and end of a particular section, then carefully bend the pages along the perforated line next to the spine of the book. Then tear the pages out along the perforation.

The layout of *Toronto Notes* allows easy identification of important information.
These items are indicated by icons interspersed throughout the text:

| Icon | Icon Name | Significance |
|---|---|---|
|  | Key Objectives | This icon is found next to headings in the text. It identifies key objectives and conditions as determined by the Medical Council of Canada or the National Board of Medical Examiners in the USA. If it appears beside a dark title bar, all subsequent subheadings should be considered key topics. |
|  | Clinical Pearl | This icon is found in sidebars of the text. It identifies concise, important information which will aid in the diagnosis or management of conditions discussed in the accompanying text. |
|  | Memory Aid | This icon is found in sidebars of the text. It identifies helpful mnemonic devices and other memory aids. |
|  | Clinical Flag | This icon is found in sidebars of the text. It indicates information or findings that require urgent management or specialist referral. |
|  | Evidence Based Medicine | This icon is found in sidebars of the text. It identifies key research studies for evidence-based clinical decision making related to topics discussed in the accompanying text. |

## Chapter Divisions

To aid in studying and finding relevant material quickly, each chapter is organized in the following general framework:

**Basic Anatomy/Physiology Review**
- features the high-yield, salient background information students are often assumed to have remembered from their early medical school education

**Common Differential Diagnoses**
- aims to outline a clinically useful framework to tackle the common presentations and problems faced in the area of expertise

**Diagnoses**
- the bulk of the book
- etiology, epidemiology, pathophysiology, clinical features, investigations, management, complications, and prognosis

**Common Medications**
- a quick reference section for review of medications commonly prescribed

# Common Unit Conversions

To convert from the conventional unit to the SI unit, **multiply** by conversion factor

To convert from the SI unit to the conventional unit, **divide** by conversion factor

| | Conventional Unit | Conversion Factor | SI Unit |
|---|---|---|---|
| ACTH | pg/mL | 0.22 | pmol/L |
| Albumin | g/dL | 10 | g/L |
| Bilirubin | mg/dL | 17.1 | μmol/L |
| Calcium | mg/dL | 0.25 | mmol/L |
| Cholesterol | mg/dL | 0.0259 | mmol/L |
| Cortisol | μg/dL | 27.59 | nmol/L |
| Creatinine | mg/dL | 88.4 | μmol/L |
| Creatinine clearance | mL/min | 0.0167 | mL/s |
| Ethanol | mg/dL | 0.217 | mmol/L |
| Ferritin | ng/mL | 2.247 | pmol/L |
| Glucose | mg/dL | 0.0555 | mmol/L |
| HbA1c | % | 0.01 | proportion of 1.0 |
| Hemaglobin | g/dL | 10 | g/L |
| HDL cholesterol | mg/dL | 0.0259 | mmol/L |
| Iron, total | μg/dL | 0.179 | μmol/L |
| Lactate (lactic acid) | mg/dL | 0.111 | mmol/L |
| LDL cholesterol | mg/dL | 0.0259 | mmol/L |
| Leukocytes | x $10^3$ cells/$mm^3$ | 1 | x $10^9$ cells/L |
| Magnesium | mg/dL | 0.411 | mmol/L |
| MCV | $\mu m^3$ | 1 | fL |
| Platelets | x $10^3$ cells/$mm^3$ | 1 | x $10^9$ cells/L |
| Reticulocytes | % of RBCs | 0.01 | proportion of 1.0 |
| Salicylate | mg/L | 0.00724 | mmol/L |
| Testosterone | ng/dL | 0.0347 | nmol/L |
| Thyroxine ($T_4$) | ng/dL | 12.87 | pmol/L |
| Total Iron Binding Capacity | μg/dL | 0.179 | μmol/L |
| Triiodothyronine ($T_3$) | pg/dL | 0.0154 | pmol/L |
| Triglycerides | mg/dL | 0.0113 | mmol/L |
| Urea nitrogen | mg/dL | 0.357 | mmol/L |
| Uric acid | mg/dL | 59.48 | μmol/L |

| | |
|---|---|
| Celsius → Fahrenheit | F = (C x 1.8) + 32 |
| Fahrenheit → Celsius | C = (F – 32) x 0.5555 |
| Kilograms → Pounds | 1 kg = 2.2 lbs |
| Pounds → Ounces | 1 lb = 16 oz |
| Ounces → Grams | 1 oz = 28.3 g |
| Inches → Centimetres | 1 in = 2.54 cm |

# Commonly Measured Laboratory Values

| Test | Conventional Units | SI Units |
|---|---|---|
| ***Arterial Blood Gases*** | | |
| pH | 7.35-7.45 | 7.35-7.45 |
| $PCO_2$ | 35-45 mmHg | 4.7-6.0 kPa |
| $PO_2$ | 80-105 mmHg | 10.6-14 kPa |
| ***Serum Electrolytes*** | | |
| Bicarbonate | 22-28 mEq/L | 22-28 mmol/L |
| Calcium | 8.4-10.2 mg/dL | 2.1-2.5 mmol/L |
| Chloride | 95-106 mEq/L | 95-106 mmol/L |
| Magnesium | 1.3-2.1 mEq/L | 0.65-1.05 mmol/L |
| Phosphate | 2.7-4.5 mg/dL | 0.87-1.45 mmol/L |
| Potassium | 3.5-5.0 mEq/L | 3.5-5.0 mmol/L |
| Sodium | 136-145 mEq/L | 136-145 mmol/L |
| ***Serum Nonelectrolytes*** | | |
| Albumin | 3.5-5.0 g/dL | 35-50 g/L |
| ALP | 35-100 U/L | 35-100 U/L |
| ALT | 8-20 U/L | 8-20 U/L |
| Amylase | 25-125 U/L | 25-125 U/L |
| AST | 8-20 U/L | 8-20 U/L |
| Bilirubin (direct) | 0-0.3 mg/dL | 0-5 μmol/L |
| Bilirubin (total) | 0.1-1.0 mg/dL | 2-17 μmol/L |
| BUN | 7-18 mg/dL | 2.5-7.1 mmol/L |
| Cholesterol | <200 mg/dL | <5.2 mmol/L |
| Creatinine (female) | 10-70 U/L | 10-70 U/L |
| Creatinine (male) | 25-90 U/L | 25-90 U/L |
| Creatine Kinase – MB fraction | 0-12 U/L | 0-12 U/L |
| Ferritin (female) | 12-150 ng/mL | 12-150 μg/L |
| Ferritin (male) | 15-200 ng/mL | 15-200 μg/L |
| Glucose (fasting) | 70-110 mg/dL | 3.8-6.1 mmol/L |
| HbA1c | <6% | <0.06 |
| LDH | 100-250 U/L | 100-250 U/L |
| Osmolality | 275-300 mOsm/kg | 275-300 mOsm/kg |
| ***Serum Hormones*** | | |
| ACTH (0800h) | <60 pg/mL | <13.2 pmol/L |
| Cortisol (0800h) | 5-23 μg/dL | 138-635 nmol/L |
| Prolactin | <20 ng/mL | <20 ng/mL |
| Testosterone (male, free) | 9-30 ng/dL | 0.31-1 pmol/L |
| Thyroxine ($T_4$) | 5-12 ng/dL | 64-155 nmol/L |
| Triiodothyronine ($T_3$) | 115-190 ng/dL | 1.8-2.9 nmol/L |
| TSH | 0.5-5 μU/mL | 0.5-5 μU/mL |
| ***Hematologic Values*** | | |
| ESR (female) | 0-20 mm/h | 0-20 mm/h |
| ESR (male) | 0-15 mm/h | 0-15 mm/h |
| Hemoglobin (female) | 12.3-15.7 g/dL | 123-157 g/L |
| Hemoglobin (male) | 13.5-17.5 g/dL | 140-174 g/L |
| Hematocrit (female) | 36-46% | 36-46% |
| Hematocrit (male) | 41-53% | 41-53% |
| INR | 1.0-1.1 | 1.0-1.1 |
| Leukocytes | 4.5-11 x $10^3$ cells/$mm^3$ | 4.5-11 x $10^9$ cells/L |
| MCV | 88-100 $\mu m^3$ | 88-100 fL |
| Platelets | 150-400 x $10^3/mm^3$ | 150-400 x $10^9$/L |
| PTT | 25-35 s | 25-35 s |
| Reticulocytes | 0.5-1.5% of RBC | 20-84 x $10^9$/L |

# ELOM Ethical, Legal, and Organizational Medicine

Further information on these topics can be found in the Objectives of the Considerations of the Legal, Ethical and Organizational Aspects of the Practice of Medicine (CLEO) – which can be downloaded free of charge from the Medical Council of Canada website at http://mcc.ca/wp-content/uploads/CLEO.pdf.

There are three main types of law in Canada: criminal, civil, and administrative. The penalties for violating each are, in general, as follows: criminal - fine or incarceration; civil - monetary damages paid to the wronged party; and administrative - sanctions by the regulator (such as a suspension by the College of Physicians and Surgeons). All three types of law can be engaged by a single act. For example, a physician that inappropriately touches a patient can be liable for criminal (sexual assault), civil (monetary damages paid to the patient for the civil wrong of sexual assault), and administrative (fines and sanctions up to and including loss of ability to practice medicine for sexual abuse) penalties.

Canadian law applicable to medical practice varies between jurisdictions and changes over time.

Criminal law is nationwide, but civil and administrative law varies between provinces and territories. This section is meant to serve only as a guide. Students and physicians should ensure that their practices conform to local and current laws.

# Acronyms

| | |
|---|---|
| AE | adverse event |
| ART | advanced reproductive technologies |
| CFMS | Canadian Federation of Medical Students |
| CFPC | College of Family Physicians of Canada |
| CMA | Canadian Medical Association |
| CME | continuing medical education |
| CMPA | Canadian Medical Protective Association |
| CPSO | College of Physicians and Surgeons of Ontario |
| EMR | electronic medical record |
| FMEQ | Fédération médicale étudiante du Québec |
| FRCPC | Fellow of the Royal College of Physicians of Canada |
| FRCSC | Fellow of the Royal College of Surgeons of Canada |
| GA | gestational age |
| GDP | gross domestic product |
| HCCA | Health Care Consent Act |
| IVF | in vitro fertilization |
| LMCC | Licentiate of the Medical Council of Canada |
| MCC | Medical Council of Canada |
| OECD | Organization for Economic Co-operation and Development |
| OMA | Ontario Medical Association |

| RCPSC | Royal College of Physicians and Surgeons of Canada |
| RDoC | Resident Doctors of Canada |
| SDM | substitute decision-maker |

# The Canadian Health Care System

## Overview of Canadian Health Care System

- one federal, three territorial, and ten provincial systems
- major complexities in establishment of Canadian health policy include geographical diversity, socioeconomic divisions, and international pressures
- financed by both the public (70%) and private (30%) sectors
- each provincial plan must cover all medically necessary health services delivered in hospitals and by physicians; may choose to cover services such as home care and prescription drugs
- non-insured health services and fees are either covered by private insurance or by the individual
- workers' compensation funds cover treatment for work-related injuries and diseases

**Table 1. Division of Government Responsibilities in Health Care**

| Federal Government | Provincial Government |
|---|---|
| Health care services for Indigenous people, federal government employees (RCMP and armed forces), immigrants, and civil aviation personnel | Establishment, maintenance and management of hospitals, asylums, charities, and charitable institutions (*Constitution Act*, 1867) |
| Marine hospitals and quarantine (*Constitution Act*, 1867) | Licensing of physicians, nurses, and other health professionals |
| Investigations into public health | Determining the standards for licensing all hospitals |
| Regulation of food and drugs | Administering provincial medical insurance plans |
| Inspection of medical devices | Financing health care facilities |
| Administration of health care insurance | Delivery of certain public health services |
| General information services related to health conditions and practices | |
| Role in health derived from government's constitutional powers over criminal law (basis for legislation such as *Food and Drugs Act and Controlled Substances Act*), spending, bioterrorism, and 'peace, order, and good government' | |

**Principles of the Canada Health Act**

1. Public Administration: provincial health insurance programs must be administered by public authorities
2. Comprehensiveness: provincial health insurance programs must cover all necessary diagnostic, physician, and hospital services
3. Universality: all eligible residents must be entitled to health care services
4. Portability: emergency health services must be available to Canadians who are outside their home province, paid for by the home province
5. Accessibility: user fees, charges, or other obstructions to insured health care services are not permitted

## Legal Foundation

The legal foundation of the Canadian health system is based on:

- two constitutional documents:
  1. ***Constitution Act*** (1867): deals primarily with the jurisdictional power between federal and provincial governments
  2. ***The Canadian Charter of Rights and Freedoms*** (1982): does not guarantee a right to health care, but given government's decision to finance health care, they are constitutionally obliged to do so consistently with the rights and freedoms outlined in the Charter (including the right to equality, physicians' mobility rights, etc.)
- two statutes:
  1. ***Canada Health Act*** (1984): outlines the national terms and conditions that provincial health systems must meet in order to receive federal transfer payments
  2. ***Canada Health and Social Transfer Act*** (1996): federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces' discretion

The federal government can reduce its contributions to provinces that violate the key principles of the *Canada Health Act*

# History of the Canadian Health Care System

1867 *British North America Act* (now *Constitution Act*) establishes Canada as a confederacy
- "establishment, maintenance, and management of hospitals" under provincial jurisdiction

1965 *Royal Commission on Health Services* (Hall Commission) recommends federal leadership and financial support with provincial government operation

1984 *Canada Health Act* passed by federal government
- replaces *Medical Care Act* (1966) and *Hospital Insurance and Diagnostic Services Act* (1957)
- provides federal funds to provinces with universal hospital insurance
- maintains federal government contribution at 50% on average, with poorer provinces receiving more funds
- medical insurance must be "comprehensive, portable, universal, and publicly administered"
- bans extra-billing by new fifth criterion: accessibility

1996 *Canada Health and Social Transfer Act* passed by federal government
- federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces' discretion

2001 *Kirby and Romanow Commissions* appointed

*Kirby Commission* (final report, October 2002)
- examines history of health care system in Canada, pressures and constraints of current health care system, role of federal government, and health care systems in foreign jurisdictions

*Romanow Commission* (final report, November 2002)
- dialogue with Canadians on the future of Canada's public health care system

2004 *First Ministers' Meeting on the Future of Health Care* produces a 10 year plan
- priorities include reductions in waiting times, development of a national pharmacare plan, and primary care reform

2005 *Chaoulli v. Québec*, Supreme Court of Canada decision
- rules that Québec's banning of private insurance is unconstitutional under the *Québec Charter of Rights*, given that patients do not have access to those services under the public system in a timely way

2011 First progress report by the Health Council reviews progress (2004 First Ministers' 10 year plan)
- significant reductions in wait times for specific areas (such as cancer, joint replacement, and sight restoration), but may have inadvertently caused increases in wait times of other services
- despite large investments into EMRs, Canada continues to have very low uptake, ranking last in the *Commonwealth Fund International Health Policy* survey, with only 37% use among primary care physicians
- little progress in creating a national strategy for equitable access to pharmaceuticals; however, there has been some success in increasing pharmacists' scope of practice, reducing generic drug costs, and implementing drug information systems
- increases in funding to provinces at 6% per annum until the 2016-2017 fiscal year; from then onwards, increases tied to nominal GDP at a minimum of 3% per annum

2012 Second progress report by the Health Council reviews progress towards 2004 First Ministers' 10 year plan
- funding is sufficient; however, more innovation is needed including incentivizing through models of remuneration
- 46 recommendations made to address the lack of progress

2014 Expiry of current 10 Year Health Care Funding Agreement between federal and provincial governments
- *Canadian Doctors for Refugee Care v. Canada*, the Federal Court of Canada ruled that the federal government could not significantly reduce/eliminate healthcare services for refugee claimants as to do so would constitute "cruel and unusual treatment" contrary to the Charter of Rights and Freedoms

2015 Negotiations underway for a new Health Accord with a $3 billion investment over four years to homecare and mental health services by the elected Liberal government

2017 New 10 year Canada Health Accord reached with a $11.5 billion federal investment over 10 years to homecare and mental health services and a 3% annual rise in the Canada Health Transfer (down from 6% in the previous agreement) by the elected Liberal government

2019 The federal government announced the creation of a national drug agency. It will negotiate prices on behalf of Canada's drug plans, assess the effectiveness of prescription drugs, and develop a national formulary

# Health Care Expenditure and Delivery in Canada

- the projected total health care expenditure in 2018 is expected to reach $253.5 billion, comprising 11.3% of the GDP, or approximately $6839 CDN per person

### Sources of Health Care Funding

- 69% of total health expenditure in 2018 came from public-sector funding with 65% coming from the provincial and territorial governments, and another 5% from other parts of the public sector: federal direct government, municipal, and social security funds. 31% is from private sources including out of pocket (16%), private insurance (12%), and other (3%)
- public sector covers services offered on either a fee for service, capitation, or alternate payment plan in physicians' offices and in hospitals
- public sector does not cover services provided by privately practicing health professionals (e.g. dentists, chiropractors, optometrists, massage therapists, osteopaths, physiotherapists, podiatrists, psychologists, private duty nurses, and naturopaths), prescription drugs, OTC drugs, personal health supplies, and use of residential care facilities

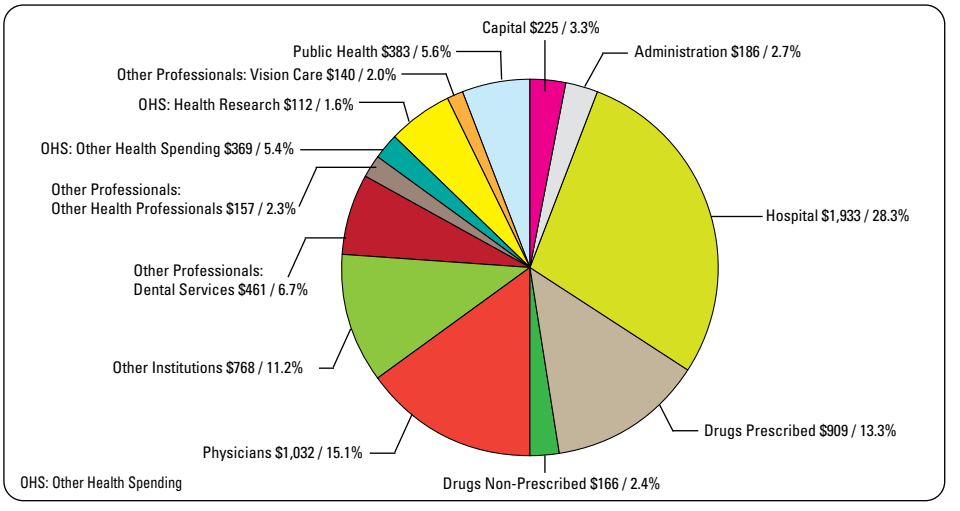

**Figure 1. Total health expenditure per capita by use of funds, Canada 2018** (dollars and percentage share)
Adpated from source: National Health Expenditure Database, Canadian Institute for Health Informaton

### Delivery of Health Care

- hospital services in Canada are publicly funded but delivered through private, not-for-profit institutions owned and operated by communities, religious organizations, and regional health authorities
- other countries, such as the United States (a mix of public and private funding, as well as private for-profit and private not-for-profit delivery), and the United Kingdom (primarily public funding and delivery) have different systems of delivery

# Physician Licensure and Certification

**Table 2. Key Physician Certification and Licensing Bodies in Canada**

| Certifying Body | Description |
|---|---|
| **MCC** | Certifies physicians with the LMCC. LMCC acquired by passing the MCC Qualifying Examination Parts I and II |
| **RCPSC** | Certifies specialists who complete an accredited residency program and pass the appropriate exam |
| | Voluntary membership of the RCPSC is designated FRCPC or FRCSC |
| **CFPC** | Certifies family physicians who complete an accredited residency program and pass the Certification Examination in Family Medicine |
| **Licensing Body** | 13 provincial medical regulatory (licensing) authorities |
| | All postgraduate residents and all practicing physicians must hold an educational or practice license from the licensing body in the province in which they study or practice |
| **CPSO** | Membership to the provincial licensing authority is mandatory |
| | Licensing authority functions include: |
| | Provide non-transferable licensure to physicians |
| | Maintaining ethical, legal, and competency standards and developing policies to guide doctors |
| | Investigating complaints against doctors |
| | Disciplining doctors guilty of professional misconduct or incompetence |
| | At times of license investiture and renewal, physicians must disclose if they have a condition (such as HIV positivity, drug addiction, or other illnesses) that may impact their ability to practice safely |

- physician certification is governed nationally, while the medical profession in Canada self-regulates under the authority of provincial legislation
- self-regulation is based on the premise that due to the advanced education and training involved in the practice of medicine, the lay person is not in a position to accurately judge the standards of the profession; the self-regulating colleges have a mandate to regulate the profession in the public interest
- the RCPSC and CFPC are responsible for monitoring ongoing CME and professional development
- certification by the LMCC plus either the RCPSC or CFPC is a minimum requirement for licensure by most provincial licensing authorities

## Role of Professional Associations

**Table 3. Key Professional Associations**

| Association | Description |
|---|---|
| **CMA** | Provides leadership to doctors and advocates for access to high quality care in Canada |
| | Represents physician and population concerns at the national level |
| | Membership is voluntary |
| **OMA and Other PTMAs** | Negotiates fee and benefit schedules with provincial governments |
| | Represents the economic and professional interests of doctors |
| | Membership is voluntary |
| **CMPA** | Physician-run organization that protects the integrity of member physicians |
| | Provides legal defence against allegations of malpractice or negligence |
| | Provides risk management and educational programs |
| | Membership is voluntary |
| **RDoC and PHO** | Upholds economic and professional interests of residents across Canada |
| | Facilitates discussion amongst PHOs regarding policy and advocacy items |
| **CFMS and FMÉQ** | Medical students are represented at their universities by student bodies, which collectively form the CFMS or FMÉQ |
| | FMÉQ membership includes that of francophone medical schools |

# Ethical and Legal Issues in Canadian Medicine

## Introduction to the Principles of Ethics

- ethics addresses:
  1. principles and values that help define what is morally permissible or not
  2. rights, duties, and obligations of individuals and groups
- the practice of medicine assumes there is one code of professional ethics for all doctors and that they will be held accountable by that code and its implications
- the doctor-patient relationship is formed on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
- a fiduciary duty is a legal duty to act in another party's interest. Profit from the fiduciary relationship must be strictly accounted for with any improper profit (monetary or otherwise) resulting in sanctions against the physician and potentially compensation to the patient, even if no harm has befallen the patient

**Table 4. The Four Principles Approach to Medical Ethics**

| Principle | Definition |
|---|---|
| **Autonomy** | Recognizes an individual's right and ability to decide for themselves according to their beliefs and values |
| | May not be applicable in situations where informed consent and choice are not possible or may not be appropriate |
| **Beneficence** | Patient values-based best interests standard that combines doing good, avoiding harm, considering the patient's values, beliefs, and preferences, so far as these are known |
| | Autonomy should be integrated with the physician's conception of a patient's medically-defined best interests |
| | Aim is to minimize harmful outcomes and maximize beneficial ones |
| | Paramount in situations where consent/choice is not possible or may not be appropriate |
| **Non-Maleficence** | Obligation to avoid causing harm; primum non nocere ("First, do no harm") |
| | Limit condition of the Beneficence principle |
| **Justice** | Fair distribution of benefits and harms within a community, regardless of geography or income |
| | Concept of fairness: Is the patient receiving what they deserve – their fair share? Are they treated the same as equally situated patients? (equity) How does one set of treatment decisions impact others? (equality) |
| | Equality and equity are different notions of justice. Equality is distribution of resources to all irrespective of needs, and equity is distribution of resources based on unique needs. Both concepts raise different considerations |
| | Basic human rights, such as freedom from persecution and the right to have one's interests considered and respected |

**Autonomy vs. Competence vs. Capacity**
**Autonomy**: the right that patients have to make decisions according to their beliefs and preferences
**Competence**: the ability to make a specific decision for oneself as determined legally by the courts
**Capacity**: the ability to make a specific decision for oneself as determined by clinicians

### CMA Code of Ethics

- the CMA developed a Code of Ethics that acts as a common ethical framework for Canadian physicians
- the Code of Ethics is:
  - prepared by physicians for physicians and applies to physicians, residents, and medical students
  - based on the fundamental ethical principles of medicine
  - sources include the Hippocratic Oath, developments in human rights, recent bioethical discussion
  - CMA policy statements address specific ethical issues not mentioned by the code (e.g. abortion, transplantation, and euthanasia)

The **CMA Code of Ethics and Professionalism** is a quasi-legal standard for physicians; if the law sets a minimal moral standard for doctors, the Code augments these standards

## Confidentiality

### Overview of Confidentiality

- when determining legal and ethical issues surrounding patient information, start from the point that all information given by the patient is both confidential (meaning it cannot be disclosed to others) and privileged (meaning it cannot be used in court), then determine whether exceptions to this exist
- the legal and ethical basis for maintaining confidentiality is that a full and open exchange of information between patient and physician is central to a therapeutic relationship
- privacy is the right of patients (which they may forego), while confidentiality is the duty of doctors (which they must respect barring patient consent or the requirements of the law)
- if inappropriately breached by a doctor, physician can be sanctioned by the hospital, court, or regulatory authority
- based on the ethical principle of patient autonomy, patients have the right to the following:
  - control of their own information
  - the expectation that information concerning them will receive proper protection from unauthorized access by others (see *Privacy of Medical Records*, ELOM7)
- confidentiality may be ethically and legally breached in certain circumstances (e.g. the threat of harm to others)
  - while physician-patient privilege exists, it is less strong than solicitor-client privilege. Physicians can tell patients that they will only disclose their information where it is mandated by law and that these exceptions are generally quite narrow. Physicians should avoid promising absolute confidentiality or privilege, as it cannot be guaranteed
- physicians should seek advice from their local health authority or the CMPA before disclosing HIV status of a patient to someone else
  - many jurisdictions make mandatory not only the reporting of serious communicable diseases (e.g. HIV), but also the reporting of those who harbour the agent of the communicable disease
  - physicians failing to abide by such regulations could be subject to professional or civil actions
- legal duty to maintain patient confidentiality is imposed by provincial health information legislation and precedent-setting cases in the common law

**Legal Aspects of Confidentiality**
Advice should always be sought from provincial licensing authorities and/or legal counsel when in doubt

**CMA Code of Ethics and Professionalism**
"Fulfill your duty of confidentiality to the patient by keeping identifiable patient information confidential; collecting, using, and disclosing only as much health information as necessary to benefit the patient; and sharing information only to benefit the patient and within the patient's circle of care. Exceptions include situations where the informed consent of the patient has been obtained for disclosure or as provided for by law"

**Reasons to Breach Confidentiality**

- Child abuse
- Fitness to drive
- Communicable disease
- Coroner report
- Duty to inform/warn

### Statutory Reporting Obligations

- legislation has defined specific instances where public interest overrides the patient's right to confidentiality; varies by province, but may include:
  1. suspected child abuse or neglect – report to local child welfare authorities (e.g. Children's Aid Society)
  2. fitness to drive a vehicle or fly an airplane – report to provincial Ministry of Transportation (see Geriatric Medicine, GM11)
  3. communicable diseases – report to local public health authority (see Public Health and Preventive Medicine, PH26)
  4. improper conduct of other physicians or health professionals – report to College or regulatory body of the health professional (sexual impropriety by physicians is required reporting in some provinces)
  5. vital statistics must be reported; reporting varies by province (e.g. in Ontario, births are required to be reported within 30 d to Office of Registrar General or local municipality; death certificates must be completed by a MD then forwarded to municipal authorities)
  6. reporting to coroners (see *Physician Responsibilities Regarding Death*, ELOM16)
- physicians who fail to report in these situations are subject to prosecution and penalty, and may be liable if a third party has been harmed

### Duty to Protect/Warn

- the physician has a duty to protect the public from a known dangerous patient; this may involve taking appropriate clinical action (e.g. involuntary detainment of violent patients for clinical assessment), informing the police, or warning the potential victim(s) if a patient expresses an intent to harm
- first established by a Supreme Court of California decision in 1976 (*Tarasoff v. Regents of the University of California*)
- Canadian courts have not expressly imposed a mandatory duty to report, however, the CMA Code of Ethics and some provincial/territorial regulatory authorities may oblige physicians to report (mandatory reporting rather than permissive)
- concerns of breaching confidentiality should not prevent the MD from exercising the duty to protect; however, the disclosed information should not exceed that required to protect others

**Ontario's Medical Expert Panel on Duty to Warn**
1998;158(11):1473-1479

- There should be a duty to inform when a patient reveals that they intend to do serious harm to another person(s) and it is more likely than not that the threat will be carried out
- Where a threat is directed at a person or group and there is a specific plan that is concrete and capable of commission and the method for carrying it out is available to the threatener, the physician should immediately notify the police and, in appropriate circumstances, the potential victim. The report should include the threat, the situation, the physician's opinion, and the information upon which it is based

- applies in a situation where:
  1. there is an imminent risk
  2. to an identifiable person or group
  3. of serious bodily harm or death

### Disclosure for Legal Proceedings
- disclosure of health records can be compelled by a court order, warrant, or subpoena

### Privacy of Medical Records
- privacy of health information is protected by professional codes of ethics, provincial and federal legislation, the *Canadian Charter of Rights and Freedoms*, and the physician's fiduciary duty
- the federal government created the PIPEDA in 2000 which established principles for the collection, use, and disclosure of information that is part of commercial activity (e.g. physician practices, pharmacies, private labs)
- PIPEDA has been superseded by provincial legislation in many provinces, such as the *Ontario Personal Health Information Protection Act*, which applies more specifically to health information

**CMA Code of Ethics and Professionalism**
- Protect the health information of your patients
- Provide information reasonable in the circumstances to patients about the reasons for the collection, use, and disclosure of their health information
- Be aware of your patients' rights with respect to the collection, use, disclosure, and access to their health information; ensure that such information is recorded accurately

### Duties of Physicians with Regard to the Privacy of Health Information
- inform patients of information-handling practices through various means (e.g. posting notices, brochures and pamphlets, and/or through discussions with patients)
- obtain the patient's expressed consent to disclose information to third parties
  - under Ontario privacy legislation, the patient's expressed consent need not be obtained to share information between health care team members involved in the "circle of care." However, the patient may withdraw consent for this sharing of information and may put parts of the chart in a "lock box"
    - physicians have a professional obligation to facilitate timely transmission of the patient's medical record to third parties (with the patient's consent), such as for insurance claims. Failure to do so has resulted in sanctions by regulatory bodies
    - while patients have a right of access to their medical records, physicians can charge a "reasonable fee" commensurate with the time and material used in providing copies/access
- provide the patient with access to their entire medical record; exceptions include instances where there is potential for serious harm to the patient or a third party
- provide secure storage of information and implement measures to limit access to patient records
- ensure proper destruction of information that is no longer necessary
- regarding taking pictures or videos of patients, findings, or procedures, in addition to patient consent and privacy laws, trespassing laws apply in some provinces
- CPSO published policy is designed to help Ontario physicians understand legal and professional obligations set out under the *Regulated Health Professions Act, 1991, the Medicine Act, 1991*, and *the Personal Health Information Protection Act, 2004*. This includes regulations regarding express or implied consent, incapacity, lock boxes, disclosure under exceptional circumstances, mandatory reporting, ministry audits, subpoenas, court orders and police, as well as electronic records and voice messaging communications: http://www.cpso.on.ca/Policies-Publications/Policy/Confidentiality-of-Personal-Health-Information
- it is the physician's responsibility to ensure appropriate security provisions with respect to electronic records and communications
  - with the advent of digital records, there have been increasing issues with access of healthcare providers that are not part of the patient's circle of care accessing medical records inappropriately (e.g. curiousity or for profit). All staff should be aware that most EMRs log which healthcare providers view records and automatically flag files for further review in certain cases (e.g. same surname, VIP patients, audit of access to records)

**Lock Boxes**
The term "lock boxes" applies to situations where the patient has expressly restricted their physician from disclosing specific aspects of their health information to others, even those involved in the patient's circle of care. Note that the *Personal Health Information Protection Act* (PHIPA) provisions denote that patients may not prevent physicians from disclosing personal health information permitted/required by the law

## Consent and Capacity

### Ethical Principles Underlying Consent and Capacity
- consent is the autonomous authorization of a medical intervention by a patient
- usually the principle of respect for patient autonomy must be balanced by the principle of beneficence
- where a patient cannot make an autonomous decision (i.e. incapable), it is the duty of the SDM (or the physician in an emergency) to act on the patient's known prior wishes or, failing that, to act in the patient's best interests
- there is a duty to discover, if possible, what the patient would have wanted when capable
- central to determining best interests is understanding the patient's values, beliefs, and patient's interpretation of cultural or religious background
- more recently expressed wishes take priority over remote ones
- patient wishes may be verbal or written
- patients found incapable to make a specific decision should still be involved in that decision as much as possible; this is known as assent
- agreement or disagreement with medical advice does not determine findings of capacity/incapacity
- however, patients opting for care that puts them at risk of serious harm that most people would want to avoid should have their capacity carefully assessed. Steer clear from tendency to define what reasonable person standard may be. If appropriate, look to discern patterns of justification offered by patient and how they interpret their values, beliefs and culture/religion

**CPSO Policy Consent**
Obtaining valid consent before carrying out medical, therapeutic, and diagnostic procedures has long been recognized as an elementary step in fulfilling the doctor's obligations to the patient

## Four Basic Requirements of Valid Consent

**1. Voluntary**
- consent must be given free of coercion or pressure (e.g. from parents or other family members who might exert 'undue influence')
- the physician must not deliberately mislead the patient about the proposed treatment

**2. Capable**
- the patient must be able to understand and appreciate the nature and effect of their condition as well as of the proposed treatment or decision

**3. Specific**
- the consent provided is specific to the procedure being proposed and to the provider who will carry out the procedure (e.g. the patient must be informed if students will be involved in providing the treatment)

**4. Informed**
- sufficient information and time must be provided to allow the patient to make choices in accordance with their wishes, including:
  - the nature of the treatment or investigation proposed and its expected effects
  - all significant risks and special or unusual risks
  - alternative treatments or investigations and their anticipated effects and significant risks
  - the consequences of declining treatment
  - answers to any questions the patient may have
  - the reasonable person test – the physician must provide all information that would be needed "by a reasonable person in the patient's position" to be able to make a decision
  - disclose common adverse events and all serious risks (e.g. death), even if remote
  - it is the physician's responsibility to make reasonable attempts to ensure that the patient understands the information, including overcoming language barriers, or communication challenges
  - physicians have a duty to inform the patient of all legitimate therapeutic options and must not withhold information based on conscientious objections (e.g. not discussing the option of emergency contraception)

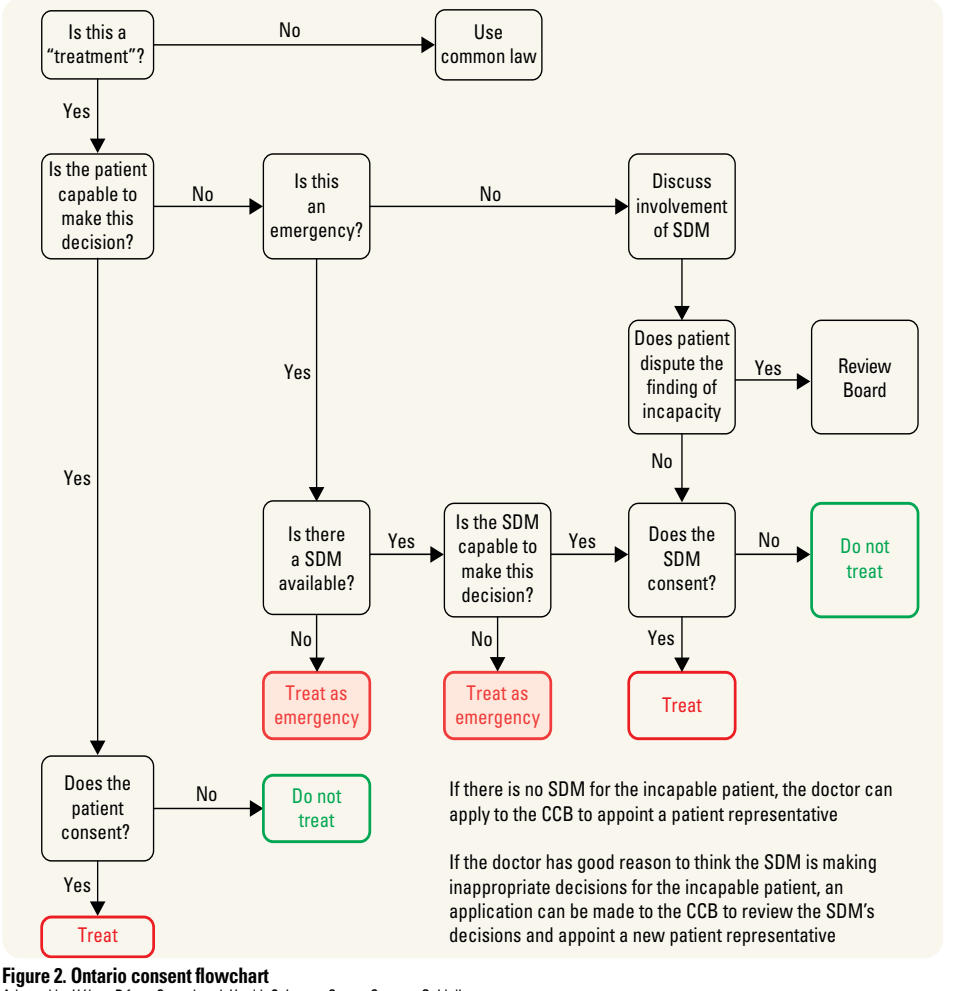

**Figure 2. Ontario consent flowchart**
Adapted by Hébert P from Sunnybrook Health Sciences Centre Consent Guidelines

**4 Basic Elements of Consent**
- Voluntary
- Capable
- Specific
- Informed

**Professional Considerations**

**Elderly Patient**
- Identify their goals of care and resuscitation options (CPR or DNR), if applicable
- Check for documentation of advance directives and POA where applicable

**Pediatric Patient**
- Identify the primary decision-maker (parents, guardian, wards-of-state, emancipated)
- Regarding capacity assessment see *Pediatric Aspects of Capacity*, ELOM11
- Be wary of custody issues if applicable

**Terminally Ill or Palliative Patient**
- Consider the SPIKES approach to breaking bad news
- What are patient's goals of care (i.e. disease vs. symptom management)?
- Identify advance directives, POA, or SDM, if applicable (see ELOM10)
- Check for documentation of resuscitation options (CPR or DNR) and likelihood of success

**Incapable Patient**
- If not already present, perform a formal capacity assessment and thoroughly document
- Identify if the patient has an SDM or who has their POA
- Check the patient's chart for any Mental Health Forms (e.g. Form 1) or any forms they may have on their person (e.g. Form 42)

**Criteria For Administration of Treatment for an Incapable Patient in Emergency Situations**
- Patient is experiencing extreme suffering
- Patient is at risk of sustaining serious bodily harm if treatment is not administered promptly (loss of life or limb)

Patients may also ask to waive the right to choice (e.g. "You know what's best for me, doctor") or delegate their right to choose to someone else (e.g. a family member)

This is not necessarily only in emergency situations. Patients may choose to exercise relational autonomy i.e. conception of self-determination where decisions are made considering relationships and person's social supports. The patient is still in the centre, but chooses to involve others in the decision

## Obtaining Legal Consent

- consent of the patient must be obtained before any medical intervention is provided; consent can be:
  - verbal or written, although written is usually preferred
  - a signed consent form is only evidence of consent – it does not replace the process for obtaining valid consent
  - most important component is what the patient understands and appreciates, not what the signed consent form states
  - implied (e.g. a patient holding out their arm for an immunization) or expressed
- consent is an ongoing process and can be withdrawn or changed after it is given, unless stopping a procedure would put the patient at risk of serious harm
  - if consent has been withdrawn during a procedure, the MD must stop treatment unless stopping the procedure would threaten the patient's life
  - in obtaining consent to continue the procedure, the physician need only re-explain the procedure and risks if there has been a material change in circumstances since obtaining consent originally. If there has been no material change in circumstances, simple assent to continue is sufficient (*Ciarlariello v. Schachter*)
- HCCA of Ontario (1996) covers consent to treatment, admission to a facility, and personal assistance services (e.g. home care)

The Supreme Court of Canada expects physicians to disclose the risks that a "reasonable" person would want to know. In practice, this means disclosing minor risks that are common as well as serious risks that happen infrequently, especially those risks that are particularly relevant to a particular patient (e.g. hearing loss for a musician)

## Exceptions to Consent

**1. Emergencies**

- treatment can be provided without consent where a patient is experiencing severe suffering, or where a delay in treatment would lead to serious harm or death and consent cannot be obtained from the patient or their SDM
- emergency treatment should not violate a prior expressed wish of the patient (e.g. a signed Jehovah's Witness card)
- if patient is incapable, MD must document reasons for incapacity and why situation is emergent
- patients have a right to challenge a finding of incapacity as it removes their decision-making ability
- if a SDM is not available, MD can treat without consent until the SDM is available or the situation is no longer emergent

**2. Legislation**

- mental health legislation allows for:
  - the detention of patients without their consent
  - psychiatric outpatients may be required to adhere to a care plan in accordance with Community Treatment Orders
  - Public Health legislation allows medical officers of health to detain, examine, and treat patients without their consent (e.g. a patient with TB refusing to take medication) to prevent transmission of communicable diseases

**3. Special Situations**

- public health emergencies (e.g. an epidemic or communicable disease treatment)
- warrant for information by police

**Major Exceptions to Consent**
- Emergencies
- Public and Mental Health Legislation
- Communicable diseases

## Consequences of Failure to Obtain Valid Consent

- treatment without consent is battery (an offense in tort), even if the treatment is life-saving (excluding situations outlined in *Exceptions to Consent*)
- treatment of a patient on the basis of poorly informed consent may constitute negligence, also an offense in tort
- the onus of proof that valid consent was not obtained rests with the plaintiff (usually the patient)

**Consent**
- Treatment without consent = battery, including if NO consent or if WRONG procedure
- Treatment with poor or invalid consent = negligence

## Overview of Capacity

- capacity is the ability to:
  - understand information relevant to a treatment decision
  - appreciate the reasonably foreseeable consequences of a decision or lack of a decision
- capacity is specific for each decision (e.g. a person may be capable to consent to having a chest x-ray, but not for a bronchoscopy)
- capacity can change over time (e.g. temporary incapacity secondary to delirium)
- most Canadian jurisdictions distinguish capacity to make healthcare decisions from capacity to make financial decisions; a patient may be deemed capable of one, but not the other
- a person is presumed capable unless there is good evidence to the contrary
- capable patients are entitled to make their own decisions
- capable patients can refuse treatment even if it leads to serious harm or death; however, decisions that put patients at risk of serious harm or death require careful scrutiny

**CPSO Policy on Capacity**
Capacity is an essential component of valid consent, and obtaining valid consent is a policy of the CMA and other professional bodies

## Assessment of Capacity

- capacity assessments must be conducted by the clinician providing treatment and, if appropriate, in consultation with other healthcare professionals (e.g. another physician, a mental health nurse)
- clinical capacity assessment may include:
  - specific capacity assessment (i.e. capacity specific to the decision at hand):
    1. effective disclosure of information and evaluation of patient's reason for decision
    2. understanding of:
       - their condition
       - the nature of the proposed treatment

**Capacity Assessment**
Test for understanding: can the patient recite what you have disclosed?
Test for appreciation: are their beliefs responsive to evidence?
Refer to: JAMA The Rational Clinical Examination "Does This Patient Have Medical Decision-Making Capacity?"

  - alternatives to the treatment
  - the consequences of accepting and rejecting the treatment
  - the risks and benefits of the various options
3. for the appreciation needed for decision-making capacity, a person must:
  - acknowledge the symptoms that affect them
  - be able to assess how the various options would affect them
  - be able to reach a decision, and make a choice, not based primarily upon delusional belief
- general impressions
- input from psychiatrists, neurologists, etc. for any underlying mental health or neurological condition that may affect insight or decision-making
- employ "Aid to Capacity Evaluation" or any other capacity assessment tool/guideline
- a decision of incapacity may warrant further assessment by psychiatrist(s), legal review boards (e.g. in Ontario, the Consent and Capacity Review Board), or the courts
- if found incapable by the Consent and Capacity Review Board, patient must receive notice of their ability to pursue judicial review (and essentially appeal the determination)

### Treatment of the Incapable Patient in a Non-Emergent Situation
- obtain informed consent from SDM
- an incapable patient can only be detained against their will to receive treatment if they meet criteria for certification under the *Mental Health Act* (see Psychiatry, PS53); in such a situation:
  - document assessment in chart
  - notify patient of assessment using appropriate Mental Health Form(s) (Form 42 in Ontario)
  - notify Rights Advisor

### Substitute Decision-Makers
- SDMs must follow the following principles when giving informed consent:
  - act in accordance with wishes previously expressed by the patient while capable
  - if wishes unknown, act in the patient's best interest, taking the following into account:
    1. values and beliefs held by the patient while capable
    2. whether well-being is likely to improve with vs. without treatment
    3. whether the expected benefit outweighs the risk of harm
    4. whether a less intrusive treatment would be as beneficial as the one proposed
- the final decision of the SDM may and should be challenged by the MD if the MD believes the SDM is not abiding by the above principles

### Instructional Advance Directives
- allow patients to exert control over their care once they are no longer capable
- the patient sets out their decisions about future health care, including who they would allow to make treatment decisions on their behalf and what types of interventions they would want
- takes effect once the patient is incapable with respect to treatment decisions
- in Ontario, a person can appoint a power of attorney for personal care to carry out their advance directives
  - the legal threshold to appoint a Power of Attorney for personal care is intentionally set lower than the legal threshold for capacity to consent to many complex medical treatments. This allows a patient that lacks treatment capacity to appoint a person of their choosing to make the decision for them
- patients should be encouraged to review these documents with their family and physicians and to reevaluate them often to ensure they are current with their wishes

## POWERS OF ATTORNEY
- all Guardians and Attorneys have fiduciary duties for the dependent person

### Definitions
- **Power of Attorney for Personal Care**
  - a legal document in which one person gives another the authority to make personal care decisions (health care, nutrition, shelter, clothing, hygiene, and safety) on their behalf if they become mentally incapable
- **Guardian of the Person**
  - someone who is appointed by the Court to make decisions on behalf of an incapable person in some or all areas of personal care, in the absence of a POA for personal care
- **Continuing Power of Attorney for Property**
  - legal document in which a person gives another the legal authority to make decisions about their finances if they become unable to make those decisions
- **Guardian of Property**
  - someone who is appointed by the Public Guardian and Trustee or the Courts to look after an incapable person's property or finances
- **Public Guardian and Trustee**
  - acts as a SDM of last resort on behalf of mentally incapable people who do not have another individual to act on their behalf

**Aid to Capacity Evaluation**
J Gen Intern Med 1999;14(1):27-34
- Ability to understand the medical problem
- Ability to understand the proposed treatment
- Ability to understand the alternatives (if any) to the proposed treatment
- Ability to understand the option of refusing treatment or of it being withheld or withdrawn
- Ability to appreciate the reasonably foreseeable consequences of accepting the proposed treatment
- Ability to appreciate the reasonably foreseeable consequences of refusing the proposed treatment
- Ability to make a decision that is not substantially based on delusions or depression

Most provinces have legislated hierarchies for SDMs; the hierarchy in Ontario is:
- Legally appointed guardian
- Appointed attorney for personal care, if a power of attorney confers authority for treatment consent (see Powers of Attorney)
- Representative appointed by the Consent and Capacity Board
- Spouse or common law partner
- Child (age 16 or older) or parent (unless the parent has only a right of access)
- Parent with only a right of access
- Sibling
- Other relative(s)
- Public guardian and trustee

**Other Types of Capacity Not Covered by the HCCA**
- Testamentary (ability to make a will)
- Fitness (ability to stand trial)
- Financial (ability to manage property – Form 21 of the *Mental Health Act*)
- Personal (ability to care for oneself on a daily basis)
- Substitute consent for a procedure whose primary purpose is research, sterilization for non-therapeutic purposes, or removal of organs or tissue for transplantation (does not apply to those already declared dead)

- **Pediatric Aspects of Capacity Covered**
  - no age of consent in all provinces and territories except Québec; consent depends on patient's decision-making capacity
  - Québec has a specific age of consent, but common law and case law deem underage legal minors capable, allowing these individuals to make their own choices
  - infants and children are assumed to lack mature decision-making capacity for consent but they should still be involved (i.e. be provided with information appropriate to their comprehension level)
  - adolescents are usually treated as adults
  - preferably, assent should still be obtained from patient, even if not capable of giving consent
  - in the event that the physician believes the SDM is not acting in the child's best interests, an appeal must be made to the local child welfare authorities
  - under normal circumstances, parents have right of access to the child's medical record

There is no age of consent in Ontario
Capacity is assessed on an individual basis

# Negligence

Errors of care are compatible with non-negligent care if they are ones that a reasonably cautious and skilled MD could make (i.e. mistakes can be made due to 'honest error')

**Four Basic Elements for Action Against a Physician to Succeed in Negligence**

1. A duty of care owed to the patient (i.e. doctor/patient relationship must be established)
2. A breach of the duty of care
3. Some harm or injury to the patient
4. The harm or injury must have been caused by the breach of the duty of care

### Ethical Basis

- the doctor-patient relationship is formed on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
- negligence or malpractice is a form of failure on the part of the physician in fulfilling their fiduciary duty in providing appropriate care and leading to harm of the patient (and/or abuse of patient's trust)

### Legal Basis

- physicians are legally liable to their patients for causing harm (tort) through a failure to meet the standard of care applicable under the circumstances
- standard/duty of care is defined as one that would reasonably be expected under similar circumstances of an ordinary, prudent physician of the same training, experience, specialization, and standing
- liability arises from physician's common law duty of care to their patients in the doctor/patient relationship (or, in Québec, from the Civil Code provisions regarding general civil liability)
- action(s) in negligence (or civil liability) against a physician must be launched by a patient within a specific prescribed period required by the respective province in which the actions occurred

# Truth-Telling

**CPSO Policy on Truth-Telling**
Physicians should provide patients with whatever information that will, from the patient's perspective, have a bearing on medical decision-making and communicate that information in a way that is comprehensible to the patient

**Examples of Warning of Impending Bad News**
"I have something difficult to tell you…"
"This may come as a shock to you, but the tests indicate…"
"There is no easy way for me to tell you this, so I will tell you straight away that you have a serious problem…"

**Adverse Event**
An unintended injury or complication from health care management resulting in disability, death, or prolonged hospital stay

### Ethical Basis

- helps to promote and maintain a trusting physician-patient relationship
- patients have a right to be told important information that physicians have regarding their care
- enables patients to make informed decisions about health care and their lives

### Legal Basis

- required for valid patient consent (see *Consent and Capacity*, ELOM7)
  - goal is to disclose information that a reasonable person in the patient's position would need in order to make an informed decision ("standard of disclosure")
- withholding information can be a breach of fiduciary duty and duty of care
- obtaining consent on the basis of misleading information can be seen as negligent

### Evidence about Truth-Telling

- it is a patient's right to have the option of knowing what is wrong with them
- most patients want to know what is wrong with them
- although many patients want to protect family members from bad news, they themselves would want to be informed in the same situation
- truth-telling improves adherence and health outcomes
- informed patients are more satisfied with their care and most often take the news better than expected
- negative consequences of truth-telling can include decreased emotional well-being, anxiety, worry, social stigmatization, and loss of insurability

### Challenges in Truth-Telling

**Medical Error**

- medical error may be defined as 'preventable adverse events (AEs)' caused by the patient's medical care and not the patient's underlying illness; some errors may be identified before they harm the patient, so not all error is truly 'adverse'
- many jurisdictions and professional associations expect and require physicians to disclose medical error; that is, any event that harms or threatens to harm patients must be disclosed to the patient or the patient's family and reported to the appropriate health authorities
- physicians must disclose to patients the occurrence of AEs or errors caused by medical management, but should not suggest that they resulted from negligence because:
  - negligence is a legal determination
  - error is not equal to negligence

- disclosure allows the injured patient to seek appropriate corrective treatment promptly
- physicians should avoid simple attributions as to cause and sole responsibility of others or oneself
- physicians should offer apologies or empathic expressions of regret (e.g. "I wish things had turned out differently") as these build trust and are not admissions of guilt or liability
- Apology Acts across Canada protect apologies, both as expressions of regret and admissions of responsibility, from being used as evidence of liability and negligence

**Open Disclosure of AEs: Transparency and Safety in Health Care**
Surg Clin North Am 2012;92(1):163-177
Health care providers have a fiduciary duty to disclose AEs to their patients. Professional societies codify medical providers' ethical requirement to disclose AEs to patients in accordance with the four principles of biomedical ethics. Transparency and honesty in relationships with patients create opportunities for learning that lead to systems improvements in health care organizations. Disclosure invariably becomes a component of broad systems improvement and is closely linked to improving patient safety.

### Breaking Bad News

- 'bad news' may be any information that reveals conditions or illnesses threatening the patient's sense of well-being
- poorly done disclosure may be as harmful as non-disclosure
  - caution patients in advance of serious tests and disclose possible bad findings
  - give time for patient to reflect prior to receiving such news
  - give warnings of impending bad news by reviewing prior discussions
  - provide time for the patient and questions
  - adequate supports and strategies should always be provided following disclosure of difficult news
- **SPIKES** protocol was developed to facilitate "breaking bad news"
  - **S**ETTING and LISTENING SKILL
  - Patient **P**ERCEPTIONS of condition and seriousness
  - **I**NVITATION from patient to receive information
  - **K**NOWLEDGE - provide medical facts
  - Explore **E**MOTIONS and **E**MPATHIZE
  - **S**TRATEGY and **S**UMMARY

**Truth-Telling in Discussing Prognosis in Advanced Life-Limiting Illnesses**
Palliat Med 2007;21(6):507-517
**Purpose**: To examine truth telling in discussing prognosis in patients with progressive advanced life-limiting illnesses and their caregivers.
**Methods**: Systematic review of studies of any design evaluating communication of prognostic information that included adult patients with advanced, life-limiting illnesses, their caregivers and qualified health care professionals (HCPs).
**Results**: 46 eligible studies were identified. While most HCPs believed that patients and caregivers should be told the truth about prognosis, many avoid the topic or withhold information, possibly due to perceived lack of training, stress, no time to attend to emotional needs, fear of negatively impacting the patient, uncertainty about prognostication, requests from family members, and a feeling of inadequacy or hopelessness regarding unavailability of curative treatments.
**Conclusion**: Truth-telling regarding prognosis in advanced life-limiting illnesses is poor by HCPs, likely related to multiple personal limitations, professional demands and perceptions regarding impact on the patient and caregivers.

### Arguments Against Truth-Telling

- may go against certain cultural norms and expectations
- may lead to patient harm, but only in extreme, rare situations
- medical uncertainty may result in the disclosure of uncertain or inaccurate information

### Exceptions to Truth-Telling

- a patient may waive their right to know the truth about their situation (i.e. decline information that would normally be disclosed) when:
  - the patient clearly declines to be informed
  - a strong cultural component exists that should be respected and acknowledged
  - the patient may wish others to be informed and make the medical decisions for them
- the more weight for the consequences for the patient from non-disclosure, the more carefully one must consider the right to ignorance
- 'emergencies': an urgent need to treat may legitimately delay full disclosure; the presumption is that most people would want such treatment and the appropriate SDM cannot be found
- 'therapeutic privilege'
  - withholding of information by the clinician in the belief that disclosure of the information would itself lead to severe anxiety, psychological distress, or physical harm to the patient
  - clinicians should avoid invoking therapeutic privilege due to its paternalistic overtones; it is a defence of non-disclosure that is rarely accepted anymore
  - it is often not the truth that is unpalatable; it is how it is conveyed that can harm the patient

## Ethical Issues in Health Care

### Managing Controversial and Ethical Issues in Practice

- discuss in a non-judgmental manner
- ensure patients have full access to relevant and necessary information
- identify if certain options lie outside the physician's moral boundaries and refer to another physician if appropriate
- consult with appropriate ethics committees or boards
- protect freedom of moral choice for students or trainees

## Reproductive Technologies

### Overview of the Maternal-Fetal Relationship

- in general, maternal and fetal interests align
- in some situations, a conflict between maternal autonomy and the best interests of the fetus may arise

The fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman

### Ethical Issues and Arguments

- principle of reproductive freedom: women have the right to make their own reproductive choices
- coercion of a woman to accept efforts to promote fetal well-being is an unacceptable infringement of her personal autonomy

## Legal Issues and Arguments

- the law protects a woman's right to life, liberty, and security of person, and does not recognize fetal rights; key aspects of the mother's rights include:
  - if a woman is competent and refuses medical advice, her decision must be respected even if the fetus will suffer
  - the fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman
  - a pregnant woman that is addicted to teratogenic substances cannot be detained and treated to protect the fetus (*Winnipeg Child and Family Services (Northwest Area) v. G. (D.F.), [1997] 3 S.C.R. 925*)
  - a fetus is not a "human being" within the meaning of the Criminal Code of Canada, thus medical negligence during delivery resulting in the death of a fetus that has not been born alive does not constitute criminal negligence causing death (manslaughter) and cannot attract criminal penalties (*R v Sullivan*)

*Royal Commission on New Reproductive Technologies* (1993) recommendations:

1. medical treatment must never be imposed upon a competent pregnant woman against her wishes
2. no law should be used to confine a pregnant woman in the interest of her fetus
3. the conduct of a pregnant woman in relation to her fetus should not be criminalized
4. child welfare should never be used to control a woman's behaviour during pregnancy
5. civil liability should never be imposed upon a woman for harm done to her fetus during pregnancy

Examples involving the use of established guidelines

- a woman is permitted to refuse HIV testing during pregnancy, even if vertical transmission to fetus results, however, once the baby is born, breastfeeding and even theoretical transmission of HIV may attract criminal liability (this area of law is unsettled)
- a woman is permitted to refuse Caesarean section in labour that is not progressing, despite evidence of fetal distress

## Advanced Reproductive Therapies

- includes non-coital insemination, hormonal ovarian stimulation, and IVF
- topics with ethical concerns:
  - donor anonymity vs. child-centred reproduction (i.e. knowledge about genetic medical history)
  - preimplantation genetic testing for diagnosis before pregnancy
  - use of new techniques without patients appreciating their experimental nature
  - embryo status – the Supreme Court of Canada maintains that fetuses are "unique" but not persons under law; this view would likely apply to embryos as well
  - access to ART
  - private vs. public funding of ART
  - social factors limiting access to ART (e.g. same-sex couples)
  - the 'commercialization' of reproduction

## Fetal Tissue

- pluripotent stem cells can currently be derived from human embryonic and fetal tissue
- potential uses of stem cells in research
  - studying human development and factors that direct cell specialization
  - evaluating drugs for efficacy and safety in human models
  - cell therapy: using stem cells grown in vitro to repair or replace degenerated/destroyed/malignant tissues (e.g. Parkinson's disease)
  - genetic treatment aimed at altering somatic cells (e.g. myocardial or immunological cells) is acceptable and ongoing

## Induced Abortion

- CMA definition of induced abortion: the active termination of a pregnancy before fetal viability (fetus >500 g or >20 wk GA)
- CMA policy on induced abortion
  1. induced abortion should not be used as an alternative to contraception
  2. counselling on contraception must be readily available
  3. full and immediate counselling services must be provided in the event of unwanted pregnancy
  4. there should be no delay in the provision of abortion services
  5. no patient should be compelled to have a pregnancy terminated
  6. physicians should not be compelled to participate in abortion – if morally opposed, the physician should inform the patient so she may consult another physician
  7. no discrimination should be directed towards either physicians who do not perform or assist at induced abortions or physicians who do
  8. induced abortion should be uniformly available to all women in Canada and health care insurance should cover all the costs (note: the upper limit of GA for which coverage is provided varies between provinces)
  9. elective termination of pregnancy after fetal viability may be indicated under exceptional circumstances

**Neonate as Member of Society**
Paediatr Child Health 2012;17(8):443-444

- Once outside the mother's body, the neonate becomes a member of society with all the rights and protections other vulnerable persons receive.
- Non-treatment of a neonate born alive is only acceptable if <22 wk GA
- 23-25 wk GA: treatment should be a consensual decision between physician and parents
- 25 wk GA and more: neonate should receive full treatment unless major anomalies or conditions incompatible with life are present

**Advanced Reproductive Technologies: Ethically Appropriate Actions**

- Educate patients and address contributors to infertility (e.g. stress, alcohol, medications, etc.)
- Investigate and treat underlying health problems causing infertility
- Wait at least 1 yr before initiating treatment with ART (exceptions – advanced age or specific indicators of infertility)
- Educate and prepare patients for potential negative outcomes of ART

Payment of gamete donors is currently illegal in Canada. The ART Act is currently not being enforced as it does not clarify whether ART falls under the jurisdiction of the federal or provincial government

**Semen Regulations of the Food and Drug Act, 1996**
No one under age 18 can donate sperm or eggs, except for the purpose of creating a child that the donor plans to raise himself/herself (e.g. young patients receiving radiation therapy for cancer that may cause infertility)

**Assisted Human Reproduction Act, 2004**
Surrogate mothers cannot be paid or offered compensation beyond a reimbursement of their expenses

### Ethical and Legal Concerns and Arguments
- in Canada, there is no criminal prohibition regarding abortion
- it is a woman's medical decision to be made in consultation with whom she wishes; there is no mandatory role for spouse/family
- 2nd and even 3rd trimester abortions are not illegal in Canada, but are usually only carried out when there are serious risks to the woman's health, or if the fetus has died in utero or has major malformations (e.g. anencephaly). Medical termination of pregnancy (MTP) for social reasons are now conducted in select medical centres in Canada

### Prenatal/Antenatal Genetic Testing
- uses
  1. to confirm a clinical diagnosis
  2. to detect genetic predisposition to a disease
  3. allows preventative steps to be taken and helps patient prepare for the future
  4. gives parents the option to terminate a pregnancy or begin early treatment
- ethical dilemmas arise because of the sensitive nature of genetic information; important considerations of genetic testing include:
  - the individual and familial implications
  - its pertinence to future disease
  - its ability to identify disorders for which there are no effective treatments or preventive steps
  - its ability to identify the sex of the fetus
  - ethical issues and arguments regarding the use of prenatal/antenatal genetic testing include:
    - obtaining informed consent is difficult due to the complexity of genetic information
    - doctor's duty to maintain confidentiality vs. duty to warn family members
    - risk of social discrimination (e.g. insurance) and psychological harm

### Legal Aspects
- no current specific legislation exists
- testing requires informed consent
- no standard of care exists for clinical genetics, but physicians are legally obligated to inform patients that prenatal testing exists and is available
- a physician may be able to breach confidentiality in order to warn family members about a condition if harm can possibly be prevented via treatment or prevention. In general, the patient's consent is required, unless the harm to be avoided is sufficiently serious to rise to the level of imminent risk of serious bodily harm or death (i.e. not a chronic condition, but an acute life-threatening condition)

### Genetic Testing: Ethically Appropriate Actions
- thorough discussion and realistic planning with patient before testing is done
- genetic counselling for delivery of complex information

**The Tri-Council Policy Statement**
1. Genetic treatment aimed at altering germ cells is prohibited in Canada and elsewhere
2. Embryo research is permitted up to 14 d post-fertilization
3. Embryos created for reproductive purposes that are no longer required may be used
4. Gamete providers must give free and informed consent for research use
5. No commercial transactions in the creation and use of the embryos are permitted
6. Creation of embryos solely for research purposes is prohibited
8. Human cloning is strictly prohibited
8. Risks of coercion must be minimized (i.e. the fertility treatment team may not be pressured to generate more embryos than necessary)
9. One may only discuss the option of using fetal tissue for research after free and informed choice to have a therapeutic abortion has been made by the patient
10. Physicians responsible for fertility treatment may not be part of a stem cell research team

## End-of-Life Care

### Overview of Palliative and End-of-Life Care
- focus of care is comfort and respect for person nearing death and maximizing quality of life for patient, family, and loved ones
  - palliative care is an approach that improves the quality of life of patients facing life-threatening illness, through the prevention and relief of suffering, including treating pain, physical, psychosocial, and spiritual concerns
- appropriate for any patient at any stage of a serious or life-limiting illness
- may occur in a hospital, hospice, in the community, or at home
- often involves an interdisciplinary team of caregivers
- addresses the medical, psychosocial, and spiritual dimensions of care

**Palliative Care – Not the Same As Euthanasia**
Palliative care is an approach designed to improve symptoms and quality of life for the duration of a person's life, but unlike Medical Assistance in Dying, it does not aim directly at or intend to end the person's life. Many palliative care physicians are incorporating MAID into their practice, though some may conscientiously object

### Euthanasia and Medical-Assistance in Dying (MAID)
- euthanasia: knowingly and intentionally performing an act, with or without consent, that is explicitly intended to end another person's life where that person has an incurable illness
- medical-assistance in dying: the administering or prescribing for self-administration, by a medical practitioner or nurse practitioner, of a substance, at the request of a person, that causes their death
  - palliative sedation: the use of sedative medications for patients that are terminally ill to relieve suffering and manage symptoms. Though the intent is not to hasten death, this may be a foreseeable consequence
  - withdrawing or withholding life sustaining interventions (e.g. artificial ventilation or nutrition) that are keeping the patient alive but no longer wanted or indicated

**MAID: Ethically Appropriate Actions**
- Respect capable decisions to forgo treatment
- Provide appropriate palliative measures
- Try to assess reasons for such requests from patients to see if there are 'reversible factors' (such as depression, pain, loneliness, anxiety) that can be treated

### Common Ethical Arguments/Opinions
- criminally prohibiting assistance in death, forces some who will eventually become too unwell to end their own lives at an earlier time and forces others to endure intolerable suffering.
- patient has the right to make autonomous choices about the time and manner of their own death
- belief that there is no ethical difference between the acts of euthanasia/assisted suicide and forgoing life-sustaining treatments
- belief that these acts benefit terminally ill patients by relieving suffering

- patient autonomy has limits
- death should be the consequence of the morally justified withdrawal of life-sustaining treatments only in cases where there is a fatal underlying condition, and it is the condition (not the withdrawal of treatment) that causes death
- an argument presented in the Carter case (see below) suggested permitting MAID will detract support for palliative care, since with proper palliative care, the number of requests for MAID would decrease. This argument was rejected in *Carter v. Canada*, as making people suffer to potentially improve care for others is not acceptable

### Legal Aspect

- in the *Carter v. Canada* decision of February 2015, the criminal prohibition on assistance in suicide was ruled unconstitutional to the extent that they prohibit physician-assisted death for a competent adult person who (1) clearly consents to the termination of life and (2) has a grievous and irremediable medical condition that causes enduring suffering that is intolerable to the individual in the circumstances of his or her condition
- Bill C-14 (June 17, 2016) legalized MAID by amending the Criminal Code to create exemptions permitting medical practitioners to provide MAID, specified the eligibility criteria, safeguards, and required documentation and authorization from the Minister of Health, as well as new offences for failure to comply with the new regulations. http://www.parl.ca/DocumentViewer/en/42-1/bill/C-14/royal-assent
  - as the Bill C-14 criteria are narrower than the Carter decision, there are ongoing constitutional challenges to the MAID framework as it currently stands

### Bill C-14 Criteria for MAID

- patient is eligible for publicly-funded health services in Canada
- at least 18 yr of age, and has capacity for clear and freely given consent
- grievous and irremediable medical condition: in an advanced state of irreversible decline in capability
- suffering intolerable to the patient, not relieved under conditions they consider acceptable
- natural death is reasonably foreseeable

MAID Process

1. eligibility criteria satisfied
2. patient signs and dates a written request for MAID
3. two independent witness sign the written request. Witnesses must be 18 years of age, understand the nature of MAID, and must not a) benefit (financially or otherwise) from the death, b) be an owner or operator of the healthcare facility where the patient is receiving care, c) be directly involved in the provision of health or personal care of the patient
4. HCP must inform the patient that they can withdraw their consent at any time
5. two independent assessors (MD or NP) must provide written confirmation that eligibility criteria are met
6. 10 clear days must elapse between the request and the day on which MAID is provided, unless both healthcare providers agree that a shorter period is appropriate due to the patient's imminent death or loss of capacity
7. throughout the 10 d period and immediately before providing MAID, the HCP must give the individual an opportunity to withdraw the request and ensure that the patient gives express consent to receive MAID
   - contravention of this process is an offence punishable by up to five years in prison

### Acceptable Use of Palliative and End-of-Life Care

- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from euthanasia and assisted suicide as it is seen as allowing the underlying disease to take its 'natural course', but this distinction may be more theoretical than real
- consent for withdrawal of life-support must be sought from the capable patient, or in case of incapable patient the SDMs, as per the *Health Care Consent Act* and *Substitute Decisions Act*, and as re-affirmed by the ruling in *Cuthbertson v. Rasouli* in 2013, as palliative care would be instituted and consent for that would require SDM consent
- refusals of care by the patient that may lead to death as well as requests for a hastened death, ought to be carefully explored by the physician to rule out any 'reversible factors' (e.g. poor palliation, depression, poverty, ill-education, isolation) that may be hindering authentic choice
- Government of Canada – Services and Information for End-of-Life Care: https://www.canada.ca/en/health-canada/topics/end-life-care.html
  - options and decision making at end of life: palliative care, do not resuscitate orders, refusal or withdrawal of treatment, refusal of food and drink, palliative sedation, MAID
  - decisions at end of life: informed and capacity for consent, substitute decision maker, advanced care planning (written plan, will, or medical directive) often established through a family meeting

**Mental Health Outcomes of Family Members of Patients Who Request Physician Aid in Dying**
J Pain Symptom Manage 2009;38(6):807-815
**Purpose**: To describe how patients' end-of-life choices affected family caregivers of Oregonians who requested aid in dying and to assess degree of grief, use of mental health services and depression amongst family caregivers.
**Methods**: Family members of Oregonian patients who had explicitly requested aid in dying (including those whose loved ones received a lethal prescription and those whose loved ones died by lethal ingestion) were surveyed. For comparison purposes, family members of patients who died of cancer or amyotrophic lateral sclerosis also were surveyed.
**Results**: 95 family members were surveyed, including 59 of those whose loved ones received a lethal prescription and 36 whose loved ones died by lethal ingestion. Among those whose family member requested aid in dying, whether or not the patient accessed a lethal prescription had no influence on subsequent depression, grief, or mental health services use; however, family members of patients who received a lethal prescription were more likely to believe that their loved one's choices were honored and less likely to have regrets about how the loved one died. Comparing family members of those who requested aid in dying to those who did not revealed no differences in primary mental health outcomes of depression, grief, or mental health services use. Family members of patients who requested aid in dying felt more prepared and accepting of the death than comparison family members.
**Conclusion**: Pursuit of aid in dying does not have negative effects on surviving family members and may be associated with greater preparation and acceptance of death.

### Physician Responsibilities Regarding Death

- physicians are required by law to complete a medical certificate of death unless the coroner needs notification; failure to report death is a criminal offence
- *Coroner's Act*, 1990 (specific to Ontario, similar in other provinces) requires physicians to notify a coroner or police officer if death occurs:
  - due to violence, negligence, misconduct, misadventure, or malpractice
  - during pregnancy or is attributable to pregnancy
  - suddenly and unexpectedly
  - from disease which was not treated by a legally qualified medical practitioner
  - from any cause other than disease
  - under suspicious circumstances
  - death from MAID
- coroner investigates these deaths, as well as deaths that occur in psychiatric institutions, jails, foster homes, nursing homes, hospitals to which a person was transferred from a facility, institution or home, etc.
- in consultation with forensic pathologists and other specialists, the coroner establishes:
  - the identity of the deceased
  - where and when the death occurred
  - the medical cause of death
  - the means of death (i.e. natural, accidental, suicide, homicide, or undetermined)
- coroners do not make decisions regarding criminality or legal responsibility
- while the Supreme Court of Canada noted that nothing in the *Carter v. Canada* decision compelled a physician to participate in MAID, the College of Physicians and Surgeons of Ontario mandatory referral policy, which has been upheld by the courts, requires physicians in Ontario to provide an effective referral if the physician conscientiously objects to MAID
  - the impact of MAID on religious institutions' obligation towards patients is not yet clear

**Notify Coroner if Death Occurs due to:**
- Violence, negligence, misconduct
- Pregnancy
- Sudden or unexpected causes
- Disease not treated
- Cause other than disease
- Suspicious circumstances
- MAID

## Physician Competence and Professional Conduct

### CanMEDS Competencies (Ethical/Policy Statement)

- a framework of professional competencies established by the Medical Council of Canada (MCC) as objectives for the MCC Qualifying Exam
- further information on Medical Council of Canada objectives can be found at www.mcc.ca

**CanMeds Competencies**
- Communicator
- Collaborator
- Health Advocate
- Leader
- Professional
- Scholar
- Medical Expert

### Legal Considerations

- physicians' conduct and competence are legally regulated to protect patients and society via mandatory membership to provincial governing bodies (e.g. the CPSO)
- physicians are legally required to maintain a license with the appropriate authority, and are thus legally bound to outlined policies on matters of conduct within their medical practice
- the ultimate constraint on MD behaviour with regards to unprofessionalism is 'conduct unbecoming a physician', such as inappropriate behaviour with colleagues, conflicts of interest, untruthfulness, unethical billing practices, and sexual impropriety with patients

**CPSO Policy: Ending the Physician-Patient Relationship**
Discontinuing services that are needed is an act of professional misconduct unless done by patient request, alternative services are arranged, or adequate notice has been given

### Common Policies on Physician Conduct

- physicians must ensure that patients have access to continuous on-call coverage and are never abandoned
  - physicians are required to comply with the law, which include human rights laws. A failure to accommodate a disability in violation of human rights legislation, can result in the regulatory body sanctioning the physician in addition to any penalties assigned by the human rights tribunal
- sexual conduct with patients, even when consented to by the patient, is a serious matter that can lead to accusations of battery by the patient and provincial governing body. Important notes on this topic include:
  - inappropriate sexual conduct includes intercourse, undue touching, references to sexual matters, sexual jokes, and physician presence when capable patients undress or dress
  - in specified situations, physicians may have a personal relationship with a patient provided a year has passed since the last therapeutic contact
  - physicians are permanently prohibited from personal relationships with patients whom they saw for psychotherapy
  - in Ontario, physicians must report any colleagues of whom they have information regarding sexual impropriety (as per CPSO Code of Ethics)
- physicians must maintain adequate records for each patient, which include:
  - demonstration that care has been continuous and comprehensive
  - minimal standards for record-keeping, including readability, diagnosis, differential diagnosis, appropriate tests and referrals, and a coherent patient record, including drugs, a cumulative patient profile, and all aspects of charting that are required for safe patient care (full standards available at www.cpso.on.ca). Another physician should be able to take over the safe care of the patient based on the record
  - records stored for 10 years in most jurisdictions

**CMA Code of Ethics**
Report any unprofessional conduct by colleagues to the appropriate authority

**CPSO Policy: Treating Self and Family Members**
Physicians will not diagnose or treat themselves or family members except for minor conditions or in emergencies and then only if no other physician is readily available

  - although the medical record is the property of the physician or an institution, the patient or the patient's delegate must be:
    - allowed full access to information in the medical record
    - patient or delegate must obtain access within a reasonable period of time
    - usually upon written request by the patient or patient's delegate
    - physician can charge a reasonable fee for this service
- in the hospital, physicians must ensure their own competence, respect hospital by-laws and regulations, practice only within the limits of granted privileges, cooperate with other hospital personnel, and maintain adequate hospital records

# Research Ethics

- involves the systematic analysis of ethical dilemmas arising during research involving human subjects to ensure that:
  - study participants are protected
  - clinical research is conducted to serve the interests of the participants and/or society as a whole
- major ethical dilemmas arise when a physician's obligation to the patient comes into conflict with other obligations and incentives
- any exceptions to disclosure for therapeutic consent do not apply in an experimental situation
- important ethical principles to consider when conducting research on human subjects are laid out in the *Declaration of Helsinki, the Belmont Report*, and the *Tri-Council Policy Statement: Ethical Conduct on Research Involving Human Subjects*

**Table 5. Ethical Principles for Research Involving Human Subjects**

| |
|---|
| Patient's participation in research should not put them at a known or probable disadvantage with respect to medical care (i.e. cannot deny participants in research 'known effective care', such as randomizing patients with depression to a placebo arm with no treatment) |
| Participant's voluntary and informed choice is usually required, except in special circumstances (i.e. chart reviews without patient contact, or emergency situations for which there is no accepted or helpful standard of care and the proposed intervention is not likely to cause more harm than such patients already face) |
| Access to the treatment that is considered standard (i.e. placebo-controlled trials are generally acceptable where patients still receive the standard of care, or, if not, are informed about the placebo arm and what that entails) |
| Must employ a scientifically valid design to answer the research question (ensured via peer review, expert opinion) |
| Must demonstrate sufficient value to justify any risk posed to participants |
| Must be conducted honestly (i.e. carried out as stated in the approved protocol) |
| Findings must be reported promptly and accurately without exaggeration, to allow practicing clinicians to draw reasonable conclusions |
| Patients must not be enticed into risky research by financial incentives and investigators must not trade the interests of patients for disproportionate recompense by a sponsor; both participants and investigators are due fair recompense for their time and efforts |
| Any significant interventional trial ought to have a data safety monitoring board that is independent of the sponsor and can ensure safety of the ongoing trial |

**Guiding Principles for Research Ethics**
- Respect for persons: informed consent
- Beneficence: harm vs. benefit
- Justice: avoid exploitation/unjustified exclusion

**Informed Consent for Research**
- Purpose of study
- Sum of funding
- Name and probability of harm and benefits
- Nature of physician's participation including compensation
- Proposals for research must be submitted to a research ethics board

Randomization is allowed even if there is an efficacious standard if, for example, there are drawbacks to it (such as it doesn't work for all, has side effects, and is not tolerated). In such cases, there must be a good safety net established to make sure subjects in the placebo arm do not deteriorate (i.e. there must be a safety monitoring plan for such studies)

**CMA and CPSO Guidelines for Ethically Appropriate Physician-Industry Relations**
- The primary goal should be the advancement of the health of Canadians
- Relationships should be guided by the CMA Code of Ethics
- The physician's primary obligation is to the patient
- Physicians should avoid any self-interest in their prescribing and referral practices
- Physicians should always maintain professional autonomy, independence, and commitment to the scientific method

# Physician-Industry Relations

- health care delivery in Canada involves collaboration between physicians and the pharmaceutical and health supply industries in the areas of research, education, and clinical evaluation packages (i.e. product samples)
- however, unlike physicians, pharmaceutical and health supply industries do not have a fiduciary duty to patients and are profit-driven
  - for example, the dissemination of free product samples by pharmaceutical companies is associated with increased patient preference for new drugs that are often more expensive, thus incurring a greater long-term cost for patients and the healthcare system
  - new pharmaceutical products are not always more effective than previous standard of care and may have less robust safety evidence by virtue of being new drugs
- physicians must ensure that their participation in such collaborative efforts is in keeping with their duties to their patients and society; however, physicians often struggle to properly identify situations in which a conflict of interest is present
- even seemingly innocuous gifts or other interactions (pens with pharmaceutical logo, research honoraria, meals, speaker fees, etc.) can subconsciously influence physician practices and beliefs in favour of promoted products, resulting in the prescription of medications for reasons other than their efficacy and safety profile
- gifts or free products from the pharmaceutical industry are usually inappropriate:
  - sponsorship for travel and fees for conference attendance may be accepted only where the physician is a conference presenter and not just in attendance
  - physicians receiving such sponsorship must disclose this at presentations and/or in written articles

# Resource Allocation

- **definition**: the distribution of goods and services to programs and people
- physicians have the duty to inform patients about therapeutic options even if they are not available
- physicians must make health care resources available to patients in a manner which is fair and equitable, without bias or discrimination
  - need and benefit are morally relevant criteria for resource allocation
  - gender, sexual orientation, religion, level of education, or age **alone** are morally irrelevant criteria. Must be weighed against need and benefit to justify equitable allocation of resources
- ethical dilemmas that arise when deciding how best to allocate resources
  - fair chances vs. best outcome: favouring best outcome vs. giving all patients fair access to limited resources (e.g. transplant list prioritization)
  - priorities problem: how much priority should the sickest patients receive?
  - aggregation problem: modest benefits to many vs. significant benefits to few
  - democracy problem: when to rely on a fair democratic process to arrive at a decision

### Guidelines for Appropriately Allocating Resources

- the physician's primary obligation is to:
  - protect and promote the welfare and best interests of their patients
  - choose interventions known to be beneficial on the basis of evidence of effectiveness
  - seek the tests or treatments that will accomplish the diagnostic or therapeutic goal for the least cost
  - advocate for one's patients, but avoid manipulating the system to gain unfair advantage for them
  - resolve conflicting claims for scarce resources justly, on the basis of morally relevant criteria such as need and benefit, using fair and publicly defensible procedures
  - inform patients of the impact of cost constraints on care, but in a sensitive way
  - seek resolution of unacceptable shortages at the level of hospital management or government

# Conscientious Objection

### Patients Refusing Treatment

- in accordance with the principle of autonomy, it is generally acceptable for competent patients to refuse medical interventions for themselves or others, although exceptions may occur
- the onus of justifying reasons for refusal or agreement is higher on SDMs than on capable patients
- if parents or SDMs make decisions that are clearly not in the "best interests" of an incapable child, physicians may have ethical grounds for administering treatment, depending on the acuity of the clinical situation
  - in high-acuity scenarios (e.g. refusing blood transfusion based on religious grounds for a child in hemorrhagic shock), physicians have a stronger obligation to act in the child's best interests
  - in lower acuity scenarios (e.g. refusing childhood immunization in a developed nation) there is a stronger obligation to respect the autonomy of the decision-makers
  - in 2014, a child was found not to be "a child in need of protection" when her mother refused chemotherapy and pursued traditional Indigenous healing. While this decision purported to establish a new constitutional right to Indigenous healing, the decision was amended such that "the best interests of the child are paramount." These statements could be interpreted in contradiction with each other, so it is unclear what the current status of the law is. See *Hamilton Health Sciences Centre v. DH* for more information

### Physicians Refusing to Provide Treatment

- physicians may refuse to provide treatment or discontinue relationships with patients, but must ensure these patients can access services elsewhere by way of referring the patient to a willing practitioner (e.g. a pediatrician who refuses to treat an unvaccinated child should refer the family to another practice)

**Recommendations for Working with Families Who Refuse Childhood Immunization**
Pediatrics 2011;128:S167-174

1. Provide clear information about the risks and benefits of immunization and the diseases targeted.
2. Inform parents when their beliefs are unsupported by evidence.
3. Physicians can discontinue professional services but must comply with legal and ethical requirements. Parents are entitled to refuse treatment that a physician recommends; not every disagreement should result in discharge from practice.
4. Vaccine education for Complementary and Alternative Medicine providers.
5. Public education campaigns regarding immunization.
6. No-fault compensation for vaccine-related injury.

# Indigenous Legal and Health Policy

- Indigenous peoples collectively refers to original inhabitants of Canada and their descendants: First Nations, Inuit, and Métis peoples defined in the *Canadian Constitution Act*, 1982
  - First Nations traditional territory encompasses all of geographic Canada and constitutes many distinct communities and languages
  - Inuit refers to original inhabitants of arctic regions including Labrador, northern Quebec, Nunavut, and Northwest Territories
  - Métis are Indigenous people of both First Nations and European heritage
  - Canada's *Indian Act*, 1876, defined who is considered a "status Indian" and thus eligible for programs and services by federal and provincial agencies. Non-Status First Nations, are Indigenous people who are not a "Registered Indian" with the federal government
    - while used by the federal government and for legal proceedings, the terms "status/non-status Indian" are paternalistic and offensive
  - the *Daniels Decision*, 2016, the Federal Court of Canada, deemed Métis and non-status First Nations peoples be considered "Indians" under *Canadian Constitution Act* but no reparations in fiduciary duty or duty to consult have been made
- Indigenous Health Policy in Canada is made up of a complicated "patchwork" of policies, legislation and agreements between federal, provincial, municipal, and Indigenous governments which is in a constant state of flux; reviewed by the National Collaborating Centre for Indigenous Health (NCCIH): http://www.nccah-ccnsa.ca/en/publications.aspx?sortcode=2.8.10&publication=28
  - while some Indigenous health services are adequate, gaps and ambiguities created by complicated policy and jurisdictions have created barriers to health equity
  - for on-reserve First Nations and Inuit, the federal government finances and administers health services through the First Nations and Inuit Health Branch (FNIHB)
  - the *Indian Health Policy*, 1979, and *Health Transfer Policy*, 1989, transferred control to individual communities to negotiate with the FNIHB varying levels of health care responsibility to the community or council level
  - treaties and Self Government Agreements can define areas of jurisdiction for federal, provincial/territorial, and First Nations governments

# Acronyms

| | |
|---|---|
| 2,3-BPG | 2,3-Bisphosphoglycerate |
| ABG | arterial blood gas |
| ACC | American College of Cardiology |
| ACh | acetylcholine |
| AChE | acetylcholinesterase |
| ACV | assist-control ventilation |
| AHA | American Heart Association |
| ALS | amyotrophic lateral sclerosis |
| ARDS | acute respiratory distress syndrome |
| atm | atmosphere |
| CCS | Canadian Cardiovascular Society |
| CHF | congestive heart failure |
| CK | creatine kinase |
| CO | cardiac output |
| CSF | cerebrospinal fluid |
| CVP | central venous pressure |
| DIC | disseminated intravascular coagulation |
| DKA | diabetic ketoacidosis |
| $ETCO_2$ | End-Tidal $CO_2$ |
| ETT | endotracheal tube |
| $FiO_2$ | fraction of oxygen in inspired air |
| FFP | fresh frozen plasma |
| FRC | functional residual capacity |
| GA | general anesthesia |
| GERD | gastroesophageal reflux disease |
| Hb(i) | initial hemoglobin |
| Hb(f) | final hemoglobin |
| Hct | hematocrit |
| HES | hydroxyethyl starch |
| HHS | hyperosmolar hyperglycemic state |
| ICP | intracranial pressure |
| ICS | inhaled corticosteroids |
| IOP | intraocular pressure |
| ITP | immune thrombocytopenic purpura |
| LA | local anesthetic |
| LABA | long-acting β-agonist |
| LES | lower esophageal sphincter |
| LMA | laryngeal mask airway |
| LOC | level of consciousness |
| MAC | minimum alveolar concentration |
| MAP | mean arterial pressure |
| MH | malignant hyperthermia |
| MS | multiple sclerosis |
| NMJ | neuromuscular junction |
| NYHA | New York Heart Association |
| OCS | oral corticosteroids |
| OR | operating room |
| OSA | obstructive sleep apnea |
| $PaCO_2$ | arterial partial pressure of carbon dioxide |
| $PaO_2$ | arterial partial pressure of oxygen |
| PC | patient-controlled |
| PCA | patient-controlled analgesia |
| PCV | pressure-controlled ventilation |
| PEEP | positive end-expiratory pressure |
| PNS | parasympathetic nervous system |
| PONV | post-operative nausea and vomiting |
| PPV | positive pressure ventilation |
| RSI | rapid sequence induction |
| SABA | short-acting β-agonist |
| SCh | succinylcholine |
| SIADH | syndrome of inappropriate antidiuretic hormone |
| SNS | sympathetic nervous system |
| SV | stroke volume |
| SVR | systemic vascular resistance |
| TIA | transient ischemic attack |
| TBW | total body water |
| TIVA | total intravenous anesthetic |
| TURP | transurethral resection of prostate |
| V/Q | ventilation/perfusion |
| VT | ventricular tachycardia |
| VTE | venous thromboembolism |

# Overview of Anesthesia

- anesthesia: lack of sensation/perception

### Approach to Anesthesia

**Pre-operative**

1. pre-operative assessment
2. patient optimization

**Pre-operative/Peri-operative**

3. plan anesthetic
   various types of anesthesia
   pre-medication
   airway management
   monitors
   induction
   maintenance
   emergence
   tracheal extubation

**Post-operative**

4. post-operative care

# Types of Anesthesia

- **general**
  - general anesthesia (GA)
  - total IV anesthesia (TIVA)
- **regional**
  - spinal, epidural
  - peripheral nerve block
  - IV regional
- **local**
  - local infiltration
  - topical

Note that different types of anesthesia can be combined (general + regional)

# Pre-Operative Assessment

### Purpose

- identify concerns for medical and surgical management of patient
- allow for questions to help allay any fears or concerns patient and/or family may have
- arrange further investigations, consultations and treatments for patients not yet optimized
- plan and consent for anesthetic techniques

# History and Physical

### History

- age, gender
- indication for surgery
- surgical/anesthetic Hx: previous anesthetics, any complications, previous intubations, post-operative N/V
- FHx: abnormal anesthetic reactions, malignant hyperthermia, pseudocholinesterase deficiency (see *Uncommon Complications*, A28)
- medications, allergies (see *Pre-Operative Optimization: Medications*, A4)

- PMHx
  - neuro: seizures, TIA/strokes, raised ICP, spinal disease, aneurysm, conditions affecting neuromuscular junction (e.g. myasthenia gravis)
  - CVS: angina/CAD, MI, CHF, HTN, valvular disease, dysrhythmias, peripheral vascular disease (PVD), conditions requiring endocarditis prophylaxis, exercise tolerance, CCS/NYHA class (see Cardiology and Cardiac Surgery, C26, C35 sidebar for New York Heart Association Classification)
  - respiratory: smoking, asthma, COPD, recent upper respiratory tract infection (URTI), sleep apnea
  - GI: GERD, liver disease, NPO status
  - renal: acute vs. chronic renal insufficiency, dialysis, chronic kidney disease
  - hematologic: anemia, coagulopathies, blood dyscrasias
  - MSK: arthritides (e.g. rheumatoid arthritis, scleroderma), cervical spine pathology (e.g. cervical tumours, cervical infections/abscesses, trauma to cervical spine, previous cervical spine surgery), cervical spine instability (e.g. Trisomy 21)
  - endocrine: DM, thyroid disorders, adrenal disorders
  - other: morbid obesity, pregnancy, ethanol/recreational drug use

## Physical Exam

- weight, height, BP, heart rate, respiratory rate, oxygen saturation
- focused physical exam of the CNS, CVS, and respiratory systems
- general assessment of nutrition, hydration, and mental status
- airway assessment is done to determine intubation difficulty (no single test is specific or sensitive) and ventilation difficulty
  - cervical spine stability and neck movement – upper cervical spine extension, lower cervical spine flexion ("sniffing the morning air" position – Figure 6, Panel C)
  - Mallampati classification
  - "3-3-2 rule"
    - 3 of patient's own fingers can be placed between the incisors (incisor distance)
    - 3 fingers along the floor of the mandible between the mentum and hyoid bone (hyoid-mental distance)
    - 2 fingers in the superior laryngeal notch (thyroid-mouth distance)
    - thyromental distance (distance of lower mandible in midline from the mentum to the thyroid notch); <3 finger breadths (<6 cm) is associated with difficult intubation
    - mouth opening (<2 finger breadths is associated with difficult intubation)
    - anterior jaw subluxation (<1 finger breadth is associated with difficult intubation)
- tongue size
- dentition, dental appliances/prosthetic caps, existing chipped/loose teeth – pose aspiration risk if dislodged and must inform patients of rare possibility of damage
  - nasal passage patency (if planning nasotracheal intubation)
  - assess potential for difficult ventilation
- examination of anatomical sites relevant to lines and blocks
  - bony landmarks and suitability of anatomy for regional anesthesia (if relevant)
  - sites for IV, CVP, and pulmonary artery (PA) catheters

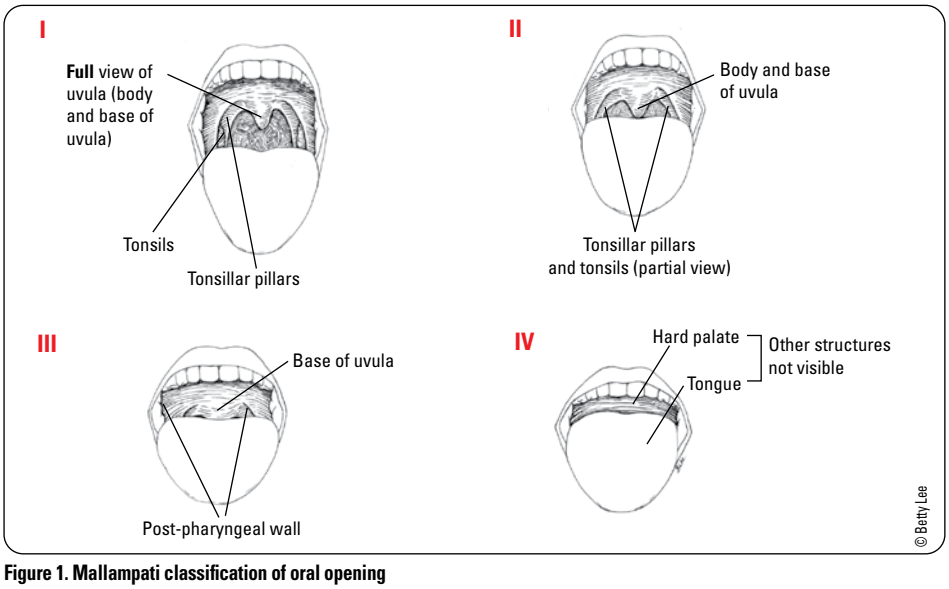

**Figure 1. Mallampati classification of oral opening**

**Evaluation of Difficult Airway**

**LEMON**
**L**ook – obesity, beard, dental/facial abnormalities, neck, facial/neck trauma
**E**valuate – 3-3-2 rule
**M**allampati score (≥3)
**O**bstruction – stridor, foreign bodies, masses
**N**eck mobility

**To Assess for Ventilation Difficulty**
Anesthesiology 2000,92:1229-36

**BONES**
**B**eard
**O**besity (BMI>26)
**N**o teeth
**E**lderly (age>55)
**S**noring Hx (sleep apnea)

**Figure 2. 3-3-2 Rule**

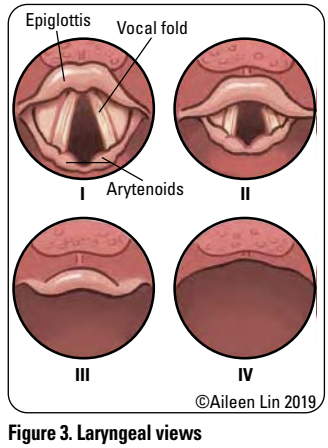

**Figure 3. Laryngeal views**

# Pre-Operative Investigations

- routine pre-operative investigations are only necessary if there are comorbidities or certain indications

**Table 1. Suggested Indications for Specific Investigations in the Pre-Operative Period**

| Test | Indications |
|---|---|
| **CBC** | Major surgery requiring group and screen or cross and match; chronic cardiovascular, pulmonary, renal, or hepatic disease; malignancy; known or suspected anemia; bleeding diathesis or myelosuppression; patient <1 yr of age |
| **Sickle Cell Screen** | Genetically predisposed patient (hemoglobin electrophoresis if screen is positive) |
| **INR, aPTT** | Anticoagulant therapy, bleeding diathesis, liver disease |
| **Electrolytes and Creatinine** | Hypertension, renal disease, DM, pituitary or adrenal disease; vascular disease, digoxin, diuretic, or other drug therapies affecting electrolytes |
| **Fasting Glucose Level** | DM (repeat on day of surgery) |
| **Pregnancy (β-hCG)** | Women of reproductive age |
| **ECG** | Heart disease, DM, other risk factors for cardiac disease; subarachnoid or intracranial hemorrhage, cerebrovascular accident, head trauma |
| **Chest Radiograph** | Patients with new or worsening respiratory symptoms/signs |

Guidelines to the Practice of Anesthesia Revised Edition 2013. Supplement to the Canadian Journal of Anesthesia, Vol 60, Dec. 2013. Reproduced with permission © Canadian Anesthesiologists' Society

# American Society of Anesthesiology Classification

- common classification of physical status at the time of surgery
- a gross predictor of overall outcome, NOT used as stratification for anesthetic risk (mortality rates)
- **ASA 1**: a healthy, fit patient
- **ASA 2**: a patient with mild systemic disease
  - e.g. controlled Type 2 DM, controlled essential HTN, obesity, smoker
- **ASA 3**: a patient with severe systemic disease that limits activity
  - e.g. stable CAD, COPD, DM, obesity
- **ASA 4**: a patient with incapacitating disease that is a constant threat to life
  - e.g. unstable CAD, renal failure, acute respiratory failure
- **ASA 5**: a moribund patient not expected to survive 24 h without surgery
  - e.g. ruptured abdominal aortic aneurysm (AAA), head trauma with increased ICP
- **ASA 6**: declared brain dead, a patient whose organs are being removed for donation purposes
- for emergency operations, add the letter E after classification (e.g. ASA 3E)

# Pre-Operative Optimization

- in general, prior to elective surgery:
  - any fluid and/or electrolyte imbalance should be corrected
  - extent of existing comorbidities should be understood, and these conditions should be optimized prior to surgery
  - medications may need adjustment

# Medications

- pay particular attention to cardiac and respiratory medications, opioids and drugs with many side effects and interactions
- **pre-operative medications to consider**
  - prophylaxis
    - risk of GE reflux: sodium citrate and/or ranitidine and/or metoclopramide 30 min-1 h prior to surgery
    - risk of infective endocarditis, GI/GU interventions: antibiotics
    - risk of adrenal suppression: steroid coverage
    - anxiety: consider benzodiazepines
    - COPD, asthma: bronchodilators
    - CAD risk factors: nitroglycerin and β-blockers
- **pre-operative medications to stop**
  - oral antihyperglycemics: do not take on morning of surgery
  - ACEI and angiotensin receptor blockers: do not take on the day of surgery (controversial – they increase the risk of hypotension post-induction but have not been shown to increase mortality or adverse outcomes; therefore, some people hold and some do not)
  - warfarin (consider bridging with heparin), anti-platelet agents (e.g. clopidogrel), Xa inhibitor, direct thrombin inhibitors

**Will This Patient Be Difficult to Intubate?**
JAMA 2019;321:493-503
**Objective**: To identify risk factors and physical findings that predict difficult intubation.
**Methods**: Systematic review of MEDLINE and EMBASE databases.
**Results**: 62 studies, 33,559 patients. Physical examination findings that best predicted a difficult intubation included grade of class 3 on upper lid bite test (lower incisors cannot reach upper lip; LR 14, 95% CI 9.9-22), shorter hyomental distance (<3-5.5 cm; LR 9.4, 95% 4.1-10), retrognathia (mandible <9 cm from angle of jaw to tip of chin; LR 6.0, 95% CI 3.1-11), and a Mallampati score ≥3 (LR 4.1, 95% CI 3.0-5.6).

**Impact of Anesthesia Management Characteristics on Severe Morbidity and Mortality**
Anesth 2005;102:257-268
**Study**: Case-control study of patients undergoing anesthesia.
**Patients**: 807 cases and 883 controls were analyzed among a cohort of 869,483 patients undergoing anesthesia between 1995-1997. Cases were defined as patients who either remained comatose or died within 24 h of receiving anesthesia. Controls were defined as patients who neither remained comatose nor died within 24 h of receiving anesthesia.
**Intervention**: General, regional, or combined anesthesia to patients undergoing a surgical procedure.
**Main Outcome**: Coma or death within 24 h of receiving anesthesia.
**Results**: The incidence of 24 h post-operative death was 8.8 per 10,000 anesthetics (95% CI 8.2-9.5) and the incidence of coma was 0.5 (95% CI 0.3-0.6). Anesthesia management risk factors that were associated with a decreased risk of morbidity and mortality were equipment check with protocol and documentation, directly available anesthesiologist with no change during anesthesia, 2 persons present at emergence of anesthesia, reversal of muscle relaxation, and post-operative pain medication.

**Continuation versus Discontinuation of Antiplatelet Therapy for Bleeding and Ischaemic Events in Adults Undergoing Non-Cardiac Surgery**
Cochrane DB Syst Rev 2018; CD012584
**Objective**: To compare continuation vs. discontinuation of antiplatelet therapy on the occurrence of bleeding and ischaemic events in adults undergoing non-cardiac surgery.
**Methods**: RCTs in Cochrane Central Register of Controlled Trials, MEDLINE, and Embase that compared adults taking single or dual antiplatelet therapy for at least two weeks, including patients with at least one cardiac risk factor. Included general, spinal, and regional anesthesia and excluded minor procedures involving only local anesthetic/sedation.
**Results**: 5 trials, 666 adult patients. Continuation or discontinuation had no difference on mortality at 30 d post-op (RR 1.21, 95% CI 0.34-4.27), blood loss (RR 1.37, 95% CI 0.83-2.26), or ischaemic events within 30 d of surgery (RR 0.67, 95% CI 0.25-1.77).
**Conclusions**: Moderate evidence supporting continuation or discontinuation of antiplatelet therapy makes no difference on bleeding requiring transfusion. Low evidence supporting no difference in mortality or ischaemic events.

- discuss perioperative use of ASA, NSAIDs with surgeon (± patient's cardiologist/internist)
- in patients undergoing non-cardiac surgery, starting or continuing low-dose ASA in the perioperative period does not appear to protect against post-operative MI or death, but increases the risk of major bleeding
  - note: this does not apply to patients with bare metal stents or drug-eluting coronary stents
- herbal supplements: stop one week prior to elective surgery (ephedra, garlic, ginko, ginseng, kava, St. John's Wort, Valerian, Echinacea)

- **pre-operative medications to adjust**
  - insulin (consider insulin/dextrose infusion or holding dose), prednisone, bronchodilators

**Perioperative β-blockers for Preventing Surgery-related Mortality and Morbidity**
Cochrane DB Syst Rev 2018; CD004476
**Objectives**: Effects of perioperative β-blockers for prevention of surgery-related mortality and morbidity in patients undergoing any type of surgery while under general anesthesia.
**Outcomes**:
Cardiac surgery: Perioperative β-blockers associated with reduced supraventricular (RR 0.44, 95% CI 0.36-0.53) and ventricular (RR 0.37, 95% CI 0.24-0.58) arrhythmias in the aftermath of surgery. Effect on mortality, AMI, stroke, CHF, hypotension, and bradycardia unclear.
Non-cardiac surgery: Perioperative β-blockers associated with decreased incidence of supraventricular arrhythmias (RR 0.73, 95% CI 0.57-0.94) and AMI (RR 0.73, 95% CI 0.61-0.87). However, this is potentially offset by increased all-cause mortality (RR 1.25, CI 95% 1.00-1.57) with potential increase in stroke rate (RR 1.59, 95% CI 0.93-2.71).

## Hypertension

- BP <180/110 is not an independent risk factor for perioperative cardiovascular complications
- target sBP <180 mmHg, dBP <110 mmHg
- assess for end-organ damage and treat accordingly

## Coronary Artery Disease

- ACC/AHA Guidelines (2014) recommend that at least 60 d should elapse after a MI before a non-cardiac surgery in the absence of a coronary intervention
  - this period carries an increased risk of re-infarction/death
  - if operative procedure is essential and cannot be delayed then invasive intra- and post-operative ICU monitoring is required to reduce the above risk
- mortality with perioperative MI is 20-50%
- perioperative β-blockers
  - may decrease cardiac events and mortality (but increases risk of perioperative strokes)
  - continue β-blocker if patient is routinely taking it prior to surgery
  - consider initiation of β-blocker in:
    - patients with CAD or indication for β-blocker
    - intermediate or high risk surgery, especially vascular surgery

## Respiratory Diseases

- smoking
  - adverse effects: altered mucus secretion and clearance, decreased small airway calibre, altered oxygen carrying capacity, increased airway reactivity, and altered immune response
  - abstain at least 8 wk pre-operatively if possible
  - if unable, abstaining even 24 h pre-operatively has been shown to increase oxygen availability to tissues
- asthma
  - pre-operative management depends on degree of baseline asthma control
  - increased risk of bronchospasm from intubation
  - administration of short course (up to 1 wk) pre-operative corticosteroids and inhaled β2-agonists decreases the risk of bronchospasm and does not increase the risk of infection or delay wound healing
  - avoid non-selective β-blockers due to risk of bronchospasm (cardioselective β-blockers (metoprolol, atenolol) do not increase risk in the short-term)
  - delay elective surgery for poorly controlled asthma (increased cough or sputum production, active wheezing)
  - ideally, delay elective surgery by a minimum of 6 wk if patient develops URTI
- COPD
  - anesthesia, surgery (especially abdominal surgery, in particular upper abdominal surgery) and pain predispose the patient to atelectasis, bronchospasm, pneumonia, prolonged need for mechanical ventilation, and respiratory failure
  - pre-operative ABG is needed for all COPD stage II and III patients to assess baseline respiratory acidosis and plan post-operative management of hypercapnea
  - cancel/delay elective surgery for acute exacerbation

**β-blockers**
- β1-receptors are located primarily in the heart and kidneys
- β2-receptors are located in the smooth muscle (i.e. bronchi, uterus)
- Non-selective β-blockers block β1 and β2-receptors (labetalol*, carvedilol**, nadolol). Caution is required with non-selective β-blockers, particularly in patients with respiratory conditions where β2 blockade can result in airway reactivity

*labetalol is both an α- and β-blocker
**carvedilol is also both an alpha and beta blocker

## Aspiration

- increased risk of aspiration with:
  - decreased LOC (drugs/alcohol, head injury, CNS pathology, trauma/shock)
  - delayed gastric emptying (non-fasted within 8 h, diabetes, narcotics)
  - decreased sphincter competence (GERD, hiatus hernia, nasogastric tube, pregnancy, obesity)
  - increased abdominal pressure (pregnancy, obesity, bowel obstruction, acute abdomen)
  - unprotected airway (laryngeal mask vs. ETT)
- management
  - manage risk factors if possible
  - utilize protected airway (i.e. endotracheal tube)
  - reduce gastric volume and acidity
  - delay inhibiting airway reflexes with muscular relaxants
  - employ rapid sequence induction (see *Rapid Sequence Induction*, A15)

# Fasting Guidelines

### Fasting Guidelines Prior to Surgery (Canadian Anesthesiologists' Society)

- before elective procedures, the minimum duration of fasting should be:
  - **8 h** after a meal that includes meat, fried or fatty foods
  - **6 h** after a light meal (such as toast or crackers) or after ingestion of infant formula or non-human milk
  - **4 h** after ingestion of breast milk
  - **2 h** after clear fluids (water, black coffee, tea, carbonated beverages, juice without pulp)

# Hematological Disorders

- history of congenital or acquired conditions (sickle cell anemia, factor VIII deficiency, ITP, liver disease)
- evaluate hemoglobin, hematocrit and coagulation profiles when indicated (see Table 1)
- anemia
  - pre-operative treatments to increase hemoglobin (PO or IV iron supplementation, erythropoietin or pre-admission blood collection in certain populations)
- coagulopathies
  - discontinue or modify anticoagulation therapies (warfarin, clopidogrel, ASA, apixaban, dabigatran) in advance of elective surgeries
  - administration of reversal agents if necessary: vitamin K, FFP, prothrombin complex concentrate, recombinant activated factor VII

**Preoperative Anemia and Postoperative Outcomes in Non-Cardiac Surgery: a Retrospective Cohort Study**
Lancet 2011; 378: 1396-1407
**Objectives**: Assess effect of preoperative anaemia on 30 d postoperative morbidity and mortality in patients undergoing major non-cardiac surgery.
**Methods**: Patients undergoing major non-cardiac surgery in 2008 from the American College of Surgeons' National Surgical Quality Improvement Program database.
**Results**: 227 425 adult patients. Postoperative mortality at 30 d was higher in patients with anaemia than those without (OR 1.42, 95% CI 1.31-1.54).
**Outcomes**: Preoperative anaemia, even to a mild degree, is independently associated with an increased risk of 30 d morbidity and mortality.

# Endocrine Disorders

- Diabetes Mellitus (DM)
  - clarify type 1 vs. type 2
  - clarify treatment – oral anti-hyperglycemics and/or insulin
  - assess glucose control with history and HbA1c; well controlled diabetics have more stable glucose levels intraoperatively
  - end organ damage: be aware of damage to cardiovascular, renal, and central, peripheral and autonomic nervous systems
  - preoperative guidelines for DM:
    - 1. verify target blood glucose concentration with frequent glucose monitoring: <10 mmol/L in critical patients, <7.8 mmol/L in stable patients)
    - 2. use insulin therapy to maintain glycemic goals
    - 3. hold biguanides, **α**-glucosidase inhibitors, thiazolidinediones, sulfonylureas and GLP-1 agonists on the morning of surgery
    - 4. consider cancelling nonemergency procedures if patient presents with metabolic abnormalities (DKA, HHS, etc.) or glucose reading above 22.2-27.7 mmol/L
  - formulate intraoperative glucose management plan based on type (1 vs. 2), glucose control, and extent of end organ damage
- hyperthyroidism and hypothyroidism
  - hyperthyroidism: can experience sudden release of thyroid hormone (thyroid storm) if not treated or well-controlled pre-operatively; treatment: **β**-blockers and pre-operative prophylaxis
- adrenocortical insufficiency (Addison's, exogenous steroid use)
  - consider intraoperative steroid supplementation

# Obesity and Obstructive Sleep Apnea

- assess for co-morbid conditions in obese patient (independent risk factor for CVD, DM, OSA, cholelithiasis, HTN)
- previously undiagnosed conditions may require additional testing to characterize severity
- severity of OSA may be determined from sleep studies and level of pressure prescribed for home CPAP device
- both obesity and OSA independently increase risk of difficult ventilation, intubation and post-operative respiratory complications

# Monitoring

### Canadian Guidelines to the Practice of Anesthesia and Patient Monitoring

- an anesthetist present: "the only indispensable monitor"
- a completed pre-anesthetic checklist: including ASA class, NPO policy, Hx and investigations
- a perioperative anesthetic record: HR and BP every 5 min, $O_2$ saturation, End Tidal $CO_2$, dose and route of drugs and fluids
- continuous monitoring: see *Routine Monitors for All Cases*, A7

**Pre-Anesthetic Checklist**

**MS MAIDS**
**M**achine: connected, pressures okay, all metres functioning, vaporizers full
**S**uction: connected and working
**M**onitor: all monitors appropriate for the case
**A**irway: laryngoscope and blades, ETT, syringe, stylet, oral and nasal airways, tape, bag, and mask
**I**V: second IV set-up and ready if needed
**D**rugs: case-specific drugs ready and emergency medications in correct location and accessible
**S**pecial equipment: OG tube, CVP monitor, shoulder roll, etc.

### Routine Monitors for All Cases

- pulse oximeter, BP monitor, electrocardiography, capnography (required for general anesthesia and deep procedural sedation, Ramsey Sedation Scale 4-6), and an agent-specific anesthetic gas monitor when inhalational anesthetic agents are used
- the following must also be available: temperature probe, peripheral nerve stimulator, stethoscope, appropriate lighting, spirometry, manometer to measure endotracheal tube cuff pressure

### Elements to Monitor

- anesthetic depth
  - end-tidal inhaled anesthetic monitoring and EEG monitoring, such as a Bispectral Index monitor, can be used as assessments of anesthetic depth
  - inadequate: blink reflex present when eyelashes lightly touched, HTN, tachycardia, tearing or sweating. However, these findings are non-specific
  - excessive: hypotension, bradycardia
- oxygenation: pulse oximetry, $FiO_2$
- ventilation: verify correct position of ETT, chest excursions, breath sounds, $ETCO_2$ analysis, end tidal inhaled anesthesia analysis
- circulation: heart rate, rhythm, BP, telemetry, oximetry, pulmonary capillary wedge pressure
- temperature
- hourly urine output

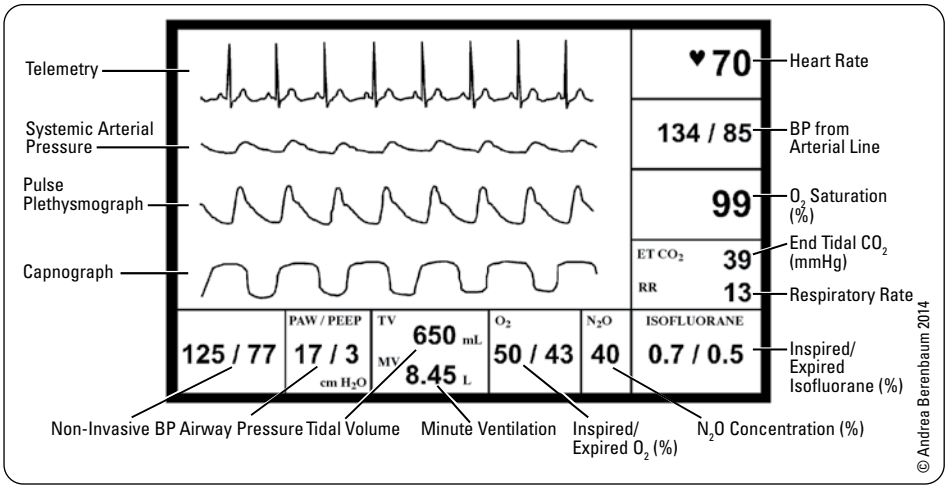

**Figure 4. Typical anesthesia monitor**

# Airway Management

## Airway Anatomy

- resistance to airflow through nasal passages accounts for approximately 2/3 of total airway resistance
- pharyngeal airway extends from posterior aspect of the nose to cricoid cartilage
- glottic opening (triangular space formed between the true vocal cords) is the narrowest segment of the laryngeal opening in adults
- the glottic opening is the space through which one visualizes proper placement of the ETT
- the trachea begins at the level of the thyroid cartilage, C6, and bifurcates into the right and left main bronchi at T4-T5 (approximately the sternal angle)

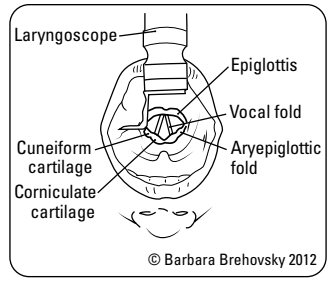

**Figure 5. Landmarks for intubation**

## Methods of Supporting Airways

1. non-definitive airway (patent airway)
   - jaw thrust/chin lift
   - oropharyngeal and nasopharyngeal airway
   - bag mask ventilation
   - LMA
2. definitive airway (patent and protected airway)
   - ETT
   - surgical airway (cricothyrotomy or tracheostomy)

**Table 2. Methods of Supporting the Airway**

| | Bag and Mask | Laryngeal Mask Airway (LMA) | Endotracheal Tube (ETT) |
|---|---|---|---|
| **Advantages/ Indications** | Basic<br>Non-invasive<br>Readily available | Easy to insert<br>Less airway trauma/irritation than ETT<br>Frees up hands (vs. face mask)<br>Primarily used in spontaneously ventilating patient | Indications for intubation (5 Ps)<br>**P**atent airway<br>**P**rotects against aspiration<br>**P**ositive pressure ventilation<br>**P**ulmonary toilet (suction)<br>**P**harmacologic administration during hemodynamic instability |
| **Disadvantages/ Contraindications** | Risk of aspiration if decreased LOC<br>Cannot ensure airway patency<br>Inability to deliver precise tidal volume<br>Operator fatigue | Risk of gastric aspiration<br>PPV<20 cm $H_20$ needed<br>Oropharyngeal/retropharyngeal pathology or foreign body<br>Does not protect against laryngospasm or gastric aspiration | Insertion can be difficult<br>Muscle relaxant usually needed<br>Most invasive – see *Complications During Laryngoscopy and Intubation*, A9 |

# Tracheal Intubation

## Preparing for Intubation

- failed attempts at intubation can make further attempts more difficult due to tissue trauma
- plan, prepare, and assess for potential difficulties (see *Pre-Operative Assessment*, A2)
- ensure equipment is available and working (test ETT cuff, check laryngoscope light and suction, machine check)
- pre-oxygenate/denitrogenate: patient breathes 100% $O_2$ for 3-5 min or for 4-8 vital capacity breaths
- may need to suction mouth and pharynx first

## Proper Positioning for Intubation

- align the three axes (mouth, pharynx, and larynx) to allow visualization from oral cavity to glottis
  - "sniffing position": flexion of lower C-spine (C5-C6), bow head forward, and extension of upper C-spine at atlanto-occipital joint (C1), nose in the air
  - contraindicated in known/suspected C-spine fracture/instability
  - poor/no view of glottic opening can be remediated by anterior lanryngeal pressure
- laryngoscope tip placed in the epiglottic vallecula in order to visualize cord

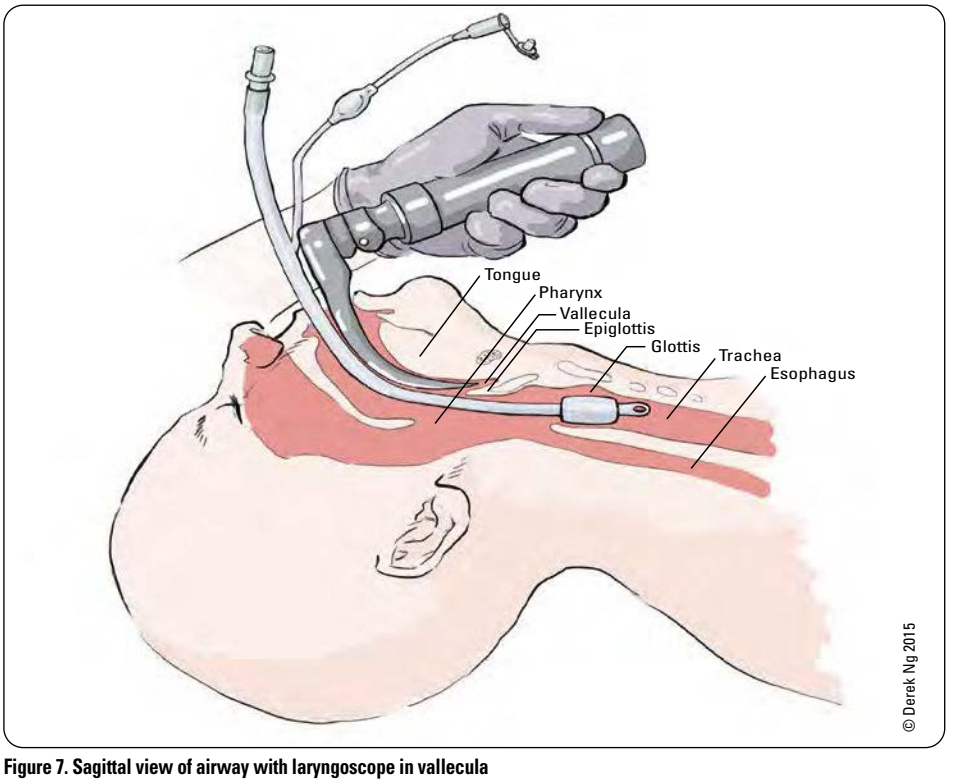

**Figure 7. Sagittal view of airway with laryngoscope in vallecula**

**Equipment for Intubation**

**MDSOLES**
**M**onitors
**D**rugs
**S**uction
**O**xygen source and self-inflating bag with oropharyngeal and nasopharyngeal airways
**L**aryngoscope
**E**ndotracheal tubes (appropriate size and one size smaller)
**S**tylet, **S**yringe for tube cuff inflation

**Medications that can be given through the ETT**

**NAVEL**
**N**aloxone
**A**tropine
**V**entolin
**E**pinephrine
**L**idocaine

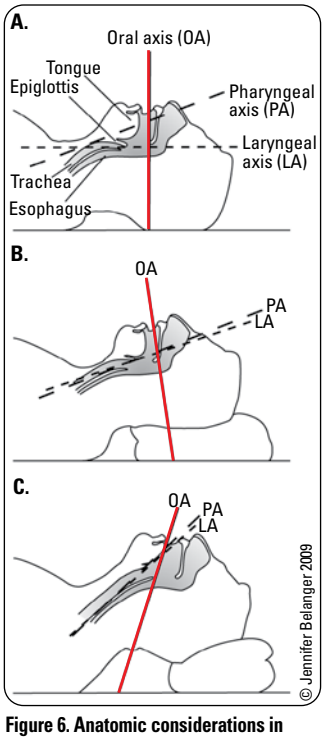

**Figure 6. Anatomic considerations in laryngoscopy**
A. Neutral position
B. C-spine flexion
C. C-spine flexion with atlanto-occipital extension

### Tube Insertion

- laryngoscopy and ETT insertion can incite a significant sympathetic response via stimulation of cranial nerves 9 and 10 due to a "foreign body reflex" in the trachea, including tachycardia, dysrhythmias, myocardial ischemia, increased BP, and coughing
- a malpositioned ETT is a potential hazard for the intubated patient
  - if too deep, may result in right endobronchial intubation, which is associated with left-sided atelectasis and right-sided tension pneumothorax
  - if too shallow, may lead to accidental extubation, vocal cord trauma, or laryngeal paralysis as a result of pressure injury by the ETT cuff
- the tip of ETT should be located at the midpoint of the trachea at least 2 cm above the carina and the proximal end of the cuff should be placed at least 2 cm below the vocal cords
- approximately 20-23 cm mark at the right corner of the mouth for men and 19-21 cm for women

**Differential Diagnosis of Poor Bilateral Breath Sounds after Intubation**

**DOPE**
**D**isplaced ETT
**O**bstruction
**P**neumothorax
**E**sophageal intubation

### Confirmation of Tracheal Placement of Endotracheal Tube

- direct
  - visualization of ETT passing through cords
  - bronchoscopic visualization of ETT in trachea
- indirect
  - $ETCO_2$ in exhaled gas measured by capnography – a mandatory method for confirming the ETT is in the airway
  - auscultate for equal breath sounds bilaterally and absent breath sounds over epigastrium
  - bilateral chest movement, condensation of water vapour in ETT visible during exhalation and no abdominal distention
  - refilling of reservoir bag during exhalation
  - CXR (rarely done): only confirms position of the tip of ETT and not whether the ETT is in the trachea
- esophageal intubation suspected when:
  - $ETCO_2$ zero or near zero on capnograph
  - abnormal sounds during assisted ventilation
  - impairment of chest excursion
  - hypoxia/cyanosis
  - presence of gastric contents in ETT
  - breath sounds heard when auscultating over epigastrium/LUQ
  - distention of stomach/epigastrium with ventilation

**Cormack-Lehane Classification of Laryngeal View (Figure 3)**

- Grade 1: all laryngeal structures revealed
- Grade 2: posterior laryngeal 2A (posterior vocal folds) 2B (arytenoids)
- Grade 3: Larynx concealed, only epiglottis
- Grade 4: Neither glottis nor epiglottis

### Complications During Laryngoscopy and Intubation

- dental damage
- laceration (lips, gums, tongue, pharynx, vallecula, esophagus)
- laryngeal trauma
- esophageal or endobronchial intubation
- accidental extubation
- insufficient cuff inflation or cuff laceration: results in leaking and aspiration
- laryngospasm (see *Extubation*, A20, for definition)
- bronchospasm

## Difficult Airway

- difficulties with bag-mask ventilation, supraglottic airway, laryngoscopy, passage of ETT through the cords, infraglottic airway or surgical airway
- algorithms exist for difficult airways (Can J Anesth 2013;60:1119-1138), see *Appendices*, A30
- pre-operative assessment (history of previous difficult airway, airway examination) and pre-oxygenation are important preventative measures
- if difficult airway expected, consider:
  - awake intubation
  - intubating with bronchoscope, trachlight (lighted stylet), fibre optic laryngoscope, glidescope, etc.
- if intubation unsuccessful after induction:
  1. CALL FOR HELP
  2. ventilate with 100% $O_2$ via bag and mask
  3. consider returning to spontaneous ventilation and/or waking patient
- if bag and mask ventilation inadequate:
  1. CALL FOR HELP
  2. attempt ventilation with oral airway
  3. consider/attempt LMA
  4. emergency invasive airway access (e.g. rigid bronchoscope, cricothyrotomy, or tracheostomy)

If you encounter difficulty with tracheal intubation, oxygenation is more important than intubation

# Oxygen Therapy

- in general, the goal of oxygen therapy is to maintain arterial oxygen saturation ($SaO_2$) at a minimum, >90%
- small decrease in saturation below $SaO_2$ of 90% corresponds to a large drop in $PaO_2$
- in intubated patients, oxygen is delivered via the ETT
- in patients not intubated, there are many oxygen delivery systems available; the choice depends on oxygen requirements ($FiO_2$) and the degree to which precise control of delivery is needed
- cyanosis can be detected at $SaO_2$ <85%, frank cyanosis at $SaO_2$ = 67%

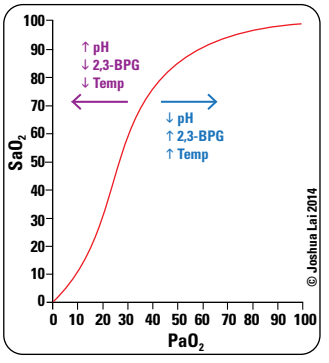

**Figure 8. $HbO_2$ saturation curve**

## Low Flow Systems

- provide $O_2$ at flows between 0-10 L/min
- acceptable if tidal volume 300-700 mL, respiratory rate (RR) <25, consistent ventilation pattern
- dilution of oxygen with room air results in a decrease in $FiO_2$
- an increase in minute ventilation (tidal volume x RR) results in a decrease in $FiO_2$
- e.g. nasal cannula (prongs)
  - well tolerated if flow rates <5-6 L/min; drying of nasal mucosa at higher flows
  - nasopharynx acts as an anatomic reservoir that collects $O_2$
  - delivered oxygen concentration ($FiO_2$) can be estimated by adding 4% for every additional litre of $O_2$ delivered
  - provides $FiO_2$ of 24-44% at $O_2$ flow rates of 1-6 L/min

## Reservoir Systems

- use a volume reservoir to accumulate oxygen during exhalation thus increasing the amount of oxygen available for the next breath
- simple face mask
  - covers patient's nose and mouth and provides an additional reservoir beyond nasopharynx
  - fed by small bore $O_2$ tubing at a rate of at least 6 L/min to ensure that exhaled $CO_2$ is flushed through the exhalation ports and not rebreathed
  - provides $FiO_2$ of 55% at $O_2$ flow rates of 10 L/min
- non-rebreather mask
  - a reservoir bag and a series of one-way valves prevent expired gases from re-entering the bag
  - during the exhalation phase, the bag accumulates with oxygen
  - provides $FiO_2$ of 80% at $O_2$ flow rates of 10-15 L/min

**Composition of Air**
78.1% nitrogen
20.9% oxygen
0.9% argon
0.04% carbon dioxide

## High Flow Systems

- generate flows of up to 50-60 L/min
- meet/exceed patient's inspiratory flow requirement
- deliver consistent and predictable concentration of $O_2$
- Venturi mask
  - delivers specific $FiO_2$ by varying the size of air entrapment
  - oxygen concentration determined by mask's port and NOT the wall flow rate
  - enables control of gas humidity
  - $FiO_2$ ranges from 24-50%

# Ventilation

- ventilation is maintained with PPV in patients given muscle relaxants
- assisted or controlled ventilation can also be used to assist spontaneous respirations in patients not given muscle relaxants as an artificial means of supporting ventilation and oxygenation

## Mechanical Ventilation

- indications for mechanical ventilation
  - apnea
  - hypoventilation/acute respiratory acidosis
  - intraoperative positioning limiting respiratory excursion (e.g. prone, Trendelenburg)
  - required hyperventilation (to lower ICP)
  - deliver positive end expiratory pressure (PEEP)
  - increased intrathoracic pressure (e.g. laparoscopic procedure)
- complications of mechanical ventilation
  - airway complications
    - tracheal stenosis, laryngeal edema
    - alveolar complications
    - ventilator-induced lung injury (barotrauma, volutrauma, atelectatrauma), ventilator-associated pneumonia (nosocomial pneumonia), inflammation, auto-PEEP, patient-ventilator asynchrony
    - cardiovascular complications
    - reduced venous return (secondary to increased intrathoracic pressure), reduced cardiac output, hypotension

Changes in peak pressures in ACV and tidal volumes in PCV may reflect changes in lung compliance and/or airway resistance – patient may be getting better or worse

**Positive End Expiratory Pressure (PEEP)**
- Positive pressure applied at the end of ventilation that helps to keep alveoli open, decreasing V/Q mismatch
- Used with all invasive modes of ventilation

**Tracheostomy**
- Tracheostomy should be considered in patients who require ventilator support for extended periods of time
- Shown to improve patient comfort and give patients a better ability to participate in rehabilitation activities

- neuromuscular complications
  - muscle atrophy
  - increased intracranial pressure
- metabolic
  - decreased $CO_2$ due to hyperventilation
  - alkalemia with over correction of chronic hypercarbia

## Ventilator Strategies

- mode and settings are determined based on patient factors (e.g. ideal body weight, compliance, resistance) and underlying reason for mechanical ventilation
- hypoxemic respiratory failure: ventilator provides supplemental oxygen, recruits atelectatic lung segments, helps improve V/Q mismatch, and decreases intrapulmonary shunt
- hypercapnic respiratory failure: ventilator augments alveolar ventilation; may decrease the work of breathing, allowing respiratory muscles to rest

## Modes of Ventilation

- assist-control ventilation (ACV) or volume control (VC)
  - every breath is delivered with a pre-set tidal volume and rate or minute ventilation
  - extra controlled breaths may be triggered by patient effort; if no effort is detected within a specified amount of time the ventilator will initiate the breath
- pressure control ventilation (PCV)
  - a minimum frequency is set and patient may trigger additional breaths above the ventilator
  - all breaths delivered at a preset constant inspiratory pressure
  - in traditional PCV, tidal volume is not guaranteed thus changes in compliance and resistance affect tidal volume
- synchronous intermittent mandatory ventilation (SIMV)
  - ventilator provides controlled breaths (either at a set volume or pressure depending on whether in VC or PCV, respectively)
  - patient can breathe spontaneously (these breaths may be pressure supported) between controlled breaths
- pressure support ventilation (PSV)
  - patient initiates all breaths and the ventilator supports each breath with a pre-set inspiratory pressure
  - useful for weaning off ventilator
- high-frequency oscillatory ventilation (HFOV)
  - high breathing rate (up to 900 breaths/min in an adult), very low tidal volumes
  - used commonly in neonatal and pediatric respiratory failure
  - occasionally used in adults when conventional mechanical ventilation is failing
- non-invasive positive pressure ventilation (NPPV)
  - achieved without intubation by using a nasal or face mask
  - BiPAP: increased pressure (like PSV) on inspiration and lower constant pressure on expiration (i.e. PEEP)
  - CPAP: delivers constant pressure on both inspiration and expiration

**Table 3. Causes of Abnormal End Tidal $CO_2$ Levels**

| Hypocapnea (Decreased $CO_2$) | Hypercapnea (Increased $CO_2$) |
|---|---|
| Hyperventilation | Hypoventilation |
| Hypothermia (decreased metabolic rate) | Hyperthermia and other hypermetabolic states |
| Decreased pulmonary blood flow (decreased cardiac output) | Improved pulmonary blood flow after resuscitation or hypotension |
| Technical issues<br>Incorrect placement of sampling catheter<br>Inadequate sampling volume | Technical issues<br>Water in capnography device<br>Anesthetic breathing circuit error<br>Inadequate fresh gas flow<br>Rebreathing<br>Exhausted soda lime<br>Faulty circuit absorber valves |
| V/Q mismatch<br>Pulmonary thromboembolism<br>Incipient pulmonary edema<br>Air embolism | Low bicarbonate |

**Monitoring Ventilatory Therapy**
- Pulse oximetry, end-tidal $CO_2$ concentration
- Regular arterial blood gases
- Assess tolerance regularly

Patients who develop a pneumothorax while on mechanical ventilation require a chest tube

**Causes of Intraoperative Hypoxemia**
**Inadequate Oxygen Supply**
e.g. breathing system disconnection, obstructed or malpositioned ETT, leaks in the anesthetic machine, loss of oxygen supply
**Hypoventilation**
**Ventilation-Perfusion Inequalities**
e.g. atelectasis, pneumonia, pulmonary edema, pneumothorax
**Reduction in Oxygen Carrying Capacity**
e.g. anemia, carbon monoxide poisoning, methemoglobinemia, hemoglobinopathy
**Leftward Shift of the Hemoglobin-Oxygen Saturation Curve**
e.g. hypothermia, decreased 2,3-BPG, alkalosis, hypocarbia, carbon monoxide poisoning
**Right-to-Left Cardiac Shunt**

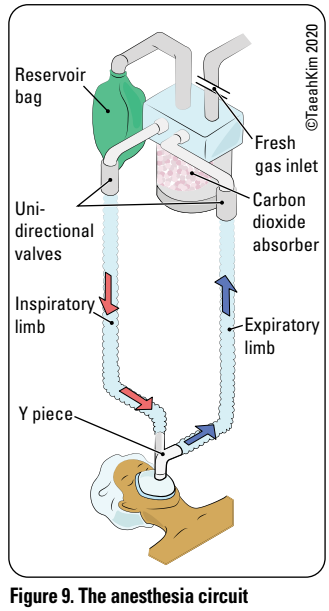

**Figure 9. The anesthesia circuit**

# Intraoperative Management

## Temperature

### Causes of Hypothermia (<36.0° C)

- intraoperative temperature losses are common (e.g. 90% of intraoperative heat loss is transcutaneous), due to:
  - OR environment (cold room, IV fluids, instruments)
  - open wound
- prevent with forced air warming blanket and warmed IV fluids

### Causes of Hyperthermia (>37.5-38.3° C)

- drugs (e.g. atropine)
- blood transfusion reaction
- infection/sepsis
- medical disorder (e.g. thyrotoxicosis)
- malignant hyperthermia (see *Uncommon Complications*, A28)
- over-zealous warming efforts

**Impact of Hypothermia (<36°C)**

- Increased risk of wound infections due to impaired immune function
- Increases the period of hospitalization by delaying healing
- Reduces platelet function and impairs activation of coagulation cascade increasing blood loss and transfusion requirements
- Triples the incidence of VT and morbid cardiac events
- Decreases the metabolism of anesthetic agents prolonging post-operative recovery

## Heart Rate

### Cardiac Arrest

- pulseless arrest occurs due to 4 cardiac rhythms divided into shockable and non-shockable rhythms
  - shockable: ventricular fibrillation (VF) and ventricular tachycardia (VT)
  - non-shockable: asystole and pulseless electrical activity (PEA)
- for VF/VT, key to survival is good early CPR and defibrillation
- for asystole/PEA, key to survival is good early CPR and exclusion of all reversible causes
- reversible causes of PEA arrest (5 Hs and 5 Ts)
  - 5 Hs: **h**ypothermia, **h**ypovolemia, **h**ypoxia, **h**ydrogen ions (acidosis), **h**ypo/**h**yperkalemia
  - 5 Ts: **t**amponade (cardiac), **t**hrombosis (pulmonary), **t**hrombosis (coronary), **t**ension pneumothorax, **t**oxins (overdose/poisoning)
  - when a patient sustains a cardiac arrest during anesthesia, it is important to remember that there are other causes on top the Hs and Ts to consider (i.e. local anesthetic systemic toxicity (LAST), excessive anesthetic dosing and others)
- for management of cardiac arrest, see *Appendices*, A32

### Intraoperative Tachycardia

- tachycardia = HR >150 bpm; divided into narrow complex supraventricular tachycardias (SVT) or wide complex tachycardias
- SVT: sinus tachycardia, atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
- wide complex tachycardia: VT, SVT with aberrant conduction
- causes of sinus tachycardia
  - shock/hypovolemia/blood loss
  - anxiety/pain/light anesthesia
  - full bladder
  - anemia
  - febrile illness/sepsis
  - drugs (e.g. atropine, cocaine, dopamine, epinephrine, ephedrine, isoflurane, isoproterenol, pancuronium) and withdrawal
  - Addisonian crisis, hypoglycemia, transfusion reaction, malignant hyperthermia
- for management of tachycardia, see *Appendices*, A33

### Intraoperative Bradycardia

- bradycardia = HR <50 bpm; most concerning are 2nd degree (Mobitz type II) and 3rd degree heart block, which can both degenerate into asystole
- causes of sinus bradycardia
  - increased parasympathetic tone vs. decreased sympathetic tone
  - must rule out hypoxemia
  - arrhythmias (see Cardiology and Cardiac Surgery, C16)
  - baroreceptor reflex due to increased ICP or increased BP
  - vagal reflex (oculocardiac reflex, carotid sinus reflex, airway manipulation)
  - drugs (e.g. suprachoroidal hemorrhage, opioids, edrophonium, neostigmine, halothane, digoxin, β-blockers)
  - high spinal/epidural anesthesia
- for management of bradycardia, see *Appendices*, A33

# Blood Pressure

## Causes of Intraoperative Hypotension/Shock

- shock: condition characterized by inability of cardiovascular system to maintain adequate end-organ perfusion and delivery of oxygen to tissues

a) hypovolemic/hemorrhagic shock
  - most common form of shock, due to decrease in intravascular volume

b) obstructive shock
  - obstruction of blood into or out of the heart
  - increased JVP, distended neck veins, increased systemic vascular resistance, insufficient cardiac output (CO)
  - e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism (and other emboli – i.e. fat, air)

c) cardiogenic shock
  - increased JVP, distended neck veins, increased systemic vascular resistance, decreased CO
  - e.g. myocardial dysfunction, dysrhythmias, ischemia/infarct, cardiomyopathy, acute valvular dysfunction

d) septic shock
  - see Infectious Diseases, ID19

e) spinal/neurogenic shock
  - decreased sympathetic tone
  - hypotension without tachycardia or peripheral vasoconstriction (warm skin)

f) anaphylactic shock
  - see Emergency Medicine, ER3

g) drugs
  - vasodilators, high spinal anesthetic interfering with sympathetic outflow

h) other
  - transfusion reaction, Addisonian crisis, thyrotoxicosis, hypothyroid, aortocaval syndrome
  - see Hematology and Endocrinology

**Intraoperative Shock**

**SHOCK TED**
**S**epsis or **S**pinal shock
**H**ypovolemic/**H**emorrhagic
**O**bstructive
**C**ardiogenic
anaphylacti**K**
**T**ransfusions
**E**ndocrine (Addison's disease, hyperthryoidism)
**D**rugs

BP = CO x SVR, where CO = SV x HR
SV is a function of preload, afterload, and contractility

## Causes of Intraoperative Hypertension

- inadequate anesthesia causing pain and anxiety
- pre-existing HTN, coarctation, or preeclampsia
- hypoxemia/hypercarbia
- hypervolemia
- increased intracranial pressure
- full bladder
- drugs (e.g. ephedrine, epinephrine, cocaine, phenylephrine, ketamine) and withdrawal
- allergic/anaphylactic reaction
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, serotonin syndrome, thyroid storm, pheochromocytoma (see Endocrinology, E37)

# Fluid Balance and Resuscitation

- total requirement = maintenance + deficit + ongoing loss
- in surgical settings, this formula must take into account multiple factors including pre-operative fasting/decreased fluid intake, increased losses during or before surgery, fluids given with blood products and medications
- increasingly, Enhanced Recovery After Surgery protocols recommend consumption of clear fluids up to two hours prior to surgery
- both inadequate fluid resuscitation AND excessive fluid administration increases morbidity post-operatively

## What is the Maintenance?

- average healthy adult requires approximately 2500 mL water/d
  - 200 mL/d GI losses
  - 800 mL/d insensible losses (respiration, perspiration)
  - 1500 mL/d urine (beware of renal failure)
- replacement of 'third space' losses is not warranted
- maintenance should not exceed 3ml/kg/hr
- increased requirements with fever, sweating, GI losses (vomiting, diarrhea, NG suction), adrenal insufficiency, hyperventilation, and polyuric renal disease
- decreased requirements with anuria/oliguria, SIADH, highly humidified atmospheres, and CHF
- maintenance electrolytes
  - $Na^+$: 3 mEq/kg/d
  - $K^+$: 1 mEq/kg/d
- 50 kg patient maintenance requirements
  - fluid = 40 + 20 + 30 = 90 mL/h = 2160 mL/d = 2.16 L/d
  - $Na^+$ = 150 mEq/d (therefore 150 mEq / 2.16 L/d ≈ 69 mEq/L)
  - $K^+$ = 50 mEq/d (therefore 50 mEq / 2.16 L/d ≈ 23 mEq/L)
- above patient's requirements roughly met with 2/3 D5W, 1/3 NS
  - 2/3 + 1/3 at 100 mL/h with 20 mEq KCl per litre
- 4-2-1 rule: 4 mL/h first 10 kg, 2 mL/h next 10 kg, 1 mL/h for every kg after to calculate maintenance fluid requirement
- may also add 40 kg to weight for adults to calculate maintenance fluid requirement in mL/h

### What is the Deficit?

- patients should be adequately hydrated prior to anesthesia
- total body water (TBW) = 60% or 50% of total body weight for an adult male or female, respectively (e.g. for a 70 kg adult male TBW = 70 x 0.6 = 42 L)
- total $Na^+$ content determines ECF volume; $[Na^+]$ determines ICF volume
- hypovolemia due to volume contraction
  - extra-renal $Na^+$ loss
    - GI: vomiting, NG suction, drainage, fistulae, diarrhea
    - skin/resp: insensible losses (fever), sweating, burns
    - vascular: hemorrhage
    - renal $Na^+$ and $H_2O$ loss
    - diuretics
    - osmotic diuresis
    - hypoaldosteronism
    - salt-wasting nephropathies
    - renal $H_2O$ loss
    - diabetes insipidus (central or nephrogenic)
    - hypovolemia with normal or expanded ECF volume
    - decreased CO
    - redistribution
      - hypoalbuminemia: cirrhosis, nephrotic syndrome
      - capillary leakage: acute pancreatitis, rhabdomyolysis, ischemic bowel, sepsis, anaphylaxis
- replace water and electrolytes as determined by patient's needs
- with chronic hyponatremia, correction must be done gradually over >48 h to avoid central pontine myelinolysis

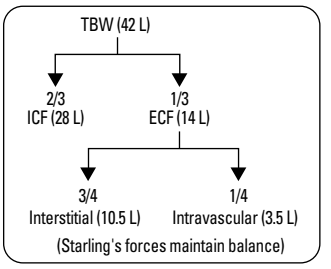

**Figure 10. Total body water division in a 70 kg adult**

**Table 4. Signs and Symptoms of Dehydration**

| Percentage of Body Water Loss | Severity | Signs and Symptoms |
|---|---|---|
| 3% | Mild | Decreased skin turgor, sunken eyes, dry mucous membranes, dry tongue, reduced sweating |
| 6% | Moderate | Oliguria, orthostatic hypotension, tachycardia, low volume pulse, cool extremities, reduced filling of peripheral veins and CVP, hemoconcentration, apathy |
| 9% | Severe | Profound oliguria or anuria and compromised CNS function with or without altered sensorium |

### What are the Ongoing Losses?

- traditionally thought that fluid loss during surgery resulted from blood loss, losses from Foley catheter, NG, surgical drains, and third spacing (sequestration of fluid into other body compartments such as GI, lung, evaporation)
- fluid therapy accounting for these losses often resulted in excess crystalloid administration
- goal-directed fluid regimens associated with lower rate of post-op complications compared to pre-determined calculations

## IV Fluids

- replacement fluids include crystalloid and colloid solutions
- IV fluids improve perfusion but NOT $O_2$ carrying capacity of blood

### Initial Distribution of IV Fluids

- $H_2O$ follows ions/molecules to their respective compartments

### Crystalloid Infusion

- salt-containing solutions that distribute only within ECF
- consensus guidelines recommend use of balanced crystalloid (i.e. Ringer's lactate) over normal saline for routine replacement and resuscitation
- maintain euvolemia in patient with blood loss: 3 mL crystalloid infusion per 1 mL of blood loss for volume replacement (i.e. 3:1 replacement)
- if large volumes are to be given, use balanced fluids such as Ringer's lactate or Plasmalyte®, as too much normal saline (NS) may lead to hyperchloremic metabolic acidosis

### Colloid Infusion

- includes protein colloids (albumin and gelatin solutions) and non-protein colloids (dextrans and starches e.g. hydroxyethol starch [HES])
- distributes within intravascular volume
- 1:1 ratio (infusion:blood loss) only in terms of replacing intravascular volume
- the use of HES solutions is controversial because of recent RCTs and meta-analyses highlighting their renal (especially in septic patients) and coagulopathic side effects, as well as a lack of specific indications for their use
  - colloids are being used based on mechanistic and experimental evidence but there is a paucity of definitive studies investigating their safety and efficacy; routine use of colloids should be avoided

**Colloids vs. Crystalloids for Fluid Resuscitation in Critically Ill People**
Cochrane DB Syst Rev 2018:CD000567
**Objectives**: To assess effect of colloids vs. crystalloids in critically ill patients on mortality, need for transfusions or renal replacement therapy, and adverse events.
**Methods**: Systematic review of RCTs and quasi-RCTs involving trauma, burns, or medical conditions (i.e. sepsis). Searched CENTRAL, MEDLINE, and Embase.
**Outcomes**: 69 studies, 30 020 participants. Starches, dextrans, albumin or FFP (moderate-certainty evidence), or gelatins (low-certainty evidence) vs. crystalloids has no difference on mortality. Starches slightly increase the need for blood transfusion (moderate-certainty evidence), and albumin or FFP may make little or no difference to the need for renal replacement therapy (low-certainty evidence). Evidence for blood transfusions for dextrans, and albumin or FFP, is uncertain.

**Table 5. IV Fluid Solutions**

| | | ECF | Ringer's Lactate | 0.9% NS | 0.45% NS in D5W | D5W | 2/3 D5W + 1/3 NS | Plasmalyte |
|---|---|---|---|---|---|---|---|---|
| mEq/L | $Na^+$ | 142 | 130 | 154 | 77 | - | 51 | 140 |
| | $K^+$ | 4 | 4 | - | - | - | - | 5 |
| | $Ca^{2+}$ | 4 | 3 | - | - | - | - | - |
| | $Mg^{2+}$ | 3 | - | - | - | - | - | 3 |
| | $Cl^-$ | 103 | 109 | 154 | 77 | - | 51 | 98 |
| | $HCO_3^-$ | 27 | 28* | - | - | - | - | 27 |
| mOsm/L | | 280-310 | 273 | 308 | 154 | 252 | 269 | 294 |
| pH | | 7.4 | 6.5 | 5.0 | 4.5 | 4.0 | 4.3 | 7.4 |

*Converted from lactate

**Table 6. Colloid HES Solutions**

| | Concentration | Plasma Volume Expansion | Duration (h) | Maximum Daily Dose (mL/kg) |
|---|---|---|---|---|
| Voluven® | 6% | 1:1 | 4-6 | 33-50 |
| Pentaspan® | 10% | 1:1.2-1.5 | 18-24 | 28 |

# Blood Products

- see Hematology, H52

# Induction

## Routine Induction vs. Rapid Sequence Induction

- routine induction is the standard in general anesthesia, however a RSI is indicated in patients at risk of regurgitation/aspiration (see *Aspiration*, A5)
- RSI uses pre-determined doses of induction drugs given in rapid succession to minimize the time patient is at risk for aspiration (e.g. from the time when they are unconscious without an ETT until the time when the ETT is in and the cuff inflated)

**Table 7. Comparison of Routine Induction vs. RSI**

| Steps | Routine Induction | RSI |
|---|---|---|
| 1. Equipment Preparation | Check equipment, drugs, suction, and monitors; prepare an alternative laryngoscope blade and a second ETT tube one size smaller, suction on | |
| 2. Pre-Oxygenation/ Denitrogenation | 100% $O_2$ for 3 min or 4-8 vital capacity breaths; reduce risk of hypoxemia during apneic period following induction | |
| 3. Pre-Treatment Agents | Use agent of choice to blunt physiologic responses to airway manipulation 3 min prior to laryngoscopy | Use agent of choice to blunt physiologic responses to airway manipulation; if possible, give 3 min prior to laryngoscopy, but can skip this step in an emergent situation |
| 4. Induction Agents | Use IV or inhalation induction agent of choice | Use pre-determined dose of fast acting induction agent of choice |
| 5. Muscle Relaxants | Muscle relaxant of choice given after the onset of the induction agent | Pre-determined dose of fast acting muscle relaxant (most commonly SCh, occasionally high dose rocuronium) given IMMEDIATELY after induction agent |
| 6. Ventilation | Bag-mask ventilation | DO NOT bag ventilate – can increase risk of aspiration |
| 7. Cricoid Pressure | Posterior pressure on thyroid cartilage to improve view of vocal cords as indicated | Traditionally Sellick maneuver, also known as cricoid pressure, to prevent regurgitation and assist in visualization (2 kg pressure with drowsiness, 3 kg with loss of consciousness) but increasingly omitted |
| 8. Intubation | Intubate, inflate cuff, confirm ETT position | Intubate once paralyzed (~45 s after SCh given), inflate cuff, confirm ETT position; cricoid pressure maintained until ETT cuff inflated and placement confirmed |
| 9. Secure Machines | Secure ETT, and begin manual/machine ventilation | |

**Calculating Acceptable Blood Losses (ABL)**

- Blood volume
  term infant 80 mL/kg
  adult male 70 mL/kg
  adult female 60 mL/kg
- Calculate estimated blood volume (EBV) (e.g. in a 70 kg male, approx. 70 mL/kg)
  EBV = 70 kg x 70 mL/kg = 4900 mL
- Decide on a transfusion trigger, i.e. the Hb level at which you would begin transfusion, (e.g. 70 g/L for a person with Hb(i) = 150 g/L)

Hb(f) = 70 g/L

- Calculate

$$ABL = \frac{Hb(Hi) - Hb(Hf)}{Hb(Hi)} \times EBV$$
$$= \frac{150 - 70}{150} \times 4900$$
$$= 2613 \text{ mL}$$

- Therefore in order to keep the Hb level above 70 g/L, RBCs would have to be given after approximately 2.6 L of blood has been lost

**Transfusion Infection Risks**

| Virus | Risk per 1 unit pRBCs |
|---|---|
| HIV | 1 in 21 million |
| Hepatitis C virus | 1 in 13 million |
| Hepatitis B virus | 1 in 7.5 million |
| HTLV | 1 in 1-1.3 million |
| Symptomatic Bacterial Sepsis | 1 in 40,000 from platelets and 1 in 250,000 from RBC |
| West Nile virus | No cases since 2003 |

**Rocuronium versus Succinylcholine for Rapid Sequence Induction Intubation**

Cochrane DB Syst Rev 2015:CD002788.

**Objective**: Whether rocuronium creates intubating conditions comparable to those of succinylcholine during RSI intubations.

**Methods**: Systematic review of RCTs or CCTs with a dose of at least 0.6 mg/kg for rocuronium and 1 mg/kg for succinylcholine.

**Results**: 50 trials, 4151 participants. Succinylcholine was superior to rocuronium for achieving excellent intubating conditions (RR 0.86, 95% CI 0.81-0.92) and clinically acceptable intubation conditions (RR 0.97, 95% CI 0.95-0.99).

**Conclusion**: Succinylcholine created superior intubation conditions to rocuronium in achieving excellent and clinically acceptable intubating conditions.

# Induction Agents

- induction in general anesthesia may be achieved with intravenous agents, volatile inhalation agents, or both

**Solubility of Volatile Anesthetics in Blood**
**Least Soluble to Most Soluble**
Nitrous oxide < desflurane < sevoflurane < isoflurane < halothane

## Intravenous Agents

- IV induction agents are non-opioid drugs used to provide hypnosis, amnesia and blunt reflexes
- these are initially used to draw the patient into the maintenance phase of general anesthesia rapidly, smoothly and with minimal adverse effects
  - most commonly used is propofol or ketamine
  - a continuous propofol infusion may also be used for the maintenance phase of GA

**Table 8. Intravenous Induction Agents**

| | Propofol (Diprivan®) | Thiopental (sodium thiopental, sodium thiopentone)* | Ketamine (Ketalar®, Ketaject®) | Benzodiazepines (midazolam [Versed®], diazepam [Valium®], lorazepam [Ativan®]) | Etomidate |
|---|---|---|---|---|---|
| **Class** | Alkylphenol – hypnotic | Ultra-short acting thiobarbiturate – hypnotic | Phencyclidine (PCP) derivative – dissociative | Benzodiazepines – anxiolytic | Imadazole derivative - hypnotic |
| **Action** | Inhibitory at GABA synapse<br>Decreased cerebral metabolic rate and blood flow, decreased ICP, decreased SVR, decreased BP, and decreased SV | Inhibitory at GABA synapse<br>Decreased cerebral metabolism and blood flow, decreased CPP, decreased CO, decreased BP, decreased reflex tachycardia, decreased respiration | May act on NMDA (antagonistically), opiate, and other receptors<br>Increased HR, increased BP, increased SVR, increased coronary flow, increased myocardial $O_2$ uptake<br>CNS and respiratory depression, bronchial smooth muscle relaxation | Inhibitory at GABA synapse<br>Produces antianxiety and skeletal muscle relaxant effects<br>Minimal cardiac depression | Decreases concentration of GABA required to activate receptor<br>CNS depression<br>Minimal cardiac or respiratory depression |
| **Indications** | Induction<br>Maintenance<br>Total intravenous anesthesia (TIVA) | Induction<br>Control of convulsive states, obstetric patients | Major trauma, hypovolemia, obstetric bleeding, severe asthma because sympathomimetic | Used for sedation, amnesia, and anxiolysis | Induction<br>Poor cardiac function, severe valve lesions, uncontrolled hypertension |
| **Caution** | Patients who cannot tolerate sudden decreased BP (e.g fixed cardiac output or shock) | Allergy to barbiturates<br>Uncontrolled hypotension, shock, cardiac failure<br>Porphyria, liver disease, status asthmaticus, myxedema | Ketamine allergy<br>TCA medication (interaction causes HTN and dysrhythmias)<br>History of psychosis<br>Patients who cannot tolerate HTN (e.g. CHF, increased ICP, aneurysm) | Marked respiratory depression | Post-operative nausea and vomiting<br>Venous irritation |
| **Dosing** | IV induction: 2.5-3.0 mg/kg (less with opioids)<br>Unconscious <1 min<br>Lasts 4-6 min<br>t1/2 = 55 min<br>Decreased post-operative sedation, recovery time, N/V | IV induction: 3-5 mg/kg<br>Unconscious about 30 s<br>Lasts 5 min<br>Accumulation with repeat dosing – not for maintenance<br>t1/2 = 5-10 h<br>Post-operative sedation lasts hours | IV induction 1-2 mg/kg<br>Dissociation in 15 s, analgesia, amnesia, and unconsciousness in 45-60 s<br>Unconscious for 10-15 min, analgesia for 40 min, amnesia for 1-2 h<br>t1/2 = ~3 h | Onset less than 5 min if given IV<br>Duration of action long but variable/ somewhat unpredictable | IV induction 0.3 mg/kg<br>Onset 30-60 s<br>Lasts 4-8 min |
| **Special Considerations** | 0-30% decreased BP due to vasodilation<br>Reduce burning at IV site by mixing with lidocaine | Combining with rocuronium causes precipitates to form | High incidence of emergence reactions (vivid dreaming, out-of-body sensation, illusions)<br>Pretreat with glycopyrrolate to decrease salivation | Antagonist: flumazenil (Anexate®) competitive inhibitor, 0.2 mg IV over 15 s, repeat with 0.1 mg/min (max of 2 mg), t1/2 of 60 min<br>Midazolam also has amnestic (antegrade) effect and decreased risk of thrombophlebitis | Adrenal suppression after first dose, cannot repeat dose or use as infusion<br>Myoclonic movements during induction |

*As of 2011, Thiopental has been discontinued from production for North America

## Volatile Inhalational Agents

- examples include sevoflurane, desflurane, isoflurane, enflurane, halothane, and nitrous oxide

**Table 9. Volatile Inhalational Agents**

| | Sevoflurane | Desflurane | Isoflurane | Enflurane | Halothane | Nitrous oxide ($N_2O$)* |
|---|---|---|---|---|---|---|
| **MAC (% gas in $O_2$)** | 2.0 | 6.0 | 1.2 | 1.7 | 0.8 | 104 |
| **CNS** | Increased ICP | Increased ICP | Decreased cerebral metabolic rate<br>Increased ICP | ECG seizure-like activity<br>Increased ICP | Increased ICP and cerebral blood flow | — |
| **Resp** | Respiratory depression (severely decreased TV, increased RR), decreased response to respiratory $CO_2$ reflexes, bronchodilation | | | | | — |
| **CVS** | Less decrease of contractility, stable HR | Tachycardia with rapid increase in concentration | Decreased BP and CO, increased HR, theoretical chance of coronary steal** | Stable HR, decreased contractility | Decreased BP, CO, HR, and conduction<br>Sensitizes myocardium to epinephrine-induced arrhythmias | Can cause decreased HR in pediatric patients with existing heart disease |
| **MSK** | Muscle relaxation, potentiation of other muscle relaxants, uterine relaxation | | | | | |

*Properties and Adverse Effects of $N_2O$
Due to its high MAC, nitrous oxide is combined with other anesthetic gases to attain surgical anesthesia. A MAC of 104% is possible in a pressurized chamber only
Second Gas Effect
Expansion of closed spaces: closed spaces such as a pneumothorax, the middle ear, bowel lumen and ETT cuff will markedly enlarge if N20 is administered
Diffusion hypoxia: during anesthesia, the washout of $N_2O$ from body stores into alveoli can dilute the alveolar [$O_2$], creating a hypoxic mixture if the original [$O_2$] is low
**Coronary steal: isoflurane causes small vessel dilation which may compromise blood flow to areas of the heart with fixed perfusion (e.g. stents, atherosclerosis)

## MAC (Minimum Alveolar Concentration)

- the alveolar concentration of a volatile anesthetic at one atmosphere (atm) of pressure that will prevent movement in 50% of patients in response to a surgical stimulus (e.g. abdominal incision)
- potency of inhalational agents is compared using MAC
- MAC of halogenated volatile anesthetics decrease by approximately 6% per additional decade of age in adults
- 1.2-1.3 times MAC will often ablate response to stimuli in the general population
- MAC values are roughly additive when mixing $N_2O$ with another volatile agent; however, this only applies to movement, not other effects such as BP changes (e.g. 0.5 MAC of a potent agent + 0.5 MAC of $N_2O$ = 1 MAC of potent agent)
- MAC-intubation: the MAC of anesthetic that will inhibit movement and coughing during endotracheal intubation, generally 1.3 MAC
- MAC-block adrenergic response (MAC-BAR): the MAC necessary to blunt the sympathetic response to noxious stimuli, generally 1.5 MAC
- MAC-awake: the MAC of a given volatile anesthetic at which a patient will open their eyes to command, generally 0.3-0.4 of the usual MAC

**Factors increasing MAC:** chronic alcohol use, hyperthyroidism, hyperthermia, stimulant (amphetamines), young age
**Factors decreasing MAC:** acute alcohol intoxication, hypothermia, sedating drugs, advanced age, drugs (opioids, benzodiazepines)

# Muscle Relaxants and Reversing Agents

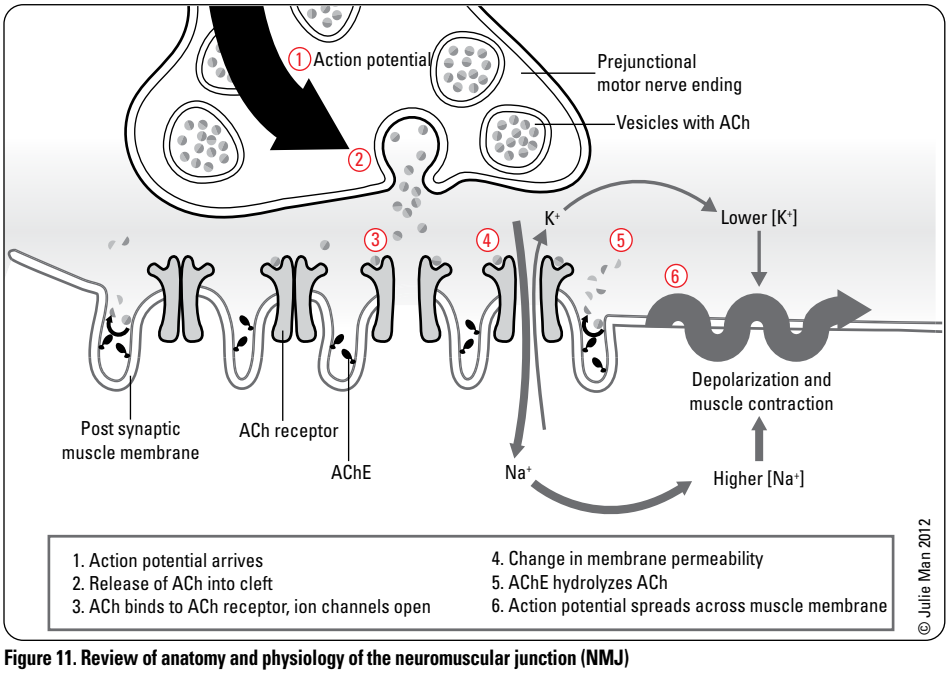

**Figure 11. Review of anatomy and physiology of the neuromuscular junction (NMJ)**

## Muscle Relaxants

- two types of muscle relaxants
  1. depolarizing muscle relaxants: succinylcholine (SCh)
  2. non-depolarizing muscle relaxants: rocuronium, mivacurium, vecuronium, cistracurium, pancuronium
- block nicotinic cholinergic receptors in NMJ
- provides skeletal muscle paralysis, including the diaphragm, but spares involuntary muscles such as the heart and smooth muscle
- never use muscle relaxants without adequate preparation and equipment to maintain airway and ventilation
- muscle relaxation produces the following desired effects:
  1. facilitates intubation
  2. assists with mechanical ventilation
  3. prevents muscle stretch reflex and decreases muscle tone
  4. allows access to the surgical field (intracavitary surgery)
- nerve stimulator (i.e. train of four) is used intraoperatively to assess the degree of nerve block; no twitch response seen with complete neuromuscular blockade

**Plasma Cholinesterase**
Plasma cholinesterase is produced by the liver and metabolizes SCh, ester local anesthetics, and mivacurium. A prolonged duration of blockade by SCh occurs with:
(a) decreased quantity of plasma cholinesterase, e.g. liver disease, pregnancy, malignancy, malnutrition, collagen vascular disease, hypothyroidism
(b) abnormal quality of plasma cholinesterase, e.g. normal levels but impaired activity of enzymes, genetically inherited

**Table 10. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine (SCh)**

| | |
|---|---|
| **Mechanism of Action** | Mimics ACh and binds to ACh receptors causing prolonged depolarization; initial fasciculation may be seen, followed by temporary paralysis secondary to blocked ACh receptors by SCh |
| **Intubating Dose (mg/kg)** | 1-1.5 |
| **Onset** | 30-60 s – rapid (fastest of all muscle relaxants) |
| **Duration** | 3-5 min – short (no reversing agent for SCh) |
| **Metabolism** | SCh is hydrolyzed by plasma cholinesterase (pseudocholinesterase), found only in plasma and not at the NMJ |
| **Indications** | Assist intubation<br>Increased risk of aspiration (need rapid paralysis and airway control (e.g. full stomach), hiatus hernia, obesity, pregnancy, trauma)<br>Short procedures<br>Electroconvulsive therapy (ECT)<br>Laryngospasm |
| **Side Effects** | 1. SCh also stimulates muscarinic cholinergic autonomic receptors (in addition to nicotinic receptors; may cause bradycardia, dysrhythmias, sinus arrest, increased secretions of salivary glands (especially in children)<br>2. Hyperkalemia<br>Disruption of motor nerve activity causes proliferation of extrajunctional (outside NMJ) cholinergic receptors<br>Depolarization of an increased number of receptors by SCh may lead to massive release of potassium out of muscle cells<br>Patients at risk<br>3rd degree burns 24 h-6 mo after injury<br>Traumatic paralysis or neuromuscular diseases (e.g. muscular dystrophy)<br>Severe intra-abdominal infections<br>Severe closed head injury<br>Upper motor neuron lesions<br>3. Can trigger MH (see *Malignant Hyperthermia*, A28)<br>4. Increased ICP/intraocular pressure/intragastric pressure (no increased risk of aspiration if competent lower esophageal sphincter)<br>5. Fasciculations, post-operative myalgia – may be minimized if small dose of non-depolarizing agent given before SCh administration |
| **Contraindications** | |
| **Absolute** | Known hypersensitivity or allergy, positive history of malignant hyperthermia, myotonia (m. congenita, m. dystrophica, paramyotonia congenital), high risk for hyperkalemic response |
| **Relative** | Known history of plasma cholinesterase deficiency, myasthenia gravis, myasthenic syndrome, familial periodic paralysis, open eye injury |

**Table 11. Non-Depolarizing Muscle Relaxants (Competitive)**

| **Mechanism of Action** | **Competitive blockade of postsynaptic ACh receptors preventing depolarization** | | | | | |
|---|---|---|---|---|---|---|
| **Classification** | **Short** | | **Intermediate** | | **Long** | |
| | Mivacuronium | Rocuronium | Vecuronium | Cisatracurium | Pancuronium | |
| **Intubating Dose (mg/kg)** | 0.2 | 0.6-1.0 | 0.1 | 0.2 | 0.1 | |
| **Onset (min)** | 2-3 | 1.5 | 2-3 | 3 | 3-5 | |
| **Duration (min)** | 15-25 | 30-45 | 45-60 | 40-60 | 90-120 | |
| **Metabolism** | Plasma cholinesterase | Liver (major) Renal (minor) | Liver | Hofmann Eliminations | Renal (major) | Liver (minor) |
| **Indications** | Assist intubation, assist mechanical ventilation in some ICU patients, reduce fasciculations, and post-operative myalgias secondary to SCh | | | | | |
| **Side Effects** | | | | | | |
| **Histamine Release** | Yes | No | No | No | No | |
| **Other** | — | — | — | — | Tachycardia | |
| **Considerations** | Increased duration of action in renal or liver failure | Quick onset of rocuronium allows its use in rapid sequence induction<br>Cisatracurium is good for patients with renal or hepatic insufficiency | | | | Pancuronium if increased HR and BP desired |

### Reversing Agents

- sugammadex is a selective relaxant binding agent
- neostigmine, pyridostigmine, edrophonium are acetylcholinesterase inhibitors
- administer reversal agents when there has been some recovery of blockade (i.e. muscle twitch)
- can only reverse the effect of non-depolarizing muscle relaxants
- anticholinergic agents (e.g. atropine, gylcopyrrolate) are simultaneously administered to minimize muscarinic effect of reversal agents (i.e. bradycardia, salivation, increased peristalsis, and bronchoconstriction)

**Table 12. Reversal Agents for Non-Depolarizing Relaxants**

| **Agent** | **Pyridostigmine** | **Neostigmine** | **Edrophonium** | **Sugammadex** |
|---|---|---|---|---|
| **Onset** | Slow | Intermediate | Intermediate | Fast |
| **Mechanism of Action** | (acetylcholinesterase inhibitors) Inhibits enzymatic degradation of ACh, increases ACh at nicotinic and muscarinic receptors, displaces non-depolarizing muscle relaxants<br>Muscarinic effects of reversing agents include unwanted bradycardia, salivation, and increased bowel peristalsis* | | | Encapsulates and inactivates rocuronium and vecuronium → ↓ amount of agent available to bind to receptors in NMJ |
| **Dose** | 0.1-0.4 mg/kg | 0.04-0.08 mg/kg | 0.5-1 mg/kg | 2-16 mg/kg |
| **Recommended Anticholinergic** | Glycopyrrolate | Glycopyrrolate | Atropine | NA |
| **Dose of Anticholinergic (per mg)** | 0.05 mg | 0.2 mg | 0.014 mg | NA |

*Atropine and glycopyrrolate are anticholinergic agents administered to minimize muscarinic effects of reversal agents

## Analgesia

- options include opioids (e.g. morphine, fentanyl, hydromorphone), NSAIDS, acetaminophen, ketamine, gabapentin, local, and regional anesthetic (see Table 15, A25)

# Maintenance

- general anesthesia is maintained using volatile inhalation agents and/or IV agents (i.e. propofol infusion)
- analgesia (usually IV opioids) and muscle relaxants are also given as needed

# Extubation

- criteria: patient must no longer have intubation requirements
  - patency: airway must be patent
  - protection: airway reflexes intact
  - patient must be oxygenating and ventilating spontaneously
- general guidelines
  - ensure patient has normal neuromuscular function (peripheral nerve stimulator monitoring) and hemodynamic status
  - ensure patient is breathing spontaneously with adequate rate and tidal volume
  - allow ventilation (spontaneous or controlled) with 100% $O_2$ for 3-5 min
  - suction secretions from pharynx, deflate cuff, remove ETT on inspiration (vocal cords abducted)
  - ensure patient is breathing adequately after extubation
  - ensure face mask for $O_2$ delivery available
  - proper positioning of patient during transfer to recovery room (supine, head elevated)

## Complications of Extubation

- early extubation: aspiration, laryngospasm
- late extubation: transient vocal cord incompetence, edema (glottic, subglottic), pharyngitis, tracheitis

### Laryngospasm

- defined as forceful involuntary spasm of laryngeal muscles caused by stimulation of superior laryngeal nerve (by oropharyngeal secretions, blood, extubation)
- causes partial or total airway obstruction
- more likely to occur in semi-conscious patients
- prevention: extubate while patient is still deeply under anesthesia or fully awake
- treatment: apply sustained positive pressure with bag-mask ventilation with 100% $O_2$, low-dose propofol (0.5-1.0 mg/kg) optional, low-dose succinylcholine (approximately 0.25 mg/kg) and reintubate if hypoxia develops

# Regional Anesthesia

- local anesthetic agent (LA) applied around a peripheral nerve at any point along the length of the nerve (from spinal cord up to, but not including, the nerve endings) for the purpose of reducing or preventing impulse transmission
- no CNS depression (unless overdose of local anesthetic); patient remains conscious
- regional anesthetic techniques categorized as follows:
  - epidural and spinal anesthesia (neuraxial anesthesia)
  - peripheral nerve blocks
  - IV regional anesthesia (e.g. Bier block)

### Patient Preparation

- sedation and/or anxiolysis may be indicated before block
- monitoring should be as extensive as for general anesthesia

**Benefits of Regional Anesthesia**

- Reduced perioperative pulmonary complications
- Reduced perioperative analgesia requirements
- Decreased PONV
- Reduced perioperative blood loss
- Ability to monitor CNS status during procedure
- Improved perfusion
- Lower incidence of VTE
- Shorter recovery and improved rehabilitation
- Pain blockade with preserved motor function

## Epidural and Spinal Anesthesia

- most common for surgeries performed below level of umbilicus but can be extended to any level (useful in thoracic, abdominal and lower extremity surgeries). Typically placed in thoracic or lumbar spine

### Anatomy of Spinal/Epidural Area

- spinal cord extends to L2; dural sac to S2 in adults
- nerve roots (cauda equina) from L2 to S2
- needle inserted below L2 should not encounter cord, thus L3-L4, L4-L5 interspace commonly used
- structures penetrated (outside to inside)
  - skin
  - subcutaneous fat
  - supraspinous ligament
  - interspinous ligament
  - ligamentum flavum (last layer before epidural space)
  - dura + arachnoid for spinal anesthesia

**Landmarking Epidural/Spinal Anesthesia**

- Spinous processes should be maximally flexed
- L4 spinous processes found between iliac crests
- T7 landmark at the tip of the scapula

**Classic Presentation of Dural Puncture Headache**

- Onset 6 h-3 d after dural puncture
- Postural component (worse when sitting)
- Occipital or frontal localization
- ± tinnitus, diplopia

**Table 13. Epidural vs. Spinal Anesthesia**

| | Epidural | Spinal |
|---|---|---|
| **Deposition Site** | LA injected in epidural space (space between ligamentum flavum and dura)<br>Initial blockade is at the spinal roots followed by some degree of spinal cord anesthesia as LA diffuses into the subarachnoid space through the dura | LA injected into subarachnoid space in the dural sac surrounding the spinal cord and nerve roots |
| **Onset** | Significant blockade requires 10-15 min<br>Slower onset of side effects | Rapid blockade (onset in 2-5 min) |
| **Effectiveness** | Effectiveness of blockade can be variable | Very effective blockade |
| **Difficulty** | Technically more difficult; greater failure rate | Easier to perform due to visual confirmation of CSF flow |
| **Patient Positioning** | Position of patient not as important; specific gravity not an issue | Hyperbaric LA solution – position of patient important |
| **Specific Gravity/ Spread** | Epidural injections spread throughout the potential space; specific gravity of solution does not affect spread | LA solution may be made hyperbaric (of greater specific gravity than the CSF by mixing with 10% dextrose, thus increasing spread of LA to the dependent (low) areas of the subarachnoid space) |
| **Dosage** | Larger volume/dose of LA (usually > toxic IV dose) | Smaller dose of LA required (usually < toxic IV dose) |
| **Continuous Infusion** | Use of catheter allows for continuous infusion or repeat injections | None |
| **Complications** | Failure of technique<br>Hypotension<br>Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. "high spinal"<br>Epidural or subarachnoid hematoma<br>Accidental subarachnoid injection can produce spinal anesthesia (and any of the above complications)<br>Systemic toxicity of LA (accidental intravenous)<br>Catheter complications (shearing, kinking, vascular or subarachnoid placement)<br>Infection<br>Dural puncture | Failure of technique<br>Hypotension<br>Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. "high spinal"<br>Epidural or subarachnoid hematoma<br>Post-spinal headache (CSF leak)<br>Transient paresthesias<br>Spinal cord trauma<br>Infection |
| **Combined Spinal-Epidural** | Combines the benefits of rapid, reliable, intense blockade of spinal anesthesia together with the flexibility of an epidural catheter | |

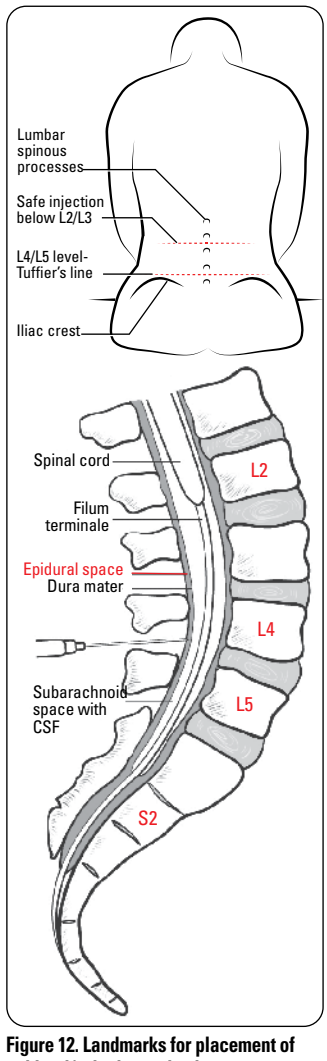

**Figure 12. Landmarks for placement of epidural/spinal anesthesia**

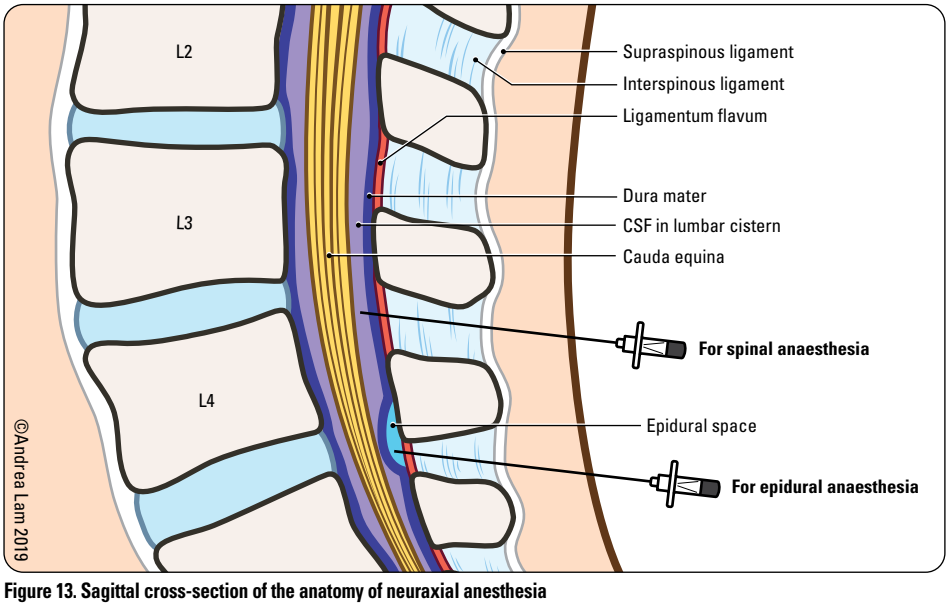

**Figure 13. Sagittal cross-section of the anatomy of neuraxial anesthesia**

## Contraindications to Spinal/Epidural Anesthesia

- absolute contraindications
  - lack of resuscitative drugs/equipment
  - patient refusal
  - allergy to local anesthetic
  - infection at puncture site or underlying tissues
  - coagulopathies/bleeding diathesis
  - raised ICP
  - sepsis/bacteremia
  - severe hypovolemia
  - cardiac lesion with fixed output states (severe mitral/aortic stenosis)
  - lack of IV access

- relative contraindications
  - pre-existing neurological disease (demyelinating lesions)
  - previous spinal surgery, severe spinal deformity
  - prolonged surgery
  - major blood loss or maneuvers that can compromise reaction

## Peripheral Nerve Blocks

- deposition of LA around the target nerve or plexus
- ultrasound guidance and peripheral nerve stimulation (needle will stimulate target nerve/plexus) may be used to guide needle to target nerve while avoiding neural trauma or intraneural injection
- most major nerves or nerve plexi can be targeted (brachial plexus block, femoral nerve block, sciatic nerve block, etc.)
- performed with standard monitors
- approximately 2-4 per 10,000 risk of late neurologic injury
- resuscitation equipment must be available

### Contraindications to Peripheral Nerve Blockade

- absolute contraindications
  - allergy to LA
  - patient refusal
- relative contraindications
  - certain types of pre-existing neurological dysfunction (e.g. ALS, MS, diabetic neuropathy)
  - local infection at block site
  - bleeding disorder

# Local Anesthesia

## Local Anesthetic Agents

- see Table 14, A22, for list of LA agents

### Definition and Mode of Action

- LA are drugs that block the generation and propagation of impulses in excitable tissues: nerves, skeletal muscle, cardiac muscle, brain
- LA bind to receptors on the cytosolic side of the $Na^+$ channel, inhibiting $Na^+$ flux and thus blocking impulse conduction
- different types of nerve fibres undergo blockade at different rates

### Absorption, Distribution, Metabolism

- LA readily crosses the blood-brain barrier (BBB) once absorbed into the bloodstream
- ester-type LA (e.g. procaine, tetracaine) are broken down by plasma and hepatic esterases; metabolites excreted via kidneys
- amide-type LA (lidocaine, bupivicaine) are broken down by hepatic mixed-function oxidases (P450 system); metabolites excreted via kidneys

### Selection of LA

- choice of LA depends on:
  - onset of action: influenced by pKa (the lower the pKa, the higher the concentration of the base form of the LA, and the faster the onset of action)
  - duration of desired effects: influenced by protein binding (longer duration of action when protein binding of LA is strong)
  - potency: influenced by lipid solubility (agents with high lipid solubility penetrate the nerve membrane more easily)
  - unique needs (e.g. sensory blockade with relative preservation of motor function by bupivicaine at low doses)
  - potential for toxicity

**Table 14. Local Anesthetic Agents**

| | Maximum Dose | Maximum Dose with Epinephrine | Potency | Duration | Onset |
|---|---|---|---|---|---|
| chloroprocaine | 11 mg/kg | 14 mg/kg | Low | 15-30 min | Fast |
| lidocaine | 5 mg/kg | 7 mg/kg | Medium | 1-2 h | Fast |
| bupivacaine | 2.5 mg/kg | 3 mg/kg | High | 3-8 h | Slow |
| ropivacaine | 2.5 mg/kg | 3 mg/kg | High | 2-8 h | Medium |
| mepivacaine | 5 mg/kg | 7 mg/kg | Medium | 3-6 h | Fast |

# Systemic Toxicity

- see Table 14, A22 for maximum doses, potency, and duration of action for common LA agents
- occurs by accidental intravascular injection, LA overdose, or unexpectedly rapid absorption

### CNS Effects
- CNS effects first appear to be excitatory due to initial block of inhibitory fibres, then subsequent block of excitatory fibres
- effects in order of appearance
  - numbness of tongue, perioral tingling, metallic taste
  - disorientation, drowsiness
  - tinnitus
  - visual disturbances
  - muscle twitching, tremors
  - unconsciousness
  - convulsions, seizures
  - generalized CNS depression, coma, respiratory arrest

### CVS Effects
- vasodilation, hypotension
- decreased myocardial contractility
- dose-dependent delay in cardiac impulse transmission
  - prolonged PR, QRS intervals
  - sinus bradycardia
- CVS collapse

### Treatment of Systemic Toxicity
- early recognition of signs; get help
- 100% $O_2$, manage ABCs
- diazepam or other anticonvulsant to prevent potential onset of seizures
- manage arrhythmias
- Intralipid® 20% to bind local anesthetic in circulation

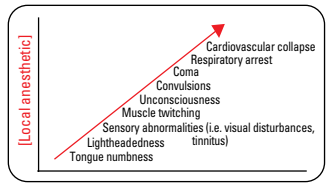

**Figure 14. Local anesthetic systemic toxicity**

# Local Infiltration and Hematoma Blocks

### Local Infiltration
- injection of tissue with LA, producing a lack of sensation in the infiltrated area due to LA acting on nerves
- suitable for small incisions, suturing, excising small lesions
- can use fairly large volumes of dilute LA to infiltrate a large area
- low concentrations of epinephrine (1:100,000-1:200,000) cause vasoconstriction, thus reducing bleeding and prolonging the effects of LA by reducing systemic absorption

**Where Not to Use LA with Epinephrine**
"Ears, Fingers, Toes, Penis, Nose"

### Fracture Hematoma Block
- special type of local infiltration for pain control during manipulation of certain fractures
- hematoma created by fracture is infiltrated with LA to anesthetize surrounding tissues
- sensory blockade may only be partial
- no muscle relaxation

# Topical Anesthetics

- various preparations of local anesthetics available for topical use, may be a mixture of agents (EMLA cream is a combination of 2.5% lidocaine and prilocaine)
- must be able to penetrate the skin or mucous membrane

# Post-Operative Care

- pain management should be continuous from OR to post-anesthetic care unit (PACU) to hospital ward and home

# Common Post-Operative Anesthetic Complications

### Uncontrolled/Poorly Controlled Pain

### Nausea and Vomiting
- hypotension and bradycardia must be ruled out
- pain and surgical manipulation also cause nausea
- often treated with dimenhydrinate (Gravol®), metoclopramide (Maxeran®; not with bowel obstruction), prochlorperazine (Stemetil®), ondansetron (Zofran®), granisetron (Kytril®)

### Confusion and Agitation
- ABCs first – confusion or agitation can be caused by airway obstruction, hypercapnea, hypoxemia
- neurologic status (Glasgow Coma Scale, pupils), residual paralysis from anesthetic
- pain, distended bowel/bladder
- fear/anxiety/separation from caregivers, language barriers
- metabolic disturbance (hypoglycemia, hypercalcemia, hyponatremia – especially post-TURP)
- intracranial cause (stroke, raised ICP)
- drug effect (ketamine, anticholinergics, serotonin)
- elderly patients are more susceptible to post-operative delirium

### Respiratory Complications
- susceptible to aspiration of gastric contents due to PONV and unreliable airway reflexes
- airway obstruction (secondary to reduced muscle tone from residual anesthetic, soft tissue trauma and edema, or pooled secretions) may lead to inadequate ventilation, hypoxemia, and hypercapnia
- airway obstruction can often be relieved with head tilt, jaw elevation, and anterior displacement of the mandible. If the obstruction is not reversible, a nasal or oral airway may be used

### Hypotension
- must be identified and treated quickly to prevent inadequate perfusion and ischemic damage
- reduced cardiac output (hypovolemia, most common cause) and/or peripheral vasodilation (residual anesthetic agent)
- first step in treatment is usually the administration of fluids ± inotropic agents

### Hypertension
- pain, hypercapnia, hypoxemia, increased intravascular fluid volume, and sympathomimetic drugs can cause hypertension
- IV nitroglycerin, hydralazine, calcium channel blockers or β-blocking drugs (e.g. esmolol and metoprolol) can be used to treat hypertension

**Risk Factors for Post-Operative Nausea and Vomiting (PONV)**
- Young age
- Female
- History of PONV
- Non-smoker
- Type of surgery: ophtho, ENT, abdo/pelvic, plastics
- Type of anesthetic: $N_2O$, opioids, volatile agents

**Dexamethasone versus Standard Treatment for Postoperative Nausea and Vomiting in Gastrointestinal Surgery: Randomised Controlled Trial (DREAMS Trial)**
BMJ 2017;357:j1455
**Objectives**: Whether preoperative dexamethasone reduces postoperative vomiting in patients undergoing elective bowel surgery and whether it is associated with other measurable benefits during recovery from surgery.
**Method**: Pragmatic two arm parallel group randomised trial with blinded postoperative care and outcome assessment.
**Results**: Patients receiving additional 8 mg of IV dexamethasone at induction is associated with lower rates of vomiting within 24 hours of surgery (NNT=13) and reduced need for antiemetics up to 72h (NNT=8) vs. standard of care.
**Conclusions**: A single dose of dexamethasone at induction of anesthesia significantly reduces incidence of PONV and need for rescue antiemetics post-operatively with no increase in adverse events.

# Pain Management

### Definitions
- pain: perception of nociception, which occurs in the brain
- nociception: detection, transduction, and transmission of noxious stimuli

### Pain Classifications
- temporal: acute vs. chronic
- mechanism: nociceptive vs. neuropathic

## Acute Pain
- pain of short duration (<6 wk) usually associated with surgery, trauma, or acute illness; often associated with inflammation
- usually limited to the area of damage/trauma and resolves with healing

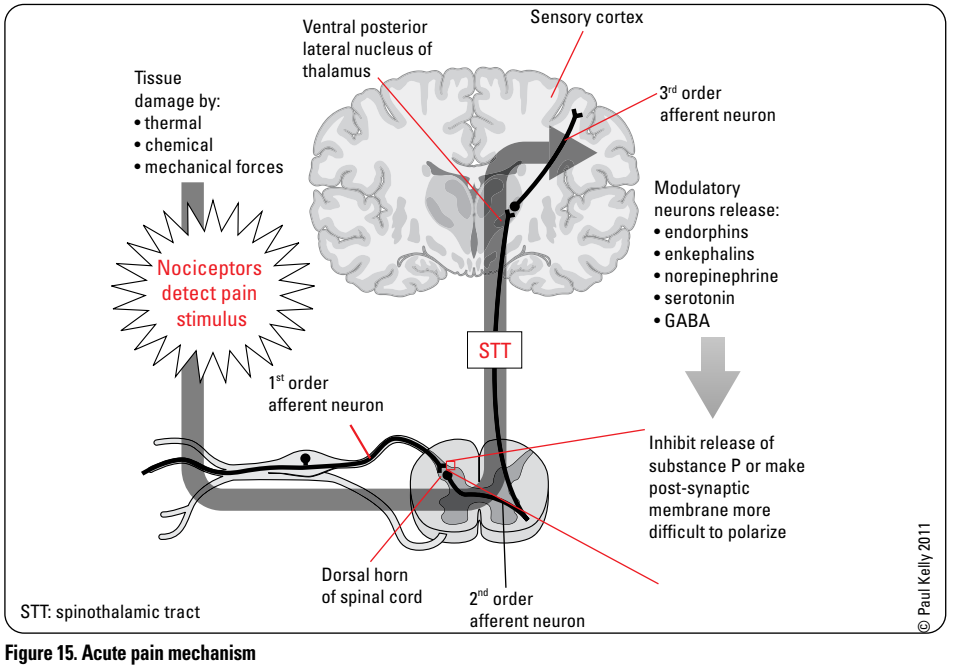

Figure 15. Acute pain mechanism

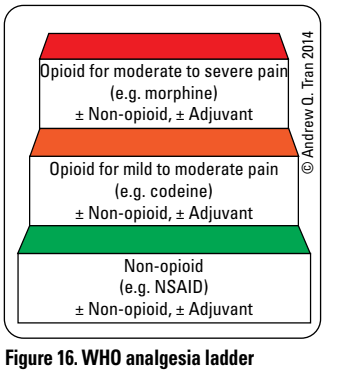

Figure 16. WHO analgesia ladder

## Pharmacological Management of Acute Pain

- ask the patient to rate the pain out of 10, or use visual analog scale, to determine severity
- pharmacological treatment guided by WHO analgesia ladder
- patient controlled analgesia (PCA)
  - involves the use of computerized pumps that can deliver a constant infusion and bolus breakthrough doses of parenterally-administered opioid analgesics
  - limited by lockout intervals
  - most commonly used agents: morphine and hydromorphone
  - see Table 17, A26 for suggested infusion rate, PCA dose and lockout intervals

### Table 15. Commonly Used Analgesics

| | Acetaminophen | NSAIDs | Opioids |
|---|---|---|---|
| **Examples** | Tylenol® | Aspirin®, ibuprofen, naproxen, ketorolac (IV) | Oral: codeine, oxycodone, morphine, hydromorphone<br>Parenteral: morphine, hydromorphone, fentanyl |
| **Indications** | First-line for mild acute pain | Mild-moderate pain | Oral: moderate acute pain<br>Parenteral: moderate-severe acute pain |
| **Mechanism of Action** | Unclear, hypothesized cyclooxygenase-2 (COX-2) inhibition<br>Unclear, hypothesized modulation of endogenous cannabinoid system | Non-selective COX-1 and 2 inhibition reducing proinflammatory prostaglandin synthesis | Dampens nociceptive transmission between 1st and 2nd order neurons in the dorsal horn<br>Activates ascending modulatory pathways resulting in release of inhibitory neurotransmitters<br>Inhibits peripheral inflammatory response and hyperalgesia<br>Affects mood and anxiety – alleviates the affective component of perceived pain |
| **Dosing/Administration** | Limited by analgesic ceiling beyond which there is no additional analgesia<br>Opioid-sparing<br>Max dose of 4 g/24 h | Limited by analgesic ceiling beyond which there is no additional analgesia<br>Opioid-sparing<br>Significant inter-individual variation in efficacy | No analgesic ceiling (except for codeine)<br>Can be administered intrathecally (spinal block) or by continuous infusion |
| **Side Effects/Toxicity** | Considered relatively safe<br>Liver toxicity in elevated doses | Gastric ulceration/bleeding<br>Decreased renal perfusion<br>Photosensitivity<br>Premature closure of the ductus arteriosus in pregnancy | Respiratory depression<br>Constipation and abdominal pain<br>Sedation<br>N/V<br>Pruritus<br>Confusion (particularly in the elderly)<br>Dependence |

### Table 16. Opioids

| Agent | Relative Dose to 10 mg Morphine IV | Moderate Dose | Onset | Duration | Special Considerations |
|---|---|---|---|---|---|
| **Codeine** | 200 mg PO | 15-30 mg PO | Late (30-60 min) | Moderate (4-6 h) | Primarily post-operative use, not for IV use. Not ideal as analgesic effect depends on highly variable CYP2D6 metabolism |
| **Meperidine (Demerol®)** | 75 mg IV | 2-3 mg/kg IV | Moderate (10 min) | Moderate (2-4 h) | Anticholinergic, hallucinations, less pupillary constriction than morphine, metabolite build up may cause seizures<br>Decreased use for pain management due to potential toxicity compared to other opioids. Typically reserved to treat post-operative shivering. Absolute contraindication in patients taking MAO-inhibitors |
| **Morphine** | 10 mg IV<br>20 mg PO | 0.2-0.3 mg/kg IV<br>0.4-0.6 mg/kg PO | Moderate (5-10 min) | Moderate (4-5 h) | Histamine release leading to decrease in BP |
| **Oxycodone Controlled Release (Oxyneo®)** | 15 mg PO | 10-20 mg PO (no IV) | Late (30-45 min) | Long (8-12 h) | Do not split, crush, or chew tablet (but can be difficult to swallow) |
| **Oxycodone Regular Tablet (Oxy IR®)** | 15 mg PO (no IV) | 5-15 mg PO | Moderate (15 min) | Moderate (3-6 h) | Percocet® = oxycodone 5 mg + acetaminophen 325 mg |
| **Hydromorphone (Dilaudid®)** | 2 mg IV<br>10 mg PO | 40-60 µg/kg IV<br>2-4 mg PO | Moderate (15 min) | Moderate (4-5 h) | Less pruritus, N&V, and sedation compared to morphine |
| **Fentanyl** | 100 µg IV | 2-3 µg/kg IV | Rapid (<5 min) | Short (0.5-1 h) | Transient muscle rigidity in very high doses |

**Cautionary Use of NSAIDs in Patients with**
- Asthma
- Coagulopathy
- GI ulcers
- Renal insufficiency
- Pregnancy, 3rd trimester

**Opioid Conversion**

| | Parenteral (IV) | Equivalent Oral Dose |
|---|---|---|
| Morphine | 10 mg | 30 mg |
| Hydromorphone | 2 mg | 4 mg |
| Codeine | 120 mg | 200 mg |
| Oxycodone | | N/A |
| 20 mg | | |
| Fentanyl IV | | 100 µg |
| N/A | | |

**Common Side Effects of Opioids**
- N/V
- Constipation
- Sedation
- Pruritus
- Abdominal pain
- Urinary retention
- Respiratory depression

When prescribing opioids, consider:
- Breakthrough dose
- Anti-emetics
- Laxative

**PCA Parameters**
- Loading dose
- Bolus dose
- Lockout interval
- Continuous infusion (optional)
- Maximum 4 h dose (limit)

**Advantages of PCA**
- Improved patient satisfaction
- Fewer side effects
- Accommodates patient variability
- Accommodates changes in opioid requirements

**Patient Controlled Opioid Analgesia versus Non-Patient Controlled Opioid Analgesia for Postoperative Pain**
Cochrane DB Syst Rev 2015:CD003348
**Purpose**: To evaluate the efficacy of patient controlled analgesia (PCA) versus non-patient controlled opioid analgesia of as-needed opioid analgesia for postoperative pain relief.
**Methods**: Meta-analyses of RCTs comparing PCA vs. conventional administration of opioid analgesia. Assessment employed a visual analog scale (VAS) for pain intensity along with overall analgesic consumption, patient satisfaction, length of stay, and adverse side effects.
**Results**: 49 studies with a total of 1725 patients receiving PCA and 1687 patients assigned to a control group. PCA had a lower VAS pain intensity score vs. non-patient controlled analgesia over most time intervals in the first 48h. PCA was associated with higher patient satisfaction and consumed higher amounts of opioids than controls. PCA was also associated with higher incidence of pruritus but not other adverse events.
**Conclusions**: Moderate to low quality evidence that PCA is an efficacious alternative to non-patient controlled systemic analgesia for postoperative pain control.

**Table 16. Opioids** (continued)

| Agent | Relative Dose to 10 mg Morphine IV | Moderate Dose | Onset | Duration | Special Considerations |
|---|---|---|---|---|---|
| **Remifentanil** | 100 µg IV | 0.5-1.5 µg/kg IV | Rapid (1-3 min) | Ultra short (<10 min) | Only use during induction and maintenance of anesthesia |
| **Methadone (opioid agonist)** | Morphine to methadone conversion is variable based on patient's morphine dose. Ranges from 1/4 to 1/20 | 15-40 mg/d in divided doses | Rapid (8 min) | 15-90 (24h average) | Can only be prescribed by federally/provincially licensed physicians<br>Acts through both NMDA and mu receptors<br>Challenging due to variable equianalgesic dose and half-life<br>After titration, accumulates in tissue for once/twice daily dosing<br>Metabolized by CYP3A4<br>Caution with high doses, may cause QT prolongation, baseline ECG required |
| **Buprenorphine (opioid agonist antagonist)** | Varies depending on route of administration (pill/film, transdermal) | Film: 2 mg up to max of 24 mg | Moderate (30 min) | 6-8 h | For moderate to severe chronic pain and opioid addiction<br>Ceiling effect for respiratory depression but not analgesia<br>High affinity to mu-opioid receptors, very resistant to reversal with opioid antagonists |

In general, parenteral route is 2-3x more potent than oral

**Table 17. Opioid PCA Doses**

| Agent | PCA Dose | PCA Lockout Interval | PCA 4 h Maximum |
|---|---|---|---|
| Morphine | 1 mg | 5 min | 30 mg |
| Hydromorphone | 0.2 mg | 5 min | 6 mg |
| Fentanyl | 25-50 µg | 5 min | 400 µg |

### Opioid Antagonists (naloxone, naltrexone)

- indication: opioid overdose (manifests primarily at CNS, e.g. respiratory depression)
- mechanism of action: competitively inhibit opioid receptors, predominantly µ receptors
  - naloxone is short-acting (t1/2 = 1 h); effects of narcotic may return when naloxone wears off; therefore, the patient must be observed closely following its administration
  - naltrexone is longer-acting (t1/2 = 10 h); less likely to see return of opioid effects
- side effects: relative overdose of naloxone may cause nausea, agitation, sweating, tachycardia, hypertension, re-emergence of pain, pulmonary edema, seizures (essentially opioid withdrawal)

## Neuropathic Pain

- see Neurology, N41

## Chronic Pain

- chronic pain: greater than 3 mo, or recurrent pain that occurs at least 3 times throughout 3 mo period
- pain of duration or intensity that persists beyond normal tissue healing and adversely affects functioning
- in the perioperative period, consider continuing regular long-acting analgesics and augmenting with regional techniques, adjuvants, additional opioid analgesia and non-pharmacological techniques

### Central Sensitization

- central sensitization: hyperalgesia (increased sensitivity to pain) as a result of central nervous system mechanisms
- may have nociceptive and neuropathic components; dysregulation of analgesic pathways implicated
- plays a role in fibromyalgia

### Chronic Post-Surgical Pain

- chronic post-surgical pain (CPSP): pain that develops after surgery and persists for at least 2 mo
- primary predictor of CPSP is history of chronic pain; other risk factors include female gender, surgical procedure/approach, poor social supports, catastrophizing behaviour

**Epidural versus Non-Epidural or No Analgesia for Pain Management in Labour**
Cochrane DB Syst Rev 2018:CD000331
**Objectives**: To assess effectiveness and safety of all types of epidural analgesia when compared with non-epidural or no pain relief during labour.
**Methods**: Systematic review of RCTs comparing epidural with any form of pain relief not involving regional blockade, or no pain relief in labour.
**Results**: 52 studies involving over 11000 women were included; 34 studies compared epidural analgesia with opioids. Epidural analgesia was associated with lower pain intensity, higher satisfaction, and decreased need for additional pain relief vs. opioids. While it was also associated with increased risk of assisted vaginal birth (RR 1.44, 95% CI 1.29-1.60), post-hoc analysis of studies conducted after 2005 eliminates this risk (RR 1.19, 95% CI 0.97-1.46). Women with epidural experienced more hypotension, motor blockage, fever, and urinary retention with less risk of respiratory depression and nausea/vomiting. There was no difference in neonatal outcomes, admission to NICU, caesarean section rates, or maternal long-term backache.
**Conclusions**: Epidural analgesia may be more effective in reducing pain during labour and increasing maternal satisfaction than non-epidural methods and, when considering modern approaches, is not associated with increased instrumentation. Epidural analgesia had no impact on the risk of caesarean section or long-term backache, and did not appear to have an immediate effect on neonatal status as determined by Apgar scores or in admissions to NICU.

**Nociceptive Pathways in Labour and Delivery**

**Labour**
- Cervical dilation and effacement stimulates visceral nerve fibres entering the spinal cord at T10-L1

**Delivery**
- Distention of lower vagina and perineum causes somatic nociceptive impulses via the pudendal nerve entering the spinal cord at S2-S4

# Obstetrical Anesthesia

## Anesthesia Considerations in Pregnancy

- airway
  - possible difficult airway as tissues becomes edematous and friable especially in labour
- respiratory
  - decreased FRC and increased $O_2$ consumption cause more rapid desaturation during apnea
- cardiovascular system
  - increased blood volume > increased RBC mass results in mild anemia
  - decreased SVR proportionately greater than increased CO results in decreased BP
  - prone to decreased BP due to aortocaval compression (supine hypotensive syndrome) – therefore for surgery, a pregnant patient is positioned in left uterine displacement (approximately 15°C) using a wedge under her right flank
- central nervous system
  - decreased MAC due to hormonal effects
  - increased block height due to engorged epidural veins
- gastrointestinal system
  - delayed gastric emptying
  - increased volume and acidity of gastric fluid
  - decreased LES tone
  - increased abdominal pressure
  - combined, these lead to an increased risk of aspiration – therefore for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity

## Options for Analgesia during Labour

- psychoprophylaxis – Lamaze method
  - patterns of breathing and focused attention on fixed object
- systemic medication
  - easy to administer, but risk of maternal or neonatal respiratory depression
  - opioids most commonly used if delivery is not expected within 4 h; fentanyl can be considered
- inhalational analgesia
  - easy to administer, makes uterine contractions more tolerable, but does not relieve pain completely
  - 50% nitrous oxide is insufficient alone but good safety profile for mother + child
- neuraxial anesthesia
  - provides excellent analgesia with minimal depressant effects
  - hypotension is the most common complication
  - maternal BP monitored q2-5min for 15-20 min after initiation and regularly thereafter
  - epidural usually given as it preferentially blocks sensation, leaving motor function intact

## Options for Caesarean Section

- neuraxial: spinal or epidural
- general: used if contraindications or time precludes regional blockade (see *Regional Anesthesia, Epidural and Spinal Anesthesia*, A20)

# Pediatric Anesthesia

## Respiratory System

- in comparison to adults, anatomical differences in infants include:
  - large head, short trachea/neck, large tongue, larynx positioned more superior and anterior, adenoids, and tonsils
  - narrow nasal passages (obligate nasal breathers until 5 mo)
  - narrowest part of airway at the level of the cricoid vs. glottis in adults
  - epiglottis is longer, U shaped and angled at 45°; carina is wider and is at the level of T2 (T4 in adults)
- physiologic differences include:
  - faster RR, immature respiratory centres which are depressed by hypoxia/hypercapnea (airway closure occurs in the neonate at the end of expiration)
  - less oxygen reserve during apnea – decreased total lung volume, vital and functional reserve capacity together with higher metabolic needs
  - greater V/Q mismatch – lower lung compliance due to immature alveoli (mature at 8 yr)
  - greater work of breathing – greater chest wall compliance, weaker intercostals/diaphragm, and higher resistance to airflow

## Cardiovascular System

- blood volume at birth is approximately 80 mL/kg; transfusion should be started if >10% of blood volume is lost
- children have a high HR and low BP
- CO is dependent on HR, not stroke volume because of low heart wall compliance; therefore, bradycardia severe compromise in CO

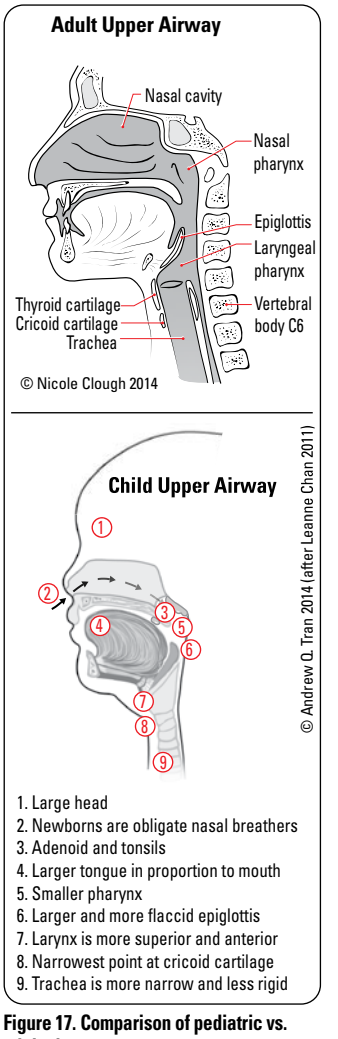

**Figure 17. Comparison of pediatric vs. adult airway**

**To increase alveolar minute ventilation in neonates, increase respiratory rate, not tidal volume**
Neonate: 30-40 breaths/min
Age 1-13: (24 – [age/2]) breaths/min

**ETT Sizing in Pediatrics**
Diameter (mm) of tracheal tube in children after 1 year = (age/4) + 4
Length (cm) of tracheal tube = (age/2) + 12

### Temperature Regulation
- vulnerable to hypothermia
- minimize heat loss by use of warming blankets, covering the infant's head, humidification of inspired gases, and warming of infused solutions

### Central Nervous System
- MAC of halothane is increased compared to the adult (0.75% adult, 1.2% infant, 0.87% neonate)
- NMJ is immature for the first 4 wk of life and thus there is an increased sensitivity to non-depolarizing relaxants
- parasympathetics mature at birth, sympathetics mature at 4-6 mo; thus, there is an autonomic imbalance
- infant brain is 12% of body weight and receives 34% of CO (adult: 2% body weight and 14% CO)

### Glucose Maintenance
- infants <1 yr can become seriously hypoglycemic during pre-operative fasting and post-operatively if feeding is not recommenced as soon as possible
- after 1 yr, children are able to maintain normal glucose homeostasis in excess of 8 h

### Pharmacology
- higher dose requirements because of higher TBW (75% vs. 60% in adults) and greater volume of distribution
- barbiturates/opioids more potent due to greater permeability of BBB
- muscle relaxants
  - non-depolarizing
    - immature NMJ, variable response
  - depolarizing
    - must pre-treat with atropine or may experience profound bradycardia and/or sinus node arrest due to PNS > SNS (also dries oral secretions)
    - more susceptible to arrhythmias, hyperkalemia, rhabdomyolysis, myoglobinemia, masseter spasm and malignant hyperthermia

# Uncommon Complications

## Malignant Hyperthermia

- hypermetabolic disorder of skeletal muscle
- due to an uncontrolled increase in intracellular $Ca^{2+}$ (because of an anomaly of the ryanodine receptor which regulates $Ca^{2+}$ channel in the sarcoplasmic reticulum of skeletal muscle)
- autosomal dominant inheritance
- incidence of 1-5 in 100,000, may be associated with skeletal muscle abnormalities such as dystrophy or myopathy
- anesthetic drugs triggering MH include:
  - all inhalational agents except nitrous oxide
  - depolarizing muscle relaxants: SCh

**Signs of Malignant Hyperthermia**
- Unexplained rise in $ETCO_2$
- Increase in minute ventilation
- Tachycardia
- Rigidity
- Hyperthermia (late sign)

### Clinical Picture
- onset: immediate or hours after contact with trigger agent
  - increased oxygen consumption
  - increased $ETCO_2$ on capnograph
  - tachycardia/dysrhythmia
  - tachypnea/cyanosis
  - diaphoresis
  - hypertension
  - increased temperature (late sign)
- muscular symptoms
  - trismus (masseter spasm) common but not specific for MH (occurs in 1% of children given SCh with halothane anesthesia)
  - tender, swollen muscles due to rhabdomyolysis
  - trunk or total body rigidity

### Complications
- coma
- DIC
- rhabdomyolysis
- myoglobinuric renal failure/hepatic dysfunction
- electrolyte abnormalities (e.g. hyperkalemia) and secondary arrhythmias
- ARDS
- pulmonary edema
- can be fatal if untreated

### Prevention

- suspect MH in patients with a family history of problems/death with anesthetic
- avoid all trigger medications, use vapour free equipment, use regional anesthesia if possible
- central body temp and $ETCO_2$ monitoring

### Malignant Hyperthermia Management

(Based on Malignant Hyperthermia Association of the U.S. [MHAUS] Guidelines, 2008)

1. notify surgeon, discontinue volatile agents and succinylcholine, hyperventilate with 100% oxygen at flows of 10 L/min or more, halt the procedure as soon as possible
2. dantrolene 2.5 mg/kg IV, through large-bore IV if possible
   - repeat until there is control of signs of MH; up to 30 mg/kg as necessary
3. bicarbonate 1-2 mEq/kg if blood gas values are not available for metabolic acidosis
4. cool patients with core temperature >39°C
   - lavage open body cavities, stomach, bladder, rectum; apply ice to surface; infuse cold saline IV
   - stop cooling if temperature is <38°C to prevent drift to <36°C
5. dysrhythmias usually respond to treatment of acidosis and hyperkalemia
   - use standard drug therapy except $Ca^{2+}$ channel blockers as they may cause hyperkalemia and cardiac arrest in presence of dantrolene
6. hyperkalemia
   - treat with hyperventilation, bicarbonate, glucose/insulin, calcium
   - bicarbonate 1-2 mEq/kg IV, calcium chloride 10 mg/kg or calcium gluconate 10-50 mg/kg for life-threatening hyperkalemia and check glucose levels hourly
7. follow $ETCO_2$, electrolytes, blood gases, creatine kinase (CK), core temperature, urine output/colour with Foley catheter, coagulation studies
   - if CK and/or potassium rises persistently or urine output falls to <0.5 mL/kg/h, induce diuresis to >1 mL/kg/h urine to avoid myoglobinuric renal failure
8. maintain anesthesia with benzodiazepines, opioids, and propofol
9. transfer to ICU bed

**Basic Principles of MH Management**

**"Some Hot Dude Better Get Iced Fluids Fast"**
**S**top all triggering agents, give 100% $O_2$
**H**yperventilate
**D**antrolene 2.5 mg/kg every 5 min
**B**icarbonate
**G**lucose and insulin
**I**V fluids; cool patient to 38°C
**F**luid output; consider furosemide
**F**ast Heart [tachycardia]; be prepared to treat VT

## Abnormal Pseudocholinesterase

- pseudocholinesterase hydrolyzes SCh and mivacurium
- individuals with abnormal pseudocholinesterase will have prolonged muscular blockade
- SCh and mivacurium are contraindicated in those with abnormal pseudocholinesterase
- if SCh or mivacurium are given accidentally, treat with mechanical ventilation until function returns to normal (do not use cholinesterase inhibitors as it will cause rebound neuromuscular blockade once cholinesterase inhibitor effect is terminated)

| LVH | left ventricular hypertrophy |
| LVOT | left ventricular outflow tract |
| MAT | multifocal atrial tachycardia |
| MI | myocardial infarction |
| MPI | myocardial perfusion imaging |
| MR | mitral regurgitation |
| MS | mitral stenosis |
| NSR | normal sinus rhythm |
| NSTEMI | non-ST elevation myocardial infarction |
| OPCAB | off-pump coronary artery bypass |
| OS | opening snap |
| PAC | premature atrial contraction |
| PCI | percutaneous coronary intervention |
| PCWP | pulmonary capillary wedge pressure |
| PDA | patent ductus arteriosus |
| PE | pulmonary embolism |
| PFO | patent foramen ovale |
| PIV | posterior-interventricular artery |
| PMI | point of maximal impulse |
| PND | paroxysmal nocturnal dyspnea |
| PUD | peptic ulcer disease |
| PVC | premature ventricular contraction |
| PVD | peripheral vascular disease |
| RA | right atrium |
| RAAS | renin angiotensin aldosterone system |
| RAE | right atrial enlargement |
| RBB | right bundle branch |
| RBBB | right bundle branch block |
| RCM | restrictive cardiomyopathy |
| RV | right ventricle |
| RVAD | right ventricular assist device |
| RVH | right ventricular hypertrophy |
| SA | sinoatrial |
| SAM | systolic anterior motion |
| SCD | sudden cardiac death |
| SEM | systolic ejection murmur |
| SLE | systemic lupus erythematosus |
| SNS | sympathetic nervous system |
| SOB | shortness of breath |
| SOBOE | shortness of breath on exertion |
| STEMI | ST elevation myocardial infarction |
| SV | stroke volume |
| SVC | superior vena cava |
| SVR | systemic vascular resistance |
| SVT | supraventricular tachycardia |
| TB | tuberculosis |
| TEE | transesophageal echocardiography |
| TIA | transient ischemic attack |
| TR | tricuspid regurgitation |
| TTE | transthoracic echocardiography |
| UA | unstable angina |
| V | ventricle |
| VAD | ventricular assist device |
| VFib | ventricular fibrillation |
| VT | ventricular tachycardia |
| VTE | venous thromboembolism |
| WPW | Wolff-Parkinson-White |

# Basic Anatomy Review

## Coronary Circulation

- conventional arterial supply to the heart arises from the right and left coronary arteries, which originate from the root of the aorta
  - right coronary artery (RCA):
    - acute marginal branches
    - atrioventricular (AV) nodal artery
    - posterior descending artery (PDA) = posterior interventricular artery (PIV)
  - left main coronary artery (LCA):
    - left anterior descending artery (LAD)
      - septal branches
      - diagonal branches
    - left circumflex artery (LCx)
      - obtuse marginal branches
- dominance of circulation
  - determined by whether the RCA or the LCx supplies the PDA
    - right-dominant circulation: PDA and at least one posterolateral branch arise from RCA (80%)
    - left-dominant circulation: PDA and at least one posterolateral branch arise from LCx (15%)
    - balanced circulation: dual supply of posteroinferior LV from RCA and LCx (5%)
- the sinoatrial (SA) node is supplied by the SA nodal artery, which may arise from the RCA (60%) or LCA (40%)
- most venous blood from the heart drains into the RA through the coronary sinus, although a small amount drains through Thebesian veins into all four chambers, contributing to the physiologic R-L shunt

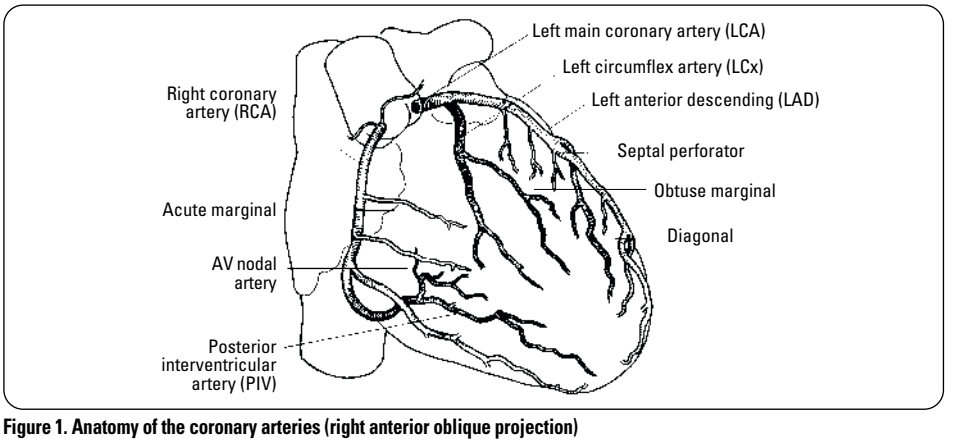

**Figure 1. Anatomy of the coronary arteries (right anterior oblique projection)**

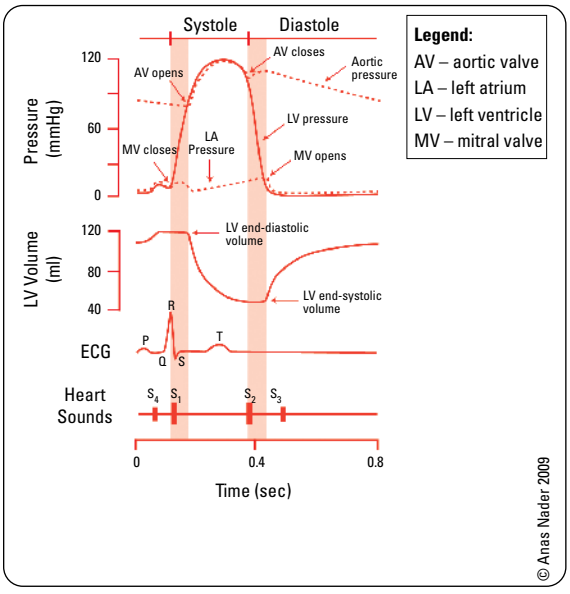

**Figure 2a. Cardiac cycle**
Grey shaded bars indicate isovolumic contraction (left) and isovolumic relaxation (right)

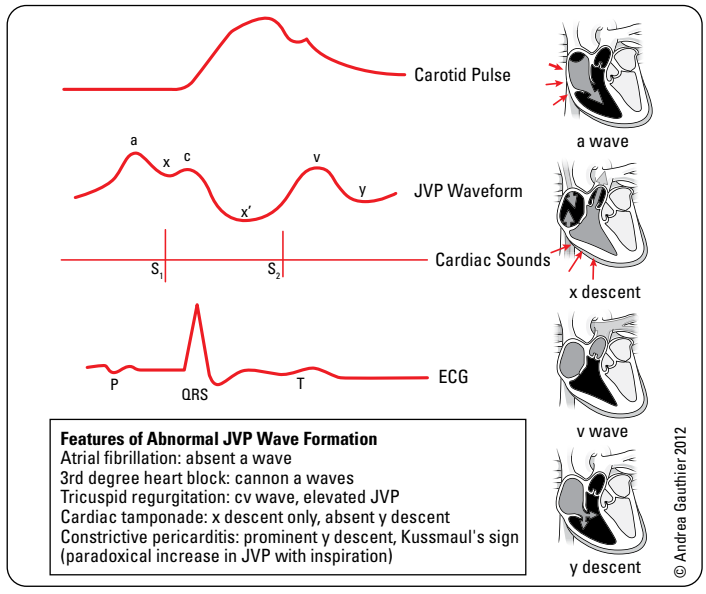

**Figure 2b. JVP waveform**

# Cardiac Anatomy

- **layers of the heart**
  - endocardium, myocardium, epicardium, visceral pericardium, pericardial cavity, parietal pericardium
- **valves**
  - semilunar valves:
    - aortic valve, 3 valve leaflets: separates LV and ascending aorta
    - pulmonic valve, 3 valve leaflets: separates RV and main pulmonary artery (PA)
  - atrioventricular valves: subvalvular apparatus present in the form of chordae tendinae and papillary muscles
    - tricuspid valve, 3 valve leaflets: separates RA and RV
    - mitral/bicuspid valve, 2 valve leaflets: separates LA and LV
- **conduction system**
  - SA node governs pacemaking control; the heart beat originates here
  - anterior-, middle-, and posterior-internal nodal tracts carry impulses in the right atrium and along Bachmann's bundle in the left atrium
  - atrial impulses converge at the AV node
  - the AV node is the only conducting tract from the atria to the ventricles because of electrical isolation by the annulus fibrosis (except when accessory pathways are present)
    - AV node connects to the bundle of His, which divides into left and right bundle branches (LBB and RBB)
  - LBB further splits into anterior and posterior fascicles
  - RBB and fascicles of LBB give off Purkinje fibres which conduct impulses into the ventricular myocardium

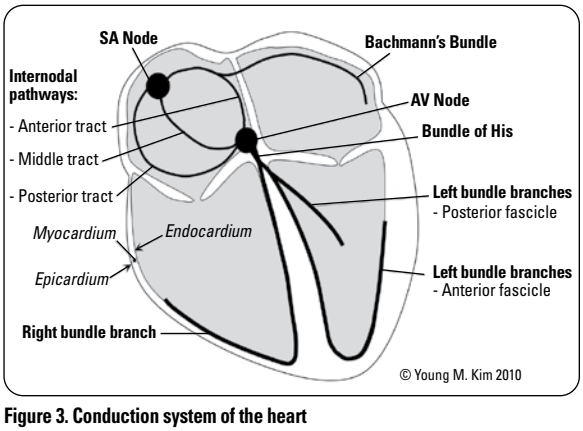

**Figure 3. Conduction system of the heart**

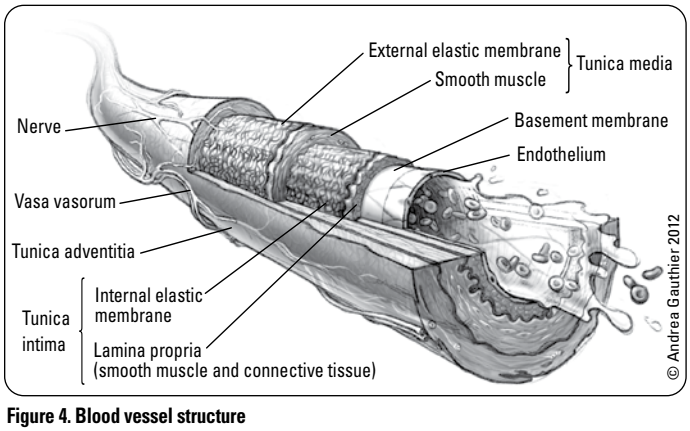

**Figure 4. Blood vessel structure**

- **cardiovascular innervation**
  - sympathetic nerves
    - innervate the SA node, AV node, ventricular myocardium, and vasculature
    - SA node (β1) increased activity leads to increased heart rate via more frequent impulse from pacemaking cells (increased chronotropy - increased HR)
    - cardiac muscle (β1) fibres increase contractility (inotropy - leads to increased SV)
    - stimulation of β1- and β2-receptors in the skeletal and coronary circulation causes vasodilatation
  - parasympathetic nerves
    - innervate the SA node, AV node, and atrial myocardium but few vascular beds
    - at rest, vagal tone dominates the tonic sympathetic stimulation of the SA node and AV node resulting in slowing of pacemaker activity (leading to a heart rate at rest slower than the intrinsic heart rate) and conduction (i.e. reduced dromotropy – if only affecting AV node conduction)
    - parasympathetics have very little impact on total peripheral vascular resistance

# Differential Diagnoses of Common Presentations

Note: **bold** text indicates most common, underlined text indicates life threatening condition

## Chest Pain

- cardiac
  - MI, angina, myocarditis, and pericarditis/Dressler's syndrome
- pulmonary
  - PE, pneumothorax/hemothorax, tension pneumothorax, pneumonia, empyema, pulmonary neoplasm, bronchiectasis, pleuritis, and TB
- gastrointestinal
  - esophageal: **GERD**, esophageal rupture, spasm, esophagitis, ulceration, achalasia, neoplasm, and Mallory-Weiss syndrome
  - other structures: PUD, gastritis, pancreatitis, and biliary colic
- mediastinal
  - lymphoma, thymoma
- vascular
  - dissecting aortic aneurysm, aortic rupture
- surface structures
- costochondritis
- rib fracture
- skin (bruising, herpes zoster)
- breast
- anxiety/psychosomatic

## Loss of Consciousness

**1. Causes of true syncope (impaired cerebral perfusion)**
- inadequate circulating volume (bleeding, hypovolemia with orthostasis)
- obstruction to blood flow
  - tamponade
  - pulmonary embolism
  - severe pulmonary hypertension
  - severe obstructive valve disease (mitral and aortic stenosis)
  - left ventricular outflow obstruction (HCM)
  - cerebrovascular events (e.g. CVA, TIA)
- sudden loss of cardiac output
  - tachyarrhythmia, ventricular tachycardia, VF
  - severe bradycardia (AV block/AV dyssynchrony)
- reflex mediated/reflex dysfunction
  - **vasovagal** (most common)
  - situational (micturition, cough, carotid hypersensitivity)
  - autonomic dysfunction (often associated with neurologic diseases)

**2. Loss of consciousness NOT due to impaired cerebral perfusion**
- seizure
- hypoglycemia
- severe hypoxia or hypercarbia
- psychiatric
- •adverse drug events (e.g. anti-hypertensives)

## Local Edema

- venous or lymphatic obstruction
  - thrombophlebitis/deep vein thrombosis, venous insufficiency, chronic lymphangitis, lymphatic tumour infiltration, filariasis
- inflammation/infection
- trauma

## Generalized Edema

- increased hydrostatic pressure/fluid overload
  - heart failure, pregnancy, drugs (e.g. CCBs), iatrogenic (e.g. IV fluids)
- decreased oncotic pressure/hypoalbuminemia
  - **liver cirrhosis**, nephrotic syndrome, malnutrition
- increased interstitial oncotic pressure
  - myxedema
- increased capillary permeability
  - severe sepsis
- hormonal
  - hypothyroidism, exogenous steroids, pregnancy, estrogens

## Palpitations

- palpitations that are continuous rapid heart action:
  - conditions causing sinus tachycardia: endocrine (thyrotoxicosis, pheochromocytoma, and hypoglycemia), systemic (anemia, fever), drugs (stimulants and anticholinergics), and psychiatric (panic attacks)
  - conditions causing pathologic tachycardia: SVT (atrial tach, A fib, and A flutter) and re-entrant SVT, VT
- palpitations with irregular/intermittent sensations e.g. PACs, PVCs

## Dyspnea

- cardiovascular
  - due to elevated pulmonary venous pressure: acute MI, CHF/LV failure, aortic/mitral stenosis, aortic/mitral regurgitation, arrhythmia, cardiac tamponade, constrictive pericarditis, and left-sided obstructive lesions (e.g. left atrial myxoma)
- respiratory
  - airway disease
    - asthma, COPD exacerbation, and upper airway obstruction (anaphylaxis, foreign body, and mucus plugging)
  - parenchymal lung disease
    - ARDS, pneumonia, interstitial lung disease
  - pulmonary vascular disease
    - PE, pulmonary HTN, pulmonary vasculitis
  - pleural disease
    - pneumothorax, pleural effusion
- neuromuscular and chest wall disorders
  - C-spine injury
    - polymyositis, myasthenia gravis, Guillain-Barré syndrome, and kyphoscoliosis
- anxiety/psychosomatic
- hematological/metabolic
  - anemia, acidosis, hypercapnia
- drugs and poisons
  - CNS depressants, carbon monoxide poisoning

# Cardiac Diagnostic Tests

## Electrocardiography Basics

### Description

- a graphical representation (time vs. amplitude of electrical vector projection) of the heart's electrical activity
- on the ECG graph
  - the horizontal axis represents time (at usual paper speed 25 mm/s)
    - 1 mm (1 small square) = 40 msec
    - 5 mm (1 large square) = 200 msec
  - the vertical axis represents voltage (at usual standard gain setting 10 mm/mV)
    - 1 mm (1 small square) = 0.1 mV
    - 10 mm (2 large squares) = 1 mV

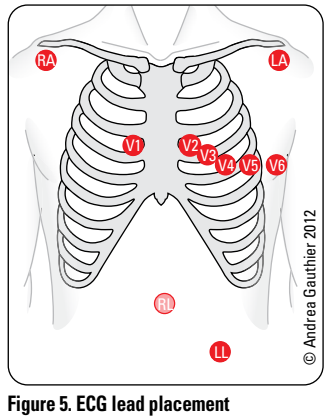

**Figure 5. ECG lead placement**

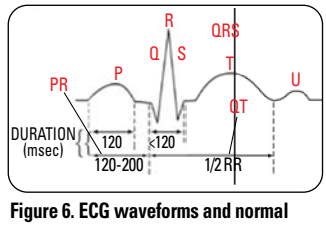

**Figure 6. ECG waveforms and normal values**

- leads
  - standard 12-lead ECG
  - limb (bipolar) leads: I, II, III, aVL, aVR, aVF
  - precordial (unipolar) leads: V1-V6 (V1-V2 septal, V3-V4 anterior, V5-V6 lateral)
- additional leads
  - right-sided leads: V3R-V6R (useful in RV infarction and dextrocardia)
- leads that indicate specific regions of the heart:
  - lateral wall = I, aVL, V5, V6
  - inferior wall = II, III, aVF
  - anterior wall= V1-V4

### Indications for brief (12-lead ECG) or prolonged (24 hrs or more) monitoring

- detect myocardial injury, ischemia, and the presence of prior infarction
- conditions associated with palpitations or risk of serious arrhythmias (e.g. WPW, long QT, HCM, heart block, and bradycardia)
- recording of cardiac rhythm during symptoms or antiarrhythmic drug monitoring
- conduction abnormalities (e.g. LBBB/RBBB)
- electrolytes abnormalities (e.g. hyperkalemia/hypokalemia)
- assessment of cardiac structure and function. (e.g. RVH/LVH and cardiomyopathy)
- non-sustained arrhythmias that can lead to prophylactic intervention

# Approach to ECGs

### Introduction

Below, we are presenting both the Classical Approach and the newer PQRSTU Approach to provide students with different ways to view the ECG. Despite methodological differences, the rigor and final result is the same.

## Classical Approach to ECGs

**Classical Approach to ECG**
- Rate
- Regular rhythm (defined by equal R-R or P-P intervals between beats)
- Axis
- Conduction abnormalities
- Hypertrophy/chamber enlargement
- Ischemia/infarction
- Miscellaneous ECG changes

### RATE

- normal = 60-100 bpm (atrial rate: 150-250 bpm = paroxysmal tachycardia, 250-350 bpm = atrial flutter, >350 bpm = AFib, in AF atrial "rate" not discernible )
- regular rhythm (defined by equal R-R or P-P intervals between beats)
  - to calculate the rate, divide 300 by number of large squares between 2 QRS complexes (there are 300 large squares in 1 min: 300 x 200 msec = 60 sec)
  - or use the square counting method by counting the number of big boxes between the R waves using the following numbers: 300-150-100-75-60-50
- irregular rhythm
  - rate = 6 x number of R-R intervals in 10 s (the "rhythm strips" are 10 sec recordings)
- atrial escape rhythm in case of sinus node failure = 60-80 bpm; junctional escape rhythm = 40-60 bpm; ventricular escape rhythm = 20-40 bpm

**Differential Diagnosis for Left Axis Deviation (LAD)**
- Left anterior hemiblock
- Inferior MI
- WPW
- RV pacing
- Normal variant
- Elevated diaphragm
- Lead misplacement
- Endocardial cushion defect

### RHYTHM

- regular: R-R interval is the same across the tracing
- irregular: R-R interval varies across the tracing
- regularly irregular: repeating pattern of varying R-R intervals e.g. Atrial flutter with variable block
- irregularly irregular: R-R intervals vary erratically e.g. AFib, VFib
- normal sinus rhythm (NSR)
  - P wave precedes each QRS; QRS follows each P wave
  - P wave axis is normal (positive in 2 out of the 3 following leads I, II, aVF)
  - rate between 60-100 bpm

**Differential Diagnosis for Right Axis Deviation (RAD)**
- RVH
- Left posterior hemiblock
- Pulmonary embolism
- COPD
- Lateral MI
- WPW
- Dextrocardia
- Septal defects

### AXIS

- mean axis indicates the direction of the mean vector
- can be determined for any waveform (P, QRS, T)
- the standard ECG reported QRS axis usually refers to the mean axis of the frontal plane – it indicates the mean direction of ventricular depolarization forces
- QRS axis in the frontal plane
  - normal axis: -30° to 90° (i.e. positive QRS in leads I and II)
  - left axis deviation (LAD): axis <-30°
  - right axis deviation (RAD): axis >90°
- QRS axis in the horizontal plane is not routinely calculated
  - transition from negative to positive is usually in lead V3

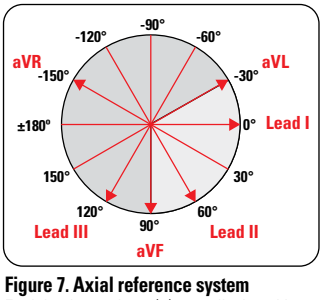

**Figure 7. Axial reference system**
Each lead contains a (+) area displayed by the bold arrows. Impulses traveling toward the positive region of the lead results in an upward deflection in that lead. Normal QRS axis is between -30° and +90°

### Table 1. Conduction Abnormalities

| Left Bundle Branch Block (LBBB) | Right Bundle Branch Block (RBBB) |
|---|---|
| **Complete LBBB**<br>QRS duration >120 msec<br>Broad notched R waves in leads V4, and V5, and/or I, aVL<br>Deep broad S waves in leads V1-2<br>Secondary ST-T changes (-ve in leads with broad notched R waves, +ve in V1-2) are usually present<br>LBBB can mask ECG signs of MI<br>LBBB: lead V 1 negative, V6 positive and notched | **Complete RBBB**<br>QRS duration >120 msec<br>Positive QRS in lead V1 (rSR' or occasionally broad R wave)<br>Broad S waves in leads I, V5-6 (>40 msec)<br>Usually secondary T wave inversion in leads V1-2<br>Frontal axis determination using only the first 60 msec<br>RBBB: V1 is positive (rSR'), V6 has broad S wave |

| Left Anterior Fascicular Block (LAFB) (Left Anterior Hemiblock) | Left Posterior Fascicular Block (LPFB) (Left Posterior Hemiblock) | Bifascicular Block |
|---|---|---|
| **Left Axis Deviation (-30° to -90°)**<br>Small q and prominent R in leads I and aVL<br>Small r and prominent S in leads II, III, and aVF | **Right Axis Deviation (110° to 180°)**<br>Small r and prominent S in leads I and aVL<br>Small q and prominent R in leads II, III, and aVF | **RBBB Pattern**<br>Small q and prominent R<br>The first 60 msec (1.5 small squares) of the QRS shows the pattern of LAFB or LPFB<br>Bifascicular block refers to impaired conduction in two of the three fascicles, most commonly a RBBB and left anterior hemiblock; the appearance on an ECG meets the criteria for both types of blocks |

### Nonspecific Intraventricular Block

- QRS duration >120 msec
- absence of definitive criteria for LBBB or RBBB

### Table 2. Hypertrophy/Chamber Enlargement

| Left Ventricular Hypertrophy (LVH) | Right Ventricular Hypertrophy (RVH) |
|---|---|
| S in V1 + R in V5 or V6 >35 mm above age 40, (>40 mm for age 31-40, >45 mm for age 21-30)<br>R in aVL >11 mm<br>R in I + S in III >25 mm<br>Additional criteria<br>LV strain pattern (asymmetric ST depression and T wave inversion in leads I, aVL, V4-V6)<br>Left atrial enlargement<br>N.B. The more criteria present, the more likely LVH is present. If only one voltage criteria present, it is called minimal voltage criteria for LVH which could be a normal variant | Right axis deviation<br>R/S ratio >1 or qR in lead V1<br>RV strain pattern: ST segment depression and T wave inversion in leads V1-2 |
| **Left Atrial Enlargement (LAE)** | **Right Atrial Enlargement (RAE)** |
| Biphasic P wave with the negative terminal component of the P wave in lead V1 ≥1 mm wide and ≥1 mm deep<br>P wave >100 msec, could be notched in lead II ("P mitrale") | P wave >2.5 mm in height in leads II, III, or aVF ("P pulmonale") |

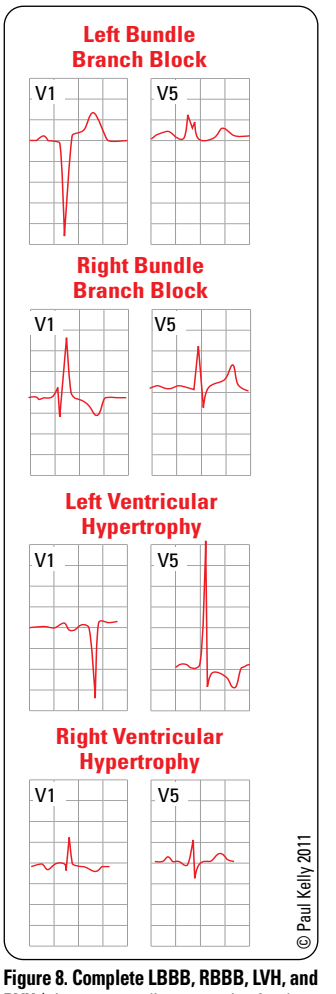

**Figure 8. Complete LBBB, RBBB, LVH, and RVH** (please see online examples for the full range of waveforms and the text for additional characteristics)

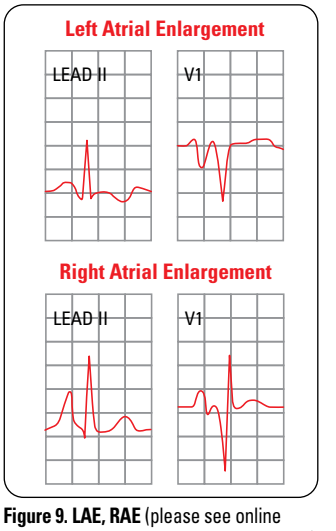

**Figure 9. LAE, RAE** (please see online examples and the text for characteristics)

## ISCHEMIA/INFARCTION

- look for the anatomic distribution of the following ECG abnormalities (see Table 3)
  - ischemia
    - ST segment depression
    - T wave inversion (most commonly in V1-V6)
  - injury/infarct
    - transmural (involving the epicardium)
    - ST elevation in the leads facing the area injured/infarcted
    - subendocardial
    - marked ST depression in the leads facing the affected area
    - may be accompanied by enzyme changes and other signs of MI

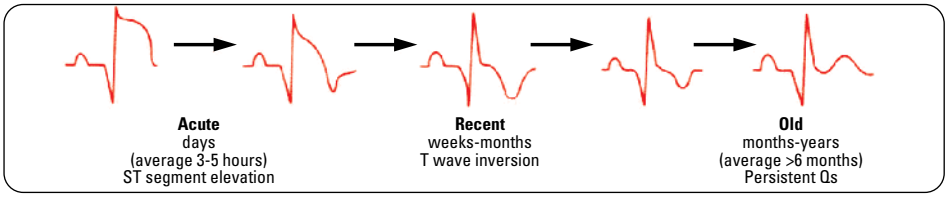

**Figure 10. Typical ECG changes with infarction**

  - ST elevation
    - new ST elevation in two contiguous leads of >0.1 mV in all leads other than leads V2-V3
    - for leads V2-V3: ≥0.2 mV in men ≥40 yr, ≥0.25 mV in men <40 yr, or ≥0.15 mV in women

- "typical" sequential changes of evolving MI
  1. hyperacute T waves (tall, symmetric T waves) in the leads facing the infarcted area, with or without ST elevation
  2. ST elevation (injury pattern) in the leads facing the infarcted area
     - usually in the first hours post infarct
     - in acute posterior MI, there is ST depression in V1-V3 (reciprocal to ST elevation in the posterior leads that are not recorded in the standard 12-lead ECG) hence get a 15-lead ECG
  3. significant Q waves: >40 msec or >1/3 of the total QRS amplitude and present in at least 2 consecutive leads in the same territory (hours to days post-infarct)
     - Q waves of infarction may appear in the very early stages, with or without ST changes
     - non-Q wave infarction: there may be only ST or T changes despite clinical evidence of infarction
  4. inverted T waves (one day to weeks after infarction)
- completed infarction
  - abnormal Q waves (Q waves may be present in lead III in normal individuals due to initial septal depolarization)
  - duration >40 msec (>30 msec in aVF for inferior infarction)
  - Q wave is >1/3 of the total QRS amplitude
  - present in at least 2 consecutive leads in the same territory
  - abnormal R waves (R/S ratio >1, duration >40 msec) in V1 and occasionally in V2 are found in posterior infarction (usually in association with signs of inferior and/or lateral infarction)

**Table 3. Areas of Infarction/Ischemia (right dominant anatomy)**

| Vessel Usually Involved | Infarct Area (LAD and LC) | Leads (LAD and LC) |
|---|---|---|
| **Left Anterior Descending (LAD)** | Anteroseptal<br>Anterior<br>Anterolateral<br>Extensive anterior | V1, V2<br>V3, V4<br>I, aVL, V3-6<br>I, aVL, V1-6 |
| **Right Coronary Artery (RCA)** | Inferior<br>Right ventricle<br>Posterior MI (assoc. with inf. MI) | II, III, aVF<br>V3R, V4R (right sided chest leads)<br>V1, V2 (prominent R waves) |
| **Left Circumflex (LCX)** | Lateral<br>Isolated posterior MI | I, aVL, V5-6<br>V1, V2 (prominent R waves) |

## MISCELLANEOUS ECG CHANGES

### Electrolyte Disturbances

- hyperkalemia
  - mild to moderate ($K^+$ 5-7 mmol/L): tall, peaked T waves
  - severe ($K^+$ >7 mmol/L): progressive changes whereby P waves flatten and disappear, QRS widens and may show abnormal morphology, axis shifts left or right, ST shift with tall T waves, eventually becomes a "sine wave" pattern
- hypokalemia
  - ST segment depression, prolonged QT interval (with risk for Torsades de Pointes ventricular tachycardia if extreme), low T waves, prominent U waves (U>T)
  - enhances the toxic effects of digitalis
- hypercalcemia
  - shortened QT interval (more extracellular $Ca^{2+}$ means shorter plateau in cardiac action potential)
- hypocalcemia
  - prolonged QT interval (less extracellular $Ca^{2+}$ means longer plateau in cardiac action potential)

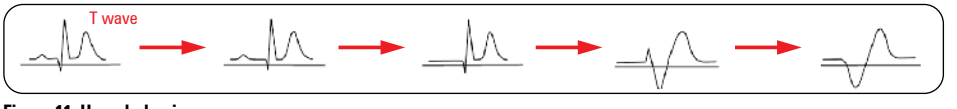

**Figure 11. Hyperkalemia**

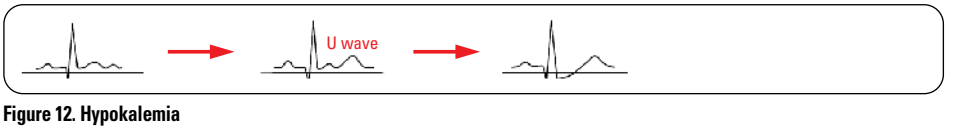

**Figure 12. Hypokalemia**

### Hypothermia

- sinus bradycardia
- when severe, prolonged QRS and QT intervals
- AFib with slow ventricular response and other atrial/ventricular dysrhythmias
- Osborne J waves: "hump-like" waves at the junction of the J point and the ST segment

### Pericarditis

- early: diffuse ST segment elevation ± PR segment depression, upright T waves
- later: isoelectric ST segment, flat or inverted T waves
- ± tachycardia

**Pacemakers**

- Demand pacemaker has discharge (narrow vertical spike on ECG strip) prior to widened QRS
- Atrial pacemaker has discharge prior to P wave
- Triggered pacemaker has discharge following the P wave but prior to the widened QRS
- Atrial and ventricular pacing have discharge before the P wave and widened QRS wave

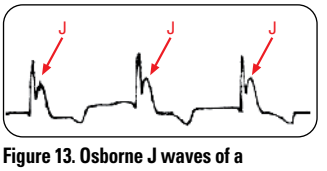

**Figure 13. Osborne J waves of a hypothermic patient**

### Drug Effects

- digitalis – rare in 2018; <1/1000 cardiac patients overall
  - therapeutic levels may be associated with "digitalis effect"
    - ST downsloping or "scooping"
    - T wave depression or inversion
    - QT shortening ± U waves
    - slowing of ventricular rate in AFib
    - toxic levels associated with:
      - arrhythmias: paroxysmal atrial tachycardia (PAT) with conduction block, severe bradycardia in AFib, accelerated junctional rhythms, PVCs, ventricular tachycardia (see *Arrhythmias*, C16)
      - "regularization" of ventricular rate in AFib due to a junctional rhythm and AV dissociation
- amiodarone, quinidine, phenothiazines, tricyclic antidepressants, antipsychotics, some antihistamines, and some antibiotics (prolonged QT interval, U waves)

**Digitalis Side Effects**
Palpitations, fatigue, visual changes (yellow vision), decreased appetite, hallucinations, confusion, and depression

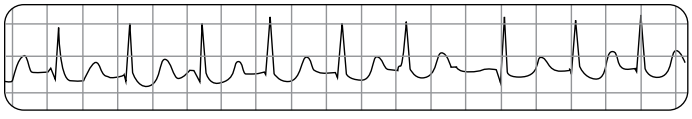

**Figure 14. Atrial fibrillation, ST change due to digitalis ("digitalis effect")**

### Pulmonary Disorders

- cor pulmonale (often secondary to COPD)
  - low voltage, right axis deviation (RAD), poor R wave progression in precordial leads
  - RAE and RVH with strain
  - multifocal atrial tachycardia (MAT)
- massive pulmonary embolism (PE)
  - sinus tachycardia and AFib/atrial flutter are the most common arrhythmias
  - RAD, RVH with strain
  - most specific sign is S1Q3T3 (S in I, Q and inverted T wave in III) but rather uncommon

## Alternative PQRSTU Approach to ECGs

Note: the PQRSTU Approach is organized a different way based on the anatomy of the ECG

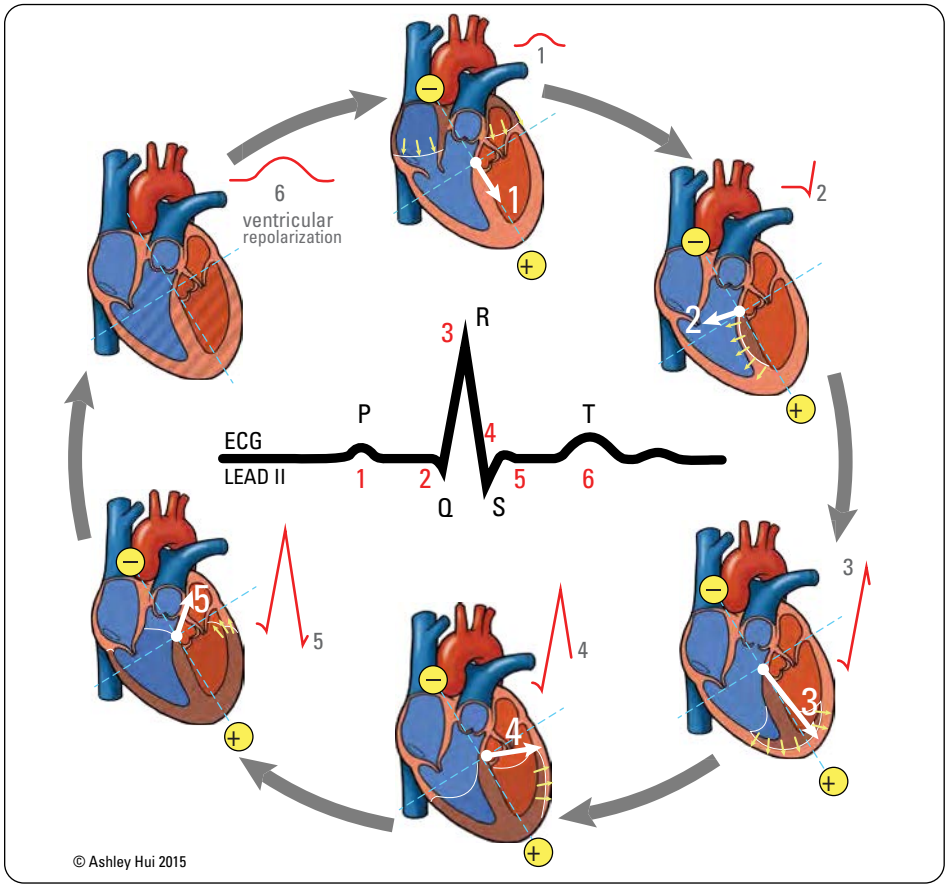

**Figure 15. ECG correlations with heart activity**

**PQRSTU approach to ECGs**
**P** wave
**P-R** interval
**QRS** complex
**ST** segment
**T** wave
**Q-T** interval
**U** wave

## P WAVE
- the P wave represents atrial contraction; best seen in leads: II and V1
  - lead II: the P wave should be rounded, <120 msec and <2.5 mm in height
  - lead V1: the P wave is biphasic with a positive phase slightly greater than the negative phase
- atrial flutter: sawtooth P wave with continuous atrial activity at 300/min indicates the interval (Hint: flip the ECG upside-down to see it better if unclear)
- atrial fibrillation: absent P wave, may have fibrillatory wave, irregular rhythm
- right atrial enlargement: tall P wave (>2.5 mm) in II or V1 (P pulmonale)
- left atrial enlargement: biphasic P wave with negative deflection >1 mm deep or >1 mm wide in V1, wide (>100 msec) notched P wave in II may be present (P mitrale)

## P-R INTERVAL
- the P-R interval indicates the interval between sinus node activation and the start of ventricular depolarization
  - includes the impulse traveling through the atrium, the AV node, and the bundle of the magnitude of the conduction velocity is referred to as "dromotropy" ( faster = positive, slower = negative dromotropy)
  - positive dromotropy associated with increased conduction velocity (e.g. sympathetic stimulation), while negative dromotropy with decreased velocity (e.g. vagal stimulation)
- P-R interval should be 120-200 msec
- long P-R interval (>200 msec)
  - heart block
    - first degree: fixed, prolonged P-R interval (though every P wave has a QRS following)
    - second and third degree AV block: some P waves are NOT followed by a QRS
    - second degree Mobitz I (Wenckebach): gradual prolongation of the P-R interval precedes a dropped P wave
    - second degree Mobitz II (Hay): fixed P-R interval with ratio of beat to dropped beat (e.g. for every 3 beats, there is one dropped beat [3:1])
  - third degree/complete: constant P-P and R-R intervals but variable P-R intervals
  - sinus bradycardia (normal to have long P-R if heart rate slow)
  - hypokalemia
  - "trifascicular" block -1st degree AV block with LAHF and complete RBBB
- short P-R interval (<120 msec)
  - pre-excitation syndrome (delta wave: upswooping of P-R segment into QRS complex) due to accessory pathways
  - low atrial rhythm, P waves inverted in II, III, aVF

**Significant ECG Changes**
- Look for ST changes starting at 60 msec from J point
- J point = the junction between the QRS complex and the ST segment
- ST elevation: at least 1 mm in 2 adjacent limb leads, or at least 1-2 mm in adjacent precordial leads
- ST depression: downsloping or horizontal
- Q Wave: pathological if Q wave ≥1 small square (≥40 msec) or >33% of the total QRS

## QRS COMPLEX
- represents ventricular contraction
- rate: check if R-R interval matches the P-P interval
- amplitude: check for hypertrophy (see Table 2)
- narrow QRS (<120 msec) means that the His-Purkinje system is being used
- wide QRS (>120 msec) means that the His-Purkinje system is being bypassed or is diseased
  - BBB, VT, ventricular hypertrophy, cardiomyopathy, WPW, ectopic ventricular beat, hyperkalemia, or drugs (e.g. TCAs, antiarrhythmics)
- Q wave: the first downward deflection of the QRS complex
  - significant Q wave (>40 msec or >1/3 of total QRS amplitude) indicates myocardial necrosis (new or old)
- R and S wave abnormalities typically show pathology in terms of BBB or intraventricular abnormalities

**Insignificant Q Wave**
- Septal depolarization by the left bundle
- Seen in leads I, II, III, aVL, V5, V6
- <40 msec
- Q wave <1/3 of the total QRS amplitude

## ST SEGMENT
- located between QRS complex and the beginning of T wave
  - corresponds to the completion of ventricular depolarization
- normally at the same level as baseline (T-P segment)
- ST elevation: please see the infarct section above
- ST depression: ischemia
  - ischemia which causes ST depression can result in myocardial damage (NSTEMI)
  - lateral ST depression (leads I, aVL, V5, V6) may actually indicate a STEMI in the right heart
  - ST depression may be nonspecific, or associated with remote myocardial infarction or ischemia

## T WAVE
- repolarization phase of ventricles (repolarization of the atria is obscured by the QRS complex)
- typically positive (except in aVR and V1) on ECG but normal isolated negative T waves may be present (especially in V1 and V2)
- pathology when T wave variation occur in consecutive leads
  - inversion: BBB, ischemia, hypertrophy, drugs (e.g. digitalis), pulmonary embolism (lead III as part of S1Q3T3 sign)
  - elevation: infarction (STEMI, Prinzmetal, hyperacute), hyperkalemia (wider, peaked)
  - flattened: hypokalemia, pericarditis, drugs (e.g. digitalis), pericardial effusion
    - T waves may be flat as a nonspecific finding without clinical significance (common)
  - variations: T wave alterans; beat-to-beat variations due to PVC overlap (R on T phenomenon which may precipitate VT or VFib)
- appropriate T wave discordance: in BBB, T wave deflection should be opposite to that of the terminal QRS deflection (i.e. T wave negative if ends with R or R'; positive if ends with S)
  - inappropriate T wave concordance suggests ischemia or infarction

### Q-T INTERVAL

- duration of ventricular depolarization plus repolarization; often difficult to interpret
- corrected QT (QTc) corrects for the repolarization duration (since QT interval normally shortens with increased heart rate)
  - QTc = QT ÷ √RR (Bazett's formula)
- normal QTc is 360-450 msec for males and 360-460 msec for females
  - increased (>450 msec for males and >460 msec for females): risk of Torsades de Pointes (lethal tachyarrhythmia; rare if <520 msec)
    - genetic Long QT Syndrome (often a channelopathy)
    - drugs: antiarrhythmics (class I and III), antipsychotics (haloperidol, ziprasidone), antidepressants (citalopram), antibiotics (erythromycin, azithromycin)
    - electrolytes: low $Ca^{2+}$, low $K^{+}$, low $Mg^{2+}$
    - others: hypothyroidism, hypothermia, cardiomyopathy
  - decreased (<360 msec): risk of VFib (very rare)
    - electrolytes: high $Ca^{++}$
    - drugs: digoxin
    - others: hyperthyroidism

### U WAVE

- origin unclear but may be repolarization of Purkinje fibres or delayed/prolonged repolarization of the myocardium
- more visible at slower heart rates
- deflection follows T wave with <25% of the amplitude
- variations from norm could indicate pathologic conditions
  - prominent (>25% of T wave): electrolyte (low $K^{+}$), drugs (digoxin, antiarrhythmics)
  - inverted (from T wave): ischemia, volume overload

**Differential Diagnosis of ST Segment Changes**

**ST Elevation I HELP A PAL**
**I**schemia with reciprocal changes
**H**ypothermia (Osborne waves)
**E**arly repolarization (normal variant, need old **EC**Gs to confirm)
**L**BBB
**P**ost-MI
**A**cute STEMI
**P**rinzmetal's (Vasospastic) angina
**A**cute pericarditis (diffuse changes)
**L**eft/right ventricular aneurysm

**ST Depression WAR SHIP**
**W**PW syndrome
**A**cute NSTEMI
**R**BBB/LBBB
**S**TEMI with reciprocal changes
**H**ypertrophy (LVH or RVH) with strain
**I**schemia
**P**ost-MI

## Cardiac Biomarkers

- provide diagnostic and prognostic information in acute coronary syndromes and in heart failure

**Table 4. Cardiac Enzymes**

| Enzyme | Peak | Duration Elevated | DDx of Elevation |
|---|---|---|---|
| Troponin I, Troponin T | 1-2 d | Up to 2 wk | MI, CHF, AFib, acute PE, myocarditis, chronic renal insufficiency, sepsis, hypovolemia |
| CK-MB | 1 d | 3 d | MI, myocarditis, pericarditis, muscular dystrophy, cardiac defibrillation, chronic renal insufficiency |

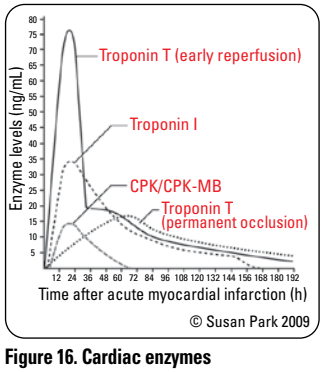

**Figure 16. Cardiac enzymes**

- check troponin I at presentation and 8 h later ± creatine kinase-MB (CK-MB; depends on local laboratory protocol)
- new CK-MB elevation can be used to diagnose re-infarction
- other biomarkers of cardiac disease
  - AST and LDH also increased in MI (low specificity)
  - BNP and NT-proBNP: secreted by ventricles in response to increased end-diastolic pressure and volume
    - DDx of elevated BNP: CHF, AFib, PE, COPD exacerbation, pulmonary HTN

**Use of B-Type Natriuretic Peptide in the Evaluation and Management of Acute Dyspnea (BASEL)**
NEJM 2004;350;647-54
**Study:** Prospective, RCT.
**Population:** 452 patients (mean age 71 yr, 58% male) with acute dyspnea; patients with severe renal disease or cardiogenic shock were excluded.
**Intervention:** Assessment including measurement of B-type natriuretic peptide or standard assessment.
**Outcome:** Time to discharge and total cost of treatment.
**Results:** Median time to discharge was significantly shorter in the intervention group when compared with the control group (8.0 vs. 11.0 d, p=0.001). Total cost was also significantly lower in the intervention group ($5410 vs. $7264, p=0.006). In addition, the measurement of B-type natriuretic peptide significantly reduced the need for admission to hospital and intensive care. The 30-d mortality rates were similar (10% vs. 12%, p=0.45).
**Conclusions:** In patients with acute dyspnea, measurement of B-type natriuretic peptide improves clinical outcomes (need for hospitalization or intensive care) and reduces time to discharge and total cost of treatment.

## Ambulatory ECG

- **description**
  - extended ambulatory ECG monitoring
  - provides a view of only two or three leads of electrocardiographic data over an extended period of time
  - permits evaluation of changing dynamic cardiac electrical phenomena that are often transient
  - **continuous ambulatory monitor**: a small, lightweight, battery operated recorder (box or patch) that records two or three channels of electrocardiographic data
    - patient activated event markers
    - minimum of 24-72 h, up to 14 d
  - **implantable device**: subcutaneous monitoring device for the detection of cardiac arrhythmias
    - typically implanted in the left pectoral region and stores events when the device is activated automatically according to programmed criteria or manually with magnet application
    - generally used for months to years of continuous monitoring for infrequent events
- **indications**
  - evaluation of cardiac rhythm abnormalities, especially as they correlate with symptoms
  - has also been used for assessing pacemaker and implantable cardioverter-defibrillator function, evidence of myocardial ischemia, late potentials, and heart rate variability

# Echocardiography

### Transthoracic Echocardiography (TTE)

- **description**
  - ultrasound beams are directed across the chest wall to obtain images of the heart
- **indications**
  - evaluation of chamber size, LVEF, wall motion abnormalities, myocardial ischemia and complications of MI
  - evaluation of wall thickness, valve morphology, proximal great vessel morphology, pericardial effusion
  - evaluation of unexplained hypotension, murmurs, syncope, and congenital heart disease or other cardiac symptoms and unexplained signs on physical exam (i.e. leg edema)

### Transoesophageal Echocardiography (TEE)

- **description**
  - invasive procedure used to complement TTE
  - ultrasound probe inserted into the esophagus to allow for better resolution of the heart and structures
  - better visualization of posterior structures, including left atrium, mitral, and aortic valves, inter-atrial septum
- **indications**
  - should be performed as the initial test in certain life-threatening situations (e.g. aortic dissection) when other tests contraindicated (e.g. CT angiography in patient with renal failure)
  - most importantly, TTE is used to evaluate valvular morphology and function (particularly the aortic and mitral valves)
  - intracardiac thrombi, tumours, valvular vegetations (infective endocarditis), aortic dissection, aortic atheromas, prosthetic valve function, shunt, technically inadequate transthoracic study
  - evaluation for left atrialthrombus/left atrial appendage thrombus in a patient with atrial fibrillation/atrial flutter to facilitate clinical decision making regarding electrical cardioversion or ablation
- **risks**
  - serious complications are extremely rare (<1 in 5000)
  - esophageal perforation
  - gastrointestinal bleeding
  - pharyngeal hematoma

### Stress Echocardiography (SE)

- **description**
  - echocardiography using exercise (treadmill or bicycle) or pharmacologic agents (dobutamine or adenosine) as physiologic stressor
- **indications**
  - useful alternative to other stress imaging modalities
  - when ECG cannot be interpreted appropriately
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - post-ACS when used to decide on potential efficacy of revascularization
  - to evaluate the clinical significance of valvular heart disease
  - evaluation of myocardial viability, dyspnea of possible cardiac origin, mitral valve disease, aortic stenosis, mitral regurgitation, pulmonary hypertension, and patients with hypertrophic cardiomyopathy (for LVOT obstruction)
  - dobutamine
    - pharmacologic stress for patients physically unable to exercise; same indications as exercise stress echo
    - low dose dobutamine stress echo can be used to assess myocardial viability and for assessing aortic stenosis with LV systolic dysfunction
- **contraindications**
  - contraindications to exercise testing (see below)
  - contraindications to dobutamine stress echocardiography: tachyarrhythmias and systemic hypertension
  - AAA has been considered as a relative contraindication to exercise testing or dobutamine stress echocardiography

### Contrast Echocardiography with Agitated Saline Contrast

- **description**
  - improves visualization and provides real-time assessment of intracardiac blood flow
  - conventional agent is agitated saline (contains microbubbles of air)
  - visualization of right heart and intracardiac shunts, most commonly patent foramen ovale (PFO) and intrapulmonary shunt

### Contrast Echocardiography with Transpulmonary Contrast Agents

- **description**
  - newer contrast agents are capable of crossing the pulmonary bed and achieving left heart opacification following intravenous injection; these contrast agents improve visualization of endocardial borders and enhance evaluation of LV ejection fraction and wall motion abnormalities (in patients with technically inadequate echocardiograms) and intracardiac mass (e.g. LV thrombus)
- **risks**
  - risk of non-fatal MI and death are rare
  - ultrasound contrast agents may cause back pain, headache, urticaria, and anaphylaxis
  - should not be done in patients with significant intra-cardiac shunts

# Stress Testing

## EXERCISE TESTING

- **description**
  - cardiovascular stress test that uses treadmill or bicycle exercise with electrocardiographic and blood pressure monitoring
- **indications**
  - patients with intermediate (10-90%) pretest probability of CAD based on age, gender, and symptoms
  - ST depression <1 mm at rest, no left bundle branch block, no digoxin or estrogen use
  - exercise test results stratify patients into 3 risk groups
    1. low risk patients can be treated medically without invasive testing
    2. intermediate risk patients may need additional testing in the form of exercise imaging studies or cardiac catheterization
    3. high risk patients should be referred for cardiac catheterization
- **contraindications**
  - acute myocardial infarction (within 2 d) or unstable angina pectoris
  - uncontrolled arrhythmias causing symptoms of hemodynamic compromise
  - symptomatic severe valvular stenosis
  - uncontrolled symptomatic heart failure
  - active endocarditis or acute myocarditis or pericarditis
  - acute aortic dissection
  - acute pulmonary or systemic embolism
  - acute non-cardiac disorders that may affect exercise performance or may be aggravated by exercise
  - termination of exercise testing
    - patient's desire to stop
    - drop in systolic blood pressure of >10 mmHg from baseline despite an increase in workload, when accompanied by other evidence of ischemia
    - moderate to severe angina
    - ST elevation (>1 mm) in leads without diagnostic Q-waves (other than V1 or aVR)
    - increasing nervous system symptoms (e.g. ataxia, dizziness, or near syncope)
    - signs of poor perfusion (cyanosis or pallor)
    - technical difficulties in monitoring ECG or systolic blood pressure
    - sustained ventricular tachycardia
- **risks**
  - death, myocardial infarction, arrhythmia, hemodynamic instability, and orthopedic injury (<1-5/10,000 supervised tests)

## NUCLEAR CARDIOLOGY

- **description**
  - myocardial perfusion imaging (MPI) with ECG-gated single photon emission computed tomography (SPECT), using radiolabelled tracer
  - evaluates myocardial viability, detects ischemia, and assesses perfusion and LV function simultaneously
  - predicts the likelihood of further cardiac event rates independent of the patient's history, examination, resting ECG, and stress ECG
  - often denoted as MIBI scan with reference to radiolabelled tracer (sestamibi)
  - stress with either treadmill or IV vasodilator stress (dipyridamole, adenosine, regadenoson)
  - images of the heart obtained during stress and at rest 3-4 h later
  - tracers
    - Thallium-201 ($^{201}$Tl, a $K^+$ analogue)
    - Technetium-99 ($^{99}$Tc)-labeled tracer (sestamibi/Cardiolite® or hexamibi/Myoview®)
- **indications**
  - to diagnose CAD in possible ACS patients with non-diagnostic ECG and negative serum biomarker
  - exercise MPI
    - when ECG cannot be interpreted appropriately due to LBBB or abnormal baseline ECG
    - intermediate pre-test probability with normal/equivocal exercise ECG
    - in patients with previous imaging whose symptoms have changed
    - to diagnose ischemia
  - dipyridamole/adenosine MPI
    - exercise testing is always preferred
    - pharmacological stress imaging test for patients who cannot exercise or do not want to hold cardiac meds (BB/CCBs)
    - same indication as exercise MPI
- **contraindications**
  - contraindications to exercise testing
  - vasodilators (i.e. adenosine, regadenoson, and dipyridamole) are contraindicated in patients with hypotension, sick sinus syndrome, high-degree AV block (in the absence of backup pacemaker capability), and reactive airways disease
  - pregnancy
- **risks**
  - radiation exposure

## STRESS ECHOCARDIOGRAPHY

- see *Echocardiography*, C12

**Most Commonly Used Treadmill Stress Test Protocols**

- The Bruce Protocol: 7 stage test with each stage lasting 3 min. With each successive stage, the treadmill increases in both speed (2.7 km/h to 9.6 km/h) and grade (10% with a 2% increase per stage up to 22%)
- The Modified Bruce, Modified Naughton Protocol: for older individuals or those with limited exercise capacity

**Important Contraindications to Exercise Testing**

- Acute MI, aortic dissection, pericarditis, myocarditis, PE
- Severe AS, arterial HTN
- Inability to exercise adequately

**Important Prognostic Factor**

Duke Treadmill Score (DTS)
Weighted Index Score

- Treadmill exercise time using standard Bruce protocol
- Maximum net ST segment deviation (depression or elevation)
- Exercise-induced angina provides diagnostic and prognostic information (such as 1 yr mortality)

DTS = exercise time – (5 x MaxST) – (4 x angina index)
Angina index: 0 (no angina), 1 (angina but not exercise-limiting), 2 (exercise-limiting angina)
DTS ≥5: 0.25% 1 yr mortality
DTS 4 to -10: 1.25% 1 yr mortality
DTS ≤ -11: 5.25% 1 yr mortality
*Ann Intern Med* 1987;106:793-800

Patients with normal imaging (nuclear perfusion or stress echo) studies at peak stress have a <1%/yr incidence of death or nonfatal MI and are thus often spared further invasive evaluation

# Cardiac Catheterization and Angiography

## Right Heart Catheterization (Swan-Ganz Catheter)

- **description**
  - also known as pulmonary artery catheterization
  - obtain direct measurements of central venous, right-sided intracardiac, pulmonary artery, and pulmonary artery occlusion pressures
  - can estimate cardiac output, systemic and pulmonary vascular resistance as well as mixed venous oxyhemoglobin saturation, oxygen delivery, and oxygen uptake
  - right atrial, right ventricular, and pulmonary artery pressures are recorded
  - can also be used to measure the Cardiac Index (CI), a measure of cardiac function
    - CI = CO/body surface area
    - 2.6-4.2 L/min/$m^2$ is considered normal while <1.8 L/min/$m^2$ usually means cardiogenic shock
  - pulmonary capillary wedge pressure (PCWP)
    - obtained by advancing the catheter to wedge in the distal pulmonary artery
    - records pressure measured from the pulmonary venous system
    - in the absence of pulmonary venous disease reflects left atrial pressure
- **indications**
  - unexplained or unknown volume status in shock
  - severe cardiogenic shock (e.g. acute valvular disease, suspected pericardial tamponade)
  - suspected or known pulmonary artery hypertension
  - severe underlying cardiopulmonary disease (e.g. congenital heart disease, left-to-right shunt, severe valvular disease, pulmonary hypertension) and undergoing corrective or other surgery
- **contraindications**
  - infection at the insertion site
  - presence of a right ventricular assist device
  - insertion during cardiopulmonary bypass
- **risks**
  - complications for diagnostic catheterization <1%
  - inadequate diagnostic procedures occur in <1% of cases
  - complications of insertion: atrial and/or ventricular arrhythmias (~3% of patients)
  - catheter misplacement or knotting (uncommon)
  - perforation of a cardiac chamber and rupture of a cardiac valve or the pulmonary artery (rare)
  - complications of catheterization: pulmonary artery rupture, pulmonary infarction, thromboembolic events, infection, and data misinterpretation
  - within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

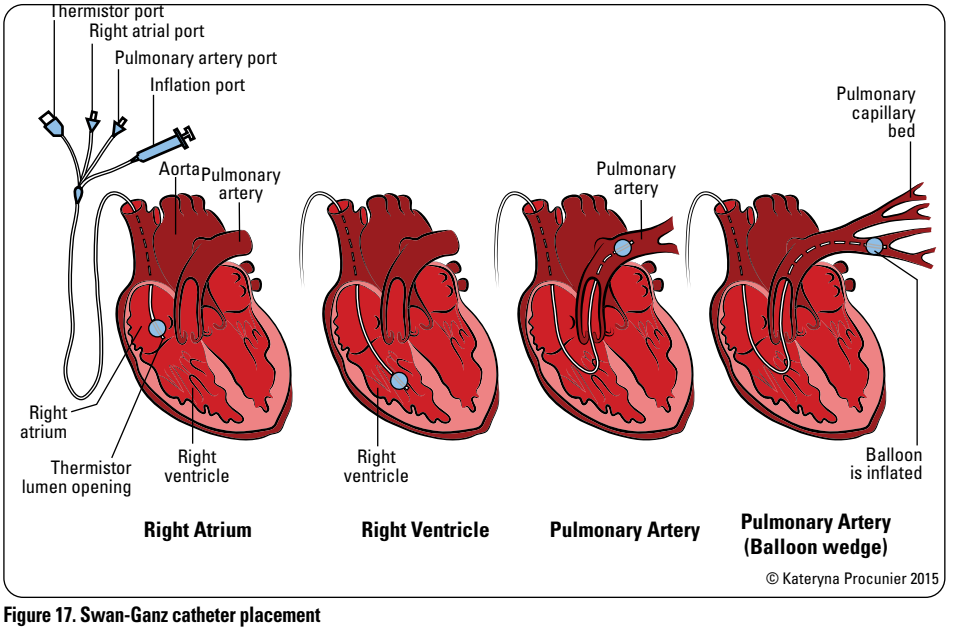

**Figure 17. Swan-Ganz catheter placement**

### Left Heart Catheterization

- **description**
  - accomplished by introducing a catheter into the brachial or femoral artery and advancing it through the aorta, across the aortic valve, and into the left ventricle
  - evaluates mitral and aortic valvular defects and myocardial disease
  - systolic and end-diastolic pressure tracings recorded
  - LV size, wall motion and ejection fraction can be assessed by injecting contrast into the LV (left ventriculography) via femoral/radial artery catheterization
  - cardiac output (measured by the Fick oxygen method or the indicator dilution method)
- **indications**
  - identification of the extent and severity of CAD and evaluation of left ventricular function
  - assessment of the severity of valvular or myocardial disorders (e.g. aortic stenosis or insufficiency, mitral stenosis or insufficiency, and various cardiomyopathies) to determine the need for surgical correction
  - collection of data to confirm and complement noninvasive studies
  - investigating CAD in patients with confusing clinical features or chest pain of uncertain origin
- **contraindications**
  - severe uncontrolled hypertension
  - ventricular arrhythmias
  - acute stroke
  - severe anemia
  - active gastrointestinal bleeding
  - allergy to radiographic contrast
  - acute renal failure
  - uncompensated congestive failure (patient cannot lie flat)
  - unexplained febrile illness or untreated active infection
  - electrolyte abnormalities (e.g. hyperkalemia)
  - severe coagulopathy
- **risks**
  - major complications for diagnostic catheterization (death, MI, stroke) <3 in 1000
  - minor complications e.g. vascular assess issue, kidney dysfunction <1 in 100
  - inadequate diagnostic procedures occur in <1% of cases

| Chambers | Pressure (systolic; mmHg) |
|---|---|
| Right atrium/central venous | 1-8 |
| Right ventricle | 1-8 (15-30) |
| Pulmonary artery | 4-12 (15-30) |
| Left atrium/ pulmonary capillary wedge | 4-12 |
| Left ventricle end diastolic | 4-12 |

## Coronary Angiography

- **description**
  - radiographic visualization of the coronary vessels after injection of radiopaque contrast media
  - coronary vasculature accessed via the coronary ostia
- **indications**
  - to define the coronary anatomy and the degree of luminal obstruction of the coronary arteries
  - to determine the presence and extent of obstructive CAD
  - to assess the feasibility and appropriateness of various forms of therapy, such as revascularization by percutaneous or surgical interventions
  - can be used when the diagnosis of CAD is uncertain and cannot be excluded by noninvasive techniques
- **contraindications**
  - severe renal failure due to contrast agent toxicity (must check patient's renal status due to contrast agent toxicity)
- **risks**
  - major complications for diagnostic catheterization (death, MI, stroke) <3 in 1000
  - minor complications e.g. vascular assess issue, kidney damage <1/100

**ACC/AHA 2011 Recommended Indications for Coronary Angiography**

- Disabling (CCS classes III and IV) chronic stable angina despite medical therapy
- High-risk criteria on clinical assessment or non-invasive testing
- Serious ventricular arrhythmia or CHF
- Uncertain diagnosis or prognosis after non-invasive testing
- Inability to undergo non-invasive testing

**Coronary Angiography**
Gold standard for localizing and quantifying CAD

Hemodynamically significant stenosis is defined as 70% or more narrowing of the luminal diameter

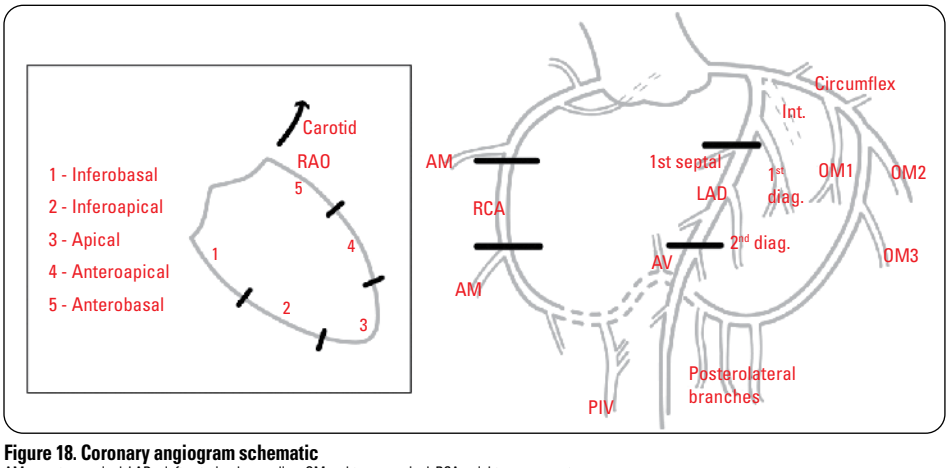

**Figure 18. Coronary angiogram schematic**
AM = acute marginal; LAD = left anterior descending; OM = obtuse marginal; RCA = right coronary artery

### Diagnostic Catheterization

- provocative pharmacological agents can be used to unmask pathology
  - fluid loading may unmask latent pericardial constriction
  - afterload reduction or inotropic stimulation may be used to increase the outflow tract gradient in HCM
  - coronary vasoreactive agents (e.g. methylergonovine, acetylcholine)
  - a variety of pulmonary vasoreactive agents in primary pulmonary HTN (e.g. oxygen, calcium channel blockers, adenosine, nitric oxide, prostacyclin)

## Contrast-Enhanced CT Coronary Angiography

- **description**: fast ECG-synchronized multi-slice CT image acquisition in the heart to enable non-invasive imaging of the coronary arterial tree
- **indications**: often used to assess coronary artery and previous graft stenosis/viability that could not be seen during coronary angiography
- sensitivity = 85%, specificity = 90% for the diagnosis of obstructive coronary disease with >50% stenosis
- **contraindications**: allergy to contrast dye; severe renal dysfunction
- **risks**: radiation exposure

## Magnetic Resonance Imaging

- **description**
  - offers high spatial resolution, eliminates the need for iodinated contrast, and does not involve exposure to ionizing radiation
- **indications**
  - valuable in assessment of congenital cardiac anomalies, abnormalities of the aorta, assessment of viable myocardium, and assessment of cardiomyopathies
- **contraindications**
  - metallic foreign bodies/implants, kidney dysfunction due to gadolinium contrast medium
- **risks**
  - hazards posed by certain metallic devices inside patients

# CARDIAC DISEASE

# Arrhythmias

## Mechanisms of Arrhythmias

### Alterations in Impulse Formation

**A. Normal Automaticity**

- impulses from the SA node, caused by spontaneous depolarization, result in the basic cardiac pacemaker function. "Downstream" cells in the AV node and Purkinje fibres also depolarize spontaneously, but at a slower rate; they serve as the "backup" pacemaking cells if the upstream rate is slower than the more distal spontaneous rate.
- normal automaticity is influenced by:
  - neurohormonal tone (sympathetic tone increases and parasympathetic tone decreases spontaneous firing rate and thus heart rate)
  - myocardial ischemia/infarction or other cardiac pathology (e.g. heart failure) may alter heart rate via these mechanisms
  - abnormal metabolic conditions (e.g. hypoxia, acidosis, hypothermia)
  - electrolyte abnormalities, especially hyperkalemia which slows heart rate
  - drugs (e.g. digitalis, beta blockers, calcium channel blockers)

**B. Abnormal Automaticity due to Triggered Activity (due to Afterdepolarizations)**

**1. Early Afterdepolarizations**

- during the terminal plateau or repolarization phases of action potential
- consequence of the membrane potential transiently becoming more positive during repolarization (depolarization interrupting repolarization)
  - these are called EADs and DADs (early and delayed afterdepolarization, respectively)
- may result in self-maintaining oscillations of depolarization, giving rise to action potentials thereby generating a tachyarrhythmia (e.g. new baseline voltage is greater than threshold, which automatically triggers a new action potential after the refractory period ends)
- EADs are the basis for the arrhythmias associated with QT prolongation, either congenital or acquired; termed "Torsades de Pointes"

**Sinus Arrhythmia (SA)**

- Normal P waves, with variation of the P-P interval by >120 msec due to varying rate of SA node depolarization

**Respiratory SA**

- Seen more often in young adults (<30 yr old)
- Normal, physiologic results from changes in autonomic tone during respiratory cycle
- Rate increases with inspiration, slows with expiration

**Non-Respiratory SA**

- Seen more often in the elderly
- Can occur in the normal heart; if marked may be due to sinus node dysfunction (e.g. in heart disease or after digitalis toxicity)
- Usually does not require treatment

**2. Delayed Afterdepolarizations**
- occur after the action potential has fully repolarized, but before the next usual action potential
- commonly occurs in situations of high intracellular calcium (e.g. digitalis intoxication, ischemia) or during enhanced catecholamine stimulation (e.g. "twitchy" pacemaker cells)

## Alterations in Impulse Conduction

**A. Re-Entry Circuits**
- the presence of self-sustaining re-entry circuit causes rapid repeated depolarizations in a region of myocardium (see Figure 26, C20, for an example in the context of AV nodal re-entrant tachycardia)
- the conditions necessary for reentry include block of an impulse into a region of the heart that is refractory (non-excitable tissue or because of local functional block, where the impulse encounters tissue still in its refractory period), followed by "reentry" of the impulse around a region of block to the site of origin, forming a complete reentry circuit
  - e.g. myocardium that is infarcted/ischemic will consist of non-excitable and partially excitable zones which will promote the formation of re-entry circuits

**B. Conduction Block**
- ischemia, fibrosis, trauma, and drugs can cause transient or permanent, unidirectional or bidirectional block
- most common cause of block is due to refractory myocardium (cardiomyocytes are in refractory period or zone of myocardium unexcitable due to fibrosis)
- cells in the conduction system distal to the block can assume pacemaking control if the block occurs along the specialized conduction system
- conduction block can lead to bradycardia

**C. Bypass Tracts**
- normally, the only electrical connection between atria (A) and ventricles (V) is the AV node and penetrating Bundle of His
- an accessory bypass tract is a direct connection between atrium and ventricle, histologically similar to atrial tissue, through the valve ring which is impervious to electrical impulses
  - see *Pre-Excitation Syndromes*, C21

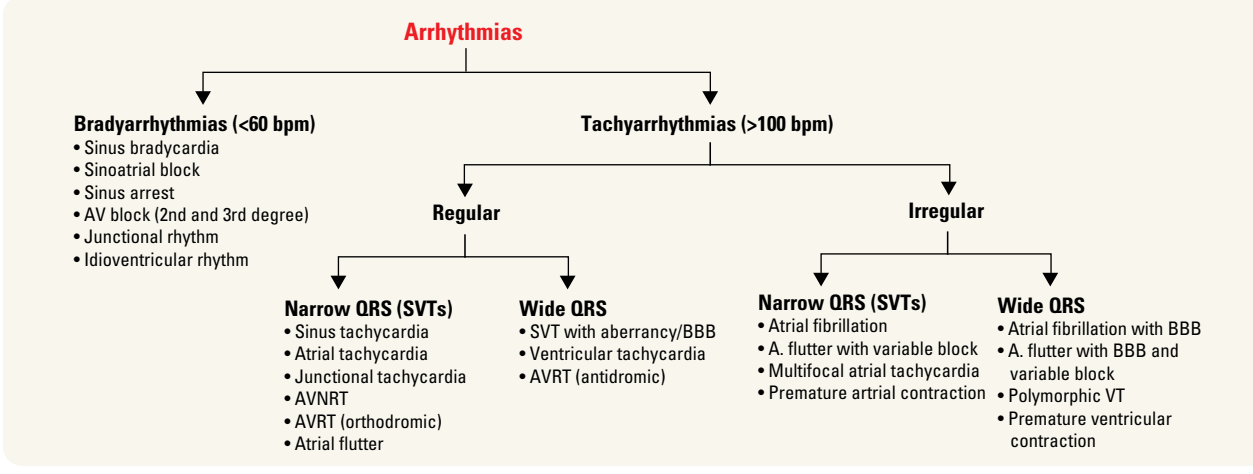

**Figure 19. Clinical approach to arrhythmias**

# Bradyarrhythmias

## 1. SA NODAL DYSFUNCTION

### A. Sinus Bradycardia

P axis normal (P waves positive in I and aVF)
Rate <60 bpm; marked sinus bradycardia (<50 bpm)
May be seen in normal adults, particularly athletes, and in elderly individuals
Increased vagal tone or vagal stimulation; drugs (e.g. β-blockers, calcium channel blockers); ischemia/infarction

Atropine; pacing for sick sinus syndrome

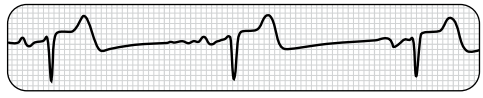

**Figure 20. Sinus bradycardia**

## 2. AV CONDUCTION BLOCKS

### A. First Degree AV Block

Prolonged PR interval (>220 msec)
Frequently found among otherwise healthy adults

No treatment required

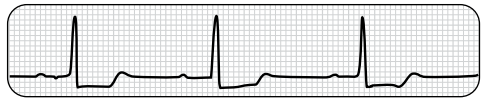

**Figure 21. First degree AV block**

### B. Second Degree AV Block: Type I (Mobitz I)

A gradual prolongation of the PR interval precedes the failure of conduction of a P wave (Wenckebach phenomenon)
AV block is usually in AV node (proximal) triggers (usually reversible): increased vagal tone (e.g. following surgery), RCA-mediated ischemia

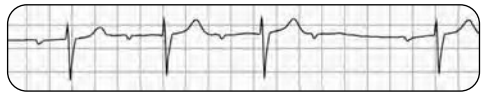

**Figure 22. Second degree AV block with Wenckebach phenomenon (Mobitz I) (4:3 conduction) (lead V1)**

### B. Second Degree AV Block: Type II (Mobitz II)

The PR interval is constant; there is an abrupt failure of conduction of a P wave
Often associated with distal conduction system disease (bundle branch block)
AV block is usually distal to the AV node (i.e. bundle of His); increased risk of high grade or 3rd degree AV block

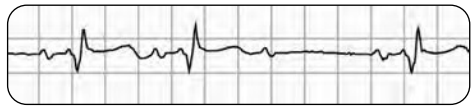

**Figure 23. Second degree AV block (Mobitz II) (3:2 conduction) (lead V1)**

### B. Third Degree AV Block

Complete failure of conduction of the supraventricular impulses to the ventricles; ventricular depolarization initiated by an escape pacemaker distal to the block
Wide or narrow QRS, P-P and R-R intervals are constant, variable PR intervals; no relationship between P waves and QRS complexes (P waves "marching through")

Management (see *Electrical Pacing*, C24)

**Figure 24. Third degree AV block (complete heart block) (lead II)**

# Supraventricular Tachyarrhythmias

## Presentation for SVT (and Pre-Excitation Syndromes)

- presentation can include: palpitations, dizziness, dyspnea, chest discomfort, presyncope/syncope
- may precipitate CHF, hypotension, or ischemia in patients with underlying cardiovascular disease
- untreated tachycardias of long duration (days) can cause tachycardia induced cardiomyopathy (rare, potentially reversible with treatment of SVTs)
- arrhythmias involving the AV node (AVNRT and AVRT) may terminate spontaneously, after vagal stimulation, or adenosine treatment

## Supraventricular Tachyarrhythmias

- tachyarrhythmias that originate in the atria or AV junction
- this term is used when a more specific diagnosis of mechanism and site of origin cannot be made
- characterized by narrow QRS unless there is pre-existing bundle branch block or aberrant ventricular conduction (abnormal conduction due to a change in cycle length)

## 1. Sinus Tachycardia

- sinus rhythm with rate >100 bpm
- occurs in normal subjects with increased sympathetic tone (e.g. exercise, anxiety, pain, pregnancy), alcohol use, caffeinated beverages, drugs (e.g. β-adrenergic agonists, anticholinergic drugs)
- systemic etiology: fever, hypotension, hypovolemia, anemia, thyrotoxicosis, CHF, MI, shock, pulmonary embolism
- treatment: treat underlying disease; consider β-blocker if symptomatic, calcium channel blocker if β-blockers contraindicated; ivabradine may be considered as an alternative agent for inappropriate sinus tachycardia

## 2. Premature Beats
- premature atrial contraction
  - ectopic supraventricular beat originating in the atria
  - P wave morphology of the PAC usually differs from that of a normal sinus beat
- junctional premature beat
  - ectopic supraventricular beat that originates in the vicinity of the AV node
  - P wave is usually not seen or an inverted P wave is seen and may be before or closely follow the QRS complex (referred to as a retrograde, or "traveling backward" P wave)
- treatment usually not required

## 3. Atrial Flutter
- rapid, regular atrial depolarization from a macro re-entry circuit within the atrium (most commonly right atrium)
- atrial rate 250-350 bpm, usually 300 bpm
- AV block usually occurs; it may be fixed (e.g. 2:1, 3:1, 4:1, etc.) or variable
- etiology: hypertension, cardiomyopathy , in association with atrial fibrillation; less often, CAD, thyrotoxicosis, mitral valve disease, cardiac surgery, COPD, PE, pericarditis
- ECG: sawtooth flutter waves (most common type of flutter, called "isthmus dependent, typical flutter) in inferior leads (II, III, aVF); narrow QRS (unless aberrancy); commonly seen as 2:1 block with HR of 150
- in atrial flutter with 2:1 block, carotid sinus massage (first check for bruits), Valsalva maneuver, or adenosine may decrease AV conduction and allow flutter waves to be more easily seen
- treatment of acute atrial flutter
  - if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if stable:
    1. rate control: β-blocker, diltiazem, verapamil, or digoxin
    2. chemical cardioversion: sotalol, amiodarone, type I antiarrhythmics, or electrical cardioversion
  - anticoagulation guidelines same as for patients with AFib
- treatment of long-term AFib includes antiarrhythmics and radiofrequency (RF) ablation (success rate dependent on site of origin of atrial flutter)

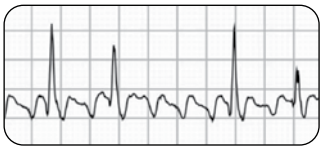

**Figure 25. Atrial flutter with variable block**

## 4. Multifocal Atrial Tachycardia (MAT)
- irregular rhythm caused by presence of 3 or more atrial foci (may mimic AFib)
- atrial rate 100-200 bpm
  - 3 or more distinct P wave morphologies and PR intervals vary, some P waves may not be conducted
- occurs more commonly in patients with COPD and hypoxemia; less commonly in patients with hypokalemia, hypomagnesemia, sepsis, theophylline, or digitalis toxicity
- treatment: treat the underlying cause; calcium channel blockers may be used (e.g. diltiazem, verapamil), β-blockers may be contraindicated because of severe pulmonary disease
- no role for electrical cardioversion, antiarrhythmics, or ablation

## 5. Atrial Fibrillation
- see *CCS Atrial Fibrillation Guidelines 2016* for details (free mobile app – iCCS available on iOS and Android)
- most commonly sustained arrhythmia
- incidence increases with age (10% of population >80 yr)
- symptoms: palpitations, fatigue, dyspnea, syncope, may precipitate or worsen heart failure
- **classification**
  - lone: generally occurs in persons <65 yr and in whom no clinical or echocardiographic causes are found
  - nonvalvular: not caused by valvular disease, prosthetic heart valves, or valve repair
  - paroxysmal: episodes that terminate spontaneously
  - persistent: AFib sustained for more than 7 d or AFib that terminates only with cardioversion
  - permanent/chronic: continuous AFib that is unresponsive to cardioversion or in which clinical judgement has led to a decision not to pursue cardioversion
  - recurrent: two or more episodes of AFib
  - secondary: caused by a separate underlying condition or event (e.g. MI, cardiac surgery, pulmonary disease, hyperthyroidism)
  - may be associated with thromboembolic events (stroke risk can be assessed by CHADS2 score in nonvalvular AFib; CHADS2-VASc if the former gives a score of 0 or 1)
- **initiation**
  - single circuit re-entry and/or ectopic foci, mostly arising from the pulmonary veins, act as aberrant generators producing atrial tachycardia (350-600 bpm), which leads to multiple re-entry circuity (microreentry)
  - impulses conduct irregularly across the atrial myocardium to give rise to fibrillation
  - in most cases, ectopic foci have also been mapped to the pulmonary vein ostia and can be ablated
- **maintenance**
  - the tachycardia causes atrial structural and electrophysiological remodelling changes that further promote AFib; the longer the patient is in AFib the more difficult it is to convert back to sinus rhythm
- **consequences**
  - the AV node irregularly filters incoming atrial impulses producing an irregular ventricular response usually <200 bpm, and the tachycardia leads to suboptimal cardiac output
  - fibrillatory conduction of the atria promotes blood stasis increasing the risk of thrombus formation
    - AFib is an important risk factor for stroke

**Atrial Fibrillation – AFFIRM Trial**
NEJM 2002;347:1825-1833
**Study:** Randomized, multicentre trial with mean follow-up of 3.5 yr.
**Population:** 4060 patients (mean age 70 yr, 61% male, 89% white) with AF and a high risk of stroke or death.
**Intervention:** Rate control (β-blockers, calcium channel blockers, or digoxin alone or in combination) vs. rhythm control (antiarrhythmic drug chosen by the treating physician).
**Primary Outcome:** All cause mortality.
**Results:** There was no difference in mortality or disabling stroke, anoxic encephalopathy, major bleeding, and cardiac arrest between the two groups. There were more incidents of hospitalizations (80.1% vs. 73%, p<0.001) and adverse events (Torsades de Pointes (12 vs. 2, p=0.007), pulseless or bradycardic arrest (9 vs. 1, p=0.01), pulmonary event (108 vs. 24, p<0.001), gastrointestinal event (127 vs. 35, p<0.001), prolonged QT interval (31 vs. 4, p≤0.001), bradycardia (105 vs. 64, p=0.001) in the rhythm-control group.
**Conclusion:** Rate-control was as effective as rhythm-control in AF and was better tolerated. There were more hospitalization incidents in the rhythm-control group.

**Table 5. CHADS2 Risk Prediction for Non-Valvular AFib**

| Risk Factor | Points | CHADS2 Score | Stroke Risk (%/Yr) |
|---|---|---|---|
| **Congestive Heart Failure** | 1 | 0 | 1.9 (low) |
| **Hypertension** | 1 | 1 | 2.8 (low-mod) |
| **Age >75** | 1 | 2-3 | 4.0-5.9 (mod) |
| **Diabetes** | 1 | 4-6 | 8.5-18.2 (high) |
| **Stroke/TIA (prior)** | 2 | | |

JAMA 2001;285:2864-70 and Can J Cardiol 2014 Oct;30(10):1114-30.

- **ECG findings**
  - no organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic fibrillatory baseline
  - irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
  - wide QRS complexes due to aberrancy may occur following a long-short cycle sequence ("Ashman phenomenon")
  - loss of atrial contraction, thus no "a" wave seen in JVP, no S4 on auscultation

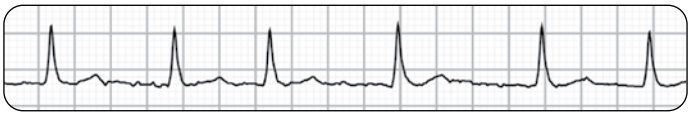

**Figure 26. Atrial fibrillation (lead II)**

- management (adapted from CCS Atrial Fibrillation Guidelines 2016 & 2018)
  - primary goal is symptom control
  - **major objectives (RACE)**: all patients with AFib (paroxysmal, persistent, or permanent), should be stratified using a predictive index for stroke risk and for the risk of bleeding, and most patients should receive either an oral anticoagulant or ASA
    1. **R**ate control: β-blockers, diltiazem, verapamil (in patients with heart failure: digoxin, amiodarone)
       - digoxin can be considered as a therapeutic option to achieve rate control in patients whose response to β-blockers and/or calcium channel blockers is inadequate, contraindicated or not tolerated
    2. **A**nticoagulation: use either warfarin or novel oral anticoagulant (NOACs) e.g. apixaban, dabigatran, rivaroxaban, edoxaban to prevent thromboembolism
       - for patients with non-valvular AF (NVAF): oral anticoagulant (OAC) is recommended for most patients aged >65 yr or $CHADS_2$ ≥1
         - ASA 81 mg is recommended only for patients with none of the risk outlined in the CCS algorithm (age <65 and no $CHADS_2$ risk factors) who also have arterial disease (coronary, aortic, or peripheral)
         - novel oral anticoagulant (NOAC) is to be used in preference to warfarin
    3. **C**ardioversion (electrical)
       - if AFib <48 h, can usually cardiovert without anticoagulation
       - if AFib >48 h, anticoagulate for 3 wk prior and 4 wk after cardioversion due to risk of unstable intra-atrial thrombus
       - if patient unstable (hypotensive, active angina due to tachycardia, uncontrolled heart failure) should cardiovert immediately
    4. **E**tiology
       - HTN, obesity, sleep apnea, CAD, valvular disease, pericarditis, cardiomyopathy, myocarditis, ASD, post-operative, PE, COPD, thyrotoxicosis, sick sinus syndrome, alcohol ("holiday heart")
       - may present in young patients without demonstrable disease ("lone AFib") and in the elderly without underlying heart disease
  - studies of patients with AFib suggest that there is no difference in long-term survival when treating patients with a rhythm-control versus rate-control strategy
  - many patients with a significant underlying structural heart lesion (e.g. valve disease, cardiomyopathy) will not tolerate AFib well (since may be dependent on atrial kick) and these patients should be cardioverted (chemical or electrical) as soon as possible
  - **newly discovered AFib**
    - anticoagulants may be beneficial if high risk for stroke
    - if the episode is self-limited and not associated with severe symptoms, no need for antiarrhythmic drugs
    - if AFib persists, 2 options:
      1. rate control and anticoagulation (as indicated above)
      2. cardioversion (as indicated above)
    - recurrent or permanent AFib
    - if episodes are brief or minimally symptomatic, antiarrhythmic drugs may be avoided; rate control and anticoagulation are appropriate
    - patients who have undergone at least one attempt to restore sinus rhythm may remain in AFib after recurrence; permanent AFib may be accepted (with rate control and antithrombotics as indicated by $CHADS_2$ score) in certain clinical situations
    - if symptoms are bothersome or episodes are prolonged, antiarrhythmic drugs should be used
      - no or minimal heart disease: flecainide, propafenone once proven to have no underlying CAD (may consider exercise stress testing)

**Lenient versus Strict Rate Control in Patients with Atrial Fibrillation**
NEJM 362:1363-1373
**Study:** Randomized, multi-centre Netherlands prospective study, follow-up for at least 2 yr
**Population:** 614 patients with permanent atrial fibrillation.
**Intervention:** Lenient control (resting HR <110 bpm) or strict control (resting HR <80 bpm)
**Primary Outcomes:** Death from cardiovascular causes, hospitalization for heart failure, and stroke, systemic embolism, bleeding, and life-threatening arrhythmic events.
**Results:** Goal of the study was to establish whether lenient control was equivalent to strict control for prevention of primary outcomes. Resulting hazard ratios were not significantly different between the treatment groups (P = 0.001). Frequencies of hospitalization and adverse effects were also similar. More patients were able to maintain lenient targets (97.7%) compared to strict targets (67%).
**Conclusion:** Lenient control was equivalent to strict control for prevention of primary outcomes in patients with atrial fibrillation. Furthermore, lenient control was more easily achieved.

- LV dysfunction: amiodarone
- CAD: β-blockers, amiodarone
- if antiarrhythmic drugs fail or are not tolerated, can consider RF ablation for rhythm/symptom control

### 6. AV NODAL RE-ENTRANT TACHYCARDIA (AVNRT)

- re-entrant circuit using dual pathways (fast conducting β-fibres and slow conducting α-fibres) within or near the AV node; often found in the absence of structural heart disease
  - cause is commonly idiopathic, although familial AVNRT has been reported
- sudden onset and offset, patients often describe "neck pounding" and "shirt flapping"
- fast regular rhythm: rate 150-250 bpm
- usually initiated by a supraventricular or ventricular premature beat
- AVNRT accounts for 60-70% of all paroxysmal SVTs
- retrograde P waves may be seen but are usually lost in the QRS complex
- treatment
  - acute: Valsalva maneuver or carotid sinus pressure technique, adenosine is first choice if unresponsive to vagal maneuvers; if no response, try metoprolol, digoxin, diltiazem, electrical cardioversion if patient hemodynamically unstable (hypotension, angina, or CHF)
  - long-term: 1st line – radiofrequency ablation (>98% cure rate and << 1% complication rate), β-blocker, diltiazem, digoxin; 2nd line – flecainide, propafenone

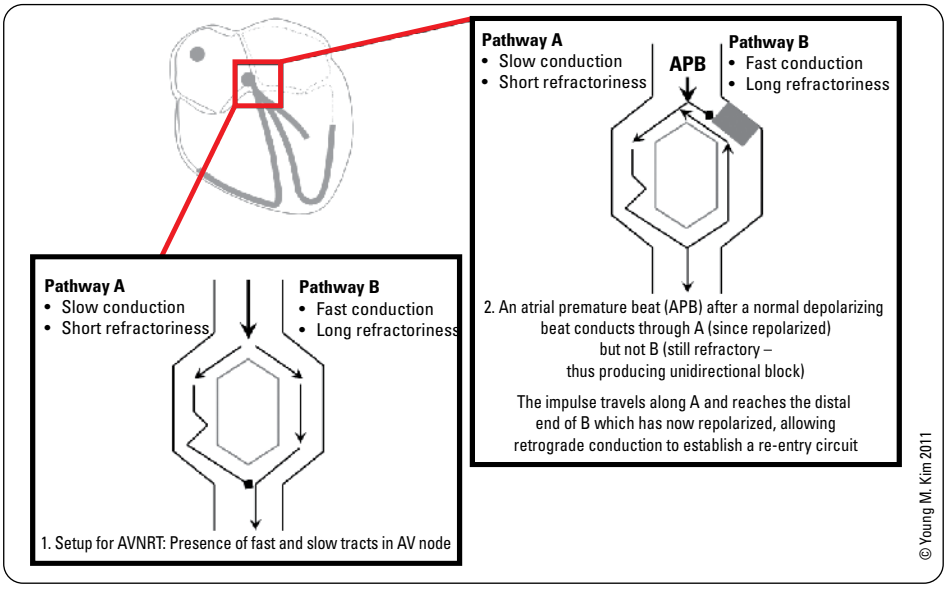

**Figure 28. Mechanism for AVNRT**

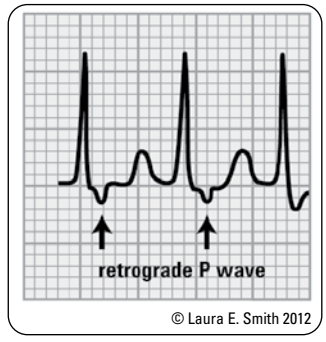

**Figure 27. AVNRT**

N.B. Refer to ECG Made Simple for further discussion and an animation of the mechanism (www.ecgmadesimple.com)

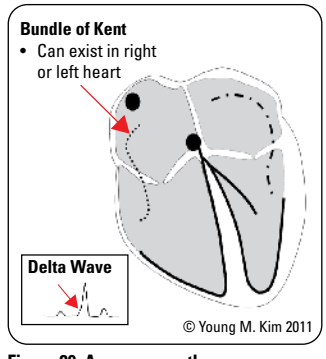

**Figure 29. Accessory pathway conduction in WPW.** Early ventricular activation leads to the appearance of a delta wave (slurred upstroke of the QRS) on the ECG before usual conduction across the AV node

## Pre-Excitation Syndromes

- refers to a subset of SVTs mediated by an accessory pathway which can lead to ventricular pre-excitation

### Wolff-Parkinson-White Syndrome (WPW)

- congenital defect present in 1.5-2/1000 of the general population
- an accessory conduction tract (Bundle of Kent; can be in right or left atrium) abnormally allows early electrical activation of part of one ventricle
- impulses travel at a greater conduction velocity across the Bundle of Kent thereby effectively 'bypassing' AV node
- since the ventricles are activated earlier, the ECG shows early ventricular depolarization in the form of initial slurring of the QRS complex – the so-called "delta wave"
- atrial impulses that conduct to the ventricles through both the Bundle of Kent and the normal AV node/His-Purkinje system generate a broad "fusion complex"
- ECG features of WPW
  - PR interval <120 msec
  - delta wave: slurred upstroke of the QRS (the leads with the delta wave vary with site of bypass)
  - widening of the QRS complex due to premature activation
  - secondary ST segment and T wave changes
  - tachyarrhythmias may occur – most often AVRT and AFib

### AFib in WPW Patients

- AFib is the index arrhythmia in up to 20% of patients with WPW syndrome
  - usually intermittent rather than persistent or permanent
- rapid atrial depolarizations in AFib are conducted through the bypass tract which is not able to filter impulses like the AV node can and thus the ventricular rate becomes extremely rapid (>200 bpm) and the QRS complex widens

- treatment: electrical cardioversion, IV procainamide, or IV amiodarone
  - do not use drugs that slow AV node conduction (digoxin, β-blockers) as this may cause preferential conduction through the bypass tract and precipitate VF
  - long-term: ablation of bypass tract if possible

### AV Re-Entrant Tachycardia

- re-entrant loop via accessory pathway and normal conduction system
- initiated by a premature atrial or ventricular complex
- **orthodromic AVRT**: stimulus from a premature complex travels up the bypass tract (V to A) and down the AV node (A to V) with narrow QRS complex (no delta wave because stimulus travels through normal conduction system)
- comprises 95% of the reentrant tachycardias associated with WPW syndrome
- **antidromic AVRT**: more rarely the stimulus goes up the AV node (V to A) and down the bypass tract (A to V); wide and abnormal QRS as ventricular activation is only via the bypass tract
- **treatment**
  - acute: similar to AVNRT except avoid long-acting AV nodal blockers (e.g. digoxin and verapamil)
  - long-term: for recurrent arrhythmias ablation of the bypass tract is recommended
  - drugs such as flecainide and procainamide can be used

## Ventricular Tachyarrhythmias

### Premature Ventricular Contraction (PVC) or Ventricular Premature Beat (VPB)

- QRS width >120 msec, no preceding P wave, bizarre QRS morphology
- origin: LBBB morphology of VT = RV origin; RBBB morphology of VT = LV origin
- PVCs may be benign but are usually significant in the following situations:
  - consecutive (≥3 = VT) or multiform (varied origin)
  - PVC falling on the T wave of the previous beat ("R on T phenomenon"): may precipitate ventricular tachycardia or VF
- risk of sustained arrhythmia depends on the clinical situation (i.e. MI, HF), not the PVCs themselves

### Accelerated Idioventricular Rhythm

- ectopic ventricular rhythm with rate 50-100 bpm
- more frequently occurs in the presence of sinus bradycardia and is easily overdriven by a faster supraventricular rhythm
- frequently occurs in patients with acute MI or other types of heart disease (i.e. cardiomyopathy, hypertensive, valvular) but it does not affect prognosis and does not usually require treatment

### Ventricular Tachycardia (VT)

- 3 or more consecutive ectopic ventricular complexes
  - rate >100 bpm (usually 140-200)
  - ventricular flutter: if rate >200 bpm and complexes resemble a sinusoidal pattern
  - "sustained VT" if it lasts longer than 30s
  - ECG characteristics: wide regular QRS tachycardia (QRS usually >140 msec)
  - AV dissociation; bizarre QRS pattern
  - also favour Dx of VT: left axis or right axis deviation, nonspecific intraventricular block pattern, monophasic or biphasic QRS in V1 with RBBB, QRS concordance in V1-V6
  - occasionally during VT supraventricular impulses may be conducted to the ventricles generating QRS complexes with normal or aberrant supraventricular morphology ("ventricular capture") or summation pattern ("fusion complexes")
  - by themselves, nonsustained VT not dangerous but may indicate higher than usual risk of subsequent sustained VT, especially with structural heart disease
- **monomorphic VT**
  - identical complexes with uniform morphology
  - more common than polymorphic VT
  - typically result from intraventricular re-entry circuit, may be idiopathic without any structural heart disease
  - potential causes: chronic infarct related scarring, cardiomyopathies, myocarditis, arrhythmogenic right ventricular dysplasia, idiopathic, drugs (e.g. cocaine), electrolyte disturbances
- **polymorphic VT**
  - complexes with constantly changing morphology, amplitude, and polarity
  - more frequently associated with hemodynamic instability due to faster rates (typically 200-250 bpm) vs. monomorphic VT
  - potential causes: acute MI, severe or silent ischemia, and predisposing factors for QT prolongation, dilated cardiomyopathies
- **treatment**
  - sustained VT (>30 s) is an emergency requiring immediate treatment
  - hemodynamic compromise: electrical cardioversion
  - no hemodynamic compromise: electrical cardioversion, amiodarone, type Ia agents (procainamide, quinidine)

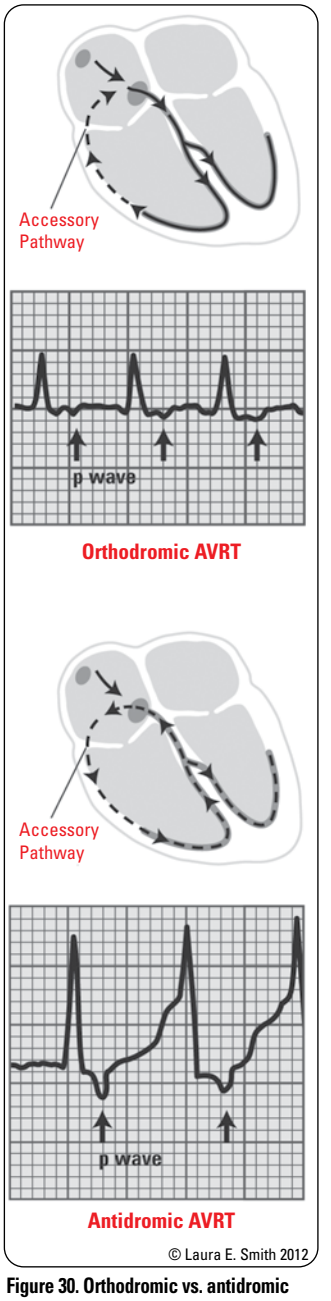

**Figure 30. Orthodromic vs. antidromic AVRT**

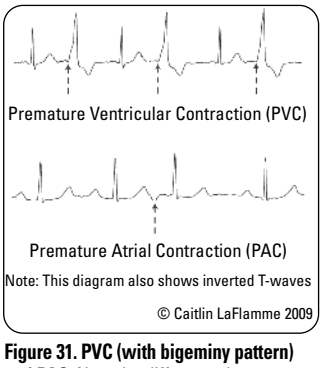

**Figure 31. PVC (with bigeminy pattern) and PAC.** Note the difference between the normal QRS/T wave and the PVC-generated QRS/T wave

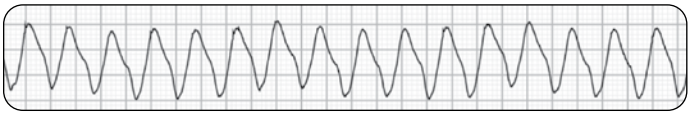

**Figure 32. Ventricular tachycardia (monomorphic)**

**Table 6. Wide Complex Tachycardia: Clues for Differentiating VT vs. SVT with Aberrancy***

| Clinical Clues | | ECG Clues | |
|---|---|---|---|
| Presenting symptoms | Not helpful | AV dissociation | VT |
| History of CAD and previous MI | VT | Capture or fusion beats | VT |
| Physical exam | | QRS width >140 msec | VT |
| Cannon "a" waves<br>Variable S1 | VT | Extreme axis deviation (left or right superior axis) | VT |
| Carotid sinus massage/ adenosine terminates arrhythmia | SVT** | Positive QRS concordance (R wave across chest leads) | VT |
| | | Negative QRS concordance (S wave across chest leads) | May suggest VT |
| | | Axis shift during arrhythmia | VT (polymorphic) |

***If patient >65 yr and previous MI or structural heart disease, then chance of VT >95%**
**May terminate VT in some patients with no structural heart disease

**Arrhythmias that May Present as a Wide QRS Tachycardia**
- VT
- SVT with aberrant conduction (rate related)
- SVT with preexisting BBB or nonspecific intraventricular conduction defect
- AV conduction through a bypass tract in WPW patients during an atrial tachyarrhythmia (e.g. atrial flutter, atrial tachycardia)
- Antidromic AVRT in WPW patients (see *Pre-Excitation Syndromes*, C21)

## Torsades de Pointes

- a variant of polymorphic VT that occurs in patients with baseline QT prolongation – "twisting of the points"
- looks like usual VT except that QRS complexes "rotate around the baseline" changing their axis and amplitude
- ventricular rate >100 bpm, usually 150-300 bpm
  - usual onset after a post PVC pause ("pause dependent" QT prolongation associated)
- **etiology**: predisposition in patients with prolonged QT intervals
  - congenital long QT syndromes
  - drugs: e.g. class IA (quinidine), class III (sotalol), phenothiazines (TCAs), erythromycin, quinolones, antihistamines
  - electrolyte disturbances: hypokalemia, hypomagnesemia
  - nutritional deficiencies causing above electrolyte abnormalities
- **treatment**: IV magnesium, temporary pacing, isoproterenol and correcting the underlying cause of prolonged QT, electrical cardioversion if hemodynamic compromise

**Figure 33. Torsades de pointes**

## Ventricular Fibrillation (VFib)

- chaotic ventricular arrhythmia, with very rapid irregular ventricular fibrillatory waves of varying morphology
- terminal event, unless advanced cardiac life-support (ACLS) procedures are promptly initiated to maintain ventilation and cardiac output, and electrical defibrillation is carried out
- most frequent cause of sudden death
- refer to ACLS algorithm for complete therapeutic guidelines

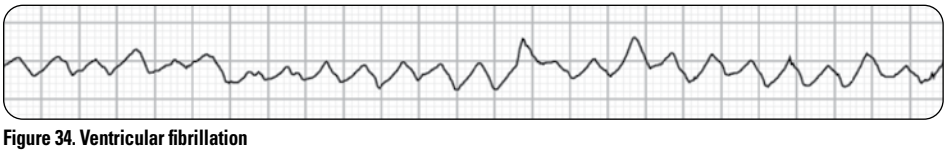

**Figure 34. Ventricular fibrillation**

# Sudden Cardiac Arrest

### Definition
- unanticipated, non-traumatic cardiac death in a stable patient which occurs within 1 h of symptom onset; VFib is most common cause

### Etiology
- primary cardiac pathology
  - ischemia/MI
  - cardiomyopathy with LV dysfunction
  - severe ventricular hypertrophy
  - HCM
  - AS
  - congenital heart disease e.g. arrhythmogenic right ventricular dysplasia
  - mutations in cardiac ion channels e.g. long QT syndrome, Brugada syndrome

### Management
- acute: resuscitate with prompt CPR and defibrillation
- investigate underlying cause (cardiac catheterization, electrophysiologic studies, echocardiography)
- treat underlying cause
- antiarrhythmic drug therapy: amiodarone, β-blockers
- implantable cardioverter defibrillator (ICD)
- refer to ACLS guidelines (see Anesthesia and Perioperative Medicine, A30)

**CCS Consensus Conference 2003: Assessment of the Cardiac Patient for Fitness to Drive and Fly – Executive Summary**
Can J Cardiol 2004;20:1313-1323
In both primary and secondary prevention ICD patients with private driving licenses, no restrictions to drive directly following implantation or an inappropriate shock are warranted. However, following an appropriate shock these patients are at an increased risk to cause harm to other road users and therefore should be restricted to drive for a period of 2 and 4 mo, respectively. In addition, all ICD patients with commercial driving licenses have a substantial elevated risk to cause harm to other road users during the complete follow-up after both implantation and shock and should therefore be restricted to drive permanently. (A complete set of easy to access CCS Drive and Fly guidelines is available in the iCCS App available for iOS and Android platforms)

# Electrophysiology Studies

- invasive test for the investigation and treatment of cardiac rhythm disorders using intracardiac catheters
- provide detailed analysis of the arrhythmia mechanism and precise site of origin when ECG data are nondiagnostic or unobtainable
- bradyarrhythmias: define the mechanisms of SA node dysfunction and localize site of AV conduction block
- tachyarrhythmias: map for possible ablation or to assess inducibility of VT

# Electrical Pacing

- the decision to implant a pacemaker usually is based on symptoms of a bradyarrhythmia or tachyarrhythmia in the setting of heart disease

### Pacemaker Indications
- SA node dysfunction (most common): symptomatic bradycardia ± hemodynamic instability
- common manifestations include: syncope, presyncope, or severe fatigue
- SA node dysfunction is commonly caused by: intrinsic disease within the SA node (e.g. idiopathic degeneration, fibrosis, ischemia, or surgical trauma), abnormalities in autonomic nervous system function, and drug effects
- AV nodal-infranodal block: Mobitz II, complete heart block

### Pacemaker Complications
- complications related to surgical implantation include venous access (pneumothorax, hemothorax, air embolism), pacemaker leads (perforation, malposition), pocket hematomas and infection
- complications specific to the pacemaker include a failure to pace, failure to sense, pulse generator failure, pacemaker syndrome and pacemaker mediated tachycardia

### Pacing Techniques
- temporary: transvenous (jugular, subclavian, femoral) or external (transcutaneous) pacing
- permanent: transvenous into RA, apex of RV, or both
- can sense and pace atrium, ventricle, or both
- new generation: rate responsive, able to respond to physiologic demand
- biventricular

**Systematic Review: Implantable Cardioverter Defibrillators for Adults with Left Ventricular Systolic Dysfunction**
Ann Intern Med 2007;147:251-262
**Study:** Meta-review of 12 RCTs used for ICD efficacy, 5 RCTs and 48 observational studies for effectiveness, and 21 RCTs and 43 observational studies for safety review.
**Population:** 8516 patients for ICD efficacy, 26,840 patients for effectiveness, and 86,809 patients for safety review with left ventricular ejection fraction ≤0.35.
**Intervention:** ICD implantation.
**Outcomes:** All-cause mortality and adverse events.
**Results:** ICDs reduced all-cause mortality by 20% (95% CI, 10%-29%; I2=44.4%) with greatest reduction (54%) in sudden cardiac death (CI 37%-63%; I2=0%). Observational studies had a reduced relative risk of 0.54 for all-cause mortality versus RCTs (CI 0.43-0.58, I2=60.4%). Rates of success of ICD implantation were 99% (CI 98.8%-99.3%) with a 1.2% (CI 0.9%-1.5%) chance of peri-implantation death. Post-implantation complications (per 100 patient yr) were: 1.4 (CI 1.2-1.6) device malfunctions; 1.5 (CI 1.3-1.8) lead problems; 0.6 (CI 0.5-0.8) implant site infection and 19.1 (CI 16.5-22.0) inappropriate discharges in RCTs versus a rate of 4.9 (CI 4.5-5.3) inappropriate discharges in observational studies.
**Conclusion:** ICDs are safe and effective in reducing mortality in adult patients with LV systolic dysfunction but carry significant risks of inappropriate discharges. Differences between RCTs and observational studies show that improved risk stratification of patients may further improve outcomes and reduce adverse events.

# Implantable Cardioverter Defibrillators

- sudden cardiac death (SCD) usually results from ventricular fibrillation (VFib), sometimes preceded by monomorphic or polymorphic ventricular tachycardia (VT)
- ICDs detect ventricular tachyarrhythmias and are highly effective in terminating VT/VFib and in aborting SCD
- mortality benefit vs. antiarrhythmics in secondary prevention
- benefit seen in patients with ischemic and non-ischemic cardiomyopathy, depressed left ventricular ejection fraction (LVEF), prolonged QRS
- see *Heart Failure*, C34 for current treatment recommendations

# Catheter Ablation

### Techniques

- radiofrequency (RF) ablation: a low-voltage high-frequency form of electrical energy (similar to cautery); RF ablation produces small, homogeneous, necrotic lesions approximately 5-7 mm in diameter and 3-5 mm in depth
- cryoablation: new technology which uses a probe with a tip that can decrease in temperature to -20˚C and -70˚C which produces small, necrotic lesions similar to RF ablation; when brought to -20˚C, the catheter tip reversibly freezes the area; bringing the tip down to -70˚C for 5 min permanently scars the tissue
  - advantage: can "test" areas before committing to an ablation
  - disadvantage: takes much longer than RF (5 min per cryoablation vs. 1 min per RF ablation)

### Indications

- paroxysmal SVT
  - AVNRT: accounts for more than half of all cases
- accessory pathway (orthodromic reciprocating tachycardia): 30% of SVT
  - re-entrant rhythm, with an accessory AV connection as the retrograde limb
  - corrected by targeting the accessory pathway
- atrial flutter: re-entry pathway in right atrium
- AFib: primarily pulmonary vein isolation, sometimes with added ablation in the atrial chambers
- ventricular tachycardia: focus arises from the right ventricular outflow tract and less commonly originates in the inferoseptal left ventricle near the apex (note: majority of cases of VT are due to scarring from previous MI and cannot be ablated)

### Major Complications

- 1% of patients; death: 0.1-0.2%
- cardiac: high grade AV block requiring permanent pacemaker (less risk with cryoablation), tamponade, pericarditis
- vascular: hematoma, vascular injury, thromboembolism, TIA/stroke
- pulmonary: pulmonary embolism

**Catheter Ablation for Atrial Fibrillation with Heart Failure (CASTLE-AF Trial)**
NEJM 2018;378:417-427
**Study**: Multicentre, open-label, randomized, controlled trial.
**Population**: 363 patients with symptomatic paroxysmal or persistent AF; New York Heart Association class II, III, or IV HF; a left ventricular ejection fraction of ≤35 percent; failure or unwillingness to take antiarrhythmic drug therapy.
**Intervention**: catheter ablation vs. medical therapy.
**Outcomes**: primary endpoint was a composite of death from any cause or worsening of heart failure that led to an unplanned overnight hospitalization. Major secondary endpoints were death from any cause, unplanned hospitalization related to heart failure, death from cardiovascular disease, cerebrovascular accident, unplanned hospitalization for cardiovascular disease, and any hospitalization. In the ablation group, procedure-related adverse events and atrial fibrillation-free intervals were also assessed
**Results**: After a median follow-up of 37.8 mo, the primary composite endpoint occurred in significantly fewer patients in the ablation group than in the medical-therapy group (28.5% vs. 44.6%; P=0.007). Significantly fewer patients in the ablation group died from any cause (13.4% vs. 25.0%; hazard ratio, 0.53; P=0.01), were hospitalized for worsening heart failure (20.7% vs. 66 35.9%; P=0.004), or died from cardiovascular causes (11.2% vs. 41 22.3%; P=0.009).
**Conclusions**: Catheter ablation for atrial fibrillation in patients with heart failure was associated with a significantly lower rate of a composite end point of death from any cause or hospitalization for worsening heart failure than was medical therapy.

# Ischemic Heart Disease

### Epidemiology

- most common cause of cardiovascular morbidity and mortality
- atherosclerosis and thrombosis are the most important pathogenetic mechanisms
- M:F = 2:1 with all age groups included (Framingham study), 8:1 for age <40, 1:1 for age >70
  - CHD incidence in women triples shortly after menopause
- peak incidence of symptomatic IHD is age 50-60 (men) and 60-70 (women)
- for primary prevention of ischemic heart disease see Family Medicine, FM7

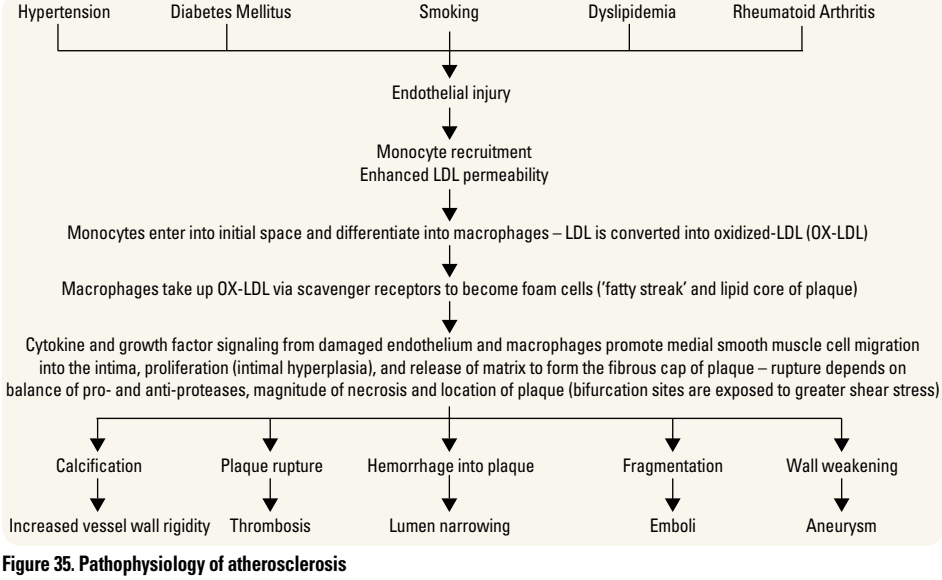

**Figure 35. Pathophysiology of atherosclerosis**

**Table 7. Risk Factors and Markers for Atherosclerotic Heart Disease**

| Non-Modifiable Risk Factors | Modifiable Risk Factors § | Markers of Disease |
|---|---|---|
| Age<br>Male, postmenopausal female<br>Family history (FHx) of MI*<br>First degree male relative <55<br>First degree female relative <65 | Hyperlipidemia*<br>HTN*<br>DM*<br>Cigarette smoking*<br>Psychosocial stress<br>Abdominal obesity<br>Sedentary lifestyle<br>Heavy alcohol intake<br>Not consuming fruits and vegetables daily<br>Elevated lipoprotein(a)<br>Hyperhomocysteinemia | Elevated high-sensitivity C-reactive protein (hsCRP)<br>Coronary artery calcification<br>Carotid IMT/plaque<br>Ankle-brachial index |

* Major risk factors
§ Modifiable risk factors account for >90% of MIs

# Chronic Stable Angina

## Definition
- symptom complex resulting from an imbalance between oxygen supply and demand in the myocardium

## Etiology and Pathophysiology
- factors that decrease myocardial oxygen supply:
  - decreased luminal diameter: atherosclerosis, vasospasm
  - decreased duration of diastole: tachycardia (decreased duration of diastolic coronary perfusion)
  - decreased hemoglobin: anemia
  - decreased $SaO_2$: hypoxemia
  - congenital anomalies
- factors that increase myocardial oxygen demand:
  - increased heart rate: hyperthyroidism
  - increased contractility: hyperthyroidism
  - increased wall stress: myocardial hypertrophy, aortic stenosis

## Signs and Symptoms
- typical
  1. retrosternal chest pain, tightness or discomfort radiating to left (± right) shoulder/arm/neck/jaw, associated with diaphoresis, nausea, anxiety
  2. predictably precipitated by the "3 Es": exertion, emotion, eating
  3. brief duration, lasting <10-15 min and typically relieved by rest and nitrates
- atypical/probable angina (meets 2 of the above)
- non-cardiac chest pain (meets none or 1 of the above)
- Levine's sign: clutching fist over sternum when describing chest pain
- anginal equivalents: dyspnea, acute LV failure, flash pulmonary edema

## Clinical Assessment
- history including directed risk factor assessment and physical exam
- labs: Hb, fasting glucose, fasting lipid profile
- ECG (at rest and during episode of chest pain if possible)
- CXR (suspected heart failure, valvular disease, pericardial disease, aortic dissection/aneurysm, or signs or symptoms of pulmonary disease)
- stress testing (see *Stress Testing*, C13) or angiography
- echo
- to assess systolic murmur suggestive of aortic stenosis, mitral regurgitation, and/or HCM
- to assess LV function in patients with Hx of prior MI, pathological Q waves, signs or symptoms of CHF

## Differential Diagnosis
- see *Differential Diagnosis of Common Presentations*, C4

## Treatment of Chronic Stable Angina
**1. General Measures**
- goals: to reduce myocardial oxygen demand and/or increase oxygen supply
- lifestyle modification (diet, exercise)
- treatment of risk factors: e.g. statins (see Endocrinology, E5, Family Medicine, FM9 for target lipid guidelines), antihypertensives
- pharmacological therapy to stabilize the coronary plaque to prevent rupture and thrombosis

**2. Antiplatelet Therapy (first-line therapy)**
- ASA
- clopidogrel when ASA absolutely contraindicated

**3. β-blockers (first-line therapy – improve survival in patients with hypertension)**
- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- cardioselective agents preferred (e.g. metoprolol, atenolol) to avoid peripheral effects (inhibition of vasodilation and bronchodilation via β2 receptors)
- avoid intrinsic sympathomimetics (e.g. acebutolol) which increase demand

Chronic stable angina is most often due to a fixed stenosis caused by an atheroma

Acute coronary syndromes are the result of plaque rupture

**Canadian Cardiovascular Society (CCS) Functional Classification of Angina**
- **Class I:** ordinary physical activity (walking, climbing stairs) does not cause angina; angina with strenuous, rapid, or prolonged activity
- **Class II:** slight limitation of ordinary activity: angina brought on at >2 blocks on level or climbing >1 flight of stairs or by emotional stress
- **Class III:** marked limitation of ordinary activity: angina brought on at <2 blocks on level or climbing <1 flight of stairs
- **Class IV:** inability to carry out any physical activity without discomfort; angina may be present at rest

**4. Nitrates (symptomatic control, no clear impact on survival)**
- decrease preload (venous dilatation) and afterload (arteriolar dilatation), and increase coronary perfusion
- maintain daily nitrate-free intervals to prevent tolerance (tachyphylaxis)

**5. Calcium Channel Blockers (CCBs, second-line or combination)**
- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- caution: verapamil/diltiazem combined with β-blockers may cause symptomatic sinus bradycardia or AV block

**6. ACE Inhibitors (ACEI, not used to treat symptomatic angina)**
- angina patients tend to have risk factors for CV disease which warrant use of an ACEI (e.g. HTN, DM, proteinuric renal disease, previous MI with LV dysfunction)
- benefit in all patients at high risk for CV disease (concomitant DM, renal dysfunction, or LV systolic dysfunction)

**7. Invasive Strategies**
- revascularization (see *Coronary Revascularization*, C31 and COURAGE trial sidebar)

### VARIANT ANGINA (PRINZMETAL'S ANGINA)
- myocardial ischemia secondary to coronary artery vasospasm, with or without atherosclerosis
- uncommonly associated with infarction or LV dysfunction
- typically occurs between midnight and 8 am, unrelated to exercise, relieved by nitrates
- typically ST elevation on ECG
- diagnosed by provocative testing with ergot vasoconstrictors (rarely done)
- treat with nitrates and CCBs

### SYNDROME X
- typical symptoms of angina but normal angiogram
- may show definite signs of ischemia with exercise testing
- thought to be due to inadequate vasodilator reserve of coronary resistance vessels
- better prognosis than overt epicardial atherosclerosis

**Optimal Medical Therapy with or without PCI for Stable Coronary Disease. COURAGE Trial**
NEJM 2007;356:1503-1516
**Study:** Randomized, controlled trial with median follow-up of 4.6 yr.
**Population:** 2287 patients who had objective evidence of myocardial ischemia and significant stable coronary artery disease.
**Intervention**: Patients were randomized to receive intensive pharmacologic therapy and lifestyle intervention with or without percutaneous coronary intervention (PCI).
**Outcome:** Primary outcome was all-cause mortality and nonfatal myocardial infarction (MI). Secondary outcome had additional events of stroke, all MI, and hospitalization for unstable angina with negative biomarkers.
**Results:** There was no significant difference in primary (unadjusted hazard ratio: 1.05; p=0.62) or secondary outcomes (hazard ratio: 1.05; p=0.62) between the PCI and non-PCI intervention groups. The PCI group had significantly lower rates of subsequent revascularization at 4.6 yr of follow-up (hazard ratio 0.60, p<0.001) and was more angina-free in the first 4 yr of follow-up.
**Conclusions:** PCI as an adjunct in initial management in patients with significant stable coronary artery disease does not reduce mortality, MI, stroke, or hospitalization for ACS, but does provide angina relief and reduced risk of revascularization.

## Acute Coronary Syndromes

### Definition
- ACS includes the spectrum of unstable angina (UA), NSTEMI, and STEMI; this distinction aids in providing the appropriate therapeutic intervention
  - **UA** is clinically defined by any of the following:
    - accelerating pattern of pain: increased frequency, increased duration, decreased threshold of exertion, decreased response to treatment
    - angina at rest
    - new-onset angina
    - angina post-MI or post-procedure (e.g. percutaneous coronary intervention [PCI], coronary artery bypass grafting [CABG])
  - **MI** (STEMI/NSTEMI) is defined by evidence of myocardial necrosis and is diagnosed by a rise/fall of serum markers plus any one of:
    - symptoms of ischemia (chest/upper extremity/mandibular/epigastric discomfort; dyspnea)
    - ECG changes (ST-T changes, new BBB or pathological Q waves)
    - imaging evidence (myocardial loss of viability, wall motion abnormality, or intracoronary thrombus)
    - if biomarker changes are unattainable, cardiac symptoms combined with new ECG changes is sufficient
  - **NSTEMI** meets criteria for MI without ST elevation or BBB
  - **STEMI** meets criteria for MI characterized by ST elevation or new BBB

### Investigations
- history and physical
  - note that up to 30% of MIs are unrecognized or "silent" due to atypical symptoms – more common in women, DM, elderly, post-heart transplant (because of denervation)
- ECG
- CXR
- labs
  - serum cardiac biomarkers for myocardial damage (repeat 8 h later) (see *Cardiac Biomarkers*, C11)
  - CBC, INR/PTT, electrolytes and magnesium, creatinine, urea, glucose, serum lipids
  - draw serum lipids within 24-48 h because values are unreliable from 2-48 d post-MI

### MANAGEMENT OF ACUTE CORONARY SYNDROMES

**1. General Measures**
- ABCs: assess and correct hemodynamic status first
- bed rest, cardiac monitoring, oxygen
- nitroglycerin SL followed by IV
- morphine IV

**2. Anti-Platelet and Anticoagulation Therapy**

- see also *CCS Antiplatelet Guidelines 2012* for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
- ASA chewed
- NSTEMI
  - ticagrelor in addition to ASA or if ASA contraindicated, subcutaneous low molecular weight heparin or IV unfractionated heparin (UFH)
    - LMWH preferable, except in renal failure or if CABG is planned within 24 h
  - clopidogrel used if patient ineligible for ticagrelor
- if PCI is planned: ticagrelor or prasugrel and consider IV GP IIb/IIIa inhibitor (e.g. abciximab)
  - clopidogrel used if patient ineligible for ticagrelor and prasugrel
  - prasugel contraindicated in those with a history of stroke/TIA, and avoidance of or lower dose is recommended for those >75 yr old or weighing under 60 kg (TRITON-TIMI 38)
- anticoagulation options depend on reperfusion strategy:
  - primary PCI: UFH during procedure; bivalirudin is a possible alternative
  - thrombolysis: LMWH (enoxaparin) until discharge from hospital; can use UFH as alternative because of possible rescue PCI
  - no reperfusion: LMWH (enoxaparin) until discharge from hospital
- continue LMWH or UFH followed by oral anticoagulation at discharge if at high risk for thromboembolic event (large anterior MI, AFib, severe LV dysfunction, CHF, previous DVT or PE, or echo evidence of mural thrombus)

**3. β-blockers**

- STEMI: contraindications include signs of heart failure, low output states, risk of cardiogenic shock, heart block, asthma or airway disease; initiate orally within 24 h of diagnosis when indicated
- if β-blockers are contraindicated or if β-blockers/nitrates fail to relieve ischemia, non-dihydropyridine calcium channel blockers (e.g. diltiazem, verapamil) may be used as second-line therapy in the absence of severe LV dysfunction or pulmonary vascular congestion (calcium channel blockers do not prevent MI or decrease mortality)

**4. Invasive Strategies and Reperfusion Options**

- UA/NSTEMI: early coronary angiography ± revascularization if possible is recommended with any of the following high-risk indicators:
  - recurrent angina/ischemia at rest despite intensive anti-ischemic therapy
  - CHF or LV dysfunction
  - hemodynamic instability
  - high (≥3) TIMI risk score (tool used to estimate mortality following an ACS)
  - sustained ventricular tachycardia
  - dynamic ECG changes
  - high-risk findings on non-invasive stress testing
  - PCI within the previous 6 mo
  - repeated presentations for ACS despite treatment and without evidence of ongoing ischemia or high risk features
  - note: thrombolysis is NOT administered for UA/NSTEMI
- STEMI
  - after diagnosis of STEMI is made, do not wait for results of further investigations before implementing reperfusion therapy
  - goal is to re-perfuse artery: thrombolysis ("EMS-to-needle") within 30 min or primary PCI ("EMS-to-balloon") within 90 min (if available)
  - thrombolysis
    - preferred if patient presents ≤12 h of symptom onset, and <30 min after presentation to hospital, has contraindications to PCI, or PCI cannot be administered within 90 min
  - PCI
    - early PCI (≤12 h after symptom onset and <90 min after presentation) improves mortality vs. thrombolysis with fewer intra-cranial hemorrhages and recurrent MIs
    - primary PCI: without prior thrombolytic therapy – method of choice for reperfusion in experienced centres
    - rescue PCI: following failed thrombolytic therapy (diagnosed when following thrombolysis, ST segment elevation fails to resolve below half its initial magnitude and patient still having chest pain)

**TIMI Risk Score for UA/NSTEMI**

| Characteristics | Points |
|---|---|
| **Historical** | |
| Age ≥65 yr | 1 |
| ≥3 risk factors for CAD | 1 |
| Known CAD (stenosis ≥50%) | 1 |
| Aspirin® use in past 7 d | 1 |
| **Presentation** | |
| Recent (≤24 h) severe angina | 1 |
| ST-segment deviation ≥0.5 mm | 1 |
| Increased cardiac markers | 1 |

Risk Score = Total Points
If TIMI risk score ≥3, consider early LMWH and angiography
TIMI = thrombolysis in myocardial infarction
UA = unstable angina
JAMA 2000;284:835-842

Newer, more accurate risk quantification scores for UA/NSTEMI exist, such as the GRACE Risk Score; however, TIMI is still used most often

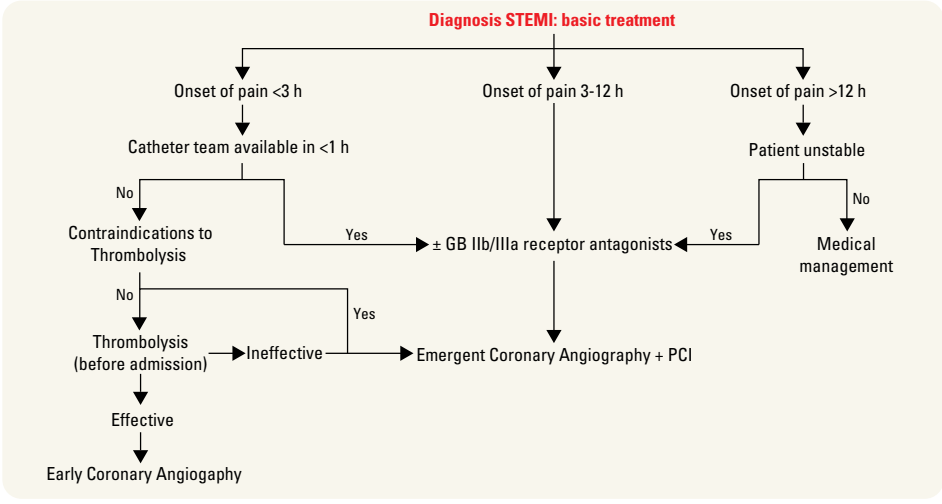

**Figure 36. Reperfusion strategy in STEMI**

**Table 8. Contraindications for Thrombolysis in STEMI**

| Absolute | Relative |
|---|---|
| Prior intracranial hemorrhage | Chronic, severe, poorly controlled HTN |
| Known structural cerebral vascular lesion | Uncontrolled HTN (sBP >180, dBP >110) |
| Known malignant intracranial neoplasm | Current anticoagulation |
| Significant closed-head or facial trauma (≤3 mo) | Noncompressible vascular punctures |
| Ischemic stroke (≤3 mo) | Ischemic stroke (≥3 mo) |
| Active bleeding | Recent internal bleeding (≤2-4 wk) |
| Suspected aortic dissection | Prolonged CPR or major surgery (≤3 wk) |
| | Pregnancy |
| | Active peptic ulcer disease |

## Long-Term Management of ACS

- risk of progression to MI or recurrence of MI or death is highest within 1 mo
- at 1-3 mo after the acute phase, most patients resume a clinical course similar to that in patients with chronic stable coronary disease
- pre-discharge workup: ECG and echo to assess residual LV systolic function
- drugs required in hospital to control ischemia should be continued after discharge in all patients
- other medications for long-term management of ACS are summarized below

**1. General Measures**
- education
- risk factor modification

**2. Antiplatelet and Anticoagulation Therapy**
- see also *CCS Antiplatelet Guidelines 2012* for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
- ECASA 81 mg daily
- ticagrelor 90 mg twice daily or prasugrel 10 mg daily (at least 1 mo, up to 9-12 mo, if stent placed at least 12 mo)
- clopidogrel 75 mg daily can be used as alternatives to ticagrelor and prasugrel when indicated
- ± warfarin x 3 mo if high risk (large anterior MI, LV thrombus, LVEF <30%, history of VTE, chronic AFib)

**3. β-Blockers** (e.g. metoprolol 25-50 mg bid or atenolol 50-100 mg daily)

**4. Nitrates**
- alleviate ischemia but do not improve outcome
- use with caution in right-sided MI patients who have become preload dependent

**5. Calcium Channel Blockers** (NOT recommended as first line treatment, consider as alternative to β-blockers)

**6. Angiotensin-Converting Enzyme Inhibitors**
- prevent adverse ventricular remodelling
- recommended for asymptomatic high-risk patients (e.g. diabetics), even if LVEF >40%
- recommended for symptomatic CHF, reduced LVEF (<40%), anterior MI
- use ARBs in patients who are intolerant of ACEI; avoid combining ACEI and ARB

**7. ± Aldosterone Antagonists**
- if on ACEI and β-blockers and LVEF <40% and CHF or DM
- significant mortality benefit shown with eplerenone by 30 d

**8. Statins** (early, intensive, irrespective of cholesterol level; e.g. atorvastatin 80 mg daily)

**9. Invasive Cardiac Catheterization if indicated** (risk stratification)

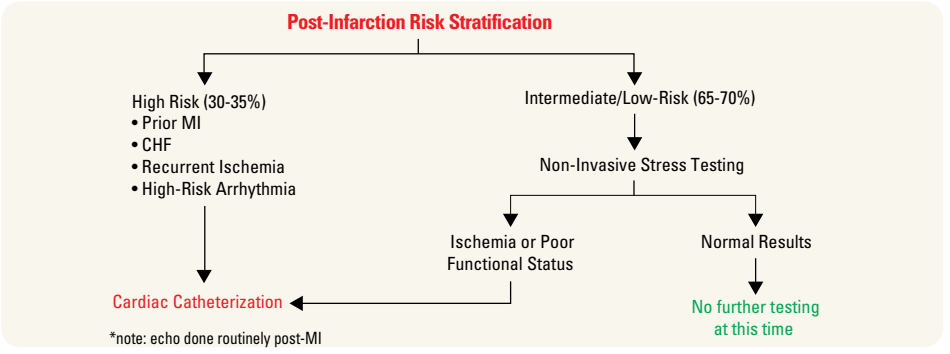

**Figure 37. Post-MI risk stratification**

## Prognosis following STEMI

- 5-15% of hospitalized patients will die
  - risk factors
    - infarct size/severity
    - age
    - comorbid conditions
    - development of heart failure or hypotension
- post-discharge mortality rates
  - 6-8% within first year, half of these within first 3 mo
  - 4% per year following first yr
  - risk factors
    - LV dysfunction
    - residual myocardial ischemia
    - ventricular arrhythmias
    - history of prior MI

**Table 9. Complications of Myocardial Infarction**

| Complication | Etiology | Presentation | Therapy |
|---|---|---|---|
| Arrhythmia | | | See *Arrhythmias*, C16 |
| 1. Tachycardia | Sinus, AFib, VT, VFib | First 48 h | |
| 2. Bradycardia | Sinus, AV block | First 48 h | |
| Myocardial Rupture | | | |
| 1. LV free wall | Transmural infarction | 1-7 d | Surgery |
| 2. Papillary muscle (→ MR) | Inferior infarction | 1-7 d | Surgery |
| 3. Ventricular septum (→ VSD) | Septal infarction | 1-7 d | Surgery |
| Shock/CHF | Infarction or aneurysm | Within 48 h | Inotropes, intra-aortic balloon pump |
| Post-Infarct Angina | Persistent coronary stenosis<br>Multivessel disease | Anytime | Aggressive medical therapy<br>PCI or CABG |
| Recurrent MI | Reocclusion | Anytime | Aggressive medical therapy<br>PCI or CABG |
| Thromboembolism | Mural/apical thrombus<br>DVT | 7-10 d, up to 6 mo | Anticoagulation |
| Pericarditis | Inflammatory | 1-7 d | ASA |
| Dressler's Syndrome | Autoimmune | 2-8 wk | |

**Is this Patient Having a Myocardial Infarction? From The Rational Clinical Examination**
JAMA 2009; http://www.jamaevidence.com/content/3484335
**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of an acute myocardial infarction.
**Results:** In patients with normal or non-diagnostic ECG, no established CAD, and prolonged or recurrent chest pain typical of their usual discomfort, radiation of pain to the shoulder OR both arms had the highest positive likelihood ratio (+LR) of 4.1 (95% CI 2.5-6.5) and a negative likelihood ratio (-LR) of 0.68 (95% CI 0.52-0.89). Radiation to right arm had a +LR of 3.8 (95% CI 2.2-6.6) and –LR of 0.86 (95% CI 0.77-0.96), vomiting had a +LR of 3.5 (95% CI 2.0-6.2) and –LR of 0.87 (95% CI 0.79-0.97), while radiation to left arm only had a +LR of 1.3 (95% CI 0.93-1.8) and a –LR of 0.9 (95% CI 0.76-1.1).
**Conclusions:** The most compelling features that increase likelihood of an MI are ST-segment and cardiac enzyme elevation, new Q-wave, and presence of an S3 heart sound. In patients where the diagnosis of MI is uncertain, radiation of pain to the shoulder OR both arms, radiation to the right arm, and vomiting had the best predictive values, while radiation to the left arm is relatively non-diagnostic.

**Complications of MI**

**CRASH PAD**
**C**ardiac **R**upture
**A**rrhythmia
**S**hock
**H**ypertension/Heart failure
**P**ericarditis/Pulmonary emboli
**A**neurysm
**D**VT

Resting LVEF is a useful prognostic factor

**Enoxaparin vs. Unfractionated Heparin with Fibrinolysis for ST-elevation Myocardial Infarction**
NEJM 2006;354:1477-1488
**Study:** Prospective multicentre RCT.
**Patients:** 20,479 patients (median age 60 yr, 77% male) with STEMI who were scheduled to undergo fibrinolysis.
**Intervention:** Patients were randomized to receive either enoxaparin or weight based unfractionated heparin in addition to thrombolysis and standard therapies.
**Primary Outcome:** Death or recurrent nonfatal MI 30 d post-event.
**Results:** The composite primary outcome occurred less often in the enoxaparin group compared with those who received unfractionated heparin (9.9% vs. 12.0%, p<0.001, NNT=47). Taken separately, there was a trend toward reduced mortality (6.9% vs. 7.5%, p=0.11) and a significant reduction in nonfatal reinfarction (3.0% vs. 4.5%, p<0.001) in the enoxaparin group. The risk of major bleeding was significantly increased in the enoxaparin group (2.1% vs. 1.4%, p<0.001, NNH=142).
**Conclusion:** In patients with STEMI receiving thrombolysis, enoxaparin is superior to unfractionated heparin in preventing recurrent nonfatal MI and may lead to a small reduction in mortality.

# Treatment Algorithm for Chest Pain

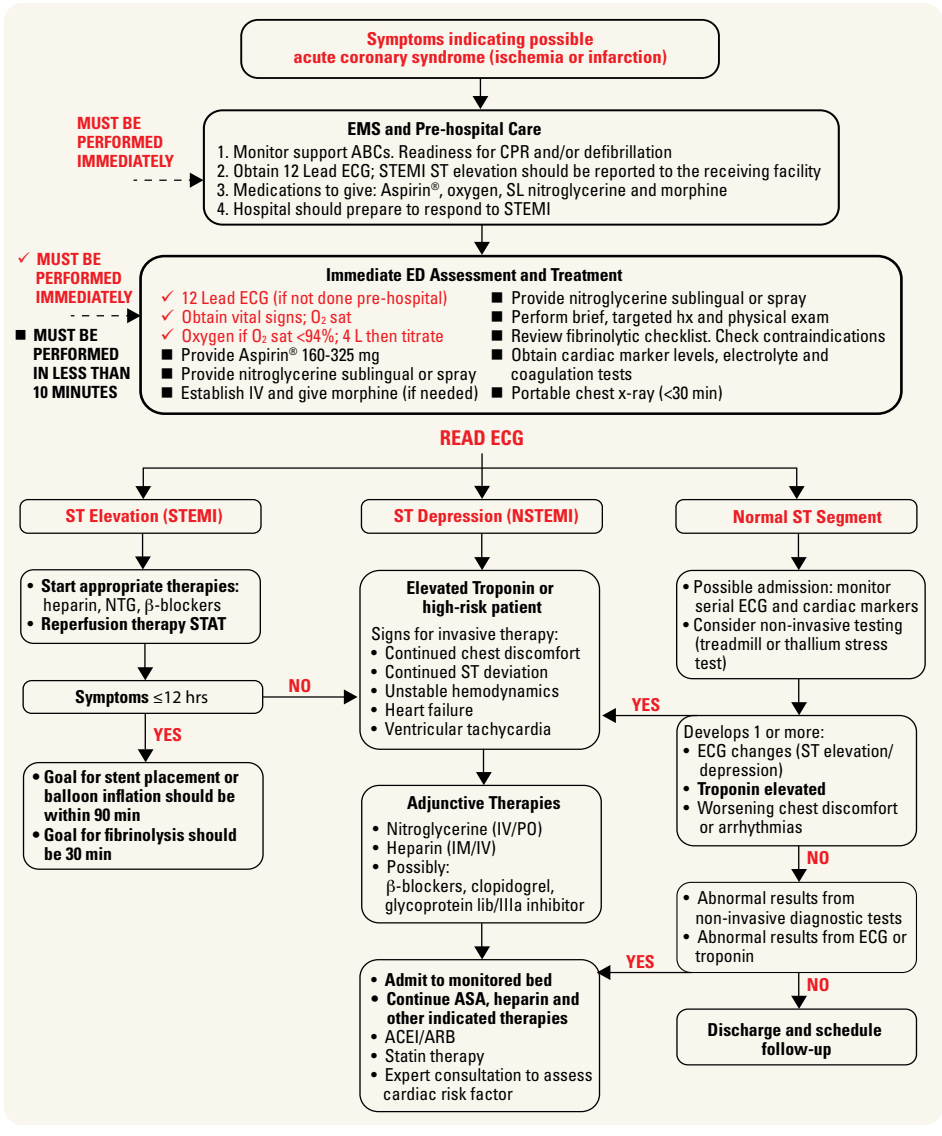

**Figure 38. AHA ACLS acute coronary syndrome algorithm**
Adapted from: Jeffery Media Productions 2016. Amsterdam EA, Wenger NK, Brindis RG, et al. 2014 AHA/ACC guideline for the management of patients with non-ST-elevation acute coronary syndromes. Circulation. 2014 Jan 1:CIR-0000000000000134

**Intensive vs. Moderate Lipid Lowering with Statins after Acute Coronary Syndromes**
NEJM 2004;350:1495-1504
**Study:** Prospective, double blind, RCT; mean follow-up of 2 yr.
**Population:** 4162 patients who had been hospitalized for an ACS within the preceding 10 d.
**Intervention:** Patients were randomized to receiving pravastatin 40 mg or atorvastatin 80 mg daily.
**Primary Outcome:** Composite of death from any cause, myocardial infarction, documented unstable angina requiring rehospitalization, revascularization (performed at least 30 d after randomization), and stroke.
**Results:** High dose atorvastatin was associated with a 16% hazard ratio reduction (p=0.005; 95% CI 5-26%) in the primary outcome compared to standard dose pravastatin.
**Conclusions:** In patients who recently experienced an ACS, high dose statin therapy provides greater protection against death and major cardiovascular events than standard dose therapy.

# Coronary Revascularization

## PERCUTANEOUS CORONARY INTERVENTION

- interventional cardiology technique aimed at relieving significant coronary stenosis
- main techniques: balloon angioplasty, stenting
- less common techniques: rotational/directional/extraction atherectomy

### Indications

- medically refractory angina
- NSTEMI/UA with high risk features (e.g. high TIMI risk score)
- primary/rescue PCI for STEMI

### Balloon Angioplasty and Intracoronary Stenting

- coronary lesions dilated with balloon inflation
- major complication is restenosis (approximately 15% at 6 mo), felt to be due to elastic recoil and neointimal hyperplasia
- majority of patients receive intracoronary stent(s) to prevent restenosis
  - bare metal stent (BMS) versus drug-eluting stents: PRAMI trial demonstrated stenting non-culprit lesions results in 14% absolute risk reduction of cardiac death, nonfatal MI, or refractory angina
  - coated with antiproliferative drugs (sirolimus, paclitaxel, everolimus)
  - reduced rate of neointimal hyperplasia and restenosis compared to BMS (5% vs. 20%)
  - complication: late stent thrombosis (5 events per 1000 stents implanted)

**Treatment of NSTEMI**

**BEMOAN**
β-blocker
**E**noxaparin
**M**orphine
**O**$_2$
**A**SA
**N**itrates

### Adjunctive Therapies
- ASA and heparin decrease post-procedural complications
- further reduction in ischemic complications has been demonstrated using GPIIb/IIIa inhibitors (abciximab, eptifibatide, tirofiban) in coronary angiography and stenting
- following stent implantation
  - dual antiplatelet therapy (ASA and clopidogrel) for 1 mo with BMS or ≥12 mo with DES
  - DAPT study showed benefit of dual antiplatelet therapy beyond 12 mo
  - ASA and prasugrel can be considered for those at increased risk of stent thrombosis

### Procedural Complications
- mortality and emergency bypass rates <1%
- nonfatal MI: approximately 2-3%

## CORONARY ARTERY BYPASS GRAFT SURGERY
- objective of CABG is complete reperfusion of the myocardium

### Indications
- CABG
  - ≥50% diameter stenosis in the left main coronary artery
  - ≥70% diameter stenosis in three major coronary arteries
  - ≥70% diameter stenosis in the proximal LAD artery plus one other major coronary artery
  - survivors of sudden cardiac arrest with presumed ischemia-mediated VT caused by significant (≥70% diameter) stenosis in a major coronary artery
- other
  - ≥70% diameter stenosis in two major coronary arteries (without proximal LAD disease) and evidence of extensive ischemia
  - ≥70% diameter stenosis in the proximal LAD artery and evidence of extensive ischemia
  - multivessel CAD in patients with diabetes
  - LV systolic dysfunction (LVEF 35% to 50%) and significant multivessel CAD or proximal LAD stenosis where viable myocardium is present in the region of intended revascularization
- PCI
  - UA/NSTEMI if not a CABG candidate
  - STEMI when PCI can be performed more rapidly and safely than CABG
- CABG or PCI
  - one or more significant (≥70% diameter) coronary artery stenosis amenable to revascularization and unacceptable angina despite medical therapy

**Duration of Triple Therapy in Patients Required Oral Anticoagulation (OAC) After Drug-Eluting Stent Implantation: The ISAR-TRIPLE Trial.**
Journal of the American College of Cardiology 66.9 (2015):1088-1089
**Study**: RCT comparing whether shortening the duration of clopidogrel therapy from 6 mo to 6 wk after DES implantation was associated with superior net clinical outcome in patients receiving concomitant aspirin and OAC.
**Population**: 614 patients from 3 European centres receiving DES implantation on OAC and aspirin.
Intervention: 6 wk vs. 6 mo clopidogrel therapy post-DEC.
**Outcome**: Death, myocardial infarction, definite stent thrombosis, stroke, thrombolysis in myocardial infraction major bleeding at 9 mo
**Results**: Primary endpoint occurred in 9.8% in 6 wk group vs. 27 patients in 6 mo group (HR: 1.14; 95% CI: 0.68-1.91; p-0.63)
**Conclusions**: Six weeks of triple therapy is not superior to 6 mo. Physician should weigh trade-off between ischemic and bleeding risk when choosing shorter or longer duration of triple therapy.

**Table 10. Choice of Revascularization Procedure**

| | PCI | CABG |
|---|---|---|
| **Advantages** | Less invasive technique<br>Decreased periprocedural morbidity and mortality<br>Shorter periprocedural hospitalization | Greater ability to achieve complete revascularization<br>Decreased need for repeated revascularization procedures |
| **Indications** | Single or double-vessel disease<br>Inability to tolerate surgery | Triple-vessel or left main disease<br>DM<br>Plaque morphology unfavourable for PCI |

**Table 11. Conduits for CABG**

| Graft | Occlusion/Patency Rate | Considerations |
|---|---|---|
| **Saphenous Vein Grafts (SVG)** | At 10 yr, 50% occluded, 25% stenotic, 25% angiographically normal | Used when arterial grafts are not available or many grafts are required, such as triple or quadruple bypass |
| **Left Internal Thoracic/Mammary Artery (LITA/LIMA) (LIMA to LAD)** | 90-95% patency at 15 yr | Most preferred option because of excellent patency<br>Improved event-free survival (angina, MI)<br>Decreased late cardiac events<br>No increase in operative risk |
| **Right Internal Thoracic/ Mammary Artery (RITA/RIMA)** | Pedicled RIMA patency comparable to LIMA<br>Free RIMA patency less | Used in bilateral ITA/IMA grafting<br>Patients receiving bilateral ITAs/IMAs have less risk of recurrent angina, late MI, angioplasty |
| **Radial Artery (free graft)** | 85-90% patency at 5 yr | Prone to severe vasospasm post-operatively due to muscular wall |
| **Right Gastroepiploic Artery** | 80-90% patency at 5 yr | Primarily used as an in situ graft to bypass the RCA<br>Use limited because of the fragile quality of the artery, other technical issues, increased operative time (laparotomy incision), and incisional discomfort with associated ileus |
| **Complete Arterial Revascularization** | | For younger patients (<60 yr of age)<br>Is preferred due to longer term graft patency |
| **Redo Bypass Grafting** | | Operative mortality 2-3x higher than first operation<br>10% perioperative MI rate<br>Reoperation undertaken only in symptomatic patients who have failed medical therapy and in whom angiography has documented progression of the disease<br>Increased risk with redo-sternotomy secondary to adhesions which may result in laceration to aorta, RV, IMA/ITA, and other bypass grafts |

**Percutaneous Coronary Intervention vs. Coronary-Artery Bypass Grafting for Severe Coronary Artery Disease: The SYNTAX Trial**
NEJM 2009;360;961-972
**Study:** Prospective RCT.
**Population:** 1800 patients with untreated three-vessel or left main coronary artery disease and anatomically equivalent for both Percutaneous Intervention (PCI) and Coronary Artery Bypass Graft (CABG).
**Intervention:** PCI vs. CABG.
**Outcome:** Composite of death from any cause, stroke, MI, or repeat revascularization in 12 mo post-intervention.
**Results:** Incidence of primary outcome was lower in the CABG intervention vs. PCI (12.4% vs. 17.8%, p=0.002, NNT=19). PCI was associated with significantly higher rates of repeat revascularization (13.5% vs. 5.9%, p<0.001) and cardiac death (3.7% vs. 2.1%, p=0.05), while CABG had higher rates of stroke (2.2% vs. 0.6%, p=0.03).
**Conclusions:** In patients with three-vessel or left main coronary artery disease CABG is superior to PCI in preventing major adverse cardiovascular and cerebrovascular events within 12 mo of intervention.

### Operative Issues
- left ventricular (LV) function is an important determinant of outcome of all heart diseases
- patients with severe LV dysfunction usually have poor prognosis, but surgery can sometimes dramatically improve LV function
- assess viability of non-functioning myocardial segments in patients with significant LV dysfunction using delayed thallium myocardial imaging, stress echocardiography, PET scanning, or MRI

### CABG and Antiplatelet Regimens
- refer to CCS guidelines – 2012 update on antiplatelet therapy – for more information
- prior to CABG, clopidogrel, and ticagrelor should be discontinued for 5 d and prasugrel for 7 d before surgery
- dual antiplatelet therapy should be continued for 12 mo in patients with ACS within 48-72 h after CABG
- ASA (81 mg) continued indefinitely (can be started 6 h after surgery)
- patients requiring CABG after PCI should continue their dual antiplatelet therapy as recommended in the post-PCI guidelines

**Table 12. Risk Factors for CABG Mortality and Morbidity (decreasing order of significance)**

| Risk Factors for CABG Mortality | Risk Factors for CABG Post-Operative Morbidity or Increased Length of Stay |
|---|---|
| Urgency of surgery (emergent or urgent) | Reoperation |
| Reoperation | Emergent procedure |
| Older age | Pre-operative intra-aortic balloon pump (IABP) |
| Poor left ventricular function (see below) | CHF |
| Female gender | CABG + valve surgery |
| Left main disease | Older age |
| Others include catastrophic conditions (cardiogenic shock, ventricular septal rupture, ongoing CPR), dialysis-dependent renal failure, end-stage COPD, DM, cerebrovascular disease, and peripheral vascular disease | Renal dysfunction<br>COPD<br>DM<br>Cerebrovascular disease |

**Safety and Efficacy of Drug-Eluting and Bare Metal Stents**
Circulation 2009;119;3198-3206
**Study:** Meta-analysis of RCTs and observational studies. 22 RCTs and 34 observational studies.
**Population:** 9470 and 182,901 patients in RCTs and observational studies respectively who underwent percutaneous coronary intervention.
**Intervention:** Drug-Eluting Stents (DES) versus Bare Metal Stents (BMS).
**Outcome:** All-cause mortality, myocardial infarction (MI), and target vessel revascularization (TVR).
**Results:** No difference in mortality was found between DES vs. BMS by RCTs, while observational studies showed significantly lower mortality rates in DES-treated patients (hazard ratio (HR) 0.78, p<0.001). No difference in MI incidence was found in RCTs, while lower incidences of MI were found in observational studies (HR 0.87, p=0.014). DES has a significantly lower TVR rate in both RCT (HR 0.45, p<0.001) and observational studies (HR 0.46, p<0.001).
**Conclusions:** DES significantly reduces rates of TVR compared to BMS. Although there is no difference in mortality or MI incidence as found by RCTs, observational studies suggest lowered mortality and MI rates in patients with DES over BMS.

### Procedural Complications
- CABG using cardiopulmonary bypass (CPB)
  - stroke and neurocognitive defects (microembolization of gaseous and particulate matter)
  - immunosuppression
  - systemic inflammatory response leading to:
    - myocardial dysfunction
    - renal dysfunction
    - neurological injury
    - respiratory dysfunction
    - coagulopathies

## OFF-PUMP CORONARY ARTERY BYPASS SURGERY

### Procedure
- avoids the use of CPB by allowing surgeons to operate on a beating heart
  - stabilization devices (e.g. Genzyme Immobilizer®) hold heart in place allowing operation while positioning devices (Medtronic Octopus® and Starfish® system) allow the surgeon to lift the beating heart to access the lateral and posterior vessels
  - procedure is safe and well tolerated by most patients; however, this surgery remains technically more demanding

### Indications/Contraindications
- used in poor candidates for CPB who have: calcified aorta, poor LVEF, severe peripheral vascular disease (PVD), severe COPD, chronic renal failure, coagulopathy, transfusion objections (e.g. Jehovah's Witness), good target vessels, anterior/lateral wall revascularization, target revascularization in older, sicker patients
- **absolute contraindications**: hemodynamic instability, poor quality target vessels including intramyocardial vessels, diffusely diseased vessels, and calcified coronary vessels
- **relative contraindications**: cardiomegaly/CHF, critical left main disease, small distal targets, recent or current acute MI, cardiogenic shock, LVEF <35%

### Outcomes
- off-pump coronary artery bypass (OPCAB) surgery decreases in-hospital morbidity (decreased incidence of chest infection, inotropic requirement, supraventricular arrhythmia), blood product transfusion, ICU stay, length of hospitalization, and CK-MB and troponin I levels
- no significant difference in terms of survival at 2 yr, frequency of cardiac events (MI, PCI, CHF, recurrent angina, redo CABG), or medication usage compared to on-pump CABG

# Heart Failure

- see also *CCS Heart Failure Guidelines 2012* for details (free mobile apps available on iOS and Android platforms in the CCS app stores) as well as the CCS Heart Failure Guidelines Compendium available at CCS.ca

## Congestive Heart Failure

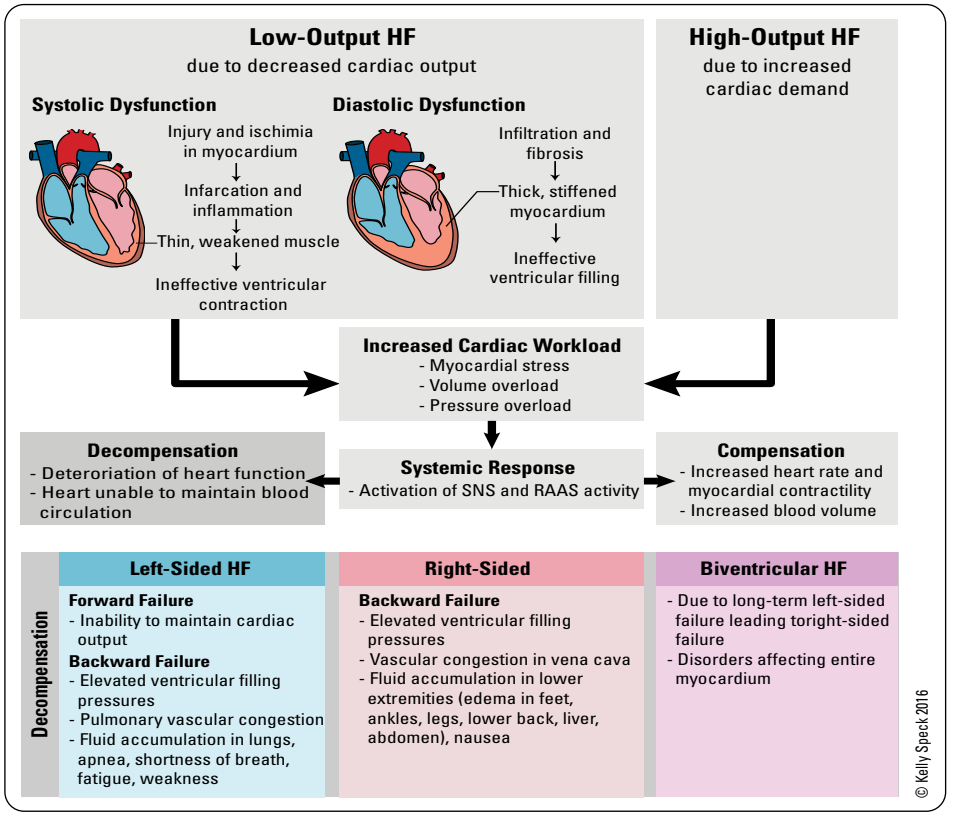

**Figure 39. Congestive heart failure**

**Table 13. Signs and Symptoms of Left vs. Right Heart Failure**

| | Left Failure | Right Failure |
|---|---|---|
| **Low Cardiac Output (Forward)** | Fatigue<br>Syncope<br>Systemic hypotension<br>Cool extremities<br>Slow capillary refill<br>Peripheral cyanosis<br>Pulsus alternans<br>Mitral regurgitation<br>S3 | Left failure symptoms if decreased RV output leads to LV underfilling<br>Tricuspid regurgitation<br>S3 (right-sided) |
| **Venous Congestion (Backward)** | Dyspnea, orthopnea, PND<br>Cough<br>Crackles | Peripheral edema<br>Elevated JVP with abdominojugular reflux, and ± Kussmaul's sign<br>Hepatomegaly<br>Pulsatile liver |

### Pathophysiology

- most common causes are ischemic heart disease, hypertension and valvular heart disease
- myocardial insult causes pump dysfunction/impaired filling leading to myocardial remodelling
  - pressure overload (e.g. AS or HTN) leads to compensatory hypertrophy (i.e. concentric remodelling) and eventually interstitial fibrosis
  - volume overload (e.g. aortic insufficiency) leads to dilatation (i.e. eccentric remodelling)
  - both processes lead to maladaptive changes contributing to disease process
- results in decreased volume cardiac output resulting in activation of the SNS and RAAS
- $Na^+$ and water retention, which increase preload and afterload, and tachycardia perpetuate the cycle of increasing cardiac demand and thus decompensation

**Does this Dyspneic Patient in the Emergency Department have Congestive Heart Failure?**
JAMA 2005;294:1944-1956

| | LR + (95% CI) | LR – (95% CI) |
|---|---|---|
| Initial clinical judgment | 4.4 (1.8-10.0) | 0.45 (0.28-0.73) |
| **Past Medical History** | | |
| Heart failure | 5.8 (4.1-8.0) | 0.45 (0.38-0.53) |
| Myocardial infarction | 3.1 (2.0-4.9) | 0.69 (0.58-0.82) |
| Coronary artery disease | 1.8 (1.1-2.8) | 0.68 (0.48-0.96) |
| **Symptoms** | | |
| Paroxysmal nocturnal dyspnea | 2.6 (1.5-4.5) | 0.7 (0.54-0.91) |
| Orthopnea | 2.2 (1.2-3.9) | 0.65 (0.45-0.92) |
| Dyspnea on exertion | 1.3 (1.2-1.4) | 0.48 (0.35-0.67) |
| **Physical Exam** | | |
| Third heart sound | 11 (4.9-25) | 0.88 (0.83-0.94) |
| Jugular venous distension | 5.1 (3.2-7.9) | 0.66 ( 0.57-0.77) |
| Rales | 2.8 (1.9-4.1) | 0.51 (0.37-0.70) |
| Lower extremity edema | 2.3 (1.5-3.7) | 0.64 (0.47-0.87) |
| **Chest Radiograph** | | |
| Pulmonary venous congestion | 12 (6.8-21) | 0.48 (0.28-0.83) |
| Interstitial edema | 12 (5.2-27) | 0.68 (0.54-0.85) |
| Cardiomegaly | 3.3 (2.4-4.7) | 0.33 (0.23-0.48) |
| **ECG** | | |
| Atrial fibrillation | 3.8 (1.7-8.8) | 0.79 (0.65-0.96) |
| Any abnormal finding | 2.2 (1.6-3.1) | 0.64 (0.47-0.88) |

**Dichotomies of Heart Failure**
- Forward vs. backward
- Left-sided vs. right-sided
- Systolic vs. diastolic dysfunction
- Low output vs. high output

**Use Ejection Fraction to Grade LV Dysfunction**
- Grade I (EF >60%) (Normal)
- Grade II (EF = 40-59%)
- Grade III (EF = 21-39%)
- Grade IV (EF ≤20%)

## Heart Failure with Reduced Ejection Fraction (HFREF: LVEF ≤40%)

- impaired myocardial contractile function → decreased LVEF and SV → decreased CO
- volume overload is the typical phenotype
- findings: apex beat displaced, S3, cardiothoracic ratio >0.5, decreased LVEF, LV dilatation
- causes
  - ischemic (e.g. extensive CAD, previous MI)
  - non-ischemic
    - HTN
    - DM
    - alcohol (and other toxins)
    - myocarditis
    - dilated cardiomyopathy (multiple causes – see *Dilated Cardiomyopathy*, C40)
    - tachycardia-induced

## Heart Failure with Mid-range Ejection Fraction (HF-mrEF: LVEF 41-49%)

- epidemiological studies are currently being conducted to better characterize clinical management of this group
- causes: strong association with CAD

## Heart Failure with Preserved Ejection Fraction (HFPEF: LVEF ≥50%)

- previously known as "diastolic heart failure"
- concentric remodelling with a "stiff" left ventricle is the typical phenotype
- 1/2 of patients with heart failure have preserved EF; confers similar prognosis to HFREF; more common in the elderly and females
- reduced LV compliance causes increased LV filling pressures, increased LA pressure/volume, and pulmonary congestion
- findings: HTN, apex beat sustained, S4, normal-sized heart on CXR, LVH on ECG/echo, normal EF
- causes
  - transient: ischemia (e.g. CAD, MI)
  - permanent: severe hypertrophy (HTN, aortic stenosis, HCM), restrictive cardiomyopathy (e.g. amyloid), MI

## High-Output Heart Failure

- caused by demand for increased cardiac output
- often exacerbates existing heart failure or decompensates a patient with other cardiac pathology
- differential diagnosis: anemia, thiamine deficiency (beriberi), hyperthyroidism, A-V fistula or L-R shunting, Paget's disease, renal disease, hepatic disease

## Precipitants of Symptomatic Exacerbations

- consider natural progression of disease vs. new precipitant
- always search for reversible cause
- differential diagnosis can also be organized as follows:
  - new cardiac insult/disease: MI, arrhythmia, valvular disease
  - new demand on CV system: HTN, anemia, thyrotoxicosis, infection
  - medication non-compliance
  - dietary indisretion e.g. salt intake
  - obstructive sleep apnea

## Investigations

- identify and assess precipitating factors and treatable causes of CHF
- blood work: CBC, electrolytes (including calcium and magnesium), BUN, creatinine, fasting blood glucose, HbA1c, lipid profile, liver function tests, serum TSH ± ferritin, BNP, uric acid
- ECG: look for chamber enlargement, arrhythmia, ischemia/infarction
- CXR: cardiomegaly, pleural effusion, redistribution, Kerley B lines, bronchiolar-alveolar cuffing
- echo: systolic function (LVEF), diastolic function (E/A ratio, E/e'), cardiac dimensions, wall motion abnormalities, right ventricular systolic pressure (from TR jet), valvular disease, pericardial effusion
- radionuclide angiography: LVEF
- myocardial perfusion scintigraphy (thallium or sestamibi SPECT)

## Acute Treatment of Pulmonary Edema

- treat acute precipitating factors (e.g. ischemia, arrhythmias)
- **L** – Lasix® (furosemide) 40-500 mg IV
- **M** – morphine 2-4 mg IV: decreases anxiety and preload (venodilation)
- **N** – nitroglycerin: topical/IV/SL - use with caution in preload-dependent patients (e.g. right HF or RV infarction) as it may precipitate CV collapse
- **O** – oxygen: in hypoxemic patients
- **P** – positive airway pressure (CPAP/BiPAP): decreases preload and need for ventilation when appropriate
- **P** – position: sit patient up with legs hanging down unless patient is hypotensive

**A Validated Clinical and Biochemical Score for the Diagnosis of Acute Heart Failure: the ProBNP Investigation of Dyspnea in the Emergency Department (PRIDE) Acute Heart Failure Score**
Am Heart J 2006;151:48-54

| Predictor | Possible Score |
|---|---|
| Age >75 yr | 1 |
| Orthopnea present | 2 |
| Lack of cough | 1 |
| Current loop diuretic use (before presentation) | 1 |
| Rales on lung exam | 1 |
| Lack of fever | 2 |
| Elevated NT-proBNP (>450 pg/mL if <50 yr, >900 pg/mL if >50 yr) | 4 |
| Interstitial edema on chest x-ray | 2 |
| Total | /14 |

Likelihood of heart failure
Low = 0-5
Intermediate = 6-8
High = 9-14

Brain natieuretic peptide (BNP) is secreted by ventricles due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into ventricles, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP. The above scoring algorithm developed by Baggish et al. is commonly used. A score of <6 has a negative predictive value of 98%, while scores ≥6 had a sensitivity of 96% and specificity of 84% (p<0.001) for the diagnosis of acute heart failure.

**New York Heart Association (NYHA) Functional Classification of Heart Failure**

- **Class I:** ordinary physical activity does not cause symptoms of HF
- **Class II:** comfortable at rest, ordinary physical activity results in symptoms
- **Class III:** marked limitation of ordinary activity; less than ordinary physical activity results in symptoms
- **Class IV:** inability to carry out any physical activity without discomfort; symptoms may be present at rest

**Five Most Common Causes of CHF**

- CAD (60-70%)
- HTN
- Idiopathic (often dilated cardiomyopathy)
- Valvular (e.g. AS, AR, and MR)
- Alcohol (dilated cardiomyopathy)

**Precipitants of Heart Failure**

**HEART FAILED**
**H**ypertension (common)
**E**ndocarditis/environment (e.g. heat wave)
**A**nemia
**R**heumatic heart disease and other valvular disease
**T**hyrotoxicosis
**F**ailure to take meds (very common)
**A**rrhythmia (common)
**I**nfection/Ischemia/Infarction (common)
**L**ung problems (PE, pneumonia, COPD)
**E**ndocrine (pheochromocytoma, hyperaldosteronism)
**D**ietary indiscretions (common)

- in ICU setting or failure of LMNOPP: other interventions may be necessary
  - nitroprusside IV
  - hydralazine PO
  - sympathomimetics
    - dopamine
      - low dose: selective renal vasodilation (high potency D1 agonist)
      - medium dose: inotropic support (medium potency β1 agonist)
      - high dose: increases SVR (low potency β1 agonist), which is undesirable
    - dobutamine
      - β1-selective agonist causing inotropy, tachycardia, hypotension (low dose) or hypertension (high dose); most serious side effect is arrhythmia, especially AF
    - phosphodiesterase inhibitors (milrinone)
      - inotropic effect and vascular smooth muscle relaxation (decreased SVR), similar to dobutamine
- consider pulmonary artery catheter to monitor pulmonary capillary wedge pressure (PCWP) if patient is unstable or a cardiac etiology is uncertain (PCWP >18 indicates likely cardiac etiology)
- mechanical ventilation as needed
- rarely used, but potentially life-saving measures:
  - intra-aortic balloon pump (IABP) - reduces afterload via systolic unloading and improves coronary perfusion via diastolic augmentation
  - left or right ventricular assist device (LVAD/RVAD)
  - cardiac transplant

## Long-Term Management

- overwhelming majority of evidence-based management applies to HFREF
- currently no proven pharmacologic therapies shown to reduce mortality in HFPEF; control risk factors for HFPEF (e.g. hypertension)

## Conservative Measures

- symptomatic measures: oxygen in hospital, bedrest, elevate the head of bed
- lifestyle measures: diet, exercise, DM control, smoking cessation, decrease alcohol consumption, patient education, sodium and fluid restriction
- multidisciplinary heart failure clinics: for management of individuals at higher risk, or with recent hospitalization

## Non-Pharmacological Management

- from CCS guidelines (2017 update)
- cardiac rehabilitation: participation in a structured exercise program for NYHA class I-III after clinical status assessment to improve quality of life (HF-ACTION trial)

## Pharmacological Therapy (* indicates initial therapy)

- **ACEI/ARB***: Renin-angiotensin-aldosterone blockade
  - ACEI: standard of care – slows progression of LV dysfunction and improves survival
    - all symptomatic patients functional class II-IV
    - all asymptomatic patients with LVEF <40%
    - post-MI
  - angiotensin II receptor blockers
    - second-line to ACEI (if ACEI not tolerated), or as adjunct to ACEI if β-blockers not tolerated
      - combination with ACEI is not routinely recommended and should be used with caution as it may precipitate hyperkalemia, renal failure, the need for dialysis (CHARM, ONTARGET)
    - combination angiotensin II receptor blockers with neprilysin inhibitors (ARNI) is a new class of medication that has morbidity and mortality benefit over ACEI alone; it has been recommended to replace ACEI or ARBs for patients who have persistent symptoms (PARADIGM HF)

- **β-blockers***: slow progression and improve survival
  - class I-III with LVEF <40%
  - stable class IV patients
  - carvedilol improves survival in class IV HF (COMET)
  - note: should be used cautiously, titrate slowly because may initially worsen CHF

- **Diuretics***: symptom control, management of fluid overload
  - furosemide (40-500 mg daily) for potent diuresis
  - metolazone may be used with furosemide to increase diuresis
  - furosemide, metolazone, and thiazides oppose the hyperkalemia that can be induced by β-blockers, ACEI, ARBs, and aldosterone antagonists

- **Mineralocorticoid receptor (aldosterone) antagonists**: mortality benefit in symptomatic heart failure and severely depressed ejection fraction
  - spironolactone or eplerenone – for symptomatic heart failure in patients already on ACEI, β-blocker and loop diuretic
  - note: potential for life threatening hyperkalemia
    - monitor $K^+$ after initiation and avoid if Cr >220 μmol/L or $K^+$ >5.2 mmol/L

- **Digoxin and cardiac glycosides**: digoxin improves symptoms and decreases hospitalizations; no effect on mortality
  - indications: patient in sinus rhythm and symptomatic on ACEI or CHF and AFib
  - patients on digitalis glycosides may worsen if these are withdrawn

The most common cause of right heart failure is left heart failure

**Measuring NT-Pro BNP**

BNP is secreted by ventricles due to LV stretch and wall tension

Cardiomyocytes secrete BNP precursor that is cleaved into proBNP

After secretion into ventricles proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP portion

| | NT-proBNP levels (pg/mL) |
|---|---|
| Age | HF very likely |
| <50 | >450 |
| 50-75 | >900 |
| >75 | >1800 |

Limitations: Age, body habitus, renal function, pulmonary embolism

**Features of Heart Failure on CXR**

**HERB-B**
**H**eart enlargement (cardiothoracic ratio >0.50)
Pleural **E**ffusion
**R**e-distribution (alveolar edema)
Kerley **B** lines
**B**ronchiolar-alveolar cuffing

Patients on β-blocker therapy who have acute decompensated heart failure should continue β-blockers where possible (provided they are not in cardiogenic shock or in severe pulmonary edema)

**Can the Clinical Examination Diagnose Left-Sided Heart Failure in Adults?**
**From The Rational Clinical Examination**
JAMA 2009; http://www.jamaevidence.com/content/3478992
**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of CHF.
**Results:** The diagnosis of left ventricular dysfunction in patient after an MI based on the presence of radiographic pulmonary venous congestion with edema, rales one-third up the lung fields in the absence of a chronic pulmonary disease, or a 3rd heart sound had a positive likelihood ratio (+LR) of 3.1 (95% CI 1.7-5.8) and a negative likelihood ratio (-LR) of 0.62 (95% CI 0.46-0.83). In inpatients the combination of clinical findings, ECG, and CXR had a +LR of 2.0 (95% CI 1.6-2.5) and a –LR of 0.41 (95% CI 0.30-0.56). Female sex (+LR, 1.6 [95% CI 1.2-2.2]) and sBP ≥160 mmHg (+LR, 1.8 [95% CI 1.3-2.6]) were most indicative for diastolic dysfunction. Heart rate ≥100/min (+LR 0.43 [95% CI 0.28-0.65]) and left atrial ECG abnormality (+LR 0.42 [95% CI 0.26-0.63]) were most indicative for systolic dysfunction.
**Conclusions:** Patients with signs, symptoms, and risk factors for systolic dysfunction should receive an ECG and CXR. Female sex and sBP ≥160 mmHg are suggestive of diastolic dysfunction; heart rate ≥100/min and left atrial ECG abnormality suggest systolic dysfunction.

- **Antiarrhythmic drugs**: for use in CHF with arrhythmia
  - can use amiodarone, β-blocker, or digoxin
- **Anticoagulants**: warfarin for prevention of thromboembolic events
  - prior thromboembolic event or AFib, presence of LV thrombus on echo
- **Ivabradine**: selective inhibition of the $I_f$ current
  - recommended for CV death and hospitalization prevention in patients with HFREF and symptomatic despite treatment with appropriate doses of guideline-directed medical therapy (GDMT), with a resting HR >70 bpm, in sinus rhythm and a prior HF hospitalization within 12 mo
- **Hydralazine plus isosorbide dinitrate**: symptom control and mortality benefit in black patients with symptomatic HFREF despite GDMT
  - recommended also for HFREF patients with drug intolerance to ACEI and ARB

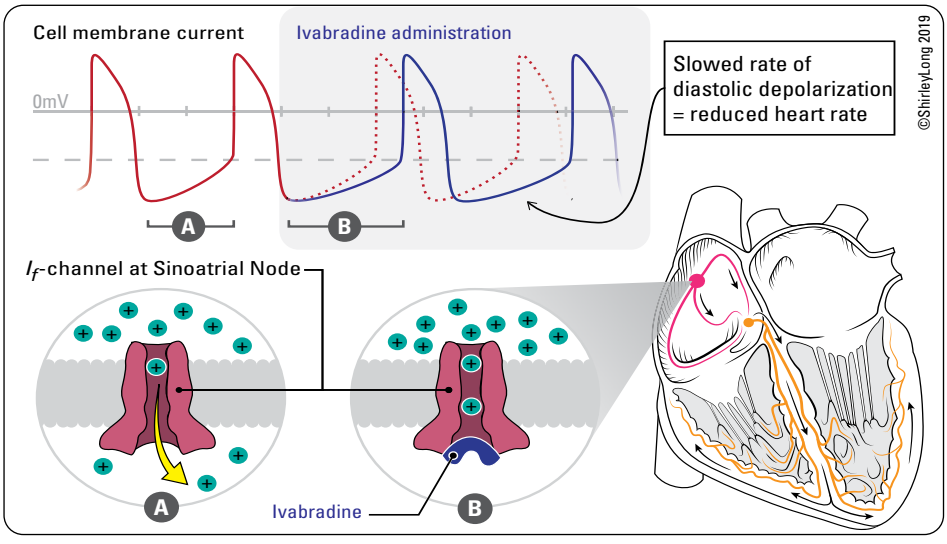

**Figure 40. Ivabradine mechanism of action**

## Procedural Interventions

- resynchronization therapy: symptomatic improvement with biventricular pacemaker
  - consider if QRS >130 msec, LVEF <35%, and persistent symptoms despite optimal therapy
  - greatest benefit likely with marked LV enlargement, mitral regurgitation, QRS >150 msec
- ICD: mortality benefit in 1° prevention of sudden cardiac death
  - prior MI, optimal medical therapy, LVEF <30%, clinically stable
  - prior MI, non-sustained VT, LVEF 30-40%, EPS inducible VT
- LVAD/RVAD (see *Ventricular Assist Devices*, C38)
- cardiac transplantation (see *Cardiac Transplantation*, C38)
- valve repair if patient is surgical candidate and has significant valve disease contributing to CHF (see *Valvular Heart Disease*, C42)

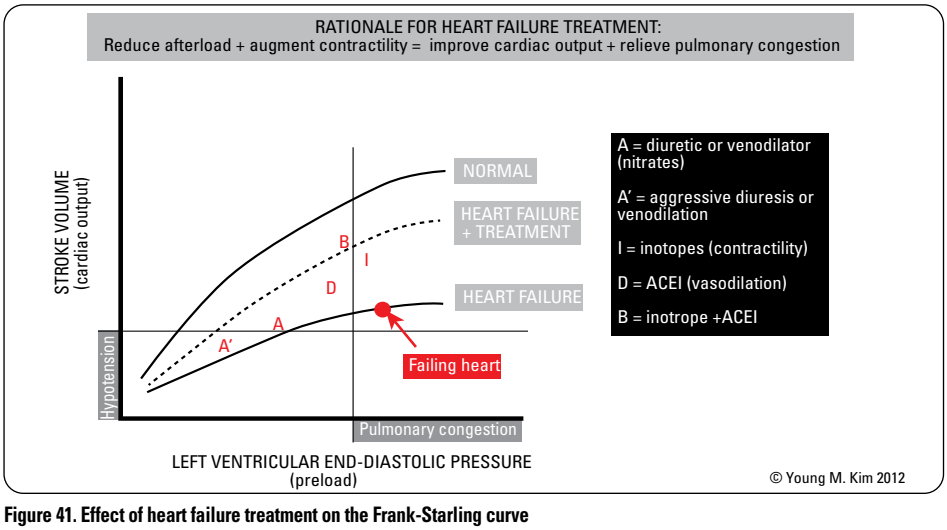

**Figure 41. Effect of heart failure treatment on the Frank-Starling curve**

**Chronic Treatment of CHF**
- ACEI*
- β-blockers*
- ± Mineralocorticoid receptor antagonists*
- Diuretic
- ± Inotrope
- ± Antiarrythmic
- ± Anticoagulant

*Mortality benefit

**Ivabradine and Outcomes in Chronic Heart Failure (SHIFT): A Randomized Placebo-Controlled Study**
Lancet 2010;376:11-17
**Study**: randomised, double-blind, placebo-controlled, parallel-group trial.
**Population**: patients with symptomatic heart failure and LVEF of 35% or lower, in sinus rhythm with HR greater than or equal to 70bpm, had been admitted to hospital for heart failure within previous year, on stable background treatment included beta blocker if tolerated.
**Intervention**: ivabradine titrated to a maximum of 7.5 mg twice daily vs. placebo.
**Outcome**: primary endpoint was composite of cardiovascular death or hospital admission for worsening heart failure.
**Results**: 793 (24%) patients in the ivabradine group and 937 (29%) of those taking placebo had a primary endpoint event (HR 0.82, 95% CI 0.75–0.90, p<0.0001). Fewer serious adverse events occurred in the ivabradine group (3388 events) than in the placebo group (3847; p=0.025). 150 (5%) of ivabradine patients had symptomatic bradycardia vs. 32 (1%) of the placebo group (p<0.0001). Median follow-up was 22.9 (IQR 18–28) months.
**Conclusions**: Results support the importance of heart-rate reduction with ivabradine for improvement of clinical outcomes in heart failure and confirm the important role of heart rate in the pathophysiology of this disorder. Note: Limitation of this study was that only 26% of patients were on target β-blocker doses. Ivabradine currently recommended in these patients when HR is not controlled on maximum tolerated β-blocker dose or there is a contraindication to β-blocker use.

**Higher New York Heart Association Classes and Increased Mortality and Hospitalization in Patients with Heart Failure and Preserved Left Ventricular Function**
Am Heart J 2006;151:444-450
**Purpose**: To establish the association between NYHA class and outcomes with heart failure and preserved systolic function.
**Methods**: Retrospective follow-up study (median 38.5 mo) of 988 patients with heart failure with ejection fracture >45%. Estimated risks of various outcomes using Cox proportional hazard models.
**Results**: Adjusted hazard ratio for all-cause mortality for NYHA class II, III, IV patients was 1.54, 2.56, and 8.46, respectively. Adjusted hazard ratio for all-cause hospitalization for NYHA class II, III, IV patients was 1.23, 1.71, and 3.4, respectively.
**Conclusions**: Higher NYHA classes were associated with poorer outcomes in patients with heart failure and preserved systolic function. Proportions of NYHA I, II, III, and IV patients who died of all causes during the study were 14.3%.

| NYHA | Proportion of All-Cause Hospitalization | Proportion of All-Cause Mortality |
|---|---|---|
| I | 60.7% | 14.3% |
| II | 65.2% | 21.3% |
| III | 77.7% | 35.9% |
| IV | 75.0% | 58.3% |

# Sleep-Disordered Breathing

- patients with CHF can have sleep disturbances; 40% of patients have central sleep apnea with Cheyne-Stokes breathing and 11% of patients have obstructive sleep apnea
- associated with a worse prognosis and greater LV dysfunction
- nasal continuous positive airway pressure (CPAP) is effective in treating symptoms of sleep apnea with secondary beneficial effects in cardiac function and symptoms

# Cardiac Transplantation

- treatment for end-stage heart disease; due to ischemic or non-ischemic cardiomyopathy
- worldwide 1 yr survival is 85-90%, 5 yr survival about 60%, annual mortality rate of 4%
- matching is according to blood type, body size and weight (should be within 25%), and HLA tissue matching (if time allows)

**Effects of Donor Pre-Treatment with Dopamine on Survival After Heart Transplantation: A Cohort Study of Heart Transplant Recipients Nested in a Randomized Controlled Multicentre Trial**
J Am Coll Cardiol 2010;58:1768-1777
Treatment of brain-dead donors with dopamine of 4 μg/kg/min will not harm cardiac allografts but appears to improve the clinical course of the heart allograft recipient.

### Indications for Surgery
- severe cardiac disability despite maximal medical therapy (e.g. recurrent hospitalizations for CHF, NYHA III or IV, peak metabolic oxygen consumption <14 mL/kg/min in absence of β-blocker)
- symptomatic cardiac ischemia refractory to conventional treatment (e.g. unstable angina not amenable to CABG or PCI with LVEF <30%; recurrent, symptomatic ventricular arrhythmias)
- cardiogenic shock requiring IV inotropic agents or mechanical circulatory support to sustain organ perfusion
- exclusion of all surgical alternatives to cardiac transplantation

### Contraindications (*indicates absolute contraindications)
- incurable malignancy*
- major systemic illness*
- irreversible major organ disease*
- active systemic infection
- obesity
- irreversible pulmonary HTN (pulmonary vascular resistance [PVR] >6 Wood units)*
- severe COPD (FEV1 <1 L)*
- active drug addiction or alcoholism*

### Prerequisites
- psychosocial stability
- medically compliant and motivated

**REMATCH Trial**
NEJM 2001;345:1435-1443
Increased survival of 23% vs. 8% with LVAD vs. medical management of heart failure after 2 yr. Heartmate VAD has a biologic surface, therefore, does not require long-term anticoagulation but higher risk of infection

### Complications
- rejection
  - common, <5% have serious hemodynamic compromise
  - gold standard to detect rejection: endomyocardial biopsy
  - risk of acute rejection is greatest during the first 3 mo after transplant
- infection
  - leading cause of morbidity and mortality after cardiac transplantation
  - risk peaks early during the first few months after transplantation and then declines to a low persistent rate
- allograft vasculopathy
  - approximately 50% develop graft vasculopathy within 10 yr of transplantation
  - most common cause of late death following transplantation
- malignancy
  - develops in 15% of cardiac transplant recipients due to immunosuppressive medication
  - second most common cause of late death following transplantation
  - cutaneous neoplasms most common, followed by non-Hodgkin's lymphoma and lung cancer
- immunosuppressive medication side effects (prednisone, cyclosporine, tacrolimus, sirolimus)

**Canadian Cardiovascular Society Focused Position Statement Update on Assessment of the Cardiac Patient for Fitness to Drive: Fitness following Left Ventricular Assist Device Implantation**
Can J Cardiol 2012;28:137-140
Patients with a continuous flow, NYHA class I-III, LVAD that are stable 2 mo post LVAD implantation qualify for private driving only and are disqualified from commercial driving.

# Ventricular Assist Devices

- work to unload the ventricle while maintaining output; also results in decreased myocardial oxygen consumption permitting recovery of the myocardium that is not irreversibly injured
- can support the left (LVAD), right (RVAD), or both ventricles (BiVAD)
- indications:
  - bridge to transplantation, bridge to decision (for transplant), or long term permanent therapy ("destination therapy")
  - post-operative mechanical support when unable to separate from cardiopulmonary bypass despite inotropic and intra-aortic balloon pump (IABP) support
    - IABP is a catheter based device inserted into the femoral artery and advanced to the descending aorta that decreases myocardial $O_2$ demand and increases blood flow to coronary arteries
    - inflation of the balloon occurs during diastole to increase ascending aorta and coronary artery perfusion pressure; deflation occurs at systole to reduce intra-aortic pressure thus reducing afterload
    - cardiogenic shock

# Myocardial Disease

## Definition of Cardiomyopathy

- intrinsic or primary myocardial disease not secondary to congenital, hypertensive, coronary, valvular, or pericardial disease
- functional classification: dilated, hypertrophic, or restrictive
- LV dysfunction 2º to MI, often termed "ischemic cardiomyopathy", is not a true cardiomyopathy (i.e. primary myocardial disorder) since the primary pathology is obstructive CAD

**Table 14. Summary Table for CHF and Myocardial Disease**

| Heart Failure Reduced Ejection Fraction | | Heart Failure Preserved Ejection Fraction | | |
|---|---|---|---|---|
| **Dilated Cardiomyopathy** | **Secondary Causes** | **Hypertrophic Cardiomyopathy** | **Restrictive Cardiomyopathy** | **Secondary Causes** |
| Idiopathic, infectious (e.g. myocarditis), alcohol, familial, collagen vascular disease | CAD, MI, DM, valvular (e.g. AR, MR) | Genetic disorder affecting cardiac sarcomeres (most common cause of sudden cardiac death in young athletes) | Amyloidosis, sarcoidosis, scleroderma, hemochromatosis, Fabry's, Pompe's Disease, Loeffler's | HTN, DM, valvular (e.g. AS), post-MI, transiently by ischemia |

**Cardiomyopathy**

**HARD**
**H**ypertrophic cardiomyopathy
**A**rrhythmogenic right ventricular cardiomyopathy
**R**estrictive cardiomyopathy
**D**ilated cardiomyopathy

# Myocarditis

## Definition

- inflammatory process involving the myocardium ranging from acute to chronic; an important cause of dilated cardiomyopathy

## Etiology

- idiopathic
- infectious
  - viral (most common): parvovirus B19, influenza, coxsackie B, echovirus, poliovirus, HIV, mumps
  - bacterial: *S. aureus, C. perfringens, C. diphtheriae, Mycoplasma, Rickettsia*
  - fungi
  - spirochetal (Lyme disease – *Borrelia burgdorferi*)
  - Chagas disease (*Trypanosoma cruzi*), toxoplasmosis
- toxic: catecholamines, chemotherapy, cocaine
- hypersensitivity/eosinophilic: drugs (e.g. antibiotics, diuretics, lithium, clozapine), insect/snake bites
- systemic diseases: collagen vascular diseases (e.g. SLE, rheumatoid arthritis), sarcoidosis, autoimmune
- other: giant cell myocarditis, acute rheumatic fever

## Signs and Symptoms

- constitutional symptoms
- acute CHF: dyspnea, tachycardia, elevated JVP
- chest pain: due to pericarditis or cardiac ischemia
- arrhythmias
- systemic or pulmonary emboli
- pre-syncope/syncope/sudden death

## Investigations

- ECG: non-specific ST-T changes ± conduction defects
- blood work
  - increased CK, troponin, LDH, and AST with acute myocardial necrosis ± increased WBC, ESR, ANA, rheumatoid factor, complement levels
  - blood culture, viral titres, and cold agglutinins for *Mycoplasma*
- CXR: enlarged cardiac silhouette
- echo: dilated, hypokinetic chambers, segmental wall motion abnormalities
- cardiovascular magnetic resonance: functional and morphological abnormalities as well as tissue pathology (gadolinium enhancement)
- myocardial biopsy

## Management

- supportive care
- restrict physical activity
- treat CHF
- treat arrhythmias
- anticoagulation
- treat underlying cause if possible

## Prognosis

- often unrecognized and may be self-limited
- myocarditis treatment trial showed 5 yr mortality between 25-50%
- giant cell myocarditis, although rare can present with fulminant CHF and be rapidly fatal, with 5 yr mortality >80%
- sudden death in young adults
- may progress to dilated cardiomyopathy

# Dilated Cardiomyopathy

### Definition
- unexplained dilation and impaired systolic function of one or both ventricles

### Etiology
- idiopathic (presumed viral or idiopathic) ~50% of DCM
- alcohol
- familial/genetic
- uncontrolled tachycardia (e.g. persistent rapid AFib)
- collagen vascular disease: SLE, polyarteritis nodosa, dermatomyositis, progressive systemic sclerosis
- infectious: viral (coxsackie B, HIV), Chagas disease, Lyme disease, Rickettsial diseases, acute rheumatic fever, toxoplasmosis
- neuromuscular disease: Duchenne muscular dystrophy, myotonic dystrophy, Friedreich's ataxia
- metabolic: uremia, nutritional deficiency (thiamine, selenium, carnitine)
- endocrine: hyper/hypothyroidism, DM, pheochromocytoma
- peripartum
- toxic: cocaine, heroin, organic solvents
- drugs: chemotherapies (doxorubicin, cyclophosphamide), anti-retrovirals, chloroquine, clozapine, TCA
- radiation

**Major Risks Factors for DCM**
Alcohol, cocaine, family history

**Abnormal Labs in DCM**
- High BNP
- High Cr
- High LFTs
- Low bicarbonate
- Low $Na^+$

### Signs and Symptoms
- may present as:
  - CHF
  - systemic or pulmonary emboli
  - arrhythmias
  - sudden death (major cause of mortality due to fatal arrhythmia)

### Investigations
- blood work: CBC, electrolytes, Cr, bicarbonate, BNP, CK, troponin, LFTs, TSH, TIBC
- ECG: variable ST-T wave abnormalities, poor R wave progression, conduction defects (e.g. BBB), arrhythmias (e.g. non-sustained VT)
- CXR: global cardiomegaly (i.e. globular heart), signs of CHF, pleural effusion
- echo: chamber enlargement, global hypokinesis, depressed LVEF, MR and TR, mural thrombi
- endomyocardial biopsy: not routine, used to rule out a treatable cause
- coronary angiography: in selected patients to exclude ischemic heart disease

### Management
- treat underlying disease: e.g. abstinence from alcohol
- treat CHF: see *Heart Failure*, C34
- thromboembolism prophylaxis: anticoagulation with warfarin
  - indicated for: AFib, history of thromboembolism or documented thrombus
- treat symptomatic or serious arrhythmias
- immunize against influenza and *S. pneumoniae*
- consider surgical options (e.g. LVAD, transplant, volume reduction surgery) in appropriate candidates with severe, drug refractory disease
- consider ICD among patients with a LVEF <30%

### Prognosis
- depends on etiology
- better with reversible underlying cause, worst with infiltrative diseases, HIV, drug-induced
- cause of death usually CHF (due to pump failure) or sudden death 2° to ventricular arrhythmias
- systemic emboli are significant source of morbidity
- 20% mortality in 1st yr, 10% per year thereafter

# Hypertrophic Cardiomyopathy

- see *2011 ACCF/AHA Guideline for the Diagnosis and Treatment of Hypertrophic Cardiomyopathy* for details

### Definition
- defined as unexplained ventricular hypertrophy
- various patterns of HCM are classified, but most causes involve pattern of septal hypertrophy

### Etiology and Pathophysiology
- histopathologic features include myocyte disarray, myocyte hypertrophy, and interstitial fibrosis
- cause is felt to be a genetic defect involving one of the cardiac sarcomeric proteins (>400 mutations associated with autosomal dominant inheritance, incomplete penetrance)
- prevalence of 1/500-1/1000 in general population
- generally presents in early adulthood

### Hemodynamic Classification
- hypertrophic obstructive cardiomyopathy (HOCM): dynamic LV outflow tract (LVOT) obstruction, either at rest or with provocation, defined as LVOT gradient of at least 30 mmHg
  - dynamic i.e. obstruction (and the murmur) is reduced with maneuvers that increase preload and augmented with maneuvers that reduce preload

- non-obstructive HCM: no LVOT obstruction
- many patients have diastolic dysfunction (impaired ventricular filling secondary to LV hypertrophy which decreases compliance)

### Signs and Symptoms
- clinical manifestations: asymptomatic (common, therefore screening is important), shortness of breath on exertion (SOBOE), angina, presyncope/syncope (due to LV outflow obstruction or arrhythmia), CHF, arrhythmias, SCD
- pulses: rapid upstroke, "spike and dome" pattern in carotid pulse (in HCM with outflow tract obstruction)
- precordial palpation: PMI localized, sustained, double impulse, 'triple ripple' (triple apical impulse in HOCM), LV lift
- precordial auscultation: normal or paradoxically split S2, S4, harsh systolic diamond-shaped murmur at LLSB or apex, enhanced by squat to standing or Valsalva (murmur secondary to LVOT obstruction as compared to AS); often with pansystolic murmur due to mitral regurgitation

### Investigations
- ECG/Holter monitor: LVH, high voltages across precordium, prominent Q waves (lead I, aVL, V5, V6), tall R wave in V1, P wave abnormalities
- transthoracic echocardiography and echo-Doppler study: asymmetric septal hypertrophy (less commonly apical), systolic anterior motion (SAM) of mitral valve and MR; LVOT gradient can be estimated by Doppler measurement
- genetic studies (± magnetic resonance imaging) can be helpful when echocardiography is inconclusive for diagnosis
- cardiac catheterization (only when patient being considered for invasive therapy)

### Management
- avoid factors which increase obstruction (e.g. volume depletion)
  - avoidance of all competitive sports
- treatment of obstructive HCM
  - medical agents: β-blockers, disopyramide, verapamil (started only in monitored setting), phenylephrine (in setting of cardiogenic shock)
  - avoid nitrates, diuretics, and ACEI as they increase LVOT gradient and worsen symptoms
- patients with obstructive HCM and drug-refractory symptoms
  - surgical myectomy
  - alcohol septal ablation - percutaneous intervention that ablates the hypertrophic septum with 100% ethanol via the septal artery
  - dual chamber pacing (rarely done)
- treatment of patients at high risk of sudden death: ICD
- first-degree relatives (children, siblings, parents) of patients with HCM should be screened (physical, ECG, 2D echo) every 12-18 mo during adolescence, then serially every 5 yr during adulthood

### Prognosis
- potential complications: AFib, VT, CHF, sudden cardiac death (1% risk/yr; most common cause of SCD in young athletes)
  - major risk factors for sudden death (consider ICD placement)
  - history of survived cardiac arrest/sustained VT
  - family history of multiple premature sudden deaths
  - other factors associated with increased risk of sudden cardiac death
    - syncope (presumed to be arrhythmic in origin)
    - non-sustained VT on ambulatory monitoring
    - marked ventricular hypertrophy (maximum wall thickness ≥30 mm)
    - abnormal BP in response to exercise (in patients <40 yr old with HCM)

**RCM vs. Constrictive Pericarditis (CP)**
Present similarly but CP is treatable with surgery

## Restrictive Cardiomyopathy

### Definition
- impaired ventricular filling with preserved systolic function in a non-dilated, non-hypertrophied ventricle secondary to factors that decrease myocardial compliance (fibrosis and/or infiltration)

**Key Investigations**
- Echo: may show respiratory variation in blood flow in CP
- CT: may show very thickened pericardium and calcification in CP
- MRI: best modality to directly visualize pericardium and myocardium

### Etiology
- infiltrative: amyloidosis, sarcoidosis
- non-infiltrative: scleroderma, idiopathic myocardial fibrosis
- storage diseases: hemochromatosis, Fabry's disease, Gaucher's disease, glycogen storage diseases
- endomyocardial
  - endomyocardial fibrosis, Loeffler's endocarditis, or eosinophilic endomyocardial disease
  - radiation heart disease
  - carcinoid syndrome (may have associated tricuspid valve or pulmonary valve dysfunction)

### Clinical Manifestations
- CHF (usually with preserved LV systolic function), arrhythmias
- elevated JVP with prominent x and y descents, Kussmaul's sign
- S3, S4, MR, TR
- thromboembolic events

### Investigations
- ECG: low voltage, non-specific, diffuse ST-T wave changes ± non-ischemic Q waves
- CXR: mild cardiac enlargement
- Echo: LAE, RAE; specific Doppler findings with no significant respiratory variation
- cardiac catheterization: increased end-diastolic ventricular pressures
- endomyocardial biopsy: to determine etiology (especially for infiltrative RCM)

### Management
- exclude constrictive pericarditis
- treat underlying disease: control HR, anticoagulate if AFib
- supportive care and treatment for CHF, arrhythmias
- cardiac transplant: might be considered for CHF refractory to medical therapy

### Prognosis
- depends on etiology

# Valvular Heart Disease

- see the *2017 AHA/ACC Focused Update of the 2014 AHA/ACC Guideline for the Management of Patients With Valvular Heart Disease*. JACC Jul 11;70(2):252-289 for details

### Infective Endocarditis
- see Infectious Diseases, ID13
- American Heart Association (AHA) 2007 guidelines recommend IE prophylaxis
  - only for patients with:
    - prosthetic valve material
    - past history of IE
    - certain types of congenital heart disease
    - cardiac transplant recipients who develop valvulopathy
  - only for the following procedures:
    - dental
    - respiratory tract
    - procedures on infected skin/skin structures/MSK structures
    - not GI/GU procedures specifically

# Rheumatic Fever

- see Pediatrics, P56

### Prognosis
- acute complications: myocarditis (DCM/CHF), conduction abnormalities (sinus tachycardia, AFib), valvulitis (acute MR), acute pericarditis (not constrictive pericarditis)
- chronic complications: rheumatic valvular heart disease – fibrous thickening, adhesion, calcification of valve leaflets resulting in stenosis/regurgitation, increased risk of IE ± thromboembolism
- onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever
- mitral valve most commonly affected

# Valve Repair and Valve Replacement

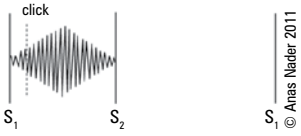
- indication for valve repair or replacement depends on the severity of the pathology; typically recommended when medical management has failed to adequately improve the symptoms or reduce the risk of morbidity and mortality
- pathologies that may require surgical intervention include congenital defects, infections, rheumatic heart disease as well as a variety of valve diseases associated with aging (i.e. degenerative valve lesions)
- valve repair: surgical valvuloplasty (commissurotomy, annuloplasty), chordae tendineae repair, tissue patch
- valve replacement: typically for aortic or mitral valves only; mitral valve repair is favoured in younger individuals (and patients with mitral valve prolapse with severe mitral regurgitation)
- percutaneous techniques are being established to replace or repair valves
- decision between mechanical vs. bioprosthetic prosthesis for patients 50-70 yr old remains uncertain as valve techniques evolve

# Choice of Valve Prosthesis

**Table 15. Mechanical Valve vs. Bioprosthetic Valve**

| Mechanical Valve | Bioprosthetic Valve |
|---|---|
| Good durability | Limited long-term durability (mitral<aortic) |
| Less preferred in small aortic root sizes | Good flow in small aortic root sizes |
| Increased risk of thromboembolism (1-3%/yr): requires long-term anticoagulation with coumadin | Decreased risk of thromboembolism: long-term anticoagulation not needed for aortic valves |
| Target INR Aortic valves: 2.0-3.0 (mean 2.5)<br>Mitral valves: 2.5-3.5 (mean 3.0) | Some recommendation for limited anticoagulation for mitral valves |
| Increased risk of hemorrhage: 1-2%/yr | Decreased risk of hemorrhage |
| ≤50 yr | Any age |

**Mitral Valve Repair vs. Replacement for Severe Ischemic Mitral Regurgitation**
NEJM 2014;370:23-32
**Purpose**: Ischemic mitral regurgitation is associated with significant mortality risk. The purpose of this study was to compare the effectiveness and safety of repairing versus replacing the mitral valve in patients with severe chronic ischemic mitral regurgitation.
**Study Design**: RCT with 251 patients with severe ischemic mitral regurgitation were randomly assigned to mitral valve repair or chordal-sparing replacement. The primary endpoint was the left ventricular end-systolic volume index (LVESVI) at 12 mo.
**Results**: There were no significant between-group differences in LVESVI, in the rate of major adverse cardiac or cerebrovascular events, in functional status, or in quality of life at 12 mo. The rate of moderate or severe mitral regurgitation recurrence at 12 mo was significantly higher in the repair group than in the replacement group (32.6% vs. 2.3%, respectively).
**Conclusions**: No significant difference in left ventricular reverse modelling or survival at 12 mo between patients who underwent mitral valve repair or replacement. Replacement provided more durable correction of mitral regurgitation, but there were no significant differences in clinical outcomes.



# Prosthetic Valve Management

- follow-up
  - TTE after prosthetic valve implantation to assess hemodynamics
  - anticoagulation and INR monitoring for patients with a mechanical valve
  - no known medical therapies to prevent bioprosthetic valve degeneration
  - TEE or repeat TTE when clinical symptoms or signs suggest prosthetic valve dysfunction
  - annual TTE is reasonable in asymptomatic patients with a bioprosthetic valve after the first 10 yr
- bioprosthetic valve dysfunction
  - etiology: tissue degeneration, pannus formation, IE, thrombosis
  - presentation: exertional dyspnea, louder systolic murmur, new diastolic murmur
  - investigations: TTE
  - treatment: depends on the type and severity of the pathology as well as patient characteristics
    - surgical intervention (thrombosed left-sided valve, severe valve stenosis, or regurgitation)
    - fibrinolytic therapy (thrombosed valve)
    - transcatheter valve-in-valve procedure (severely symptomatic aortic stenosis at high or prohibitive risk of reoperation)
- mechanical valve dysfunction
  - etiology: thrombosis, pannus formation, IE, suture disruption
  - presentation: symptoms of HF, systemic thromboembolism, hemolysis, new murmur
  - investigations: urgent multimodal imaging for suspected valve thrombosis (TTE, TEE, fluoroscopy, and/or CT), otherwise TTE
  - treatment: depends on the type and severity of the pathology as well as patient characteristics
    - surgical intervention (thrombosed left-sided valve, severe valve stenosis, or regurgitation)
    - fibrinolytic therapy (thrombosed valve)

# Summary of Valvular Disease

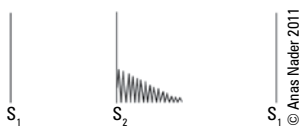


**Table 16. Valvular Heart Disease**

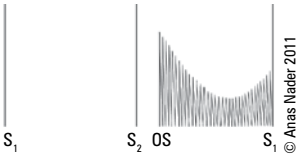
## Aortic Stenosis (AS)

**Etiology**
Congenital (bicuspid, unicuspid valve), calcification (wear and tear), rheumatic disease
**Definition**
Normal aortic valve area = 3-4 $cm^2$
Mild AS >1.5 $cm^2$
Moderate AS 1.0 to 1.5 $cm^2$
Severe AS <1.0 $cm^2$
Critical AS <0.5 $cm^2$
**Pathophysiology**
Outflow obstruction → increased EDP → concentric LVH → LV failure → CHF, subendocardial ischemia
**Symptoms**
Exertional angina, syncope, dyspnea, PND, orthopnea, peripheral edema
**Physical Exam**
Narrow pulse pressure, brachial-radial delay, pulsus parvus et tardus, sustained PMI
Auscultation: crescendo-decrescendo SEM radiating to R clavicle and carotid, musical quality at apex (Gallavardin phenomenon), S4, soft S2 with paradoxical splitting, S3 (late)
**Investigations**
ECG: LVH and strain, LBBB, LAE, AFib
CXR: post-stenotic aortic root dilatation, calcified valve, LVH, LAE, CHF
Echo: reduced valve area, pressure gradient, LVH, reduced LV function
**Treatment**
Asymptomatic: serial echos, avoid exertion
Symptomatic: avoid nitrates/arterial dilators and ACEI in severe AS
Surgery if: symptomatic or asymptomatic severe AS with low-to-intermediate surgical risk and who meet an indication (survival benefit, symptom improvement, and improvement in LV systolic function)
**Surgical Options**
Valve replacement: aortic rheumatic valve disease and trileaflet valve
– prior to pregnancy (if AS significant)
– balloon valvuloplasty (in very young or as a bridge to valve replacement for symptomatic patients with severe AS)
**Interventional Options**
Percutaneous valve replacement (transfemoral or transapical approach) is an option in selected symptomatic patients with severe AS who are at an intermediate to prohibitive risk for surgery with a predicted post-procedure survival ≥12 mo

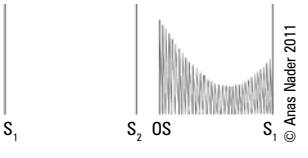


## Aortic Regurgitation (AR)

**Etiology**
Supravalvular: aortic root disease (Marfan's, atherosclerosis and dissectin( aneurysm, connective tissue disease)
Valvular: congenital (bicuspid aortic valv large VSD), IE
Acute Onset: IE, aortic dissection, trauma, failed prosthetic valve
**Pathophysiology**
Volume overload → LV dilatation → increased SV, high sBP and low dBP → increased wall tension → pressure overload → LVH (low dBP → decreased coronary perfusion)
**Symptoms**
Usually only becomes symptomatic late in disease when LV failure develops
Dyspnea, orthopnea, PND, syncope, angina
**Physical Exam**
Waterhammer pulse, bisferiens pulse, femoral-brachial sBP >20 mmHg (Hill's test wide pulse pressure), hyperdynamic apex, displaced PMI, heaving apex
Auscultation: early decrescendo diastolic murmur at LLSB (cusp pathology) or RLSB (aortic root pathology), best heard sitting, leaning forward, on full expiration, soft S1, absent S2, S3 (late)
**Investigations**
ECG: LVH, LAE
CXR: LVH, LAE, aortic root dilatation
Echo/TTE: quantify AR, leaflet or aortic root anomalies
Cath: if >40 yr and surgical candidate – to assess for ischemic heart disease
Exercise testing: hypotension with exercise
**Treatment**
Asymptomatic: serial echos, afterload reduction (e.g. ACEI, nifedipine, hydralazine)
Symptomatic: avoid exertion, treat CHF
Surgery if: NYHA class III-IV CHF; LV dilatation and/or LVEF <50% with/without symptoms
**Surgical Options**
Valve replacement: most patients
Valve repair: very limited role
Aortic root replacement (Bentall procedure):
– when ascending aortic aneurysm present, valved conduit used

**Table 16. Valvular Heart Disease** (continued)

## Mitral Stenosis (MS)



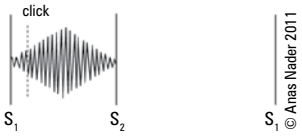
**Etiology**
Rheumatic disease most common cause, congenital (rare)
**Definition**
Severe MS is mitral valve area (MVA) <1.5 $cm^2$
**Pathophysiology**
MS → fixed CO and LAE → increased LA pressure → pulmonary vascular resistance and CHF; worse with AFib (no atrial kick), tachycardia (decreased atrial emptying time) and pregnancy (increased preload)
**Symptoms**
SOB on exertion, orthopnea, fatigue, palpitations, peripheral edema, malar flush, pinched and blue facies (severe MS)
**Physical Exam**
AFib, no "a" wave on JVP, left parasternal lift, palpable diastolic thrill at apex
Auscultation: mid-diastolic rumble at apex, best heard with bell in left lateral decubitus position following exertion, loud S1, OS following loud P2 (heard best during expiration), long diastolic murmur, and short A2-OS interval correlate with worse MS
**Investigations**
ECG: NSR/AFib, LAE (P mitrale), RVH, RAD
CXR: LAE, CHF, mitral valve calcification
Echo/TTE: shows restricted opening of mitral valve
Cath: indicated in concurrent CAD if >40 yr (male) or >50 yr (female)
**Treatment**
Avoid exertion, fever (increased LA pressure), treat AFib and CHF, increase diastolic filling time (β-blockers, digitalis)
Surgery if: NYHA class III-IV CHF and failure of medical therapy
**Invasive Options**
Percutaneous balloon valvuloplasty: young rheumatic pts and good leaflet morphology (can be determined by echo), asymptomatic pts with moderate-severe MS, pulmonary HTN
Contraindication: left atrial thrombus, moderate MR
Open Mitral Commissurotomy: if mild calcification + leaflet/chordal thickening – restenosis in 50% pts in 8 yr
Valve replacement: indicated in moderate-severe calcification and severely scarred leaflets

## Mitral Regurgitation (MR)

**Etiology**
Mitral valve prolapse, congenital cleft leaflets, LV dilatation/aneurysm (CHF, DCM, myocarditis), IE abscess, Marfan's syndrome, HOCM, acute MI, myxoma, mitral valve annulus calcification, chordae/papillary muscle trauma/ischemia/rupture (acute), rheumatic disease
**Pathophysiology**
Reduced CO → increased LV and LA pressure → LV and LA dilatation → CHF and pulmonary HTN
**Symptoms**
Dyspnea, PND, orthopnea, palpitations, peripheral edema
**Physical Exam**
Displaced hyperdynamic apex, left parasternal lift, apical thrill
Auscultation: holosystolic murmur at apex, radiating to axilla ± mid-diastolic rumble, loud S2 (if pulmonary HTN), S3
**Investigations**
ECG: LAE, left atrial delay (bifid P waves), ± LVH
CXR: LVH, LAE, pulmonary venous HTN
Echo: etiology and severity of MR, LV function, leaflets
Swan-Ganz Catheter: prominent LA "v" wave
**Treatment**
Asymptomatic: serial echos
Symptomatic: decrease preload (diuretics), decrease afterload (ACEI) for severe MR and poor surgical candidates; stabilize acute MR with vasodilators before surgery
Surgery if: acute MR with CHF, papillary muscle rupture, NYHA class III-IV CHF, AF, increasing LV size or worsening LV function, earlier surgery if valve repairable (>90% likelihood) and patient is low-risk for surgery
**Surgical Options**
Valve repair: >75% of pts with MR and myxomatous mitral valve prolapse – annuloplasty rings, leaflet repair, chordae transfers/shorten/replacement
Valve replacement: failure of repair, heavily calcified annulus
Advantage of repair: low rate of endocarditis, no anticoagulation, less chance of re-operation

## Tricuspid Stenosis (TS)

**Etiology**
Rheumatic disease, congenital, carcinoid syndrome, fibroelastosis; usually accompanied by MS (in RHD)
**Pathophysiology**
Increased RA pressure → right heart failure → decreased CO and fixed on exertion
**Symptoms**
Peripheral edema, fatigue, palpitations
**Physical Exam**
Prominent "a" waves in JVP, +ve abdominojugular reflux, Kussmaul's sign, diastolic rumble 4th left intercostal space
**Investigations**
ECG: RAE
CXR: dilatation of RA without pulmonary artery enlargement
Echo: diagnostic
**Treatment**
Preload reduction (diuretics), slow HR
Surgery if: only if other surgery required (e.g. mitral valve replacement)
**Surgical Options**
Valve Replacement:
– if severely diseased valve
– bioprosthesis preferred



## Tricuspid Regurgitation (TR)

**Etiology**
RV dilatation, IE (particularly due to IV drug use), rheumatic disease, congenital (Ebstein anomaly), carcinoid
**Pathophysiology**
RV dilatation → TR further RV dilatation → right heart failure
**Symptoms**
Peripheral edema, fatigue, palpitations
**Physical Exam**
"cv" waves in JVP, +ve abdominojugular reflux, holosystolic murmur at LLSB accentuated by inspiration, left parasternal lift
**Investigations**
ECG: RAE, RVH, AFib
CXR: RAE, RV enlargement
Echo: diagnostic
**Treatment**
Preload reduction (diuretics)
Surgery if: only if other surgery required (e.g. mitral valve replacement)
**Surgical Options**
Annuloplasty (i.e. repair, rarely replacement)

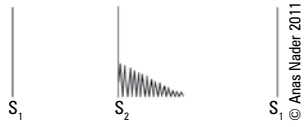


**Table 16. Valvular Heart Disease** (continued)

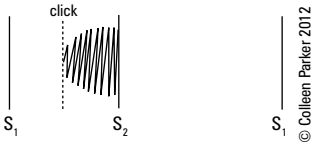
## Pulmonary Stenosis (PS)



**Etiology**
Usually congenital, rheumatic disease (rare), carcinoid syndrome
**Pathophysiology**
Increased RV pressure → RV hypertrophy → right heart failure
**Symptoms**
Chest pain, syncope, fatigue, peripheral edema
**Physical Exam**
Systolic murmur at 2nd left intercostal space accentuated by inspiration, pulmonary ejection click, right-sided S4
**Investigations**
ECG: RVH
CXR: prominent pulmonary arteries enlarged RV
Echo: diagnostic
**Treatment**
Balloon valvuloplasty if severe symptoms
**Surgical Options**
Percutaneous or open balloon valvuloplasty

## Pulmonary Regurgitation (PR)

**Etiology**
Pulmonary HTN, IE, rheumatic disease, tetrology of Fallot (post-repair)
**Pathophysiology**
Increased RV volume → increased wall tension → RV hypertrophy → right heart failure
**Symptoms**
Chest pain, syncope, fatigue, peripheral edema
**Physical Exam**
Early diastolic murmur at LLSB, Graham Steell (diastolic) murmur 2nd and 3rd left intercostal space increasing with inspiration
**Investigations**
ECG: RVH
CXR: prominent pulmonary arteries if pulmonary HTN; enlarged RV
Echo: diagnostic
**Treatment**
Rarely requires treatment; valve replacement (rarely done)
**Surgical Options**
Pulmonary valve replacement

## Mitral Valve Prolapse (MVP)

**Etiology**
Myxomatous degeneration of chordae, thick, bulky leaflets that crowd orifice, associated with Marfan's syndrome, pectus excavatum, straight back syndrome, other MSK abnormalities; <3% of population
**Pathophysiology**
Mitral valve displaced into LA during systole; no causal mechanisms found for symptoms
**Symptoms**
Prolonged, stabbing chest pain, dyspnea, anxiety/panic, palpitations, fatigue, presyncope
**Physical Exam**
Auscultation: mid-systolic click (due to billowing of mitral leaflet into LA; tensing of redundant valve tissue); mid to late systolic murmur at apex, accentuated by Valsalva or squat-to-stand maneuvers
**Investigations**
ECG: non-specific ST-T wave changes, paroxysmal SVT, ventricular ectopy
Echo: systolic displacement of thickened mitral valve leaflets into LA
**Treatment**
Asymptomatic: no treatment; reassurance
Symptomatic: β-blockers and avoidance of stimulants (caffeine) for significant palpitations, anticoagulation if AFib
**Surgical Options**
Mitral valve surgery (repair favoured over replacement) if symptomatic and significant MR

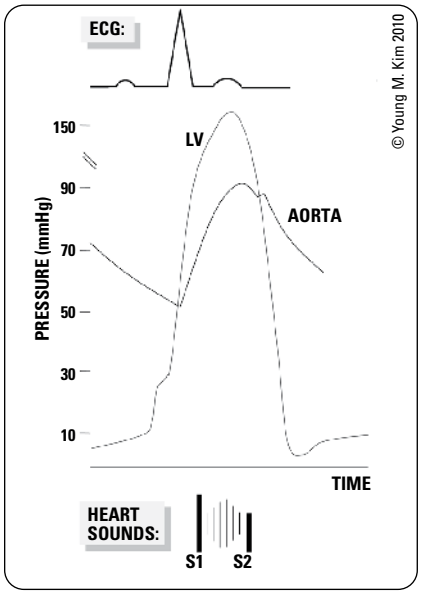


**Figure 42. Hemodynamics of aortic stenosis**
Stenosis across the aortic valve results in the generation of a significant pressure gradient between the left ventricle and the aorta and a crescendo-decrescendo murmur during systolic contraction. The stenosis decreases the intensity of aortic valve closure hence diminishing S2

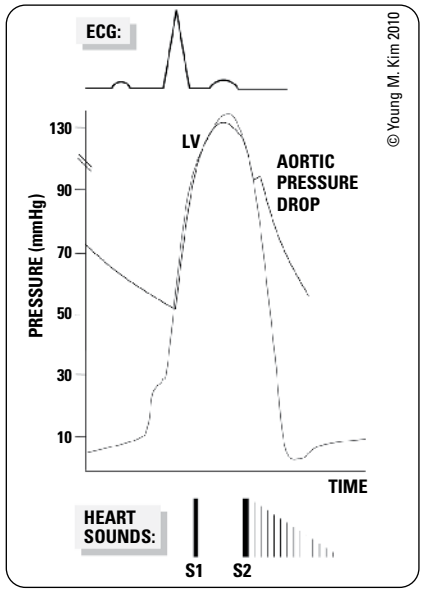

**Figure 43. Hemodynamics of aortic regurgitation**
Regurgitation across the aortic valve during diastole causes the aortic pressure to rapidly decrease and a decrescendo murmur can be heard at the onset of diastole (after S2 is audible). The presence of regurgitant blood from the aorta increases left-ventricular end-diastolic volume

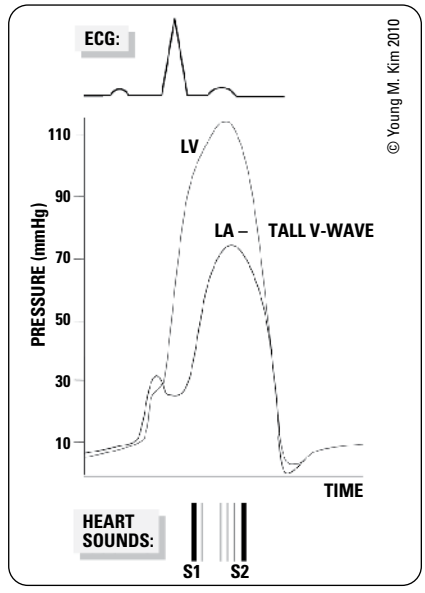

**Figure 44. Hemodynamics of acute mitral regurgitation**
During systolic contraction, blood regurgitates from the left ventricle into the left atrium across the incompetent mitral valve resulting in an audible holosystolic murmur between S1 and S2. The portion of left ventricular end diastolic volume that regurgitates into the left atrial myocardium increases left atrial pressures resulting in a tall V-wave (in the JVP)

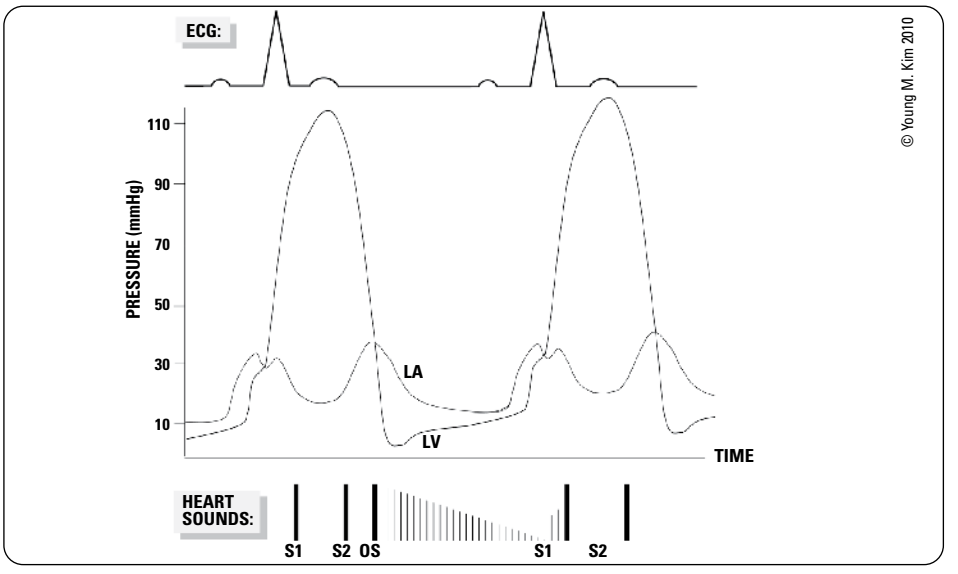

**Figure 45. Hemodynamics of mitral stenosis**
First note that the left atrial pressure exceeds the left ventricular pressure during diastole due to mitral stenosis and the consequent generation of a pressure gradient across the left atrium and left ventricle. In diastole, the stenotic mitral valve opens which corresponds to the opening snap (OS) and the passage of blood across the mitral stenosis results in an audible decrescendo murmur. Left atrial contraction prior to S1 increases the pressure gradient resulting in accentuation of the murmur before S1 is audible

# Pericardial Disease

## Acute Pericarditis

### Etiology of Pericarditis/Pericardial Effusion
- idiopathic is most common: presumed to be viral
- infectious
  - viral: Coxsackie virus A, B (most common), echovirus
  - bacterial: *S. pneumoniae, S. aureus*
  - TB
  - HIV
- fungal: histoplasmosis, blastomycosis
- post-MI: acute (direct extension of myocardial inflammation, 1-7 d post-MI), Dressler's syndrome (autoimmune reaction, 2-8 wk post-MI)
- post-cardiac surgery (e.g. CABG), other trauma
- metabolic: uremia (common), hypothyroidism
- neoplasm: Hodgkin's, breast, lung, renal cell carcinoma, melanoma
- collagen vascular disease: SLE, polyarteritis, rheumatoid arthritis, scleroderma
- vascular: dissecting aneurysm
- other: drugs (e.g. hydralazine), radiation, infiltrative disease (e.g.sarcoid), vaccination (e.g. smallpox)

### Signs and Symptoms
- diagnostic triad: chest pain, friction rub, and ECG changes (i.e. diffuse ST elevation and PR depression with reciprocal changes in aVR)
- pleuritic chest pain: alleviated by sitting up and leaning forward
- pericardial friction rub: may be uni-, bi-, or triphasic; evanescent and rare
- ± fever, malaise

### Investigations
- ECG: initially diffuse elevated ST segments ± depressed PR segment, the elevation in the ST segment is concave upwards → 2-5 d later ST isoelectric with T wave flattening and inversion
- CXR: normal heart size, pulmonary infiltrates
- Echo: performed to assess for pericardial effusion
- biomarkers: troponin I elevation may suggest myopericarditis

**Acute Pericarditis Triad**
- Chest pain
- Friction rub
- ECG changes

### Treatment
- treat the underlying disease
- anti-inflammatory agents (i.e. high dose NSAIDs/ASA; steroid use controversial), analgesics
- colchicine reduces the rate of incessant/recurrent pericarditis (ICAP N Engl J Med 2013; 369:1522-1528)
- physical activity restriction until symptom resolution

### Complications
- recurrent episodes of pericarditis, atrial arrhythmia, pericardial effusion, tamponade, constrictive pericarditis

# Pericardial Effusion

### Etiology
- transudative (serous)
- CHF, hypoalbuminemia/hypoproteinemia, hypothyroidism
- exudative (serosanguinous or bloody)
  - causes similar to the causes of acute pericarditis
  - may develop acute effusion secondary to hemopericardium (trauma, post-MI myocardial rupture, aortic dissection)
- physiologic consequences depend on type and volume of effusion, rate of effusion development, and underlying cardiac disease

### Signs and Symptoms
- may be asymptomatic or similar to acute pericarditis
- dyspnea, cough
- extra-cardiac (esophageal/recurrent laryngeal nerve/tracheo-bronchial/phrenic nerve irritation)
- JVP increased with dominant "x" descent
- arterial pulse normal to decreased volume, decreased pulse pressure
- auscultation: distant heart sounds ± rub
- Ewart's sign

**Ewart's Sign**
Bronchial breathing and dullness to percussion at the lower angle of the left scapula in pericardial effusion due to effusion compressing left lower lobe of lung

### Investigations
- ECG: low voltage, flat T waves, electrical alternans (classic, but not a sensitive sign to exclude effusion)
  - be cautious in diagnosing STEMI in a patient with pericarditis and an effusion – antiplatelets may precipitate hemorrhagic effusion
- CXR: cardiomegaly, rounded cardiac contour
- ER: bedside ultrasound with subxiphoid view showing fluid in pericardial sac
- Echo (procedure of choice): fluid in pericardial sac
- pericardiocentesis: definitive method of determining transudate vs. exudate, identify infectious agents, neoplastic involvement

### Treatment
- mild: frequent observation with serial echos, treat underlying cause, anti-inflammatory agents
- severe: treat as in tamponade (see *Cardiac Tamponade*)

# Cardiac Tamponade

### Etiology
- major complication of rapidly accumulating pericardial effusion
- cardiac tamponade is a clinical diagnosis
- any cause of pericarditis but especially trauma, malignancy, uremia, proximal aortic dissection with rupture

### Pathophysiology
- high intra-pericardial pressure → decreased venous return → decreased diastolic ventricular filling → decreased CO → hypotension and venous congestion

### Signs and Symptoms
- tachypnea, dyspnea, shock, muffled heart sounds
- pulsus paradoxus (inspiratory fall in systolic BP >10 mmHg during quiet breathing)
- JVP "x" descent only, blunted "y" descent
- hepatic congestion/peripheral edema

**Classic Quartet of Tamponade**
- Hypotension
- Increased JVP
- Tachycardia
- Pulsus paradoxus

### Investigations
- ECG: electrical alternans (pathognomonic variation in R wave amplitude), low voltage
- echo: pericardial effusion, compression of cardiac chambers (RA and RV) in diastole
- cardiac catheterization

**Beck's Triad**
- Hypotension
- Increased JVP
- Muffled heart sounds

### Treatment
- pericardiocentesis: Echo-guided
- pericardiotomy
- avoid diuretics and vasodilators (these decrease venous return to already under-filled RV → decrease LV preload → decrease CO) as well as mechanical ventilation
- IV fluid may increase CO
- treat underlying cause

# Constrictive Pericarditis

### Etiology
- chronic pericarditis resulting in fibrosed, thickened, adherent, and/or calcified pericardium
- any cause of acute pericarditis may result in chronic pericarditis
- major causes are idiopathic, post-infectious (viral, TB), radiation, post-cardiac surgery, uremia, MI, collagen vascular disease

### Signs and Symptoms
- dyspnea, fatigue, palpitations
- abdominal pain
- may mimic CHF (especially right-sided HF)
  - ascites, hepatosplenomegaly, edema
- increased JVP, Kussmaul's sign (paradoxical increase in JVP with inspiration), Friedreich's sign (prominent "y" descent)
- BP usually normal (and usually no pulsus paradoxus)
- precordial examination: ± pericardial knock (early diastolic sound)
- see Table 17 for differentiation from cardiac tamponade

**DDx Pulsus Paradoxus**
- Constrictive pericarditis (rarely)
- Severe obstructive pulmonary disease (e.g. asthma)
- Tension pneumothorax
- Pulmonary embolism (large)
- Cardiogenic shock
- Cardiac tamponade

### Investigations
- ECG: non-specific – low voltage, flat T wave, ± AFib
- CXR: pericardial calcification, effusions
- echo/CT/MRI: pericardial thickening, ± characteristic echo-Doppler findings
- cardiac catheterization: equalization of end-diastolic chamber pressures (diagnostic)

### Treatment
- medical: diuretics, salt restriction
- surgical: pericardiectomy (only if refractory to medical therapy)
- prognosis best with idiopathic or infectious cause and worst in post-radiation; death may result from heart failure

**Table 17. Differentiation of Constrictive Pericarditis vs. Cardiac Tamponade**

| Characteristic | Constrictive Pericarditis | Cardiac Tamponade |
|---|---|---|
| JVP | "y" > "x" | "x" > "y" |
| Kussmaul's sign | Present | Absent |
| Pulsus paradoxus | Uncommon | Always |
| Pericardial knock | Present | Absent |
| Hypotension | Variable | Severe |

# Common Medications

**Table 18. Commonly Used Cardiac Therapeutics**

| Drug Class | Examples | Mechanism of Action | Indications | Contraindications | Side Effects |
|---|---|---|---|---|---|
| **ANGIOTENSIN CONVERTING ENZYME INHIBITORS (ACEI)** | | | | | |
| | enalapril (Vasotec®), perindopril (Coversyl®), ramipril (Altace®), lisinopril (Zestril®) | Inhibit ACE-mediated conversion of angiotensin I to angiotensin II (AT II), causing peripheral vasodilation and decreased aldosterone synthesis | HTN, CAD, CHF, post-MI, DM | Bilateral renal artery stenosis, pregnancy, caution in decreased GFR | Dry cough, 10% hypotension, fatigue, hyperkalemia, renal insufficiency, angioedema |
| **ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs)** | | | | | |
| | candesartan, irbesartan, losartan, olmesartan, telmisartan, valsartan | Block AT II receptors, causing similar effects to ACEI | Same as ACEI, although evidence is generally less for ARBs; often used when ACEI are not tolerated | Same as ACEI | Similar to ACEI, but do not cause dry cough |
| **DIRECT RENIN INHIBITORS (DRIs)** | | | | | |
| | aliskiren | Directly blocks renin thus inhibiting the conversion of angiotensinogen to angiotensin I; this also causes a decrease in AT II | HTN (exact role of this drug remains unclear) | Pregnancy, severe renal impairment | Diarrhea, hyperkalemia (higher risk if used with an ACEI), rash, cough, angioedema, reflux, hypotension, rhabdomyolysis, seizure |
| **β-BLOCKERS** | | | | | |
| β1 antagonists<br><br>β1/β2 antagonists<br>α1/β1/β2 antagonists<br>β1 antagonists with intrinsic sympathomimetic activity | atenolol, metoprolol, bisoprolol<br>propranolol<br>labetalol, carvedilol<br>acebutalol | Block β-adrenergic receptors, decreasing HR, BP, contractility, and myocardial oxygen demand, slow conduction through the AV node | HTN, CAD, acute MI, post-MI, CHF (start low and go slow), AFib, SVT | Sinus bradycardia, 2nd or 3rd degree heart block, hypotension<br>Caution in asthma, claudication, Raynaud's phenomenon, and decompensated CHF | Hypotension, fatigue, light-headedness, depression, bradycardia, hyperkalemia, bronchospasm, impotence, depression of counterregulatory response to hypoglycemia, exacerbation of Raynaud's phenomenon, and claudication |
| **CALCIUM CHANNEL BLOCKERS (CCBs)** | | | | | |
| Benzothiazepines<br>Phenylalkylamines (non-dihydropyridines) | diltiazem<br>verapamil | Block smooth muscle and myocardial calcium channels causing effects similar to β-blockers<br>Also vasodilate | HTN, CAD, SVT, AFib, diastolic dysfunction | Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, CHF | Hypotension, bradycardia, edema<br>Negative inotrope |
| Dihydropyridines | amlodipine (Norvasc®), nifedipine (Adalat®), felodipine (Plendil®) | Block smooth muscle calcium channels causing peripheral vasodilation | HTN, CAD | Severe aortic stenosis and liver failure | Hypotension, edema, flushing, headache, light-headedness |

**Table 18. Commonly Used Cardiac Therapeutics** (continued)

| Drug Class | Examples | Mechanism of Action | Indications | Contraindications | Side Effects |
|---|---|---|---|---|---|
| **DIURETICS** | | | | | |
| Thiazides | hydrochlorthiazide, chlorthalidone, metolazone | Reduce $Na^+$ reabsorption in the distal convoluted tubule (DCT) | HTN (drugs of choice for uncomplicated HTN) | Sulfa allergy, pregnancy | Hypotension, hypokalemia, polyuria |
| Loop diuretics | furosemide (Lasix®) | Blocks $Na^+/K^+$-ATPase in thick ascending limb of the loop of Henle | CHF, pulmonary or peripheral edema | Hypovolemia, hypokalemia | Hypovolemia, hypokalemic metabolic alkalosis |
| Aldosterone receptor antagonists | spironolactone, eplenerone | Antagonize aldosterone receptors | HTN, CHF, hypokalemia | Renal insufficiency, hyperkalemia, pregnancy | Edema, hyperkalemia, gynecomastia |
| **INOTROPES** | | | | | |
| | digoxin (Lanoxin®) | Inhibit $Na^+/K^+$-ATPase, leading to increased intracellular $Na^+$ and $Ca^{2+}$ concentration, and increased myocardial contractility<br>Also slows conduction through the AV node | CHF, AFib | 2nd or 3rd degree AV block, hypokalemia | AV block, junctional tachycardia, biderctional VT, bradyarrhythmias, blurred or yellow vision (van Gogh syndrome), anorexia, N/V |
| **ANTICOAGULANTS** | | | | | |
| Coumarins | warfarin (Coumadin®) | Antagonizes vitamin K, leading to decreased synthesis of clotting factors II, VII, IX, and X | AFib, LV dysfunction, prosthetic valves, venous thrombosis | Recent surgery or bleeding, bleeding diathesis, pregnancy | Bleeding (by far the most important side effect), paradoxical thrombosis, skin necrosis |
| Heparins | Unfractionated heparin<br>LMWHs: dalteparin, enoxaparin, tinzaparin | Antithrombin III agonist, leading to decreased clotting factor activity | Acute MI/ACS; when immediate anticoagulant effect needed, pulmonary embolism, venous thrombosis | Recent surgery or bleeding, bleeding diathesis, thrombocytopenia, renal insufficiency (for LMWHs) | Bleeding, osteoporosis, heparin-induced thrombocytopenia (less in LMWHs) |
| Direct thrombin inhibitors | dabigatran | Competitive, direct thrombin inhibitor; thrombin enables fibrinogen conversion to fibrin during the coagulation cascade, thereby preventing thrombus development | AFib, venous thrombosis, pulmonary embolism | Severe renal impairment, recent surgery, active bleeding | Bleeding, GI upset |
| Direct Factor Xa inhibitors | rivaroxaban<br>apixaban<br>edoxaban | Direct, selective and reversible inhibition of factor Xa in both the intrinsic and extrinsic coagulation pathways | AFib, venous thrombosis, pulmonary embolism | Hepatic disease, active bleeding, bleeding diathesis, pregnancy, lactation | Bleeding, elevated liver enzymes |
| **ANTIPLATELETS** | | | | | |
| Salicylates | ASA (Aspirin®) | Irreversibly acetylates platelet COX-1, preventing thromboxane A2-mediated platelet aggregation | CAD, acute MI, post-MI, post-PCI, CABG | Active bleeding or PUD | Bleeding, GI upset, GI ulceration, impaired renal perfusion |
| Thienopyridines | clopidogrel (Plavix®), ticlopidine (Ticlid®)<br>prasugrel (Effient®) | P2Y12 antagonist (block platelet ADP receptors) | Acute MI, post-MI, post-PCI, CABG | Active bleeding or PUD | Bleeding, thrombotic thrombocytopenic purpura, neutropenia (ticlopidine) |
| Nucleoside analogues | ticagrelor (Brillinta®) | P2Y12 antagonist (but different binding site than thienopyridines) | | | |
| GPIIb/IIIa inhibitors | eptifibatide, tirofiban, abciximab | Block binding of fibrinogen to Gp IIb/IIIa | Acute MI, particularly if PCI is planned | Recent surgery or bleeding, bleeding diathesis | Bleeding |
| **THROMBOLYTICS** | | | | | |
| | alteplase, reteplase, tenecteplase, streptokinase | Convert circulating plasminogen to plasmin, which lyses cross-linked fibrin | Acute STEMI | See Table 8, C29 | Bleeding |
| **NITRATES** | | | | | |
| | nitroglycerin | Relax vascular smooth muscle, producing venous and arteriolar dilation | CAD, MI, CHF (isosorbide dinitrate plus hydralazine) | Concurrent use of cGMP phosphodiesterase inhibitors, angle closure glaucoma, increased intracranial pressure | Headache, dizziness, weakness, postural hypotension |
| **LIPID LOWERING AGENTS** | | | | | |
| Statins | atorvastatin (Lipitor®), pravastatin (Pravachol®), rosuvastatin (Crestor®), simvastatin (Zocor®), lovastatin (Meracor®) | Inhibit HMG-CoA reductase, which catalyzes the rate-limiting step in cholesterol synthesis | Dyslipidemia (1° prevention of CAD), CAD, post-MI (2° prevention of CV events) | Liver or muscle disease | Myalgia, rhabdomyolysis, abdominal pain |
| Cholesterol absorption inhibitor | ezetimibe (Ezetrol®) | inhibits gut absorption of cholesterol | Decreases LDL but does not reduce mortality | Liver or renal impairment | Myalgia, rhabdomyolysis, abdominal pain |
| Miscellaneous | fibrates, bile acid sequestrates, nicotinic acid | | Primarily in familial hypercholesterolemia | | GI side effects common |
| PCKS9 inhibitor | evolocumab<br>alirocumab | monoclonal antibody | hypercholesterolemia | Hypersensitivity reaction to drug | Mild reactions to site of injection, nasopharyngitis |

# Antiarrhythmics

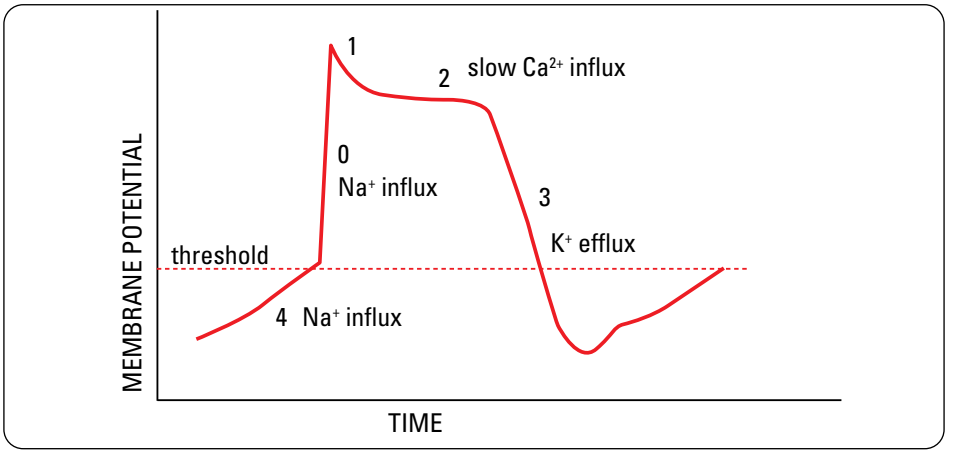

**Figure 46. Representative cardiac action potential**

**Table 19. Antiarrhythmic* Drugs (Vaughan-Williams Classification)**

| Class | Agent | Indications | Side Effects | Mechanism of Action |
|---|---|---|---|---|
| **Ia** | quinidine<br>procainamide<br>disopyramide | SVT, VT | Torsades de Pointes (all Ia), diarrhea<br>Lupus-like syndrome<br>Anticholinergic effects | Moderate $Na^+$ channel blockade<br>Slows phase 0 upstroke<br>Prolongs repolarization, slowing conduction |
| **Ib** | lidocaine<br>mexiletine | VT | Confusion, stupor, seizures<br>GI upset, tremor | Mild $Na^+$ channel blockade<br>Shortens phase 3 repolarization |
| **Ic** | propafenone<br>flecainide<br>encainide | SVT, VT<br>AFib | Exacerbation of VT (all Ic)<br>Negative inotropy (all Ic)<br>Bradycardia and heart block (all Ic) | Marked $Na^+$ channel blockade<br>Markedly slows phase 0 upstroke |
| **II** | propranolol<br>metoprolol, etc. | SVT, AFib | Bronchospasm, negative inotropy, bradycardia, AV block, impotence, fatigue | β-blocker<br>Decreases phase 4 depolarization |
| **III** | amiodarone**<br>sotalol | SVT, VT<br>AFib<br>SVT, VT, AFib | Amiodarone: Photosensitivity, pulmonary toxicity, hepatotoxicity, thyroid disease, increased INR<br>Amiodarone and Sotalol: Torsades de Pointes, bradycardia, heart block, β-blocker side effects | Blocks $K^+$ channel<br>Prolongs phase 3 repolarization, which prolongs refractory period |
| **IV** | verapamil<br>diltiazem | SVT<br>AFib | Bradycardia, AV block<br>Hypotension | Calcium channel blocker<br>Slows phase 4 spontaneous depolarization, slowing AV node conduction |

*All antiarrhythmics have potential to be proarrhythmic **Amiodarone has class I, II, III, and IV properties

**Table 20. Actions of α and β Adrenergic Receptors**

| | α RECEPTORS | | β RECEPTORS | |
|---|---|---|---|---|
| **Target System** | α1 | α2 | β1 | β2 |
| **Cardiovascular** | Constriction of vascular smooth muscle<br>Constriction of skin, skeletal muscle, and splanchnic vessels<br><br>Increased myocardial contractility<br>Decreased heart rate | Same as α1<br><br>Peripherally act to modulate vessel tone<br>Vasoconstrict and dilate; oppose α1 vasoconstrictor activity | Increased myocardial contractility<br>Accelerate SA node<br>Accelerate ectopic pacemakers | Decreased vascular smooth muscle tone |
| **Respiratory** | | | | Bronchodilation |
| **Dermal** | Pilomotor smooth muscle contraction<br>Apocrine constriction | | | |
| **Ocular** | Radial muscle contraction | | Ciliary muscle relaxation | |
| **Gastrointestinal** | Inhibition of myenteric plexus<br>Anal sphincter contraction | | | |
| **Genitourinary** | Pregnant uterine contraction<br>Penile and seminal vesicle ejaculation<br>Urinary bladder contraction | Smooth muscle wall relaxation | Stimulation of renal renin release | Bladder wall relaxation<br>Uterine relaxation |
| **Metabolic** | Stimulate liver gluconeogenesis and glycogenolysis at the liver | Same as α1<br>Fat cell lipolysis | Fat cell lipolysis<br>Glycogenolysis | Gluconeogenesis<br>Fat cell lipolysis |

# Landmark Cardiac Trials

| Trial | Reference | Results |
|---|---|---|
| **ISCHEMIC HEART DISEASE** | | |
| ODYSSEY OUTCOMES | NEJM 2018;379:2097-2107 | Among patients with an ACS event within the preceding 1-12 mo, use of alirocumab, administered every other week, significantly reduces ischemic events, including all-cause mortality and MI |
| ARRIVE | Lancet 2018;392:1036-1046 | Among patients at moderate risk of CHD, the use of aspirin was not beneficial. Aspirin was not associated with a reduction in adverse cardiovascular events |
| ASCOT-LLA | Lancet 2003;361:1149-58 | In hypertensive patients with risk factors for CHD and average or below-average cholesterol, atorvastatin reduced nonfatal MI, fatal CHD, fatal/nonfatal stroke, coronary events but not all-cause mortality |
| CAPRIE | Lancet 1996;348:1329-39 | In atherosclerotic vascular disease, clopidogrel reduced the primary combined endpoint of stroke, MI, or vascular death and improved PAD compared to ASA |
| CARE | NEJM 1996;335:1001-9 | Pravastatin reduced MI and stroke in patients with previous MI and average cholesterol |
| COURAGE | NEJM 2007;356:1503-16 | Compared with optimal medical therapy alone, PCI + medical therapy did not reduce all-cause mortality and non fatal MI, and it did not reduce the incidence of major cardiovascular events |
| CURE | NEJM 2001;345:494-502 | Clopidogrel plus ASA reduced death from CV causes, non fatal MI, or stroke but increased bleeding complications |
| EUROPA | Lancet 2003;362:782-88 | With stable CAD and no CHF, perindopril reduced cardiovascular death, MI, and total mortality |
| HOPE | NEJM 2000;342:154-60 | In high-risk patients without low LVEF or CHF, ramipril reduced rates of death, MI, stroke, revascularization, new diagnosis of DM, and complications due to DM; vitamin E had no effect on outcomes |
| HPS | Lancet 2002;360:7-22 | In high-risk patients with various cholesterol values, simvastatin reduced all-cause mortality, coronary deaths, and major vascular events |
| INTERHEART | Lancet 2004;364:937-52 | Nine modifiable risk factors account for 90% of myocardial infarction |
| IMPROVE-IT | N Engl J Med 2015 Jun 18 | Ezetimibe added to statin reduces mortality in ACS patients |
| JUPITER | NEJM 2008;359:2195-2207 | With low to normal LDL-C and elevated hsCRP treatment with rosuvastatin significantly reduced major cardiovascular events; NNT with rosuvastatin for 2 yr to prevent one primary endpoint = 95 |
| SYNTAX | NEJM 2009;360:961-972 | CABG has lower rate of major cardiac or cerebrovascular events; the rate of stroke was increased with CABG, whereas the rate of repeat revascularization was increased with PCI |
| TNT | NEJM 2005;352:1425-35 | Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d |
| WHI | JAMA 2002;288:321-333 | Estrogen plus progestin therapy is associated with increased risks of cardiovascular disease and breast cancer but decreased risks of hip fracture and colorectal cancer in postmenopausal women |

| Trial | Reference | Results |
|---|---|---|
| **MYOCARDIAL INFARCTION** | | |
| BHAT | JAMA 1982;247:1707-14 | In acute MI, propranolol reduced all-cause mortality, cardiovascular death, and sudden death from atherosclerotic heart disease |
| COURAGE | NEJM 2007;356:1503-16 | Compared with optimal medical therapy alone, PCI + medical therapy did not reduce all-cause mortality and non fatal MI, and it did not reduce the incidence of major cardiovascular events |
| DAPT | NEJM 2014;371:2155-66 | Dual antiplatelet therapy beyond one year confers additional benefit |
| ISIS-2 | Lancet 1988;2:349-60 | Early therapy with streptokinase and ASA in patients with MI individually and in combination significantly reduced all-cause mortality and in combination demonstrated additive effect |
| ISIS-4 | Lancet 1995;345:669-85 | In patients with suspected or definite acute MI, early treatment with captopril reduced all-cause mortality at 35 d and during long-term follow-up |
| OASIS-5 | NEJM 2006;354:1464-76 | Compared to enoxaparin, fondaparinux reduced mortality rates, major bleeds at 9 and MI at 30 and 180 d |
| PEGASUS-TIMI 54 | NEJM 2015;EPUB | Ticagrelor on top of ASA reduces CV events and in patients with a history of MI |
| PLATO | NEJM 2009:361:1045-57 | ACS patients with either STEMI or NSTEMI, regardless of reperfusion strategy, ticagrelor reduced mortality, MI, and stroke without increased bleeding compared to clopidogrel |
| PROVE IT – TIMI 22 | NEJM 2004;350:1495-1504 | In patients hospitalized for ACS, high-dose atorvastatin reduced all-cause mortality, MI, unstable angina, revascularization, and stroke compared with pravastatin |
| TRITON-TIMI 38 | NEJM 2007;357:2001-15 | In ACS patients scheduled for PCI, prasugrel reduced ischemic events but increased major bleeding compared to clopidogrel; no change in mortality |
| **HEART FAILURE** | | |
| PARTNER 3 | NEJM 2019;Epub ahead of print | Among low-risk patients with aortic stenosis, transcatheter aortic valve replacement (TAVR) was superior to surgical aortic valve replacement at preventing death, stroke, or rehospitalization at 1 year |
| COAPT | NEJM 2018;379:2307-2318 | Among patients with heart failure and moderate-to-severe or severe secondary mitral regurgitation who remained symptomatic despite the use of maximal doses of guideline-directed medical therapy, transcatheter mitral-valve repair resulted in a lower rate of hospitalization for heart failure and lower all-cause mortality within 24 mo of follow-up than medical therapy alone |
| AIRE | Lancet 1993;342:821-8 | Ramipril commenced 3-10 d after MI and continued for a mean 15 mo period significantly reduced all-cause mortality in patients with non-severe CHF |
| CHARM | Lancet 2003;362:759-66 | Candesartan reduced overall mortality, cardiovascular death, and CHF hospitalizations |
| CIBIS II | Lancet 1999;353:9-13 | Bisoprolol reduced all-cause mortality, cardiovascular death, all-cause hospitalization, and CHF hospitalization |
| COMET | Lancet 2003;362:7-13 | Carvedilol was associated with a reduction in all cause mortality compared with metoprolol |
| CONSENSUS | NEJM 1987;316:1429-35 | Enalapril reduced all-cause mortality, death due to progression of heart failure |
| COPERNICUS | NEJM 2001;344:1651-8 | Carvedilol in addition to standard treatment significantly reduced the risk of death or hospitalization in patients with severe CHF |
| I-PRESERVE | NEJM 2008;359:2456-2467 | In patients with CHF and normal LVEF treatment with ARB (irbesartan) did not improve mortality or cardiovascular morbidity compared to placebo |
| MERIT-HF | Lancet 1999;353:2001-7 | Metoprolol CR/XL daily in addition to optimum standard therapy improved survival in clinically stable patients equating to prevention of 1 death per 27 patients treated per year |
| PARADIGM-HF | NEJM 2014;371:993-1004 | Novel drug (LCZ696 containing valsartan and a neprilysin inhibitor (prevents degradation of natriuretic peptides) reduces hospitalization and mortality |
| RALES | NEJM 1999;341:709-17 | In severe CHF (class III/IV) and LVEF <35%, spironolactone reduced all-cause mortality, sudden death, and death due to progression of heart failure |
| SAVE | NEJM 1992;327:669-77 | Patients with LV dysfunction post-MI long-term captopril over 3.5 yr reduced the risk of death due to cardiovascular causes, recurrent MI, development of severe CHF, and CHF hospitalization |
| SCD-HeFT | NEJM 2005;352:225-237 | In mild-to-moderate CHF shock-only ICD significantly reduces risk of death; amiodarone had no benefit compared with placebo in treating patients with mild-to-moderate CHF |
| SOLVD | NEJM 1991;325:293-302 | In stable chronic CHF with decreased LVEF (<0.35), long-term enalapril reduced death due to all causes and death or hospitalization due to CHF |
| TRACE | NEJM 1995;333:1670-6 | In patients with LV dysfunction post-MI, long-term trandolapril reduced the risk of death or progression to severe CHF and reduced risk of sudden death |
| V-HeFT II | NEJM 1991;325:303-10 | In chronic CHF, enalapril reduced mortality more than hydralazine-isosorbide for at least 2 yr; treatment with either enalapril or hydralazine-isosorbide increased LVEF |

| Trial | Reference | Results |
|---|---|---|
| **DIABETES** | | |
| CARDS | Lancet 2004;264:685-96 | Atorvastatin reduces the risk of cardiovascular events in patients with type 2 DM |
| ONTARGET | NEJM 2008;358:1547-59 | In patients with vascular disease or DM without CHF, telmisartan is equally as effective as ramipril, with telmisartan causing a reduced risk of cough and angioedema, and an increased risk of hypotensive symptoms; combination therapy offers no advantage |
| **ARRHYTHMIA** | | |
| AFFIRM | NEJM 2002;347:1825-33 | No significant difference in mortality rates between rate or rhythm control of AFib |
| AF-CHF | NEJM 2008;358:2667-77 | In patients with AFib and CHF, there is no significant difference in mortality rates from cardiovascular causes between rate and rhythm control |
| ARISTOTLE | NEJM 2011;365:981-92 | AFib patients treated with apixaban had a lower incidence of stroke, major bleeding and mortality compared to warfarin |
| ENGAGE AF-TIMI48 | NEJM 2013;369:2093-2104 | AFib patients treated with edoxaban had similar rates of stroke and lower rates of major bleeding compared to warfarin |
| RE-LY | NEJM 2009;361:1139-51 | AFib patients treated with dabigatran had a lower incidence of stroke compared to warfarin, with similar rates of major bleeding |
| ROCKET-AF | NEJM 2011;365:883-891 | In patients with AFib rivoxabarin is non-inferior to warfarin for stroke prevention, and major and non-major bleeding |
| **HYPERTENSION** | | |
| HYVET | NEJM 2008;358:1887-98 | In hypertensive patients >80 yr treatment with indapamide, with or without perindopril, showed a trend towards reduced relative risk of fatal or non-fatal stroke |
| SIPLICITY-HTN 3 | NEJM 2014;370:1393-1401 | Renal denervation does not reduce blood pressure in patients with resistant hypertension compared to sham procedure |
| SPRINT | NEJM 2015;373:2103-2116 | In patients with high risk of cardiovascular events excluding diabetes, strict systolic BP control (<120 mmHg) is associated with fewer cardiovascular events and lower all-cause mortality |
| UKHDS (UKPDS) | BMJ 1998;317:703-13 | Hypertensive patients with DM and tight BP control at <150/85 mmHg by use of ACEI or β-blocker reduced risk of diabetic complications and death related to DM and reduced risk of end-organ damage |
| VALUE | Lancet 2004;363:2022-2031 | Valsartan group had higher incidence of MI than amlodipine group, whereas amlodipine had a higher incidence of new-onset DM |

# General Principles

## Drug Nomenclature

- **chemical name**: describes chemical structure; consistent in all countries via International Union of Applied Chemistry (e.g. N-(4-hydroxyphenyl)acetamide is acetaminophen)
- **DIN or NDC**: DIN assigned by Health Canada; NDC assigned by FDA (US)
- **non-proprietary name**: approved name (post-phase III trial), official name (listed in pharmacopeia), or generic name (off-patent) such as acetaminophen
- **proprietary (trade) name**: the brand name or registered trademark (e.g. Tylenol®)

## Phases of Clinical Drug Testing

- **pre-clinical**: testing a drug in a controlled environment (lab) on animal or human cells before human testing to discern the PK and toxicological profile
- **phase I**: first administration to healthy human volunteers, following animal studies; to determine PK and PD
- **phase II**: first administration to patients, small sample sizes; to determine initial safety and efficacy, dose range, PK, and PD
- **phase III**: double-blinded RCT; comparative (new drug vs. placebo or standard of care) to establish safety and efficacy
- **phase IV**: post-marketing surveillance, wide distribution; to determine effectiveness (in contrast to efficacy) and monitor long-term drug effects, and previously unappreciated ADRs

## Drug Administration

- choice of route of administration depends on: drug properties, local and systemic effects, desired time to onset and/or duration of action, and patient characteristics

**Table 1. Routes of Drug Administration**

| Route | Advantage | Potential Disadvantages |
|---|---|---|
| **Oral (PO)** | Convenient, easy to administer<br>Large surface area for absorption<br>Inexpensive relative to parenteral administration<br>Longer expiry date | Incomplete absorption<br>Hepatic first-pass effect<br>GI irritation<br>Higher likelihood of drug-drug interactions<br>Affected by dietary factors<br>Requires an intact GI system<br>Affected by GI motility |
| **Buccal/Sublingual (SL)** | Rapid onset of action<br>No hepatic first-pass effect | Must be lipid-soluble, non-irritating<br>Short duration of action |
| **Rectal (PR)** | Almost no hepatic first-pass effect<br>Use when NPO, vomiting, or unconscious | Inconvenient, irritation at site of application<br>Erratic absorption |
| **Intravenous (IV)** | No hepatic first-pass effect<br>Slow infusion or rapid onset of action<br>Easy to titrate dose | Hard to remove once administered<br>Risk of infection, bleeding, vascular injury, and extravasation<br>Expensive<br>Shorter expiry date |
| **Intramuscular (IM)** | Depot storage if oil-based = slow release of drug<br>Aqueous solution = rapid onset of action | Pain/hematoma at site of injection |
| **Subcutaneous (SC)** | Constant, even absorption<br>Alternative to IV<br>Easier administration (can be self-administered) | Pain at site of injection<br>Smaller volumes than IM<br>Possible tissue damage from multiple injections |
| **Intrathecal** | Direct into CSF<br>Bypass BBB and blood-CSF barrier | Risk of infection<br>Invasive procedure |
| **Inhalation** | Immediate action in lungs<br>Rapid delivery to blood<br>No hepatic first-pass effect | Must be gas, vapour, or aerosol |
| **Topical (skin, mucous membranes, eyes)** | Easy to administer<br>Localized (limited systemic absorption) | Effects are mainly limited to site of application |
| **Transdermal** | Drug absorption through intact skin<br>No hepatic first-pass effect | Irritation at site of application<br>Delayed onset of action<br>Hydrophilic drugs not easily absorbed |
| **Others (Intraperitoneal, Intra-Articular)** | Local effect | Risk of infection |

# Acronyms

| | |
|---|---|
| ACE | angiotensin converting enzyme |
| ACh | acetylcholine |
| ADE | adverse drug event |
| ADR | adverse drug reaction |
| ARB | angiotensin receptor blocker |
| AUC | area under the concentration-time curve |
| BBB | blood brain barrier |
| Cl | clearance |
| Cr | creatinine |
| CSF | cerebrospinal fluid |
| CSFa | certain safety factor |
| CYP | cytochrome P450 enzyme |
| DIN | drug identification number |
| F | bioavailability |
| FDA | Food and Drug Administration |
| GFR | glomerular filtration rate |
| HH | Henderson-Hasselbalch |
| NDC | National Drug Code |
| NE | norepinephrine |
| NPO | nothing by mouth |
| Po/w | partition coefficient of a drug |
| PD | pharmacodynamics |
| PDE | phosphodiesterase |
| P-gp | P-glycoprotein |
| PK | pharmacokinetics |
| RCT | randomized controlled trial |
| TBW | total body water |
| TDM | therapeutic drug monitoring |
| TI | therapeutic index |
| Vd | volume of distribution |

At the time of drug launch, only data from phases I-III are available; thus, effectiveness and safety may be unknown because real-world patients and usage patterns often differ from those in premarket phases

**Common Latin Abbreviations**

| | |
|---|---|
| q | each, every |
| OD/bid/tid/qid | once/twice/three/four times a day |
| hs | at bedtime |
| ac/pc/cc | before/after/with meals |
| prn | as necessary |
| gtt | drops |
| ung | ointment |
| ud | as directed |
| od/os/ou | right/left/each eye |
| ad/as/au | right/left/each ear |

NOTE: Certain abbreviations, symbols, and dose designations may contribute to medication errors. For more information, refer to guidelines by the Institute for Safe Medication Practices (ISMP)

# Pharmacokinetics

- study of "what the body does to a drug" – i.e. the fate of a drug following administration
- **definition**: relationship between drug administration, time-course/rate of absorption and distribution, concentration changes in the body compartments, and the drug's removal from the body

## Absorption

- **definition**: movement of the drug from the site of administration into plasma

### Mechanisms of Drug Absorption

- most drugs are absorbed into the systemic circulation via passive diffusion
- other mechanisms include active transport, facilitated diffusion, and pinocytosis/phagocytosis

### Factors Affecting the Rate and Extent of Drug Absorption

- $P_{o/w}$
- local blood flow at the site of administration (e.g. sublingual vessels facilitate rapid absorption of sublingually-administered medications)
- molecular size (e.g. drugs with smaller molecular weight are absorbed faster)
- pH and drug ionization
  - drugs are usually weak acids (e.g. ASA) or weak bases (e.g. ketoconazole) and thus exist in ionized and non-ionized forms
  - non-ionized forms cross cell membranes more readily than ionized (charged) forms
  - the ratio of ionized to non-ionized forms is determined by body compartment pH and drug pKa (H-H equation)
- total surface area for absorption
  - small intestinal villi are the primary site of absorption for most oral drugs

**$P_{o/w}$**
- Ratio of a drug's solubility in oil/lipid (e.g. cell membrane) as compared to water (e.g. extracellular fluid)
- A large $P_{o/w}$ (e.g. anesthetics) means that a drug is highly soluble in lipid and will cross cell membranes easily

### Bioavailability (F)

- **definition**: proportion of dose that reaches systemic circulation in an unchanged state
- lower F usually reflects limited drug absorption or first-pass effect
- IV dose has 100% bioavailability (F = 1)

### First-Pass Effect

- **definition**: drug metabolism by the liver and/or the gut before it reaches systemic circulation, resulting in reduced F
- occurs with PO administration of a drug: GI tract (absorption) → portal vein to liver (first-pass metabolism) → systemic circulation
- 50% of the PR administered drug absorbed in colon bypasses the portal system. CYP3A4 in the enterocytes reduce the bioavailability of some rectally administered medications

**Examples of Drugs with High First-Pass Effect**
- Levodopa
- Morphine
- Propranolol
- Lidocaine
- Organic nitrates
- Simvastatin

**Examples of Drugs with Low First-Pass Effect**
- Diazepam
- Digoxin
- Phenytoin
- Warfarin

### Efflux Pump

- P-gp is a protein found in various parts of the body that acts as a multidrug efflux pump involved in the transport of drugs out of cells
- for example, P-gp opposes intestinal absorption (e.g. dabigatran etexilate) and also enhances renal elimination of certain drugs (e.g. digoxin, etoposide, paclitaxel, tacrolimus, cyclosporine)
- some drugs (e.g. macrolide antibiotics) inhibit P-gp function, leading to increased serum concentrations of drugs transported by P-gp; P-gp inducers (e.g. rifampin, St. John's wort) do the opposite
- some tumours overexpress P-gp leading to multidrug resistance to chemotherapeutic agents

## Distribution

- **definition**: movement of drugs between different body compartments and to the site of action
- major body fluid compartments include plasma, interstitial fluid, intracellular fluid, transcellular fluid (e.g. CSF, peritoneal, pleural)
- tissue compartments include fat, brain

### Factors Affecting the Rate and Extent of Drug Distribution

- physiochemical properties of the drug (e.g. $P_{o/w}$ and pKa)
- pH of fluid
- plasma protein binding
- binding within compartments (i.e. depots)
- regional blood flow

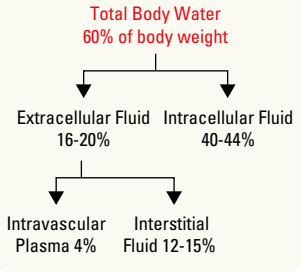

**Figure 1. Distribution of total body water (TBW)**

### Volume of Distribution

- $V_d$: the apparent volume of fluid into which a drug distributes
- maximum actual $V_d$ (anatomic fluid volume accessible to drug) = TBW (~40 L for average adult)
  - a calculated value ($V_d$) = amount of drug in body ÷ plasma drug concentration
  - a theoretical value that does not correspond to an anatomical space (i.e. can exceed TBW)
  - small $V_d$ corresponds to a drug that concentrates in plasma and/or binds plasma proteins to a high degree
  - large $V_d$ corresponds to a drug that distributes into tissues (fat, muscle, etc.); most is not in blood (measured) space; it therefore "appears" to distribute in a large volume
  - $V_d$ of plasma protein bound drugs can be altered by liver and kidney disease
  - $V_d$ of drugs change with age
    - in geriatric populations, there is a reduction in total body water and total muscle mass, but an increase in total body fat resulting in an increase in the $V_d$ of lipophilic drugs
    - $V_d$ of drugs will change in the geriatric population based on the drug $P_{o/w}$
- example: amiodarone distributes into TBW (actual $V_d$ ~40 L), but it concentrates in fat tissues yielding an apparent $V_d$ of 400 L; therefore, to achieve a given plasma concentration of amiodarone, we dose as though the drug distributes into 400 L of body fluid

Multiple drugs and endogenous substances can compete for the same protein binding sites. For example, ASA displaces highly protein-bound acidic drugs such as phenytoin, thus increasing risk of toxicity, and sulfonamide displaces bilirubin, which could potentially lead to jaundice and kernicterus in neonates

### Plasma Protein Binding

- drug molecules in the blood exist in an equilibrium of two forms:
  1. bound to plasma protein: acidic drugs bind to albumin, basic drugs bind to α1-acid glycoprotein
  2. free or unbound: can leave the circulation to distribute into tissues and exert an effect, subject to metabolism and elimination
- bound fraction is determined by drug concentration, binding affinity, and plasma protein concentration (number of binding sites)
- reduced number of binding sites (e.g. hypoalbuminemia) or saturation of binding sites (e.g. competition/displacement) may result in increased concentration of free drug, which is often metabolized with no harmful effects, although toxicity is possible

Special consideration must be given in dosing patients in hypoalbuminemic states (e.g. liver failure or nephrotic syndrome) to prevent drug toxicity. Highly protein-bound drugs (e.g. warfarin, digoxin, diazepam, furosemide, amitriptyline) will exert a greater effect in these patients than in healthy individuals because of higher levels of free drug

### Depots

- a body compartment in which drug molecules tend to be stored and released slowly over a long period of time
- fat is a depot for very lipid soluble drugs (e.g. diazepam)
- some oil-based medications are injected IM for slow release (e.g. depot medroxyprogesterone acetate q3mo; depot risperidone q2wk)

### Barriers (relative)

- body structures that limit or prevent diffusion of drug molecules, such as the placenta or BBB (a barrier composed of tight junctions between capillary endothelial cells and astrocytes)
- many of these barriers result, in part, from the activity of multidrug efflux pumps (e.g. P-gp), which serve as a natural defense mechanism against drugs and xenobiotics
- need to consider dosing route if drugs are meant to cross these barriers
- barriers are important in determining site of action and side effects profile of drugs (e.g. CNS depression if drug crosses BBB, risk of harm to a fetus if drug crosses placental barrier)

**Main Factors Governing Penetration of BBB**

- Small molecular size (<500 Da)
- High lipid solubility
- Active transport mechanisms (e.g. Pgp efflux pump)

## Metabolism (Biotransformation)

- **definition**: chemical transformation of a drug *in vivo*
- sites of biotransformation include liver (main), GI tract, lung, plasma, kidney
- as a result of the process of biotransformation:
  - an inactive prodrug may be **activated** (e.g. tamoxifen to endoxifen; codeine to morphine)
  - a drug may be **changed** to another active metabolite (e.g. diazepam to oxazepam and others)
  - a drug may be **changed** to a toxic metabolite (e.g. meperidine to normeperidine)
  - a drug may be **inactivated** (most drugs)

### Drug Metabolizing Pathways

- **phase I (P450) reactions**
  - minor molecular changes introduce or unmask polar groups on a parent compound to increase water solubility (e.g. oxidation-reduction, hydrolysis, hydroxylation, demethylation); the change in $P_{o/w}$ is typically minimal compared to phase II, and often phase I places a polar 'handle' on a lipophilic drug to allow for phase II
  - mediated by CYPs found in the endoplasmic reticulum (primarily in hepatocytes)
  - product of the reaction can be excreted or undergo further phase II reactions
- **phase II (conjugation) reactions**
  - conjugation with large polar endogenous substrates (e.g. glucuronidation, glutathione conjugation, sulfation)
  - dramatically increases water solubility and renal elimination
  - can result in biologically active metabolites (e.g. glucuronides of morphine)
  - can occur independently of phase I reactions

### Factors Affecting Drug Biotransformation

- **genetic polymorphisms** of metabolizing enzymes
  - for some enzymes, individual genotypes may alter the rate of drug metabolism (e.g. poor, intermediate, extensive, or ultrarapid metabolizers)
  - may lead to toxicity or ineffectiveness of a drug at a normal dose
  - tamoxifen and codeine are prodrugs activated by CYP2D6 (nonfunctional alleles reduce effectiveness, whereas duplicated alleles impart "ultra-rapid metabolizer" phenotype)
  - warfarin is metabolized by CYP2C9 (nonfunctional alleles lead to greater effect and lower dose requirements)
- **enzyme inhibition** may sometimes be due to other drugs
  - CYP inhibition leads to an increased concentration and bioavailability of the substrate drug (e.g. erythromycin [CYP3A4 inhibitor] can predispose patients to simvastatin toxicity [metabolized by CYP3A4])
  - grapefruit juice is a potent inhibitor of intestinal CYP3A4, resulting in numerous drug interactions (e.g. saquinavir AUC increased 3-fold, simvastatin 17-fold)
- **enzyme induction**
  - certain medications enhance gene transcription leading to an increase in the activity of a metabolizing enzyme
  - a drug may induce its own metabolism (e.g. carbamazepine) or that of other drugs (e.g. phenobarbital can induce the metabolism of OCPs) by inducing the CYP system
- **liver dysfunction** (e.g. hepatitis, alcoholic liver, biliary cirrhosis, or hepatocellular carcinoma) may decrease drug metabolism but this may not be clinically significant due to the liver's reserve capacity
- **renal disease** often results in decreased drug clearance
- **extremes of age** (neonates or elderly) have reduced biotransformation capacity, and doses should be adjusted accordingly
- **nutrition**: insufficient protein and fatty acid intake decreases CYP biotransformation, and vitamin/mineral deficiencies may also impact other metabolizing enzymes
- **alcohol**: while acute alcohol ingestion inhibits CYP2E1, chronic consumption can induce CYP2E1 and increase risk of hepatocellular damage from acetaminophen by increasing the production of acetaminophen's toxic metabolite (NAPQI)
- **smoking** can induce CYP1A2, thus increasing the metabolism of some drugs (e.g. theophylline, antipsychotics)

**Cytochrome P450 System**
The CYPs are a superfamily of heme proteins that are grouped into families and subfamilies according to their amino acid sequence. These proteins are responsible for the metabolism of drugs, chemicals, and other substances

Nomenclature: CYP3A4
"CYP" = cytochrome P450 protein
1st number = family
letter = subfamily
2nd number = isoform

The CYP1, CYP2, and CYP3 families metabolize most drugs in humans. The most important isoforms are CYP3A4 and CYP2D6; therefore, anticipate drug interactions if prescribing drugs using these enzymes

**Examples of CYP Substrates, Inhibitors, and Inducers**
http://www.medicine.iupui.edu/CLINPHARM/ddis/main-table

## Elimination

- **definition**: removal of drug from the body

### Routes of Drug Elimination

- **kidney** (main organ of elimination)
  - renal drug clearance = (glomerular filtration + tubular secretion) – (tubular reabsorption)
  - two mechanisms:
    1. **glomerular filtration**
       – a passive process, so that only the free drug fraction can be eliminated
       – drug filtration rate depends on GFR, degree of protein binding of drug, and size of drug
    2. **tubular secretion**
       – an active process that is saturable allowing both protein-bound and free drug fractions to be excreted
       – distinct transport mechanisms for weak acids (e.g. penicillin, salicylic acid, probenecid, chlorothiazide) and weak bases (e.g. quinine, quaternary ammonium compounds such as choline)
       – drugs may competitively block mutual secretion if both use the same secretion system (e.g. probenecid can reduce the excretion of penicillin)
- **tubular reabsorption**: drugs can be actively or passively reabsorbed back to the systemic circulation, countering elimination mechanisms
- **renal function** (assessed using serum Cr levels) decreases with age (7.5 mL/min per decade) and is affected by many disease states such as diabetes
- **stool**: some drugs and metabolites are actively excreted in the bile or directly into the GI tract
  - enterohepatic reabsorption counteracts stool elimination, and can prolong the drug's duration in the body
  - some glucuronic acid conjugates that are excreted in bile may be hydrolyzed in the intestines by bacteria back to their original form and can be systemically reabsorbed
- **lungs**: elimination of anesthetic gases and vapours by exhalation
- **saliva**: saliva concentrations of some drugs parallel their plasma concentrations (e.g. rifampin)

**The Cockcroft-Gault Equation can Estimate CrCl in Adults 20 yr of Age and Older**

- For males

$$\text{CrCl (mL/min)} = \frac{[(140 - \text{age in yr}) \times \text{Weight (kg)}] \times 1.2}{\text{serum Cr (μmol/L)}}$$

- For females, multiply above equation x 0.85
- Use ideal body weight in obese patients

**Limitations of Cockroft-Gault Equation**

- In individuals with large muscle mass, the equation underestimates renal clearance
- In the elderly population, physiological loss of muscle mass may result in overestimation of renal clearance

Note, only applies when renal function is at steady state

Avoid toxicity from drug or metabolite accumulation by adjusting a drug's dosage according to the elimination characteristics of the patient

# Pharmacokinetic Calculation

- **definition**: the quantitative description of the various steps of drug disposition (i.e. how drugs move through the body)
- the pharmacokinetic principles of ADME (absorption, distribution, metabolism, and elimination) can be graphically represented on a graph of concentration vs. time

## Time Course of Drug Action

- many kinetic parameters are measured using IV dosing, such that absorption is immediate and distribution for most drugs is rapid; thus elimination is the main process being measured
- the concentration axis is converted to a log10 concentration to allow for easier mathematical calculations
- drugs such as warfarin can exhibit hysteresis (for a single drug concentration, there may be two different response levels)

## Half-Life

- **definition**: time taken for the serum drug level to fall 50% during elimination
- drugs with first order kinetics require five half-lives to reach steady state with repeated dosing or for complete drug elimination once dosing is stopped

## Steady State

- drug concentration remains constant when amount of drug entering the system is the same as the amount eliminated from the system
- drug levels in therapeutic drug monitoring are of greatest utility when the steady state has been reached
- special situations
  - use a loading dose for drugs with a long half-life and when there is clinical need to rapidly achieve therapeutic levels (e.g. amiodarone, digoxin, phenytoin)
  - use continuous infusion for drugs with a very short half-life and when there is need for a long-term effect and multiple or frequently repeated doses are too inconvenient (e.g. nitroprusside, unfractionated heparin, naloxone)

## Clearance

- a quantitative measurement of the body fluid volume from which a substance is removed per unit time
- Cl = rate of elimination of drug ÷ plasma drug concentration
- must consider Cl from a specific part of the body and total body Cl

## Elimination Kinetics

- first-order kinetics (most common type)
  - constant fraction of drug eliminated per unit time
  - some drugs can follow first-order kinetics until elimination is saturated (usually at large doses) at which point the Cl is less than would be predicted for a given concentration
  - shows linear relationship when plotted on a graph of concentration (log) vs. time (linear)
- zero-order kinetics (less common, associated with overdose, e.g. alcohol)
  - constant amount of drug eliminated per unit time, regardless of concentration; concept of half-life does not apply
  - the concentration axis is converted to a log (concentration) to allow for easier mathematical calculations
- non-linear kinetics (much less common)
  - unlike first-order kinetics which assumes no change in PK parameter with drug dose, non-linear kinetics is considered dose-dependent
  - saturation of various ADME processes creates non-linear kinetics
  - the complexity of dosing drugs with non-linear kinetics has resulted in creation of drug-specific nomograms to aid clinicians in dosing, with these drugs often being the target of therapeutic drug monitoring
    - examples: phenytoin, theophylline

## Loading and Maintenance Doses

- loading doses are used when immediate effect is needed with parenteral administration being the most common way of giving a large dose to "fill up" the volume of distribution
- maintenance doses are given after a loading dose OR drug regimen can begin with maintenance doses
  - steady state levels are achieved after ~5 half lives
  - can be given as either a continuous infusion (rare) or more commonly as intermittent oral doses

# Pharmacodynamics

- study of "what the drug does to the body"

## Dose-Response Relationship

- graded dose-response relationships: relates dose to intensity of effect

## Efficacy

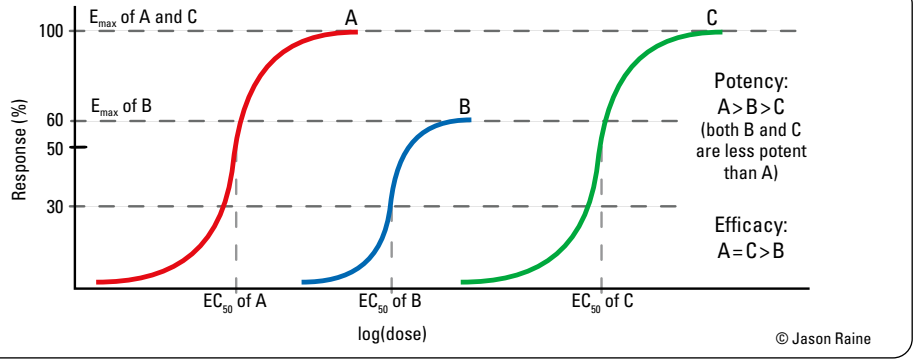
- the maximum biological response produced by a drug
- measured by $E_{max}$ (the maximal response that a drug can elicit in a RCT or under optimal circumstances)

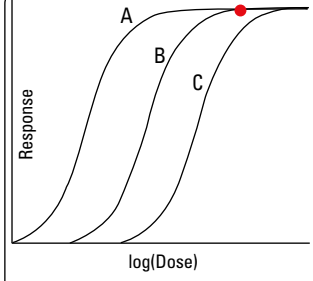
## Potency

- measured by $EC_{50}$ (the concentration of a drug needed to produce 50% of $E_{max}$)
- a drug that reaches its $EC_{50}$ at a lower dose is more potent

**Efficacy vs. Potency**

- Efficacy measures the maximal effect of a drug
- Potency measures the concentration of a drug needed to produce a certain effect





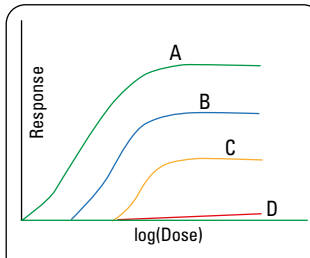


**Figure 2. Log(dose)-response curve illustrating efficacy and potency**

A → C increasing dose of competitive antagonist
At each dose of antagonist, increasing the concentration of agonist can overcome the inhibition

**Figure 3. The log(dose)-response curve for competitive reversible antagonism**

A → D increasing dose of irreversible antagonist. With co-administration of antagonist, increasing dose of agonist does not completely overcome antagonism, as seen in B. Eventually with high enough antagonism concentrations, no amount of agonist can elicit a response, as seen in D

**Figure 4. The log(dose)-response curve for irreversible antagonism**

# Effects of Drugs on Receptors

## Agonists

- drugs that mimic the effects of the endogenous ligand and evoke a response when bound to the receptor
  - **affinity**: the ability of the agonist to bind to the receptor (e.g. the β2-agonist salbutamol has greater affinity for β2-receptors than β1-receptors)
  - **efficacy**: the ability to recapitulate endogenous response via the receptor interaction (e.g. binding of salbutamol to β2-receptors results in smooth muscle relaxation)
    - drug efficacy in an RCT is different than efficacy in the context of pharmacological principles
- **full agonists**: can elicit a maximal effect at a receptor (e.g. methadone and morphine on the μ opioid receptor system)
- **partial agonists**: can only elicit a partial effect, no matter the concentration at the receptor (i.e. reduced efficacy compared to full agonists) (e.g. buprenorphine on the μ opioid receptor system)

## Antagonists

- drugs that reduce the action of an agonist or of an endogenous ligand
- **chemical antagonism**: direct chemical interaction between agonist and antagonist prevents agonist-receptor binding (e.g. chelating agents for removal of heavy metals)
- **physiological/functional antagonism**: two agonists that act independently at different receptors and have opposite physiological effects (e.g. acetylcholine at the muscarinic receptor compared to epinephrine at the adrenergic receptor)
- **pharmacological antagonism**: antagonist inhibits agonist through acting on receptor or alternative effector site
- **reversible and irreversible competitive antagonism**
  - drugs that exert no direct effect upon binding to a given receptor (i.e. zero efficacy)
  - reversible competitive antagonists reversibly bind to the same receptor as the agonist, thus displacing it (e.g. naloxone is an antagonist to morphine or heroin)
  - irreversible antagonists form a covalent bond with the receptor, thus irreversibly blocking substrates from binding (e.g. phenoxybenzamine forms a covalent bond with adrenergic receptors preventing adrenaline and NE from binding)
- **non-competitive antagonism**
  - antagonist binds to an alternate site near the agonist site, producing allosteric effects that change the ability of the agonist to bind (e.g. organophosphates irreversibly bind acetylcholinesterase)

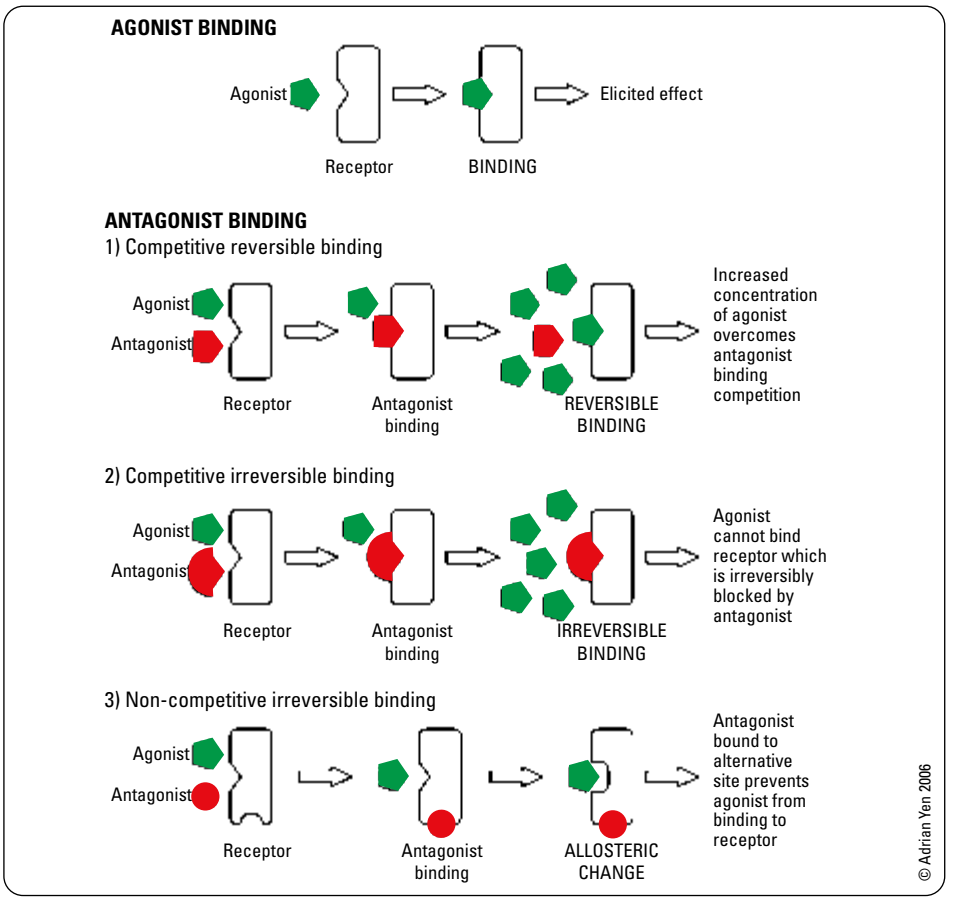

**Figure 5. Mechanism of agonists and antagonists**

# Effectiveness and Safety

### Effectiveness

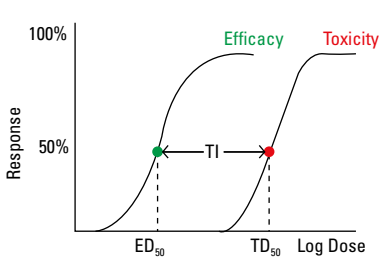
- $ED_{50}$ (effective dose): the dose of a drug needed to cause a therapeutic effect in 50% of a test population of subjects

### Safety

- $LD_{50}$ (lethal dose): the dose of a drug needed to cause death in 50% of a test population of subjects
- $TD_{50}$ (toxic dose): the dose needed to cause a harmful effect in 50% of a test population of subjects

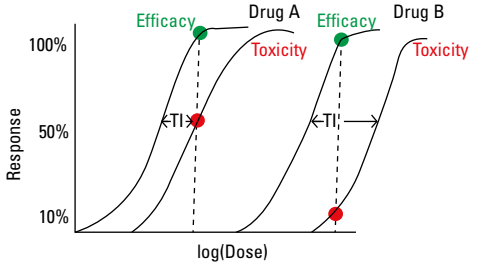
The two most clinically relevant properties of any drug are effectiveness and safety

# Therapeutic Indices



### Therapeutic Index: $TD_{50}/ED_{50}$

- reflects the "margin of safety" for a drug – the likelihood of a therapeutic dose to cause serious toxicity or death
- the larger the TI, the safer a drug
- common drugs with a narrow TI that require therapeutic drug monitoring include: digoxin, theophylline, warfarin, lithium, and cyclosporine
- factors that can change the TI
  - presence of interacting drugs
  - changes in drug ADME



Drugs with a narrow TI have a high likelihood of causing toxicity and need close therapeutic monitoring

### Certain Safety Factor: $TD_1/ED_{99}$

- >1 translates to a dose effective in at least 99% of the population and toxic in less than 1% of the population

The therapeutic index ($TD_{50}/ED_{50}$) is a measure of the margin of safety of a given drug

Drug A has a much narrower therapeutic index than Drug B. The dose of Drug A required to achieve a 100% therapeutic response will be toxic in 50% of patients. For Drug B, this is only 10%

**Figure 6. $ED_{50}$, $TD_{50}$, and the therapeutic index**

# Therapeutic Drug Monitoring

- **definition**: using serum drug concentration data to optimize drug therapy (e.g. dose adjustment, monitor compliance) serum drug samples are usually taken when the drug has reached steady state (after approximately 5 half-lives)
- TDM is often used for drugs that have: narrow TIs, unpredictable dose-response relationships, significant consequences associated with therapeutic failure or toxicity, and wide inter-patient PK variability
- nomograms are often used for narrow TI drugs, particularly in the setting of patients with complex clinical factors such as renal insufficiency, hepatic failure, dialysis, hypoalbuminemia
- examples of drugs that require therapeutic drug monitoring include:
  - vancomycin
  - aminoglycosides (gentamicin, tobramycin)
  - digoxin
  - phenytoin and other anticonvulsants
  - warfarin
  - lithium

# Adverse Drug Reactions

- adverse drug events (ADEs) are events that occur while a patient is on a drug at either appropriate or inappropriate doses. A causal relationship is not required
- adverse drug reactions (ADRs) are reactions to drugs that occur when a drug is used for the appropriate indication at normal therapeutic doses

**Table 2. Characteristics of Type A-E Adverse Drug Reactions**

| Classification | Definition | Characteristics |
|---|---|---|
| **A (Augmented)** | Dose related | Predictable extension of drug's pharmacologic effect (e.g. β-blockers causing bradycardia)<br>>80% of all ADRs |
| **B (Bizarre)** | Non-dose related | Reactions unrelated to the known pharmacological actions of the drug<br>Examples include: drug hypersensitivity syndromes, immunologic reactions (penicillin hypersensitivity), and idiosyncratic reactions (malignant hyperthermia) |
| **C (Chronic)** | Dose and time related | Related to cumulative doses<br>Effects are well-known and can be anticipated (e.g. atypical femoral fracture from bisphosphonates) |
| **D (Delayed)** | Time related | Occurs some time after use of drug (e.g. carcinogen)<br>May also be dose-related |
| **E (End of use)** | Withdrawal | Occurs after cessation of drug use (e.g. opiate withdrawal) |

**Tips to Reduce Drug-Related Adverse Events in the Elderly**

- Be mindful of longstanding medications that have never been adjusted for patient age or renal or hepatic function
- Consider whether medications initiated during hospital admission are needed long-term (and whether the discharge dose is appropriate for maintenance)
- Avoid polypharmacy by decreasing the dose of or discontinuing medications that are causing side effects
- Verify adherence to medications before automatically increasing the dose of subtherapeutic treatment
- When prescribing medications, use those with a wide therapeutic window
- Review the patient's problem list and reconcile current medications to avoid duplication or inappropriate dosing/frequency

# Approach to Suspected Adverse Drug Reactions

- history and physical exam: signs and symptoms of reaction (e.g. rash, fever, hepatitis, anaphylaxis), timing, risk factors, detailed medication history including all drugs and timing, de-challenge (response when drug is removed), and re-challenge (response when drug is given again, if applicable)
- differentiate between drug therapy vs. disease pathophysiology
- treatment: stop the drug, supportive care, symptomatic relief. Specific interventions (eg. steroids, immunosuppressants) used for some ADRs
- resources: check recent literature, Health Canada, and FDA; contact the pharmaceutical company; call Poison Control (1-888-268-9017) if overdose or poisoning suspected; check with MotherToBaby (https://mothertobaby.org/) in cases involving pregnant or breastfeeding women
- report all suspected ADRs that are: 1) unexpected, 2) serious, or 3) reactions to recently marketed drugs (on the market <5 yr) regardless of nature or severity
  - Canadian Adverse Drug Reaction Monitoring Program available for online reporting

# Variability in Drug Response

- recommended patient dosing is based on clinical research and represents mean values for a select population, but each person may be unique in their dosing requirements
- possible causes of individual variability in drug response include problems with:
  - intake: patient adherence
  - PK
  - absorption: vomiting, diarrhea, or steatorrhea; first pass effect increased due to enzyme induction or decreased due to liver disease
  - drug interactions (e.g. calcium carbonate complexes with iron, thyroxine, and fluoroquinolones)
  - distribution: very high or low percentage body fat; intact or disrupted BBB; patient is elderly or a neonate, or has liver dysfunction
  - biotransformation and elimination: certain genetic polymorphisms or enzyme deficiencies related to drug metabolism (e.g. acetylcholinesterase deficiency, CYP polymorphism); kidney or liver dysfunction
  - PD: genetic variability in drug response (e.g. immune-mediated reactions); diseases that affect drug PD; drug tolerance or cross-tolerance

# Drug Interactions

- concomitant prescriptions: one drug alters the effect of another by changing its PK and/or PD
- PK interactions involve changes in drug concentration
  - absorption: alterations in gastrointestinal pH, gastric emptying, intestinal motility, gut transporters
  - metabolism: alterations in drug metabolizing enzymes (e.g. CYP)
  - excretion: alterations in renal elimination
- PD interactions are due to two drugs that exert similar effects (additive) or opposing effects (subtractive)
- drug interactions can also involve herbal medications (e.g. St. John's wort) and food (e.g. grapefruit juice)

# Autonomic Pharmacology

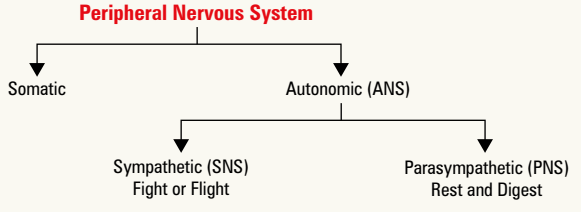


**Figure 7. Subdivisions of the peripheral nervous system**

- most organs are innervated by both sympathetic and parasympathetic nerves, which have opposing effects (see Neurology, N8)
- ACh and NE are the main neurotransmitters of the autonomic NS
- ACh binds to cholinergic receptors, which include nicotinic and muscarinic receptors
- NE binds to adrenergic receptors, which principally include β1, β2, α1, and α2
- ACh action is terminated by metabolism in the synaptic cleft by acetylcholinesterase and in the plasma by pseudocholinesterase

**Antibiotic Allergies - What is the Risk of Cross-Reactivity?**

- In clinical practice, cross-reactivity between drugs presents a problem for both patients and physicians
- In the case of penicillin allergy, cross-reactivity to cephalosporins is less than 2%, however, in patients who have a history of true anaphylactic reaction, cross-reactivity is closer to 40%
- Conversely, cross-reactivity between penicillins and carbapenems is <1%
- The term "sulfa allergy" is often misused and has no formal definition. Current evidence suggests cross-reactivity between sulfonamide antibiotics (e.g. sulfamethoxazole-trimethoprim) and non-antibiotic sulfonamides, including loop diuretics (e.g. furosemide), thiazide diuretics (e.g. hydrochlorothiazide), protease inhibitors containing an arylamine group (e.g. darunavir), carbonic anhydrase inhibitors (e.g. acetazolamide), and sulfonylureas (e.g. glipizide)

**Examples of Clinically Relevant Drug Interactions**

| Interaction | Potential Effect | Mechanism of Interaction |
|---|---|---|
| Warfarin plus ciprofloxacin, clarithromycin, erythromycin, metronidazole, or trimethoprim-sulfamethoxazole | Increased effect of warfarin | Uncertain (Likely PD – antibiotic interference with enteric flora mediated Vitamin K2 production) |
| Warfarin plus acetaminophen | Acetaminophen (NAPQI) further increases INR | PD (reduction of Vitamin K-dependent clotting factors by NAPQI) |
| **Oral contraceptive pills** plus rifampin | Decreased effectiveness of oral contraception | PD and PK (rifamycin induced increase in hormone metabolism and Cyp3A4 induction) |
| **Sildenafil** plus nitrates | Hypotension | PD (PDE5 inhibitors potentiate cGMP production, nitrates increased production) |
| **SSRI** plus St. John's wort, naratriptan, rizatriptan, sumatriptan, zolmitriptan | Serotonin syndrome | PD (concomitant use of seretonergic medications) |
| SSRI plus selegiline or non-selective MAO-I | Serotonin syndrome | PD (decrease metabolism of sereteonin with excess serotonin in synaptic clef) |
| Some **HMG-CoA reductase inhibitors** plus niacin, gemfibrozil, erythromycin or itraconazole | Possible rhabdomyolysis | PK (various mechanisms based on drugs listed; Cyp3A or OATP1B1) |
| Sulfamethoxazole-Trimethoprim and ACEIs/ARBs, spironolactone | Increased risk of hyperkalemia | PD (reduced renal potassium excretion due to trimethoprim) |

- acetylcholinesterase inhibitors (pyridostigmine, donepezil, galantamine, rivastigmine) can be used to increase ACh levels in conditions such as myasthenia gravis or Alzheimer's disease
- NE action is terminated by reuptake at the presynaptic membrane, diffusion from the synaptic cleft, and degradation at monoamine oxidase (MAO) and catechol-O-methyl transferase (COMT)

# Parasympathetic Nervous System

- blood vessels, adrenals, sweat glands, spleen capsule, and adrenal medulla do NOT have parasympathetic innervation
- parasympathetic pre-ganglionic fibres originate in the lower brainstem from cranial nerves III, VII, IX, X, and in the sacral spinal cord at levels S2-S4 and connect with post-ganglionic fibres via nicotinic receptors in ganglionic cells located near or within the target organ
- post-ganglionic fibres connect with effector tissues via:
  - M1 muscarinic receptors located in the CNS
  - M2 muscarinic receptors located in smooth muscle, cardiac muscle, and glandular epithelium

# Sympathetic Nervous System

- sympathetic pre-ganglionic fibres originate in the spinal cord at spinal levels T1-L2/L3
- pre-ganglionic fibres connect with post-ganglionic fibres via nicotinic receptors located in one of two groups of ganglia:
  1. paravertebral ganglia (i.e. the sympathetic trunk) that lie in a chain close to the vertebral column
  2. pre-vertebral ganglia (i.e. celiac and mesenteric ganglia) that lie within the abdomen
- post-ganglionic fibres connect with effector tissues via:
  - β1 receptors in cardiac tissue
  - β2 receptors in smooth muscle of bronchi and GI tract
  - α1 receptors in vascular smooth muscle
  - α2 receptors in vascular smooth muscle
  - M3 muscarinic receptors located in sweat glands

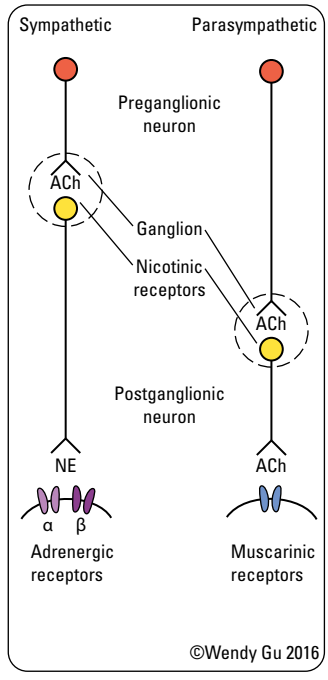

**Figure 8. Autonomic nervous system efferent tracts**

**Table 3. Direct Effects of Autonomic Innervation on the Cardiorespiratory System**

| Organ | Sympathetic NS | | Parasympathetic NS | |
|---|---|---|---|---|
| | Receptor | Action | Receptor | Action |
| **Heart** | | | | |
| 1. Sinoatrial | β1 | Increased HR | M | Decreased conduction |
| 2. Atrioventricular node | β1 | Increased conduction | M | Decreased conduction |
| 3. Atria | β1 | Increased contractility | M | Decreased conduction |
| 4. Ventricles | β1 | Increased contractility | M | Decreased HR |
| **Blood Vessels** | | | | |
| 1. Skin, splanchnic | α1, β2 | Constriction | M | Dilatation |
| 2. Skeletal muscle | α | Constriction | M | Dilatation |
| 3. Coronary | β2 (large muscles) | Dilatation | M | Dilatation |
| | α1, β2 | Constriction | M | Dilatation |
| | β2 | Dilatation | M | Dilatation |
| **Lungs** | | | | |
| 1. Bronchiolar smooth muscle | β2 | Relaxation | M | Constriction |
| 2. Bronchiolar glands | α1, β2 | Increased secretion | M | Stimulation |

# Opioid Therapy and Chronic Non-Cancer Pain

## General Management Principles

- when first considering therapy for patients with chronic non-cancer pain, optimize non-opioid pharmacotherapy and non-pharmacologic therapy, rather than a trial of opioids (strong recommendation)
- general approaches to opioid use should include avoiding initial high doses when possible and a slow, collaborative approach when tapering
- for patients with chronic non-cancer pain beginning opioid therapy, restrict the prescribed dose to less than 90 mg morphine equivalents daily (MED), and ideally less than 50 MED, rather than having no upper limit or a higher limit on dosing
  - for patients with chronic non-cancer pain who are currently using 90 mg morphine equivalents of opioids per day or more, encourage slow, collaborative taper opioids to the lowest effective dose, potentially including discontinuation, rather than making no change in opioid therapy
- for patients with chronic non-cancer pain who are using opioids and experiencing serious challenges in tapering, formal multidisciplinary program is suggested

- for more information, please refer to national opioid guidelines for a comprehensive approach to opioid use (link http://nationalpaincentre.mcmaster.ca/guidelines.html)

# Common Drug Endings

**Table 4. Common Drug Endings**

| Ending | Category | Example |
|---|---|---|
| -afil | PDE-5 inhibitor | sildenafil |
| -ane | Inhaled general anesthetic | halothane |
| -azepam | Benzodiazepine | lorazepam |
| -azole | Antifungal | ketoconazole |
| -caine | Local anesthetic | lidocaine |
| -mab | Monoclonal antibody | adalimumab |
| -nib | Small molecular inhibitors | imatinib |
| -olol | β-blocker | propranolol |
| -prazole | Proton pump inhibitor | omeprazole |
| -pril | ACE inhibitor | captopril |
| -sartan | ARB | candesartan |
| -statin | HMG-CoA inhibitor | atorvastatin |
| -terol | β2 agonist | albuterol |
| -tidine | H2 antagonist | cimetidine |
| -tropin | Pituitary hormone | somatotropin |
| -vir | Antiviral | acyclovir |
| -zosin | α1 antagonist | prazosin |

Note: Some medications are exceptions to the rule, e.g. methimazole (antithyroid)

# Introduction to Skin

## Skin Anatomy

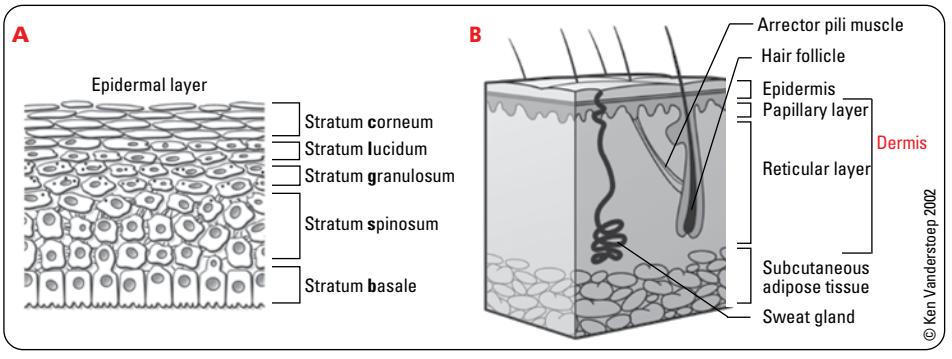

**Figure 1. Histologic layers of the skin. Epidermal layer is detailed in A**

**Layers of the Epidermis**
"**C**alifornians **L**ike **G**etting **S**un **B**urns"
OR
"**C**anadians **L**ike **G**ood **S**ushi **B**oxes"

### Skin

- divided anatomically into epidermis, dermis, and subcutaneous tissue
- **epidermis**
  - avascular: receives its nutrition from the dermal capillaries
  - derived from keratinocytes with the youngest presenting at the stratum basale
  - cells progress from stratum basale to stratum corneum in about 4 wk
    - stratum basale (germinativum): mitotic figures that give rise to keratinocytes
    - stratum spinosum (prickle cells): junctions in this layer (tonofilaments) give the epidermis its strength
    - stratum granulosum: flat cells containing basophilic granules
    - stratum lucidum: transparent layers of packed dead cells
    - stratum corneum: flat scales of the water-resistant protein keratin
  - cells of the epidermis
    - keratinocytes: located in all layers of the epidermis except the stratum corneum; connected to each other by desmosomes
    - melanocytes: located in the stratum basale; keratinocyte to melanocyte ratio in the basal layer is 10:1; melanocyte number is equal among races; produce melanosomes containing melanin, which are transferred to keratinocytes
    - Langerhans cells: dendritic cells which are important for immune surveillance
    - Merkel cells: located in the basal layer; involved in touch sensation
- **dermis**: comprised of connective tissue divided into two regions
  - papillary: contains numerous capillaries that supply nutrients to the dermis and epidermis
  - reticular: provides a strong structure for skin; consists of collagen bundles woven together along with elastic fibres, fibroblasts, and macrophages
  - cells of dermis
    - fibroblasts: produce collagen, elastin, and ground substance
    - mast cells: release histamines which mediate type I hypersensitivity
  - other components of dermis include: blood vessels, nerves, pilosebaceous units, and sweat glands
- **subcutaneous tissue** (hypodermis)
  - consists primarily of adipose cells, larger calibre vessels, nerves, and fascia

### Epidermal Appendages
- epidermal in origin, can extend into the dermis; includes hair, nails, and cutaneous glands
- pilosebaceous unit = hair + hair follicle + sebaceous gland + arrector pili muscle

### Cutaneous Glands
- **sebaceous gland**: part of pilosebaceous unit; produces sebum which is secreted into the hair follicle via the sebaceous duct, where it covers the skin surface (protective function)
  - sebum has some antifungal properties
  - these glands cover entire skin surface and are absent only in non-hair bearing areas (e.g. palms, soles, lips)
- **apocrine sweat gland**: apocrine duct empties into hair follicle above sebaceous gland
  - found in axillae and perineum
  - likely a vestigial structure, functions in other species to produce scent (e.g. pheromones)
- **eccrine sweat gland**: not part of pilosebaceous unit
  - found over entire skin surface except lips, nail beds, and glans penis
  - important in temperature regulation via secretion of sweat to cool skin surface

## Skin Function

- **protection**
  - due to continuous recycling and avascularity of epidermis
  - barrier to UV radiation (melanin), mechanical/chemical insults (sensory/mechanoreceptors), pathogens (immune cells), and dehydration (lipid rich barrier)
- **thermal regulation**
  - insulation to maintain body temperature in cool environments via peripheral vasoconstriction, hair, and subcutaneous adipose tissue
  - dissipation of heat in warm environments via increased activity of sweat glands and increased blood flow within dermal vascular networks
- **sensation**
  - touch, pain, and temperature sensation
- **metabolic function**
  - vitamin D synthesis
  - energy storage (mainly in the form of triglycerides)

# Morphology

## Primary Lesions

### Definition
- a de-novo initial lesion that has not been altered by trauma or manipulation, and has not regressed

**Table 1. Types of Primary Morphological Lesions**

| Profile | <1 cm Diameter | ≥1 cm Diameter |
|---|---|---|
| **Flat Lesion** | Macule (e.g. freckle) | Patch (e.g. vitiligo) |
| **Raised Superficial Lesion** | Papule (e.g. wart) | Plaque (e.g. psoriasis) |
| **Deep Palpable (dermal or subcutaneous) lesion** | Nodule (e.g. dermatofibroma) | Tumour (e.g. lipoma) |
| **Elevated Fluid-Filled Lesion** | Vesicle (e.g. HSV) | Bulla (e.g. bullous pemphigoid) |

**Describe a Lesion with SCALDA**

**S**ize and **S**urface area
**C**olour (e.g. hyperpigmented, hypopigmented, erythematous)
**A**rrangement (e.g. solitary, linear, reticulated, grouped, herpetiform)
**L**esion morphology
**D**istribution (e.g. dermatomal, intertriginous, symmetrical/asymmetrical, follicular)
**A**lways check hair, nails, mucous membranes and intertriginous areas

## Secondary Lesions

### Definition
- develop during the evolutionary process of skin disease, or created by manipulation, or due to complication of primary lesion (e.g. rubbing, scratching, infection)
- **crust**: dried fluid (serum, blood, or purulent exudate) originating from a lesion (e.g. impetigo)
- **scale**: excess keratin (e.g. seborrheic dermatitis)
- **lichenification**: thickening of the skin and accentuation of normal skin markings (e.g. chronic atopic dermatitis)
- **fissure**: a linear slit-like cleavage of the skin
- **excoriation**: a scratch mark
- **erosion**: a disruption of the skin involving the epidermis alone; heals without scarring
- **ulcer**: a disruption of the skin that extends into the dermis or deeper; may heal with scarring
- **xerosis**: pathologic dryness of skin (xeroderma), conjunctiva (xerophthalmia), or mucous membranes (xerostomia)
- **atrophy**: histological decrease in size or number of cells or tissues, resulting in thinning or depression of the skin

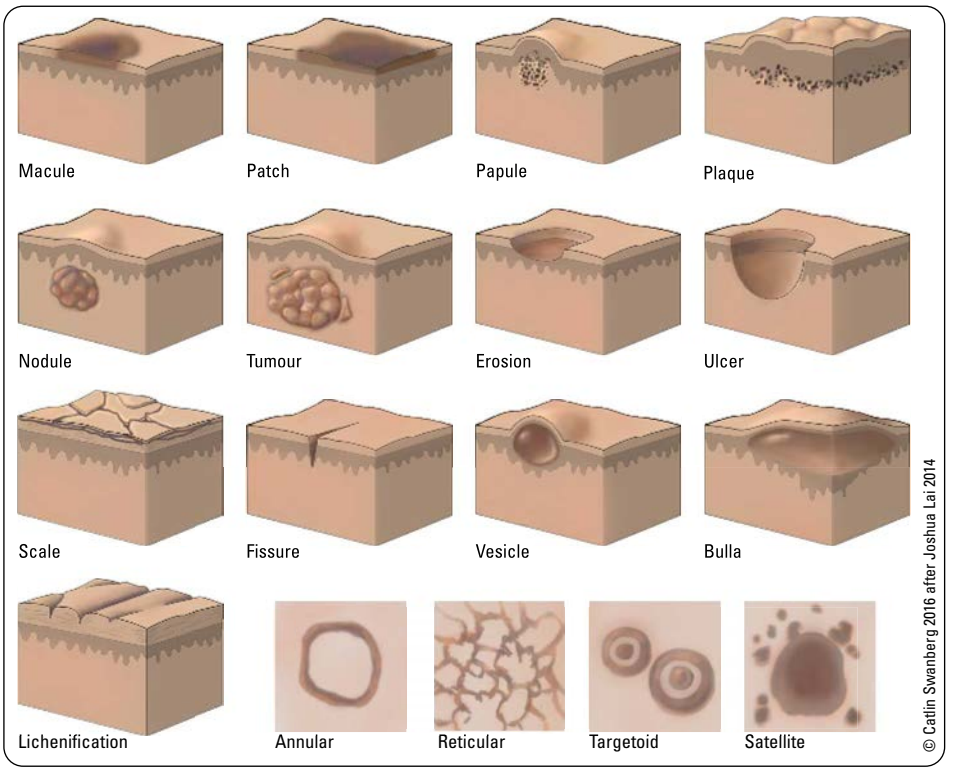

**Figure 2. Examples of primary and secondary morphology**

# Other Morphological Terms

- **cyst**: an internally epithelial-lined structure containing semi-solid material or fluid
- **pustule**: an elevated lesion containing a collection of neutrophils (infectious or inflammatory in nature)
- **scar**: replacement fibrosis of dermis and subcutaneous tissue (hypertrophic or atrophic)
- **wheal**: a special form of papule or plaque that is transient (<24 h) and blanchable, often with a halo and central clearing, formed by edema in the dermis (e.g. urticaria)
- **comedone**: a special collection of sebum and keratin
  - open comedo (blackhead)
  - closed comedo (whitehead)
- **petechiae**: pinpoint extravasation of blood into dermis resulting in hemorrhagic lesions; non-blanchable, <3 mm in size
- **purpura**: larger than petechia, 3 mm-1 cm in size
- **ecchymosis**: larger than purpura, >1 cm in size (i.e. a "bruise")
- **telangiectasia**: dilated superficial blood vessels; blanchable, reticulated, and of small calibre, can be associated with benign or malignant entities

# Patterns and Distribution

- **acral**: relating to the hands and feet (e.g. perniosis, secondary syphilis)
- **annular**: ring-shaped (e.g. granuloma annulare)
- **follicular**: involving hair follicles (e.g. folliculitis)
- **guttate**: lesions following a "drop-like" pattern (e.g. guttate psoriasis)
- **Koebner phenomenon**: i.e. isomorphic response, appearance of lesions at an injury site (e.g. lichen planus, psoriasis, vitiligo)
- **morbilliform**: literally means "measles-like", an eruption composed of macules and papules with truncal predominance
- **reticular**: lesions following a net-like pattern (e.g. livedo reticularis)
- **satellite**: small lesions scattered around the periphery of a larger lesion (e.g. candida diaper dermatitis)
- **serpiginous**: lesions following a snake-like pattern (e.g. cutaneous larva migrans)
- **target/targetoid**: concentric ring lesions, like a dartboard (e.g. EM)
- **other descriptive terms**: discrete, clustered, linear, confluent, dermatitic, indurated (i.e. hard or firm)

# Differential Diagnoses of Common Presentations

**Table 2. Differential Diagnosis of Common Presenting Problems**

| Lesion | Infectious | Inflammatory | Drug/Toxin | Miscellaneous |
|---|---|---|---|---|
| **Brown Macule** | | Post-inflammatory hyperpigmentation | UV radiation, actinic/solar lentigo, freckle (ephelide) | Congenital: café-au-lait spots, congenital nevus, epidermal/junctional nevus<br>Neoplasia: lentigo maligna, MM, pigmented BCC<br>Other: melasma/chloasma ("mask of pregnancy") |
| **Discrete Red Papule** | Folliculitis<br>Furuncle<br>Scabies | Acne vulgaris<br>Rosacea<br>Psoriasis<br>Urticaria | Bites/stings | Autoimmune: lichen planus; see *Papulosquamous Diseases*, D16<br>Vascular: hemangioma, pyogenic granuloma<br>Other: dermatofibroma, miliaria rubra |
| **Red Scales** | Pityriasis rosea<br>Secondary syphilis<br>Tinea | Dermatitis (atopic, contact, nummular, seborrheic)<br>Discoid lupus<br>Psoriasis | Gold | Autoimmune: lichen planus; see *Papulosquamous Diseases*, D16<br>Neoplastic: mycosis fungoides |
| **Vesicle** | Cat scratch disease<br>Impetigo<br>Viral: HSV, HZV, VZV, Molluscum, Coxsackie, Scabies | Acute contact dermatitis<br>Dyshidrotic eczema | | Other: dermatitis herpetiformis, porphyria cutanea tarda |
| **Bulla** | Bullous impetigo | Acute dermatitis<br>EM, SLE, SJS/TEN | Fixed drug eruption<br>SJS/TEN | Autoimmune: bullous pemphigoid, pemphigus vulgaris<br>Other: dermatitis herpetiformis, porphyria cutanea tarda |
| **Pustule** | Candida<br>Dermatophyte<br>Impetigo<br>Sepsis<br>Varicella | Acne vulgaris<br>Rosacea<br>Dyshidrotic dermatitis<br>Pustular folliculitis<br>Pustular psoriasis<br>Hidradenitis suppurativa | Acute generalized exanthematous pustulosis (usually secondary to drug reaction) | |
| **Oral Ulcer** | Aspergillosis<br>CMV<br>Coxsackie<br>Cryptococcosis<br>HSV/HZV<br>HIV, TB, Syphilis | Allergic stomatitis<br>EM<br>Lichen planus<br>Seronegative arthropathies, SLE<br>Recurrent aphthous stomatitis<br>Behçet's disease | Chemotherapy<br>Radiation therapy<br>SJS/TEN | Autoimmune: pemphigus vulgaris<br>Congenital: XXY<br>Hematologic: sickle cell disease<br>Neoplasia: BCC, SCC |
| **Skin Ulcer** | Plague<br>Syphilis<br>TB<br>Tularemia | RA, SLE, vasculitis<br>UC (pyoderma gangrenosum) | | Autoimmune: necrobiosis lipoidica diabeticorum (e.g. DM)<br>Congenital: XXY<br>Hematologic: sickle cell disease<br>Neoplasia: SCC<br>Vascular: arterial, neurotrophic, pressure, venous, aphthous, leukoplakia, traumatic |

# Common Skin Lesions

## Cysts

**Table 3. Cysts**

| | Clinical Feature | Pathophysiology | Epidemiology | Clinical Course | Management |
|---|---|---|---|---|---|
| **Epidermal Cyst** | Round, yellow/flesh-coloured, slow growing, mobile, firm, fluctuant, nodule or tumour | Epithelial cells displaced into dermis, epidermal lining becomes filled with keratin and lipid-rich debris<br>May be post-traumatic, rarely syndromic | Most common cutaneous cyst in youth – middle age | Central punctum may rupture (foul, cheesy odour, creamy colour) and produce inflammatory reaction<br>Can increase in size and number over time | No treatment<br>Elective excision |
| **Pilar Cyst** (Trichilemmal) | Multiple, hard, variable sized nodules under the scalp, lacks central punctum | Thick-walled cyst lined with stratified squamous epithelium and filled with dense keratin<br>Idiopathic<br>Post-trauma | 2nd most common cutaneous cyst<br>F>M, hereditary | Rupture causes pain and inflammation | No treatment<br>Elective excision |
| **Dermoid Cyst** | Firm nodule most commonly found at lateral third of eyebrow or midline under nose | Rare, congenital hamartomas, which arise from inclusion of epidermis along embryonal cleft closure lines, creating a thick-walled cyst filled with dense keratin | Rare | If nasal midline, risk of extension into CNS | No treatment<br>Elective excision |
| **Ganglion Cyst** | Usually solitary, rubbery, translucent; a clear gelatinous viscous fluid may be extruded | Cystic lesion that originates from joint or tendon sheath, called a digital mucous cyst when found on fingertip<br>Associated with osteoarthritis | Older age | Stable | No treatment<br>Incision and expression of contents<br>Elective excision |
| **Milium** | 1-2 mm superficial, white to yellow subepidermal papules occurring on eyelids, cheeks, and forehead | Small epidermoid cyst, primarily arising from pluripotential cells in epidermal or adnexal epithelium<br>Can be secondary to blistering, ulceration, trauma, topical corticosteroid atrophy, or cosmetic procedures | Any age<br>40-50% of infants | In newborns, spontaneously resolves in first 4 wk of life | No treatment<br>Incision and expression of contents<br>Electrodessication<br>Topical retinoid therapy |

# Fibrous Lesions

## DERMATOFIBROMA

### Clinical Feature
- button-like, firm dermal papule or nodule, skin-coloured to red-brown
- majority are asymptomatic but may be pruritic and/or tender
- site: legs > arms > trunk
- dimple sign (Fitzpatrick's sign): lateral compression causes dimpling of the lesion

### Pathophysiology
- benign tumour due to fibroblast proliferation in the dermis

### Etiology
- unknown; may be associated with history of minor trauma (e.g. shaving or insect bites)
- eruptive dermatofibroma can be associated with SLE

### Epidemiology
- adults, F>M

### Differential Diagnosis
- dermatofibrosarcoma protuberans, malignant melanoma, Kaposi's sarcoma, blue nevus

### Investigations
- biopsy if diagnosis is uncertain

### Management
- no treatment required
- excision if bothersome

## SKIN TAGS

### Clinical Feature
- small (1-10 mm), soft, skin-coloured or darker pedunculated papule, often polypoid
- sites: eyelids, neck, axillae, inframammary, and groin

**Skin tags are also known as…**
- Acrochordons
- Fibroepithelial polyps

### Pathophysiology
- benign outgrowth of skin

### Epidemiology
- middle-aged and elderly, F>M, obese, can increase in size and number during pregnancy

### Differential Diagnosis
- pedunculated seborrheic keratosis, compound or dermal melanocytic nevus, neurofibroma, fibroepithelioma of Pinkus (rare variant of BCC), nevus lipomatosis superficialis

### Management
- excision, electrodessication, cryosurgery

# Hyperkeratotic Lesions

## SEBORRHEIC KERATOSIS

### Clinical Feature
- known as 'wisdom spots,' 'age spots,' or 'barnacles of life'
- well-demarcated waxy papule/plaque with classic "stuck on" appearance
- rarely pruritic
- over time lesions appear more warty, greasy and pigmented
- sites: face, trunk, upper extremities (may occur at any site except palms or soles)

### Pathophysiology
- very common benign epithelial tumour due to proliferation of keratinocytes and melanocytes

### Epidemiology
- unusual <30 yr old
- M>F
- autosomal dominant inheritance
- Leser-Trelat: sudden appearance of SK that can be associated with malignancy, commonly gastric adenocarcinomas

### Differential Diagnosis
- malignant melanoma (lentigo maligna, nodular melanoma), melanocytic nevi, pigmented BCC, solar lentigo, spreading pigmented AK

### Investigations
- biopsy only if diagnosis uncertain

### Management
- none required, for cosmetic purposes only
- cryotherapy, electrodessication, excision

## ACTINIC KERATOSIS (SOLAR KERATOSIS)
- see *Pre-Malignant Skin Conditions*, D33

## KERATOACANTHOMA
- see *Malignant Skin Tumours*, D34

## CORNS (HELOMATA)

### Clinical Feature
- firm papule with a central, translucent, cone-shaped, hard keratin core
- painful with direct pressure
- sites: most commonly on dorsolateral fifth toe and dorsal aspects of other toes

### Pathophysiology
- localized hyperkeratosis induced by pressure on hands and feet

### Epidemiology
- F>M, can be caused by chronic microtrauma

### Differential Diagnosis
- calluses, plantar warts

### Management
- relieve pressure with padding or alternate footwear, orthotics
- paring, topical salicylic acid

**Corns vs. Warts vs. Calluses**
- Corns have a whitish yellow central translucent keratinous core; painful with direct pressure; interruption of dermatoglyphics
- Warts bleed with paring and have a black speckled central appearance due to thrombosed capillaries; plantar warts destroy dermatoglyphics (epidermal ridges)
- Calluses have layers of yellowish keratin revealed with paring; there are no thrombosed capillaries or interruption of epidermal ridges

# Keloids

### Clinical Feature
- firm, shiny, skin-coloured or red-bluish papules/nodules that most often arise from cutaneous injury (e.g. piercing, surgical scar, acne), but may appear spontaneously
- extends beyond the margins of the original injury, and may continue to expand in size for yr with claw-like extensions
- can be pruritic and painful
- sites: earlobes, shoulders, sternum, scapular area, angle of mandible

### Pathophysiology
- excessive deposition of randomly organized collagen fibres following trauma to skin

### Epidemiology
- most common in black patients, followed by those of Asian descent (predilection for darker skin)
- M=F, all age groups

### Management
- intralesional corticosteroid injections
- silicone compression

**Keloids vs. Hypertrophic Scars**
- **Keloids:** extend beyond margins of original injury with claw-like extensions
- **Hypertrophic scars:** confined to original margins of injury

# Pigmented Lesions

## CONGENITAL NEVOMELANOCYTIC NEVI (CNMN)

### Clinical Feature
- sharply demarcated pigmented papule or plaque with regular borders ± coarse hairs
- classified by size: small (<1.5 cm), medium (M1: 1.5-10 cm, M2: >10-20 cm), large (L1: >20-30 cm, L2 >30-40 cm), giant (G1: >40-60 cm, G2: >60 cm)
- may be surrounded by smaller satellite nevi

### Pathophysiology
- nevomelanocytes in epidermis (clusters) and dermis (strands)

### Epidemiology
- present at birth or develops in early infancy to childhood
- malignant transformation is rare (1-5%) and more correlated with size of the lesion
- neurocutaneous melanosis can occur in giant CNMN (melanocytes in the CNS)

### Management
- take a baseline photo and observe lesion for change in shape, colour, or size out of proportion of growth
- surgical excision if suspicious, due to increased risk of melanoma
- MRI if suspicious for neurological involvement

**DDx of Hyperpigmented Macules**
- Purpura (e.g. solar, ASA, anticoagulants, steroids, hemosiderin stain)
- Post-inflammatory
- Melasma
- Melanoma
- Fixed drug eruption

## OTHER CONGENITAL PIGMENTED LESIONS

**Table 4. Comparison of Other Congenital Pigmented Lesions**

| | Clinical Feature | Pathophysiology | Epidemiology | Differential Diagnosis | Clinical Course and Management |
|---|---|---|---|---|---|
| **Café-au-lait Macule** | Flat light brown lesions with smooth or jagged borders | Areas of increased melanogenesis | 6 or more is suggestive of neurofibromatosis type I<br>Also associated with McCune-Albright syndrome | Flat congenital melanocytic nevus, speckled lentiginous nevus | Enlarge in proportion to the child<br>No effective treatment |
| **Speckled Lentiginous Nevus** (nevus spilus) | Brown pigmented macular background (café-au-lait macule-like) with dark macular or papular speckles | Increased melanocyte concentration | Risk of melanoma similar to that of a CNMN of the same size | Café-au-lait macule, agminated lentigines, Becker's nevus | Usually the light macular background is present at birth and speckles develop over time<br>Management is similar to that of CNMNs |
| **Dermal Melanocytosis** (historically known as Mongolian Spot) | Congenital grey-blue solitary or grouped macules commonly on lumbosacral area | Ectopic melanocytes in dermis | 99% occurs in Asian and Indigenous infants | Ecchymosis | Usually fades in early childhood but may persist into adulthood |

**Other Nevi**
- **Halo nevus**: often a typical appearing nevus surrounded by a ring of depigmentation; not rare in children; uncommonly associated with vitiligo; no treatment required unless irregular colour or borders
- **Blue nevus**: round to oval macule/papule with homogenous blue to blue-black colour; often appears in childhood and late adolescence; no treatment required unless atypical features are noted

## ACQUIRED NEVOMELANOCYTIC NEVI

### Clinical Feature
- common mole: well circumscribed, round, uniformly pigmented macules/papules <1.5 cm
- average number of moles per person: 18-40
- 3 stages of evolution: junctional NMN, compound NMN, and dermal NMN

**Table 5. Evolution of Acquired Nevomelanocytic Nevi**

| Type | Age of Onset | Clinical Feature | Histology |
|---|---|---|---|
| **Junctional** | Childhood<br>Majority progress to compound nevus | Flat, regularly bordered, uniformly tan-dark brown, sharply demarcated macule | Melanocytes at dermal-epidermal junction above basement membrane |
| **Compound** | Any age | Domed, regularly bordered, smooth, round, tan-dark brown papule<br>Face, trunk, extremities, scalp<br>NOT found on palms or soles | Melanocytes at dermal-epidermal junction; migration into dermis |
| **Dermal** | Adults | Soft, dome-shaped, skin-coloured to tan/brown papules or nodules<br>Sites: face, neck | Melanocytes exclusively in dermis |

### Management
- new or changing pigmented lesions should be evaluated for atypical features which could indicate a melanoma
- excisional biopsy should be considered if the lesion demonstrates rapid change, asymmetry, varied colours, irregular borders and persistent pruritus or bleeding

## OTHER ACQUIRED PIGMENTED LESIONS

**Table 6. Comparison of Other Acquired Pigmented Lesions**

| | Clinical Feature | Pathophysiology | Epidemiology | Differential Diagnosis | Clinical Course and Management |
|---|---|---|---|---|---|
| **Atypical Nevus** (Dysplastic Nevus) | Variegated macule/papule with irregular distinct melanocytes in the basal layer<br>Risk factors: family history | Hyperplasia and proliferation of melanocytes extending beyond dermal compartment of the nevus<br>Often with region of adjacent nests | >5 atypical nevi increase risk for melanoma<br>Numerous dysplastic nevi may be part of familial atypical mole and melanoma syndrome | Melanoma | Follow with baseline photographs for changes<br>Excisional biopsy if lesion changing or highly atypical<br>Close surveillance with whole body skin examination |
| **Ephelides** (Freckles) | Small (<5 mm) well-demarcated light brown macules<br>Sites: sun-exposed skin | Increased melanin within basal layer keratinocytes secondary to sun exposure | Skin phototypes I-II most commonly | Junctional nevi<br>Juvenile lentigines | Multiply and darken with sun exposure, fade in winter<br>No treatment required<br>Sunscreen and sun avoidance may prevent the appearance of new freckles |
| **Solar Lentigo** (Liver Spot) | Well-demarcated brown/black macules<br>Sites: sun-exposed skin | Benign melanocytic proliferation in dermal-epidermal junction due to chronic sun exposure | Most common in Caucasians >40 yr<br>Skin phototypes I-III most commonly | Lentigo maligna, seborrheic keratosis, pigmented actinic keratosis | Laser therapy, shave excisions, cryotherapy |
| **Becker's Nevus** | Hairy, light brown macule/patch with a papular verrucous surface<br>Sites: trunk and shoulders, onset in teen yr | Pigmented hamartoma with increased melanin in basal cells | M>F<br>Often becomes noticeable at puberty | Hairy congenital melanocytic nevus | Hair growth follows onset of pigmentation<br>Cosmetic management (usually too large to remove) |
| **Melasma** | Symmetrical hyperpigmentation on sun-exposed areas of face (forehead, upper lip, cheeks, chin) | Increase in number and activity of melanocytes<br>Associated with estrogen and progesterone | F>M<br>Common in pregnancy and women taking OCP or HRT<br>Risk factors: sun exposure, dark skin tone<br>Can occur with mild endocrine disturbances, antiepileptic medications and other photosensitizing drugs | Post-inflammatory hyperpigmentation | Often fades over several mo after stopping hormone treatment or delivering baby<br>Treatment: hydroquinone, azelaic acid, retinoic acid, topical steroid, combination creams, destructive modalities (chemical peels, laser treatment), camouflage make-up, sunscreen, sun avoidance |

# Vascular Lesions

**Table 7. Vascular Tumours Compared to Vascular Malformations**

| | Vascular Tumours | Vascular Malformations |
|---|---|---|
| **Definition** | Endothelial hyperplasia | Congenital malformation with normal endothelial turnover |
| **Presence at Birth** | Usually postnatal | 100% at birth (not always obvious) |
| **M:F** | 1:3-5 | 1:1 |
| **Natural History** | Phases<br>Proliferating<br>Involuting<br>Involuted | Proportionate growth (can expand) |

## HEMANGIOMAS

### Clinical Feature
- red or blue subcutaneous mass that is soft/compressible, blanches with pressure; feels like a "bag of worms" when palpated

A spider angioma will blanch when the tip of a paperclip is applied to the centre of the lesion

### Pathophysiology
- benign vascular tumour
- includes: cavernous hemangioma, capillary/infantile hemangioma, spider hemangioma

**Table 8. Vascular Tumours**

| | Clinical Feature | Pathophysiology | Epidemiology | Clinical Course | Management |
|---|---|---|---|---|---|
| **Hemangioma of Infancy** | Hot, firm red to blue plaques or tumours | Benign vascular proliferation of endothelial lining | Appears shortly after birth; rarely may be congenital | Appears shortly after birth, increases in size over months, then regresses<br>50% of lesions resolve spontaneously by 5 yr | 10% require treatment due to functional impairment (visual compromise, airway obstruction, high output cardiac failure) or cosmesis<br>Consider treatment if not gone by school age; topical timolol, propranolol; systemic corticosteroids; laser treatment; surgery<br>Provide early specialist referral or treatment in infants with high-risk hemangiomas |
| **Spider Angioma (Campbell Telangiectasia)** | Central red arteriole with slender branches, blanchable | Can be associated with hyperestrogenic state (e.g. in liver disease, pregnancy, OCP) but more often is not | Any age | Increase in number over time | Reassurance<br>Electrodesiccation or laser surgery if patient wishes |
| **Cherry Angioma (Campbell De Morgan Spot)** | Bright red to deep maroon, dome-shaped vascular papules, 1-5 mm<br>Site: trunk<br>Less friable compared to pyogenic granulomas | Benign vascular neoplasm | >30 yr old | Lesions do not fade in time<br>Lesions bleed infrequently | Usually no treatment needed<br>Laser or electrocautery for small lesions<br>Excision of large lesions if necessary |
| **Pyogenic Granuloma** | Bright red, dome-shaped sessile or pedunculated friable nodule<br>Sites: fingers, lips, mouth, trunk, toes<br>DDx: glomus tumour, nodular MM, SCC, nodular BCC | Rapidly developing hemangioma<br>Proliferation of capillaries with erosion of epidermis and neutrophilia | <30 yr old | Lesion grows rapidly over wk-mo, then stabilizes<br>Lesion may persist indefinitely if untreated | Surgical excision with histologic examination<br>Electrocautery; laser; cryotherapy |

## VASCULAR MALFORMATIONS

**Table 9. Vascular Malformations**

| Type | Clinical Feature | Pathophysiology | Management |
|---|---|---|---|
| **Nevus Flammeus** (Port-wine stain) | Red to blue macule present at birth that follows a dermatomal distribution, rarely crosses midline<br>Most common site: nape of neck<br>Never spontaneously regresses but grows in proportion to the child | Congenital vascular malformation of dermal capillaries; rarely associated with Sturge-Weber syndrome (V1, V2 distribution) | Laser or make-up |
| **Nevus Simplex** (salmon patch) | Pink-red irregular patches<br>Midline macule on glabella known as "Angel Kiss"; on nuchal region known as "Stork Bites"<br>Present in 1/3 of newborns<br>Majority regress spontaneously | Congenital dilation of dermal capillaries | No treatment required |

Pyogenic granuloma is a misnomer: it is neither pyogenic nor granulomatous

**Venous Lake:** benign blue or violaceous papular lesion occurring on the face, lips, and ears due to dilation of a venule. Distinguished from malignant pigmented lesions through diascopy, as compression blanches the lesion

# Lipoma

### Clinical Feature
- single or multiple non-tender subcutaneous tumours that are soft and mobile
- occurs most frequently on the trunk, and extremities but can be anywhere on the body

### Pathophysiology
- adipocytes enclosed in a fibrous capsule

### Epidemiology
- often solitary or few in number, if multiple can be associated with rare syndromes

### Differential Diagnosis
- angiolipoma, liposarcoma

### Investigations
- biopsy only if atypical features (painful, rapid growth, firm)

### Management
- reassurance
- excision or liposuction only if desired for cosmetic purposes

# Acneiform Eruptions

## Acne Vulgaris/Common Acne

### Clinical Feature
- a common inflammatory pilosebaceous disease categorized with respect to severity
  - Type I: comedonal, sparse, no scarring
  - Type II: comedonal, papular, moderate ± little scarring
  - Type III: comedonal, papular, and pustular, with scarring
  - Type IV: nodulocystic acne, risk of severe scarring
- sites of predilection: face, neck, upper chest, and back

### Pathophysiology
- hyperkeratinization at the follicular ostia (opening) blocks the secretion of sebum leading to the formation of microcomedones
- androgens promote excess sebum production
- *Cutibacterium* acnes metabolize sebum to free fatty acids and produces pro-inflammatory mediators

### Epidemiology
- age of onset in puberty (10-17 yr in females, 14-19 yr in males)
- in prepubertal children consider underlying hormonal abnormality (e.g. late onset congenital adrenal hyperplasia)
- incidence decreases in adulthood
- genetic predisposition: majority of individuals with cystic acne have parent(s) with history of severe acne

### Differential Diagnosis
- folliculitis, keratosis pilaris (upper arms, face, thighs), perioral dermatitis, rosacea

**Table 10. Management of Acne**

| Compound/Drug Class | Product Names | Notes |
|---|---|---|
| **MILD ACNE: Topical Therapies OTC** | | |
| **Benzoyl peroxide** (BPO) | Solugel®, Benzac®, Desquam®, Fostex® | Helps prevent *C. acnes* resistance, is a bactericidal agent (targets *P. acnes*) and is comedolytic |
| **Salicylic acid** | Akurza® Cream, DermalZone | Used when patients cannot tolerate a topical retinoid due to skin irritation |
| **MILD ACNE: Prescription Topical Therapies** | | |
| **Antimicrobials** | Clindamycin (Dalacin T), Erythromycin | High rate of resistance when used as monotherapy |
| **Retinoids** | Vitamin A Acid (Tretinoin, Stieva-A, Retin A), Adapalene (Differin) | Backbone of topical acne therapy<br>All regimens should include a retinoid unless patient cannot tolerate |
| **Combination products** | Clindoxyl (Clindamycin and BPO)<br>Benzaclin (Clindamycin and BPO)<br>TactuPump (Adapalene and BPO)<br>Biacna (Clindamycin and Tretinoin)<br>Benzamycine (BPO and Erythromycin) | Allows for greater adherence and efficacy<br>Combines different mechanisms of action to increase efficacy and maximize tolerability |
| **MODERATE ACNE** | | |
| **Tetracycline/Minocycline/ Doxycycline** | Sumycin/Minocin/Vibramycin | Use caution with regard to drug interactions: do not use with isotretinoin<br>Sun sensitivity<br>Antibiotics require 3 mo of use before assessing efficacy |
| **Cyproterone acetate-ethinyl estradiol** | Diane-35® | After 35 yr of age, estrogen/progesterone should only be considered in exceptional circumstances, carefully weighing the risk/benefit ratio with physician guidance |
| **Spironolactone** | Aldactone | May cause hyperkalemia if concurrent renal dx<br>Black box warning for breast cancer |
| **SEVERE ACNE** | | |
| **Isotretinoin** | Accutane®, Clarus®, Epuris® | See Table 27 for full side effect profile<br>Most adverse effects are temporary and will resolve when the drug is discontinued<br>Baseline lipid profile (risk of hypertriglyceridemia), LFTs and β-hCG before treatment<br>May transiently exacerbate acne before patient sees improvement<br>Refractory cases may require multiple courses of isotretinoin |

**Treatment of Acne Scars**
- Tretinoin creams
- Glycolic acid
- Chemical peels for superficial scars
- Injectable fillers (collagen, hyaluronic acid) for pitted scars
- Fraxel laser
- $CO_2$ laser resurfacing

**Acne Myths Debunked**
- Eating greasy food and chocolate does not cause or worsen acne
- Blackheads (comedones) are black because of oxidized fatty acids, not dirt
- Acne is not caused by poor hygiene; on the contrary, excessive washing of face can be an aggravator

Antibiotics are used in inflammatory skin conditions since they also have anti-inflammatory properties (e.g. macrolides in acne). Topical antibiotics may also be used to treat secondary bacterial superinfections (e.g. impetigo)

**Acne Exacerbating Factors**
- Systemic medications: lithium, phenytoin, steroids, halogens, androgens, iodides, bromides, danazol
- Topical agents: steroids, tars, ointments, oily cosmetics
- Mechanical pressure or occlusion, such as leaning face on hands
- Emotional stress

A combination of topical retinoids and topical erythromycin or clindamycin is more effective than either agent used alone

**Intralesional Injections**
Intralesional corticosteroid injections are effective in the treatment of individual acne nodules

**Isotretinoin and Pregnancy**
- Use of isotretinoin during pregnancy is associated with spontaneous abortion and major birth defects such as facial dysmorphism and cognitive impairment
- Pregnancy should be ruled out before starting isotretinoin
- Patients should use 2 forms of contraception while on isotretinoin

# Perioral Dermatitis

### Clinical Feature
- discrete erythematous micropapules that often become confluent, forming inflammatory plaques on perioral, perinasal, and periorbital skin
- commonly symmetrical, rim of sparing around vermillion border of lips

### Epidemiology
- 15-40 yr old, occasionally in younger children
- predominantly females

### Differential Diagnosis
- contact dermatitis, rosacea, acne vulgaris

### Management
- avoid all topical steroids
- topical: metronidazole 0.75% gel or 0.75-1% cream to affected area bid
- systemic: tetracycline family antibiotic (utilized for its anti-inflammatory properties)
- occasional use of a non-steroidal anti-inflammatory cream (i.e. tacrolimus or pimecrolimus)

**Important Controversies Associated with Isotretinoin Therapy for Acne**
Am J Clin Dermatol 2013;14:71-76
**Main Points**:
1. The evidence on whether isotretinoin causes depression and suicide is inconsistent; however, numerous controlled studies have shown an improvement in anxiety and depression scores in those taking isotretinoin.
2. There is no association between IBD and isotretinoin use. Only one study showed a significantly increased risk of UC. When considering using isotretinoin in a patient with IBD or with a strong family history, consider involving a gastroenterologist.

# Rosacea

### Clinical Feature
- dome-shaped inflammatory papules ± pustules
- flushing, non-transient erythema, and telangiectasia
- distribution: typically on central face including forehead, nose, cheeks, and chin; rarely on scalp, neck, and upper body
- characterized by remissions and exacerbations
- exacerbating factors: heat, cold, wind, sun, stress, drinking hot liquids, alcohol, spices
- all forms of rosacea can progress from mild to moderate to severe
- rarely in longstanding rosacea, signs of thickening, induration and lymphedema in the skin can develop
- phyma: a distinct swelling caused by lymphedema and hypertrophy of subcutaneous tissue, particularly affecting the nose (rhinophyma)
- ocular manifestations: blepharoconjunctivitis, keratitis, iritis

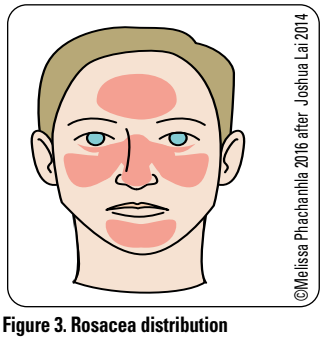

**Figure 3. Rosacea distribution**

### Pathophysiology
- unknown

### Epidemiology
- although found in all skin types, highest prevalence in fair-skinned people
- 30-50 yr old; F>M

### Differential Diagnosis
- acne vulgaris, seborrheic dermatitis, perioral dermatitis, contact dermatitis

### Management
- trigger avoidance and daily sunscreen use for long-term management
- avoid topical corticosteroids
- telangiectasia: treated by physical ablation; electrical hyfrecators, vascular lasers, and intense pulsed light therapies
- phymas: treated by physical ablation or removal; paring, electrosurgery, cryotherapy, laser therapy ($CO_2$, argon, Nd:YAG)

Rosacea can be differentiated from acne by the absence of comedones, a predilection for the central face and symptoms of flushing

**Guidelines for the Diagnosis of Rosacea**
J Drugs Dermatol 2012;11(6):725-730
Presence of one or more of the following primary features:
- Flushing (transient erythema)
- Nontransient erythema
- Papules and pustules
- Telangiectasia

May include one or more of the following secondary features:
- Burning or stinging
- Dry appearance
- Edema
- Phymatous changes
- Ocular manifestations
- Peripheral location

**Table 11. Specific Rosacea Treatments**

| 1st Line | 2nd Line | 3rd Line |
|---|---|---|
| Oral tetracyclines<br>Topical metronidazole<br>Oral erythromycin (250-500 mg PO bid)<br>Topical azelaic acid<br>Topical ivermectin | Topical clindamycin<br>Topical erythromycin 2% solution<br>Topical benzoyl peroxide<br>Oral metronidazole | Oral retinoids |

# Dermatitis (Eczema)

### Definition
- inflammation of the skin

### Clinical Feature
- poorly demarcated erythematous patches or plaques
- symptoms include pruritus and pain
- acute dermatitis: papules, vesicles
- subacute dermatitis: scaling, crusting, excoriations
- chronic dermatitis: lichenification, xerosis, fissuring

## Asteatotic Dermatitis

### Clinical Feature
- diffuse, mild pruritic dermatitis secondary to dry skin
- very common in elderly, especially in the winter (i.e. "winter itch") but starts in the fall
- shins predominate, looks like a "dried river bed"

### Management
- skin rehydration with moisturizing routine ± corticosteroid creams

## Atopic Dermatitis

### Clinical Feature
- subacute and chronic eczematous reaction associated with prolonged severe pruritus
- distribution depends on age
- inflammation, lichenification, excoriations are secondary to relentless scratching
- atopic palms: hyperlinearity of the palms (associated with ichthyosis vulgaris)
- associated with: keratosis pilaris (hyperkeratosis of hair follicles, "chicken skin"), xerosis, occupational hand dryness
- associated with severe or poorly controlled psychosocial distress and psychiatric comorbidities

### Epidemiology
- frequently affects infants, children, and young adults
- 10-20% of children in developed countries under the age of 5 are affected
- associated with personal or family history of atopy (asthma, hay fever), anaphylaxis, eosinophilia
- polygenic inheritance: one parent >60% chance for child; two parents >80% chance for child
- long-term condition with 1/3 of patients continuing to show signs of AD into adulthood

### Pathophysiology
- a T-cell driven inflammatory process with epidermal barrier dysfunction

### Investigations
- clinical diagnosis
- consider: skin biopsy, patch testing if allergic contact dermatitis is suspected

### Management
- goal: reduce signs and symptoms, prevent or reduce recurrences/flares
- better outcome (e.g. less flare-ups, modified course of disease) if diagnosis made early
- avoid triggers of AD
- be vigilant for depressive symptoms and the possible need for psychiatric referral, especially among those with severe disease
- non-pharmacologic therapy
  - moisturizers
  - apply liberally and reapply at least twice a day with goal of minimizing xerosis
  - include in treatment of mild to severe disease as well as in maintenance therapy
  - bathe in plain warm water for a short period of time once daily followed by lightly but not completely drying the skin with a towel; immediately apply topical agents or moisturizers after this
  - use fragrance-free hypoallergenic non-soap cleansers
- pharmacologic therapy
  - topical corticosteroids
    - effective in reducing acute and chronic symptoms as well as prevention of flares
    - choice of steroid potency depends on age, body site, short vs. long-term use
    - apply 1 adult fingertip unit (0.5 g) to an area the size of 2 adult palms bid for acute flares
    - local side effects: skin atrophy, purpura, telangiectasia, striae, hypertrichosis, and acneiform eruption are all very rarely seen

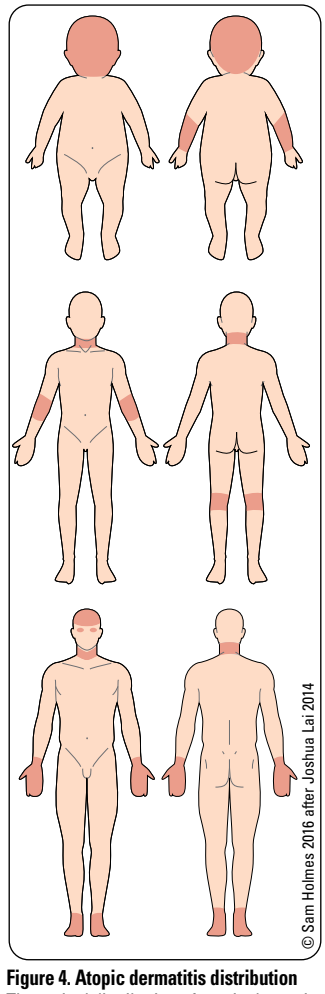

**Figure 4. Atopic dermatitis distribution**
The typical distribution of atopic dermatitis in infants <6 mo (top), children >18 mo (middle) and adults (bottom)

**Triggers for Atopic Dermatitis**
- Irritants (detergents, solvents, clothing, water hardness)
- Contact allergens
- Environmental aeroallergens (e.g. dust mites)
- Inappropriate bathing habits (e.g. long hot showers)
- Sweating
- Microbes (e.g. *S. aureus*)
- Stress

- topical calcineurin inhibitors
  - tacrolimus 0.03%, 0.1% (Protopic®) and pimecrolimus 1% (Elidel®)
  - use as steroid-sparing agents in the long-term
  - advantages over long-term corticosteroid use: sustained effect in controlling pruritus; no skin atrophy; safe for the face and neck
  - apply 2x/d for acute flares, and 2-3x/wk to recurrent sites to prevent relapses
  - local side effects: stinging, burning, allergic contact dermatitis
  - U.S. black box warning of malignancy risk: rare cases of skin cancer and lymphoma reported; no causal relationship established, warning is discounted by both the Canadian Dermatology Association and the American Academy of Dermatology

### Complications

- infections
  - treatment of infections
  - topical mupirocin, retapamulin, ozenoxacin or fusidic acid (Canada only, not available in US)
  - oral antibiotics (e.g. cloxacillin, cephalexin) for widespread *S. aureus* infections

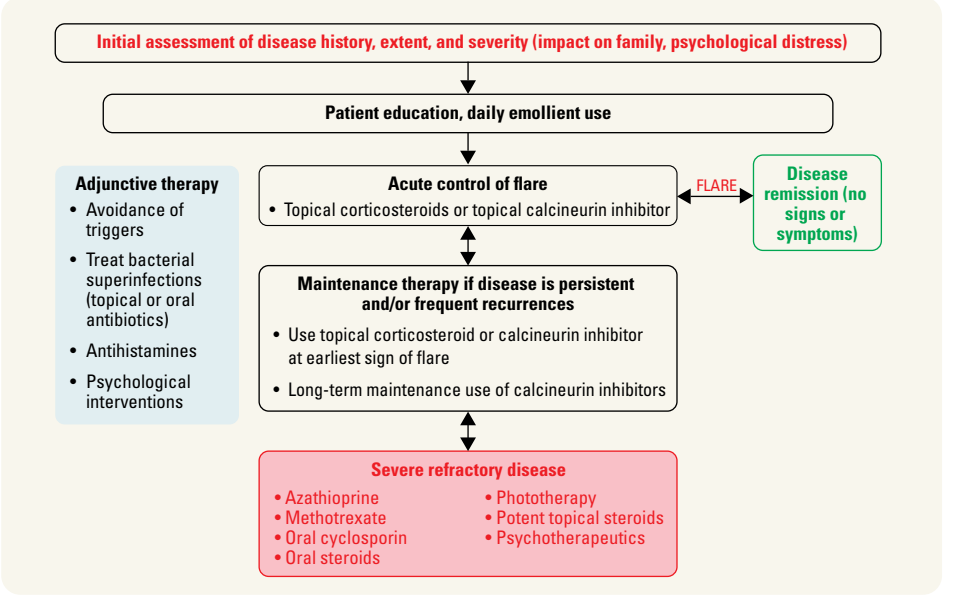

**Figure 5. Atopic dermatitis treatment algorithm**
Adapted from: Ellis C, et al. ICCAD II Faculty. International Consensus Conference on Atopic Dermatitis II (ICCAD II): clinical update and current treatment strategies. Br J Dermatol 2003;148(Suppl 63):3-10

## Contact Dermatitis

### Clinical Feature

- cutaneous inflammation caused by an external agent(s)

**Table 12. Contact Dermatitis**

| | Irritant Contact Dermatitis | Allergic Contact Dermatitis |
|---|---|---|
| **Mechanism of Reaction** | Toxic injury to skin; non-immune mechanism | Cell-mediated delayed (Type IV) hypersensitivity reaction (see Rheumatology, RH2) |
| **Type of Reaction** | Erythema, dryness, fine scale, burning<br>Acute: quick reaction, sharp margins (e.g. from acid/alkali exposure)<br>Cumulative insult: slow to appear, poorly defined margins (e.g. from soap), more common | Erythema with a papulovesicular eruption, swelling, pruritus |
| **Frequency** | Majority; will occur in anyone given sufficient concentration of irritants | Minority; patient acquires susceptibility to allergen that persists indefinitely |
| **Distribution** | Hands are the most common site | Areas exposed to allergen |
| **Examples** | Soaps, weak alkali, detergents, organic solvents, alcohol, oils | Many allergens are irritants, so may coincide with irritant dermatitis |
| **Management** | Avoidance of irritants<br>Wet compresses with Burrow's solution<br>Barrier moisturizers<br>Topical/oral steroids | Patch testing to determine specific allergen<br>Avoid allergen and its cross-reactants<br>Wet compresses soaked in Burrow's solution (drying agent)<br>Topical steroids BID prn<br>Systemic steroids prn if extensive |

# Dyshidrotic Dermatitis

### Clinical Feature
- "tapioca pudding" papulovesicular dermatitis of hands and feet that coalesce into plaques, followed by painful fissuring
- acute stage often very pruritic
- secondary infections common
- lesions heal with desquamation and may lead to chronic lichenification
- sites: palms and soles ± dorsal surfaces of hands and feet

### Pathophysiology
- unknown
- NOT caused by hyperhidrosis (excessive sweating)
- emotional stress may precipitate flares

### Management
- topical: high potency corticosteroid with plastic cling wrap occlusion to increase penetration
- intralesional triamcinolone injection
- systemic
  - prednisone in severe cases
  - alitretinoin (Toctino) for all types of chronic hand dermatitis, including dyshidrotic dermatitis
  - antibiotics for secondary *S. aureus* infection

# Nummular Dermatitis

### Clinical Feature
- nummular (coin-shaped), pruritic, dry, scaly, erythematous plaques
- often associated with atopic and dyshidrotic dermatitis
- secondary infection common

### Pathophysiology
- little is known, but it is often accompanied by xerosis, which results from a dysfunction of the epidermal lipid barrier; this in turn can allow permeation of environmental agents, which can induce an allergic or irritant response

### Management
- moisturization
- mid to high potency corticosteroid ointment twice daily

# Seborrheic Dermatitis

### Clinical Feature
- greasy, erythematous, yellow, scaling, minimally elevated papules and plaques in areas rich in sebaceous glands, can look moist and superficially eroded in flexural regions
- infants: "cradle cap"
- children: may be generalized with flexural and scalp involvement
- adults: diffuse involvement of scalp margin with yellow to white flakes, pruritus, and underlying erythema
- sites: scalp, eyebrows, eyelashes, beard, glabella, post-auricular, over sternum, trunk, body folds, genitalia

### Pathophysiology
- possible etiologic association with *Malassezia* spp. (yeast)

### Epidemiology
- common in infants and adolescents
- increased incidence and severity in immunocompromised patients and Parkinson disease
- in adults can cause dandruff (pityriasis sicca)

### Management
- face: ketoconazole (Nizoral®) cream daily or bid and/or mild steroid cream daily or bid
- scalp: salicylic acid in olive oil or Derma-Smoothe FS® lotion (peanut oil, mineral oil, fluocinolone acetonide 0.01%) to remove dense scales, 2% ketoconazole shampoo (Nizoral®), ciclopirox (Stieprox®) shampoo, selenium sulfide (e.g. Selsun®) or zinc pyrithione (e.g. Head and Shoulders®) shampoo, steroid lotion (e.g. betamethasone valerate 0.1% lotion bid)

## Stasis Dermatitis

### Clinical Feature
- erythematous, scaly, pruritic plaques in lower legs, particularly the medial ankle
- brown hemosiderin deposition, woody fibrosis, atrophy blanche, and lipodermatosclerosis in late stages
- usually bilateral, accompanied by swelling, oozing, crusting, may have accompanying varicosities

### Pathophysiology
- chronic venous insufficiency leads to venous stasis
- surrounding soft tissue inflammation and fibrosis results

### Investigations
- Doppler and colour-coded Duplex sonography if suspicious for DVT
- swab for bacterial culture if there is crusting

### Management
- compression stockings
- rest and elevate legs (above the level of the heart)
- moisturizer to treat xerosis
- mid-high potency topical corticosteroids to control inflammation

### Complications
- ulceration (common at medial malleolus), secondary bacterial infections

## Lichen Simplex Chronicus

### Clinical Feature
- well-defined plaque(s) of lichenified skin with increased skin markings ± excoriations
- common sites: neck, scalp, lower extremities, urogenital area
- often seen in patients with atopy

### Pathophysiology
- skin hyperexcitable to itch, continued rubbing/scratching of skin results
- eventually lichenification occurs

### Investigations
- if patient has generalized pruritus, rule out systemic cause: CBC with differential count, transaminases, bilirubin, renal and thyroid function tests, TSH, glucose, SPEP
- CXR if lymphoma suspected

### Management
- antipruritics (e.g. antihistamines, topical or intralesional glucocorticoids, Unna boot)

# Papulosquamous Diseases

## Lichen Planus

**The 6 Ps of Lichen Planus**
**P**urple
**P**ruritic
**P**olygonal
**P**eripheral
**P**apules
**P**enis (i.e. mucosa)

### Clinical Feature
- acute or chronic inflammation of mucous membranes or skin
- morphology: pruritic, well-demarcated, violaceous, polygonal, flat-topped papules
- common sites: wrists, ankles, mucous membranes in 60% (mouth, vulva, glans), nails, scalp
- distribution: symmetrical and bilateral
- Wickham's striae: reticulate white-grey lines over surface; pathognomonic but may not be present
- mucous membrane lesions: lacy, whitish reticular network, milky-white plaques/papules; increased risk of SCC in erosions and ulcers
- nails: longitudinal ridging; dystrophic; pterygium formation
- scalp: scarring alopecia with perifollicular hyperkeratosis and erythema
- spontaneously resolves but may last for wk, mo or yr (mouth and skin lesions)
- rarely associated with hepatitis C
- Koebner phenomenon

### Pathophysiology
- autoimmune, antigen unknown
- lymphocyte activation leads to keratinocyte apoptosis

### Epidemiology
- 1%, 30-60 yr, F>M

### Investigations
- consider a skin biopsy
- hepatitis C serology if patient has risk factors

### Management
- topical or intralesional corticosteroids
- short courses of oral prednisone (rarely)
- phototherapy or oral retinoids or systemic immunosuppressants (e.g. azathioprine, methotrexate, cyclosporine) for extensive or recalcitrant cases

## Pityriasis Rosea

### Clinical Feature
- acute, self-limiting eruption characterized by red, oval plaques/patches with central scale that does not extend to edge of lesion
- long axis of lesions follows skin tension lines (i.e. Langer's Lines) parallel to ribs producing "Christmas tree" pattern on back
- varied degree of pruritus
- most start with a "herald" patch which precedes other lesions by 1-2 wk
- common sites: trunk, proximal aspects of arms and legs

### Etiology
- suspected HHV-7 or HHV-6 reactivation

### Investigations
- none required

### Management
- none required; clears spontaneously in 6-12 wk
- symptomatic: topical glucocorticoids if pruritic, cool compresses, emollients

## Psoriasis

### Classification
1. plaque psoriasis 2. guttate psoriasis 3. erythrodermic psoriasis
4. pustular psoriasis 5. inverse psoriasis

### Pathophysiology
- not fully understood, genetic and immunologic factors
- shortened keratinocyte cell cycle leads to Th1- and Th17-mediated inflammatory response

### Epidemiology
- 1.5-2%, M=F
- all ages: peaks of onset: 20-30 yr old and 50-60 yr old
- polygenic inheritance: 8% with 1 affected parent, 41% with both parents affected
- risk factors: smoking, obesity, alcohol, drugs, infections, physical trauma (Koebner phenomenon)

### Differential Diagnosis
- AD, mycosis fungoides (cutaneous T-cell lymphoma), seborrheic dermatitis, tinea, nummular dermatitis, lichen planus

### Investigations
- biopsy (if atypical presentation, rarely needed)

### 1. PLAQUE PSORIASIS

### Clinical Feature
- chronic and recurrent disease characterized by well-circumscribed erythematous papules/plaques with silvery-white scales
- often worse in winter (lack of sun)
- Auspitz sign: bleeds from minute points when scale is removed
- common sites: scalp, extensor surfaces of elbows and knees, trunk (especially buttocks), nails, pressure areas

## Management

- depends on severity of disease, as defined by BSA affected or less commonly PASI
- mild (<3% BSA)
  - topical steroids, topical vitamin D3 analogues, or a combination of the two are first line
  - topical retinoid ± topical steroid combination, anthralin, and tar are also effective but tend to be less tolerated than first line therapies
  - emollients
  - phototherapy or systemic treatment may be necessary if the lesions are scattered or if it involves sites that are difficult to treat such as palms, soles, scalp, genitals
- moderate (3-10% BSA) to severe (>10% BSA)
  - goal of treatment is to attain symptom control that is adequate from patient's perspective
  - phototherapy if accessible
  - systemic or biological therapy based on patient's treatment history and comorbidities
  - topical steroid ± topical vitamin D3 analogue as adjunct therapy

**Calcipotriol is a Vitamin D Derivative**
**Dovobet®** = calcipotriene combined with betamethasone dipropionate and is considered to be one of the most potent topical psoriatic therapies

### Table 13. Topical Treatment of Psoriasis

| Treatment | Mechanism | Comments |
|---|---|---|
| **Emollients** | Reduce fissure formation | |
| **Salicylic acid 1-12%** | Remove scales | |
| **Tar (LCD: liquor carbonis detergens)** | Inhibits DNA synthesis, increases cell turnover | Poor long-term compliance |
| **Topical Corticosteroids** | Reduce scaling, redness and thickness | Use appropriate potency steroid in different areas for degree of psoriasis |
| **Vitamin D3 analogues: Calcipotriene / calcipotriol (Dovonex®, Silkis®)** | Reduces keratinocyte hyperproliferation | |
| **Betamethasone + calciprotriene (Dovobet®)** | Combined corticosteroid and vitamin D3 analogue. See above mechanisms | Not to be used on face and folds |
| **Tazarotene (Tazorac®) (gel/cream)** | Retinoid derivative, decreased scaling | Irritating |

### Table 14. Systemic Treatment of Psoriasis

| Treatment | Considerations | Adverse Effects |
|---|---|---|
| **Acitretin** | More effective when used in combination with phototherapy | Alopecia, cheilitis, teratogenicity, hepatotoxicity, photosensitivity, epistaxis, xerosis, hypertriglyceridemia |
| **Cyclosporine** | Used for intermittent control rather than continuously<br>Avoid using for >1 yr | Renal toxicity, hypertension, hypertriglyceridemia, immunosuppression, lymphoma |
| **Methotrexate** | Has been used for over 50 yr | Bone marrow toxicity, hepatic cirrhosis, teratogenicity |
| **Apremilast (Otezla®)** | Extremely safe | GI upset, headache, loose stool, weight loss |
| **PUVA** | Highly effective in achieving remission<br>Avoid >200 sessions in lifetime | Pruritus, burning, skin cancer |
| **UVB and "Narrow band" UVB (311-312 nm)** | UVB much less carcinogenic than PUVA<br>Narrowband has not been shown to increase the risk of skin cancer | Rare burning |

### Table 15. Biologics Approved in Canada

| Treatment | Route | Dosing Schedule | Effectiveness | Action |
|---|---|---|---|---|
| **Etanercept (Enbrel®)*** | SC | 50 mg twice weekly for 3 mo, then 50 mg weekly | +++ | Anti-TNF |
| **Adalimumab (Humira®)*** | SC | 80 mg x 1, then 40 mg at wk 1 and every 2 wk thereafter | ++++ | Anti-TNF |
| **Infliximab (Remicade®)*** | IV | 5 mg/kg at wk 0, 2, 6, and every 8 wk thereafter | +++++ | Anti-TNF |
| **Ustekinumab (Stelara®)** | SC | 45 mg or 90 mg at wk 0, 4, and every 12 wk thereafter | ++++ | Anti-IL 12/23 |
| **Secukinumab (Cosentyx®)** | SC | 300 mg at wk 0, 1, 2, 3, 4, and every 4 wk thereafter | +++++ | Anti-IL 17A |
| **Ixekizumab (Taltz®)** | SC | 160 mg at wk 0, then 80 mg at wk 2, 4, 6, 8, 10, 12, then 80 mg every 4 wk thereafter | +++++ | Anti-IL 17A |
| **Guselkumab (Tremfya®)** | SC | 100 mg at wk 0, 4, and every 8 wk thereafter | +++++ | Anti-IL 23 |
| **Broadalumab (Siliq®)** | SC | 210 mg at wk 0, 1, 2 and every 2 wk thereafter | +++++ | mAb IL-17R (brodalumab is a monoclonal antibody that targets the IL-17 receptor |

*Can also be used to treat psoriatic arthritis

- biologics under study for treatment of psoriasis: risankizumab, tildrakizumab

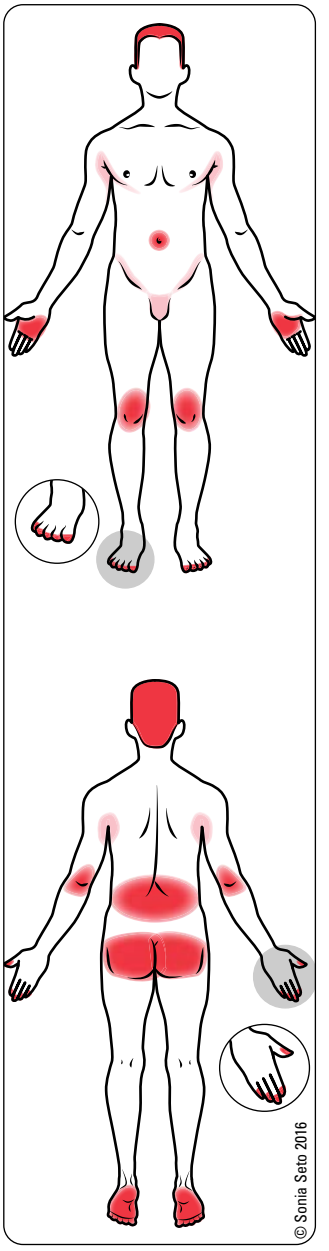

**Figure 6. Psoriasis distribution**

**Mechanism of Biologics**
"-mab" = monoclonal antibody
"-cept" = receptor

### 2. GUTTATE PSORIASIS ("DROP-LIKE")

#### Clinical Feature
- discrete, scattered salmon-pink small scaling papules
- sites: diffuse, usually on trunk and legs, sparing palms and soles
- often antecedent streptococcal pharyngitis

#### Management
- UVB phototherapy, sunlight, lubricants, topical steroids
- penicillin V or erythromycin if Group A β-hemolytic Streptococcus on throat culture

### 3. ERYTHRODERMIC PSORIASIS

#### Clinical Feature
- generalized erythema (>90% of BSA) with fine desquamative scale on surface
- associated signs and symptoms: arthralgia, pruritus, dehydration, electrolyte imbalance
- aggravating factors: lithium, β-blockers, NSAIDs, antimalarials, phototoxic reaction, infection

#### Management
- IV fluids, monitor fluids and electrolytes, may require hospitalization
- treat underlying aggravating condition, sun avoidance
- cyclosporine, acitretin, methotrexate, UV, biologics

### 4. PUSTULAR PSORIASIS

#### Clinical Feature
- sudden onset of erythematous macules and papules which evolve rapidly into pustules, can be painful
- may be generalized or localized
- patient usually has a history of psoriasis; may occur with sudden withdrawal from steroid therapy

#### Management
- methotrexate, cyclosporine, acitretin, UV, biologics

### 5. INVERSE PSORIASIS

#### Clinical Feature
- erythematous plaques on flexural surfaces such as axillae, inframammary folds, gluteal fold, inguinal folds
- lesions may be macerated

#### Management
- low potency topical corticosteroids
- topical vitamin D derivatives (e.g. calcipotriene, calcitriol)
- topical calcineurin inhibitors (e.g. tacrolimus, pimecrolimus)

### 6. PSORIATIC ARTHRITIS
- 20-30% of patients with psoriasis also suffer from psoriatic arthritis
- psoriatic patients with nail or scalp involvement are at a higher risk for developing psoriatic arthritis
- see Rheumatology, RH24

# Vesiculobullous Diseases

## Bullous Pemphigoid

#### Clinical Feature
- chronic autoimmune bullous eruption characterized by pruritic, tense, subepidermal bullae on an erythematous or normal skin base
- can present as urticarial plaques without bullae
- common sites: flexor aspect of forearms, axillae, medial thighs, groin, abdomen, mouth in 33%

#### Pathophysiology
- IgG produced against dermal-epidermal basement membrane proteins (hemidesmosomes) leads to subepidermal bullae

#### Epidemiology
- mean age of onset: 60-80 yr old, F=M

### Investigations
- immunofluorescence shows linear deposition of IgG and C3 along the basement membrane
- anti-basement membrane antibody (IgG) (pemphigoid antibody detectable in serum)

### Prognosis
- heals without scarring, usually chronic
- rarely fatal

### Management
- prednisone 0.5-1 mg/kg/d until clear, then taper ± steroid-sparing agents (e.g. azathioprine, cyclosporine, mycophenolate mofetil)
- topical potent steroids (clobetasol) may be as effective as systemic steroids in limited disease
- tetracycline ± nicotinamide is effective for some cases
- immunosuppressants such as azathioprine, mycophenolate mofetil, cyclosporine
- IVIg and plasmapheresis for refractory cases

## Pemphigus Vulgaris

**Pemphigus Vulgaris vs. Bullous Pemphigoid**
Vulgari**S** = **S**uperficial, intraepidermal, flaccid lesions
Pemphigoi**D** = **D**eeper, tense lesions at the dermal-epidermal junction

**Pemphigus Foliaceus**
An autoimmune intraepidermal blistering disease that is more superficial than pemphigus vulgaris due to antibodies against desmoglein-1, a transmembrane adhesion molecule. Appears as crusted patches, erosions and/or flaccid bullae that usually start on the trunk. Localized disease can be managed with topical steroids. Active widespread disease is treated like pemphigus vulgaris

### Clinical Feature
- autoimmune blistering disease characterized by flaccid, non-pruritic intraepidermal bullae/vesicles on an erythematous or normal skin base
- may present with erosions and secondary bacterial infection
- sites: mouth (90%), scalp, face, chest, axillae, groin, umbilicus
- Nikolsky's sign: epidermal detachment with shear stress
- Asboe-Hansen sign: pressure applied to bulla causes it to extend laterally

### Pathophysiology
- IgG against epidermal desmoglein-1 and -3 lead to loss of intercellular adhesion in the epidermis

### Epidemiology
- 40-60 yr old, M=F, higher prevalence in Jewish, Mediterranean, Asian populations
- paraneoplastic pemphigus may be associated with thymoma, myasthenia gravis, malignancy, and use of D-penicillamine

### Investigations
- immunofluorescence: shows IgG and C3 deposition intraepidermally
- circulating serum anti-desmoglein IgG antibodies

### Prognosis
- lesions heal with hyperpigmentation but do not scar
- may be fatal unless treated with immunosuppressive agents

### Management
- prednisone 1-2 mg/kg until no new blisters, then 1-1.5 mg/kg until clear, then taper ± steroid-sparing agents (e.g. azathioprine, cyclophosphamide, cyclosporine, IVIg, mycophenolate mofetil, rituximab)

## Dermatitis Herpetiformis

### Clinical Feature
- grouped papules/vesicles/urticarial wheals on an erythematous base, associated with intense pruritus, burning, stinging, excoriations
- lesions grouped, bilaterally symmetrical
- common sites: extensor surfaces of elbows/knees, sacrum, buttocks, scalp

### Pathophysiology
- transglutaminase IgA deposits in the skin alone or in immune complexes leading to eosinophil and neutrophil infiltration
- 90% have HLA B8, DR3, DQWZ
- 90-100% associated with an often subclinical gluten-sensitive enteropathy (i.e. celiac disease)
- 30% have thyroid disease; increased risk of intestinal lymphoma in untreated comorbid celiac disease; iron/folate deficiency is common

### Epidemiology
- 20-60 yr old, M:F = 2:1

### Investigations
- biopsy
- immunofluorescence shows IgA deposits in perilesional skin

### Management
- dapsone (sulfapyridine if contraindicated or poorly tolerated)
- gluten-free diet for life – this can reduce risk of lymphoma

# Porphyria Cutanea Tarda

### Clinical Feature
- skin fragility followed by formation of tense vesicles/bullae and erosions on photoexposed skin
- gradual healing to scars, milia
- periorbital violaceous discolouration, diffuse hypermelanosis, facial hypertrichosis
- common sites: light-exposed areas subjected to trauma, dorsum of hands and feet, nose, and upper trunk

### Pathophysiology
- uroporphyrinogen decarboxylase deficiency leads to excess heme precursors
- can be associated with hemochromatosis, alcohol abuse, DM, drugs (estrogen therapy, NSAIDs), HIV, hepatitis C, increased Fe indices

### Epidemiology
- 30-40 yr old, M>F

### Investigations
- urine and 5% HCl shows orange-red fluorescence under Wood's lamp (UV rays)
- 24 h urine has elevated uroporphyrins
- stool contains elevated coproporphyrins
- immunofluorescence shows IgE at dermal-epidermal junctions

### Management
- discontinue aggravating substances (alcohol, estrogen therapy)
- phlebotomy to decrease body iron load
- low dose hydroxychloroquine

# Drug Eruptions

## Exanthematous

### EXANTHEMATOUS DRUG REACTION

### Clinical Feature
- morphology: erythematous macules and papules ± scale
- spread: symmetrical, trunk to extremities
- time course: 7-14 d after drug initiation, fades 7-14 d after withdrawal

### Epidemiology
- most common cutaneous drug reaction; increased in presence of infections
- common causative agents: penicillin, sulfonamides, phenytoin

### Management
- weigh risks and benefits of drug discontinuation
- antihistamines, emollients, topical steroids

**Diagnosis of a Drug Reaction**

Classification by Naranjo et. al has 4 criteria:
1. Temporal relationship between drug exposure and reaction
2. Recognized response to suspected drug
3. Improvement after drug withdrawal
4. Recurrence of reaction on re-challenge with the drug

Definite drug reaction requires all 4 criteria to be met
Probable drug reaction requires #1-3 to be met
Possible drug reaction requires only #1

### DRUG INDUCED HYPERSENSITIVITY SYNDROME (DIHS) / DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)

### Clinical Feature
- morphology: morbilliform rash involving face, trunk, arms; can have facial edema
- systemic features: fever, malaise, cervical lymphadenopathy, internal organ involvement (e.g. hepatitis, arthralgia, nephritis, pneumonitis, lymphadenopathy, hematologic abnormalities, thyroid abnormalities)
- spread: starts with face or periorbitally and spreads caudally; no mucosal involvement
- time course: onset 1-6 wk after first exposure to drug; persists wk after withdrawal of drug

**Drug Hypersensitivity Syndrome Triad**
- Fever
- Exanthematous eruption
- Internal organ involvement

### Epidemiology
- rare: incidence varies considerably depending on drug
- common causative agents: anticonvulsants (e.g. phenytoin, phenobarbital, carbamazepine, lamotrigine), sulfonamides, and allopurinol
- 10% mortality if severe, undiagnosed, and untreated

### Management
- discontinue offending drug ± prednisone 0.5mg/kg/d, consider cyclosporine in severe cases
- may progress to generalized exfoliative dermatitis/erythroderma if drug is not discontinued

# Urticarial

## DRUG INDUCED URTICARIA AND ANGIOEDEMA

### Clinical Feature
- morphology: wheals lasting >24 h unlike non-drug induced urticaria, angioedema (face and mucous membranes)
- systemic features: may be associated with systemic anaphylaxis (bronchospasm, laryngeal edema, shock)
- time course: h-d after exposure depending on the mechanism

### Epidemiology
- second most common cutaneous drug reaction
- common causative agents: penicillins, ACEI, analgesics/anti-inflammatories, radiographic contrast media

### Management
- discontinue offending drug, treatment with antihistamines, steroids, epinephrine if anaphylactic

## SERUM SICKNESS-LIKE REACTION

### Clinical Feature
- morphology: symmetrical cutaneous eruption (usually urticarial)
- systemic features: malaise, low grade fever, arthralgia, lymphadenopathy
- time course: appears 1-3 wk after drug initiation, resolve 2-3 wk after withdrawal

### Epidemiology
- more prevalent in kids (0.02-0.2%)
- common causative agents: cefaclor in kids; bupropion in adults

### Management
- discontinue offending drug ± topical/oral corticosteroids

# Pustular

## ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS (AGEP)

### Clinical Feature
- morphology: extensive erythematous, edematous, and sterile pustules
- systemic features: high fever, leukocytosis with neutrophilia
- spread: starts in face and intertriginous areas, spreads to trunk and extremities
- time course: appears 1 wk after drug initiation, resolves 2 wk after withdrawal

### Epidemiology
- rare: 1-5/million
- common causative agents: aminopenicillins, cephalosporins, clindamycin, calcium channel blockers

### Management
- discontinue offending drug and systemic corticosteroids

# Bullous

## STEVEN-JOHNSON SYNDROME (SJS)/TOXIC EPIDERMAL NECROLYSIS (TEN)

### Clinical Feature
- morphology: prodromal rash (morbilliform/targetoid lesions ± purpura, or diffuse erythema), confluence of flaccid blisters, positive Nikolsky sign (epidermal detachment with shear stress), full thickness epidermal loss; dusky tender skin, bullae, desquamation/skin sloughing, atypical targets
- classification: BSA with epidermal detachment: <10% in SJS, 10-30% in SJS/TEN overlap, and >30% in TEN
- spread: face and extremities; may generalize; scalp, palms, soles relatively spared; erosion of mucous membranes (lips, oral mucosa, conjunctiva, GU mucosa)
- systemic features: fever (higher in TEN), cytopenias, renal tubular necrosis/AKI, tracheal erosion, infection, contractures, corneal scarring, phimosis, vaginal synechiae
- time course: appears 1-3 wk after drug initiation; progression <4 d; epidermal regrowth in 3 wk
- can have constitutional symptoms: malaise, fever, hypotension, tachycardia

### Epidemiology
- SJS: 1.2-6/million; TEN: 0.4-1.2/million
- risk factors: SLE, HIV/AIDS, HLA-B1502 (reaction most prevalent in East Asians, associated with carbamazepine), HLA-B5801 (reaction most prevalent in Asians and Caucasians, associated with allopurinol)
- common causative agents: drugs (allopurinol, anti-epileptics, sulfonamides, NSAIDs, cephalosporins) responsible in 50% of SJS and 80% of TEN; viral or mycoplasma infections
- prognosis: 5% mortality in SJS, 30% in TEN due to fluid loss and infection

**SCORTEN Score for TEN Prognosis**
One point for each of: age ≥40, malignancy, body surface area detached ≥10%, tachycardia ≥120 bpm, serum urea >10 mmol/L, serum glucose >14 mmol/L, serum bicarbonate <20 mmol/L

Used to determine appropriate clinical setting: score 0-1 can be treated in non-specialized wards; score ≥2 should be transferred to intensive care or burn unit

Score at admission is predictive of survival: 94% for 0-1, 87% for 2, 53% for 3, 25% for 4, and 17% for ≥5

### Differential Diagnosis
- scarlet fever, phototoxic eruption, GVHD, SSSS, exfoliative dermatitis, AGEP, paraneoplastic pemphigus

### Management
- discontinue offending drug
- admit to intermediate/intensive care/burn unit
- supportive care: IV fluids, electrolyte replacement, nutritional support, pain control, wound care, sterile handling, monitor for and treat infection
- IVIg or cyclosporine or etanercept

**Systemic Immunomodulating Therapies for Stevens-Johnson Syndrome and Toxic Epidermal Necrolysis: A Systematic Review and Meta-analysis**
JAMA Dermatol 2017;153:514-22.
**Purpose**: To examine possible immunomodulating treatments for SJS/TEN and estimate mortality effect compared to supportive care.
**Methods**: Systematic review of randomized and nonrandomized studies on systemic immunomodulating therapies or supportive care for SJS/TEN.
**Results**: Ninety-six studies with 3248 patients were included in the final analysis. Glucocorticoids were associated with a survival benefit for patients (aggregate - OR 0.5, 95% CI 0.3-1.01). Though findings were limited to a small number of patients overall, cyclosporine was associated with significant benefit (unstratified iPD model – OR 0.1; 95% CI 0.0-0.4). No beneficial effects were observed with other therapies, including intravenous immunoglobulins.
**Conclusion**: Though based on limited evidence, glucocorticoids and cyclosporine were most promising as SJS/TEN immunomdulating therapies.

# Other

## FIXED DRUG ERUPTION

### Clinical Feature
- morphology: sharply demarcated erythematous oval patches on the skin or mucous membranes
- spread: commonly face, mucosa, genitalia, acral; recurs in same location upon subsequent exposure to the drug (fixed location)

### Epidemiology
- common causative agents: antimicrobials (tetracycline, sulfonamides), anti-inflammatories, psychoactive agents (barbiturates), phenolphthalein

### Management
- discontinue offending drug ± prednisone 1mg/kg/d x 2 wk for generalized lesions ± potent topical corticosteroids for non-eroded lesions or antimicrobial ointment for eroded lesions

## PHOTOSENSITIVITY REACTION

### Clinical Feature
- phototoxic reaction: "exaggerated sunburn" (erythema, edema, vesicles, bullae) confined to sun-exposed areas
- photoallergic reaction: pruritic eczematous eruption with papules, vesicles, scaling, and crusting that may spread to areas not exposed to light

### Pathophysiology
- phototoxic reaction: direct tissue injury
- photoallergic reaction: type IV delayed hypersensitivity

### Epidemiology
- common causative agents: chlorpromazine, doxycycline, thiazide diuretics, procainamide

### Management
- sun protection ± topical/oral corticosteroids

# Heritable Disorders

# Ichthyosis Vulgaris

### Clinical Feature
- xerosis with fine scaling as well as large adherent scales ("fish-scales")
- affects arms, legs, palms, soles, back, forehead, and cheeks; spares flexural creases
- improves in summer, with humidity, and as the child grows into adulthood

### Pathophysiology
- genetic deficiency in filaggrin protein leads to abnormal retention of keratinocytes (hyperkeratosis)
- scaling without inflammation

### Epidemiology
- 1:300 incidence
- autosomal dominant inheritance
- associated with AD and keratosis pilaris

### Investigations
- electron microscopy: keratohyalin granules

### Management
- immersion in bath and oils followed by an emollient cream, humectant cream, or creams/oil containing urea or α- or β-hydroxy acids
- intermittent systemic retinoids for severe cases

# Neurofibromatosis (Type I; von Recklinghausen's Disease)

### Clinical Feature
- diagnostic criteria includes 2 or more of the following:
  1. more than 5 café-au-lait patches >1.5 cm in an adult or more than 5 café-au-lait macules >0.5 cm in a child <5 yr
  2. axillary or inguinal freckling
  3. iris hamartomas (Lisch nodules)
  4. optic gliomas
  5. neurofibromas
  6. distinctive bony lesion (sphenoid wing dysplasia or thinning of long bone cortex)
  7. first degree relative with neurofibromatosis Type 1
- associated with pheochromocytoma, astrocytoma, bilateral acoustic neuromas, bone cysts, scoliosis, precocious puberty, developmental delay, and renal artery stenosis
- skin lesions less prominent in neurofibromatosis Type II (see Pediatrics, P79)

### Pathophysiology
- autosomal dominant disorder with excessive and abnormal proliferation of neural crest elements (Schwann cells, melanocytes), high incidence of spontaneous mutation
- linked to absence of neurofibromin (a tumour suppressor gene)

### Epidemiology
- incidence 1:3000

### Investigations
- Wood's lamp to detect café-au-lait macules in patients with pale skin

### Management
- refer to orthopedics, ophthalmology, plastics, and psychology
- follow-up annually for brain tumours (e.g. astrocytoma)
- excise suspicious or painful lesions
- see Pediatrics, P79

# Vitiligo

### Clinical Feature
- primary pigmentary disorder characterized by depigmentation
- acquired destruction of melanocytes characterized by sharply marginated white patches
- associated with streaks of depigmented hair, chorioretinitis
- sites: extensor surfaces and periorificial areas (mouth, eyes, anus, genitalia)
- Koebner phenomenon, may be precipitated by trauma

### Pathophysiology
- acquired autoimmune destruction of melanocytes

### Epidemiology
- 1% incidence, polygenic
- 30% with positive family history

### Investigations
- rule out associated autoimmune diseases: thyroid disease, pernicious anemia, Addison's disease, Type I DM
- Wood's lamp to detect lesions: illuminates UV light onto skin to detect amelanosis (porcelain white discolouration)

### Management
- sun avoidance and protection
- topical calcineurin inhibitor (e.g. tacrolimus, pimecrolimus) or topical corticosteroids
- PUVA or NB-UVB
- make-up
- "bleaching" normal pigmented areas (i.e. monobenzyl ether of hydroquinone 20%) if widespread loss of pigmentation

**Interventions for Vitiligo**
Cochrane Database Syst Rev 2015;2:CD003263
**Purpose**: To assess the effects of existing interventions used in the management of vitiligo.
**Study**: Systematic review of RCTs assessing the effects of vitiligo treatments (topical treatments, light therapies, oral treatments, surgical methods). Primary outcomes were quality of life and >75% re-pigmentation adverse effects.
**Results**: Ninety-six RCTs with 4512 participants were deemed eligible, of which only 25 reported on the primary outcomes and were finally included. Re-pigmentation was better with combination therapy (calcipotriol plus PUVA, than PUVA alone, hydrocortisone-17-butyrate plus excimer laser vs. excimer laser alone; oral minipulse of prednisolone (OMP) plus narrowband UVB (NB-UVB) vs. OMP alone; azathioprine with PUVA vs. PUVA alone; 8-methoxypsoralen (8-MOP) plus sunlight versus psoralen). A non-significant increase in proportion of participants with >75% re-pigmentation was noted in favour of NB-UVB compared to PUVA. Compared to PUVA, the NV-UVB group reported lower incidences of nausea and erythema, but not itching.
**Conclusions**: Some studies support existing therapies for vitiligo management, but follow-up is needed to assess permanence of re-pigmentation and higher quality RCTs need to be conducted.

# Infections

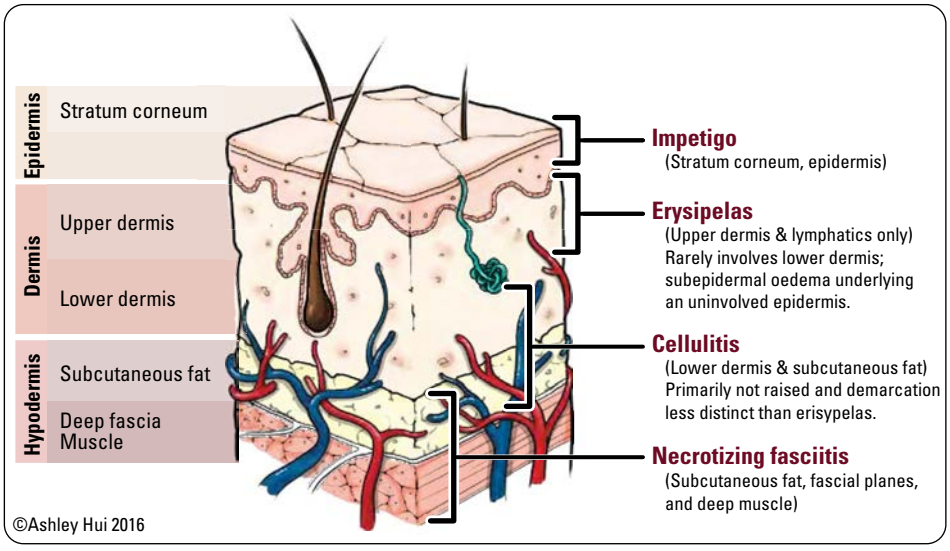

**Figure 7. Layers of skin affected by bacterial infections**

**Location Matters!**

**e.g. Group A Strep Infections**
- Impetigo → just below stratum corneum
- Erysipelas → epidermis and upper dermis only
- Cellulitis → primarily lower dermis and subcutis (primarily not raised, and demarcation less distinct than erysipelas)
- Necrotizing fasciitis → deep fascia and muscle

## Bacterial Infections

### EPIDERMIS

### IMPETIGO

#### Clinical Feature
- acute purulent infection which appears vesicular; progresses to golden yellow "honey-crusted" lesions surrounded by erythema
- can present with bullae
- common sites: face, arms, legs, and buttocks

#### Etiology
- GAS, *S. aureus*, or both

#### Epidemiology
- preschool and young adults living in crowded conditions, poor hygiene, neglected minor trauma

#### Differential Diagnosis
- infected eczema, HSV, VZV

#### Investigations
- Gram stain and culture of lesion fluid or biopsy

#### Management
- remove crusts, use saline compresses, and topical antiseptic soaks bid
- topical antibacterials (e.g. 2% mupirocin or fusidic acid (Canada only) tid; continue for 7-10 d after resolution)
- systemic antibiotics (e.g. cloxacillin or cephalexin for 7-10 d)

## DERMIS

### Table 16. Comparison of Erysipelas and Cellulitis

| | Clinical Feature | Etiology | Complications | Differential Diagnosis | Investigations | Management |
|---|---|---|---|---|---|---|
| **Erysipelas** | Involves upper dermis<br>Confluent, erythematous, sharp raised edge, warm plaque, well demarcated<br>Very painful ("St. Anthony's fire")<br>Sites: face and legs<br>Systemic symptoms: fever, chills, headache, weakness (if present, sign of more serious infection) | GAS | Scarlet fever, streptococcal gangrene, fat necrosis, coagulopathy<br>Spreads via lymphatics | DVT (less red, less hot, smoother), superficial phlebitis, contact dermatitis, photosensitivity reaction, stasis dermatitis, panniculitis, vasculitis | Clinical diagnosis: rarely do skin/blood culture<br>If suspect necrotizing fasciitis: do immediate biopsy and frozen section, histopathology | 1st line: penicillin, cloxacillin or cefazolin<br>2nd line: clindamycin or cephalexin<br>If allergic to penicillin, use erythromycin |
| **Cellulitis** | Involves lower dermis/subcutaneous fat<br>Unilateral erythematous flat lesion, often with vesicles poorly demarcated, not uniformly raised<br>Tender<br>Sites: commonly on legs<br>Systemic symptoms (uncommon): fever, leukocytosis, lymphadenopathy | GAS, *S. aureus* (large sized wounds), *H. influenzae* (periorbital), *Pasteurella multocida* (dog/cat bite) | Uncommon | Same as erysipelas | Same as erysipelas | 1st line: cloxacillin or cefazolin/cephalexin<br>2nd line: erythromycin or clindamycin<br>Children: cefuroxime<br>If DM (foot infections): TMP/SMX and metronidazole |

## COMMON HAIR FOLLICLE INFECTIONS

### Table 17. Comparison of Superficial Folliculitis, Furuncles, and Carbuncles

| | Clinical Feature | Etiology | Management |
|---|---|---|---|
| **Superficial Folliculitis** | Superficial infection of the hair follicle (versus pseudofolliculitis: inflammation of follicle due to friction, irritation, or occlusion)<br>Acute lesion consists of a dome-shaped pustule at the mouth of hair follicle<br>Pustule ruptures to form a small crust<br>Sites: primarily scalp, shoulders, anterior chest, upper back, other hair-bearing areas | Normal non-pathogenic bacteria (*Staphylococcus* – most common; *Pseudomonas* – hot tub)<br>*Pityrosporum* | Antiseptic (Hibiclens®)<br>Topical antibacterial (fusidic acid, mupirocin, erythromycin, or clindamycin)<br>Oral cloxacillin for 7-10 d |
| **Furuncles (Boils)** | Red, hot, tender, inflammatory nodules with central yellowish point, which forms over summit and ruptures<br>Involves subcutaneous tissue that arises from a hair follicle<br>Sites: hair-bearing skin (thigh, neck, face, axillae, perineum, buttocks) | *S. aureus* | Incise and drain large furuncles to relieve pressure and pain<br>If afebrile: hot wet packs, topical antibiotic<br>If febrile/cellulitis: culture blood and aspirate pustules (Gram stain and C&S)<br>Cloxacillin for 1-2 wk (especially for lesions near external auditory canal/nose, with surrounding cellulitis, and not responsive to topical therapy) |
| **Carbuncles** | Deep-seated abscess formed by multiple coalescing furuncles<br>Usually in areas of thicker skin<br>Occasionally ulcerates<br>Lesions drain through multiple openings to the surface<br>Systemic symptoms may be associated | *S. aureus* | Same as for furuncles |

# Dermatophytoses

### Clinical Feature
- infection of skin, hair, and nails caused by dermatophytes (fungi that live within the epidermal keratin or hair follicle and do not penetrate into deeper structures)

### Pathophysiology
- digestion of keratin by dermatophytes results in scaly skin, broken hairs, crumbling nails/onycholysis

### Etiology
- Trichophyton, Microsporum, Epidermophyton species (Pityrosporum is a superficial yeast and not a dermatophyte)

### Investigations
- skin scrapings, hair, and/or nail clippings analyzed with potassium hydroxide (KOH) prep to look for hyphae and mycelia

### Management
- topicals as first line agents for tinea corporis/cruris and tinea pedis (interdigital type): clotrimazole, or terbinafine or ciclopirox olamine cream applied bid
- oral therapy is indicated for onychomycosis or tinea capitis: terbinafine (Lamisil® – liver toxicity, CYP2D6 inhibitor) or itraconazole (Sporanox® – CYP3A4 inhibitor, liver toxicity)

**A Placebo-Controlled Trial of Antibiotics for Smaller Skin Abscesses**
N Engl J Med 2017;376:2545-55
**Purpose**: To determine the appropriate management of uncomplicated skin abscesses.
**Study**: Multi-centre, prospective, double-blind trial involving outpatient adults and children with abscesses 5 cm or smaller, stratified by presence of surgically drainable abscess, abscess size, number of sites of skin infection, and presence of non-purulent cellulitis. Following incision and drainage, participants were randomly assigned to 10 d courses of clindamycin, TMP-SMX or placebo. Primary outcome was clinical cure 7 to 10 d after treatment end. Intention-to-treat analyses were conducted.
**Results**: Seven hundred and eighty-six participants were enrolled (505 adults, 281 children). Ten d after therapy, the cure rate was similar between clindamycin and TMP-SMX (83.1% vs. 81.7%; p=0.73), and was higher than that of the placebo group (68.9%; p=0.001 for both comparisons). Among those who were cured, new infections at 1 mo follow-up were less common in the clindamycin group than the TMP-SMX or placebo groups (6.8% vs. 11.1%; p=0.03 vs. 12.4%; p=0.06). Adverse events were more frequent with clindamycin than either of the other groups (21.9% s. 11.1% vs. 12.5%), though all resolved without sequelae.
**Conclusions**: Clindamycin or TMP-SMX in conjunction with incision and drainage for simple abscesses improves short-term outcomes compared to incision and drainage alone, though side-effects must be considered.

**Table 18. Different Manifestations of Dermatophyte Infection**

| | Clinical Feature | Differential Diagnosis | Investigations | Management |
|---|---|---|---|---|
| **Tinea Capitis** | Round, scaly patches of alopecia, possibly with broken off hairs; pruritic<br>Sites: scalp, eyelashes, and eyebrows; involving hair shafts and follicles<br>Kerion (boggy, elevated, purulent inflamed nodule/plaque) may form secondary to infection by bacteria and result in scarring<br>May have occipital lymphadenopathy<br>Affects children (mainly black), immunocompromised adults<br>Very contagious and may be transmitted from barber, hats, theatre seats, pets | Alopecia areata, psoriasis, seborrheic dermatitis, trichotillomania | Wood's light examination of hair: green fluorescence only for Microsporum infection<br>Culture of scales/hair shaft<br>Microscopic examination of KOH preparation of scales or hair shafts | Terbinafine (Lamisil®) x 4 wk<br>NB: oral agents are required to penetrate the hair root where dermatophyte resides<br>Adjunctive antifungal shampoos or lotions may be helpful, and may prevent spread (e.g. selenium sulfide, ketoconozole, ciclopirox) |
| **Tinea Corporis** (Ringworm) | Pruritic, scaly, round/oval plaque with active erythematous margin, ± central clearing<br>Sites: trunk, limbs, face | Granuloma annulare, pityriasis rosea, psoriasis, seborrheic dermatitis | Microscopic examinations of KOH prep of scales shows hyphae<br>Culture of scales | Topicals: 1% clotrimazole, 2% ketoconazole<br>2% miconazole, terbinafine or ciclopirox olamine cream bid for 2-4 wk<br>Oral terbinafine, or itraconazole, or fluconazole, or ketoconazole if extensive |
| **Tinea Cruris** ("Jock Itch") | Scaly patch/plaque with a well-defined, curved border and central clearing<br>Pruritic, erythematous, dry/macerated<br>Sites: starts medial thigh, spreads centrifugally to perineum, gluteal cleft, buttocks | Candidiasis (involvement of scrotum and satellite lesions), contact dermatitis, erythrasma | Same as for tinea corporis | Same as for tinea corporis |
| **Tinea Pedis** (Athlete's Foot) | Pruritic scaling and/or maceration of the web spaces, and powdery scaling of soles<br>Acute infection: interdigital (especially 4th web space) red/white scales, vesicles, bullae, often with maceration<br>Secondary bacterial infection may occur<br>Chronic: non-pruritic, pink, scaling keratosis on soles, and sides of feet<br>May present as flare-up of chronic tinea pedis<br>Predisposing factors: heat, humidity, occlusive footwear | AD, contact dermatitis, dyshidrotic dermatitis, erythrasma, intertrigo, inverse psoriasis | Same as for tinea corporis | Same as for tinea corporis |
| **Tinea Manuum** | Primary fungal infection of the hand is rare; usually associated with tinea pedis<br>Acute: blisters at edge of red areas on hands<br>Chronic: single dry scaly patch | AD, contact dermatitis, granuloma annulare, psoriasis | Same as for tinea corporis | Same as for tinea corporis |
| **Tinea Unguium** (Onychomycosis) | Crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris<br>Toenail infections usually precede fingernail infections<br>*T. rubrum* (90% of all toenail infections) | Psoriasis, lichen planus, contact dermatitis, traumatic onychodystrophies, bacterial infection | Microscopic examinations of KOH prep of scales from subungual scraping shows hyphae<br>Culture of subungual scraping or nail clippings on Sabouraud's agar<br>PAS stain of nail clipping by pathology | Terbinafine (Lamisil®) (6 wk for fingernails, 12 wk for toenails)<br>Itraconazole (Sporanox®) 7 d on, 3 wk off (2 pulses for fingernails, 3 pulses for toenails)<br>Topical: ciclopirox (Penlac®); nail lacquer (often ineffective), Efinaconazole (Jublia®) (48 wk) |

# Parasitic Infections

## SCABIES

### Clinical Feature

- characterized by superficial burrows, intense pruritus (especially nocturnal), and secondary infection
- primary lesion: superficial linear burrows; inflammatory papules and nodules in the axilla and groin
- secondary lesion: small urticarial crusted papules, eczematous plaques, excoriations
- common sites: axillae, groin, buttocks, hands/feet (especially web spaces), sparing of head and neck (except in infants)

### Pathophysiology

- scabies mite remains alive 2-3 d on clothing/sheets
- incubation of 1 mo, then pruritus begins
- re-infection followed by hypersensitivity in 24 h

### Etiology

- *Sarcoptes scabiei* (a mite)
- risk factors: sexual promiscuity, crowding, poverty, nosocomial, immunocompromised

### Differential Diagnosis
- asteatotic eczema, dermatitis herpetiformis, lichen simplex chronicus (neurodermatitis)

### Investigations
- microscopic examination of root and content of burrow and mineral oil mount for mite, eggs, feces
- skin biopsy may sometimes show scabies mite

### Management
- bathe, then apply permethrin 5% cream (i.e. Nix®) from neck down to soles of feet (must be left on for 8-14 h and requires second treatment 7 d after first treatment)
- change underwear and linens; wash twice with detergent in hot water cycle then machine dry
- treat family and close contacts
- pruritus may persist for 2-3 wk after effective treatment due to prolonged hypersensitivity reaction
- mid potency topical steroids and antihistamines for symptom management

## LICE (PEDICULOSIS)

### Clinical Feature
- intensely pruritic, red excoriations, morbilliform rash, caused by louse (a parasite)
- scalp lice: nits (i.e. louse eggs) on hairs; red, excoriated skin with secondary bacterial infection, lymphadenopathy
- pubic lice: nits on hairs; excoriations
- body lice: nits and lice in seams of clothing; excoriations and secondary infection mainly on shoulders, belt-line, and buttocks

### Etiology
- *Phthirus pubis* (pubic), *Pediculus humanus capitis* (scalp), *Pediculus humanus humanus* (body): attaches to body hair and feeds on the nearby body site
- can transmit infectious agents (e.g. *Bartonella Quintana, Rickettsia prowazekii*)

### Differential Diagnosis
- bacterial infection of scalp, seborrheic dermatitis

### Diagnosis
- lice visible on inspection of affected area or clothing seams

### Management
- permethrin 1% (Nix® cream rinse) (ovicidal) or permethrin 1% (RC & Cor®, Kwellada-P® shampoo)
- comb hair with fine-toothed comb using dilute vinegar solution to remove nits
- repeat in 7 d after first treatment
- shave hair if feasible, change clothing and linens; wash with detergent in hot water cycle then machine dry

## BED BUGS (HEMIPTERA)

### Clinical Feature
- burning wheals, turning to firm papules, often in groups of three – "breakfast, lunch and dinner" – in areas with easy access (face, neck, arms, legs, hands)

### Etiology
- caused by Cimex lectularius, a small insect that feeds mainly at night (hides in crevices in walls and furniture during the day)

### Differential Diagnosis
- dermatitis herpetiformis, drug eruptions, ecthyma, other insect bites, scabies

### Investigations
- none required, but lesional biopsy can confirm insect bite reaction

### Management
- professional fumigation
- topical steroids and oral H1-antagonists for symptomatic relief
- definitive treatment is removal of clutter in home and application of insecticides to walls and furniture

# Viral Infections

## HERPES SIMPLEX

### Clinical Feature
- herpetiform (i.e. grouped) vesicles on an erythematous base on skin or mucous membranes
- transmitted via contact with erupted vesicles or via asymptomatic viral shedding
- primary
  - children and young adults
  - usually asymptomatic; may have high fever, regional lymphadenopathy, malaise
  - followed by antibody formation and latency of virus in dorsal nerve root ganglion
- secondary
  - recurrent form seen in adults; much more common than primary
  - prodrome: tingling, pruritus, pain
  - triggers for recurrence: fever, excess sun exposure, physical trauma, menstruation, emotional stress, URTI
- complications: dendritic corneal ulcer, EM, herpes simplex encephalitis (infants at risk), HSV infection on AD causing Kaposi's varicelliform eruption (eczema herpeticum)
- two biologically and immunologically different subtypes: HSV-1 and HSV-2
  - HSV-1
    - typically "cold sores" (grouped vesicles at the mucocutaneous junction which quickly burst)
    - recurrent on face, lips, and hard palate, but NOT on soft, non-keratinized mucous membranes (unlike aphthous ulcers)
  - HSV-2
    - usually sexually transmitted; incubation 2-20 d
    - gingivostomatitis: entire buccal mucosa involved with erythema and edema of gingiva
    - vulvovaginitis: edematous, erythematous, extremely tender, profuse vaginal discharge
    - urethritis: watery discharge in males
    - recurrent on vulva, vagina, penis for 5-7 d
    - differential diagnosis of genital ulcers: Candida balanitis, chancroid, syphilitic chancres

Both HSV-1 and HSV-2 can occur on face or genitalia

### Investigations
- Tzanck smear with Giemsa stain shows multinucleated giant epithelial cells
- viral culture, electron microscopy, and direct fluorescence antibody test of specimen taken from the base of a relatively new lesion
- serologic testing for antibody for current or past infection if necessary

### Management
- HSV-1
  - treat during prodrome to prevent vesicle formation
  - topical antiviral (Zovirax®/Xerese®) cream, apply 5-6x/d x 4-7 d for facial/genital lesions
  - oral antivirals (e.g. acyclovir, famciclovir, valacyclovir) are far more effective and have an easier dosing schedule than topicals
- HSV-2
  - rupture vesicle with sterile needle if you wish to culture it
  - wet dressing with aluminum subacetate solution, Burow's compression, or betadine solution
  - 1st episode: acyclovir 200 mg PO 5x/d x 10 d
    - maintenance: acyclovir 400 mg PO bid
  - famciclovir and valacyclovir may be substituted and have better enteric absorption and less frequent dosing
  - in case of herpes genitalis, look for and treat any other STIs
  - for active lesions in pregnancy, see Obstetrics, OB29

**Erythema Multiforme**
**Etiology**: most often HSV or mycoplasma pneumoniae, rarely drugs
**Morphology**: macules/papules with central vesicles; classic bull's-eye pattern of concentric light and dark rings (typical target lesions)
**Management**: symptomatic treatment (oral antihistamines, oral antacids); corticosteroids in severely ill (controversial); prophylactic oral acyclovir for 6-12 mo for HSV-associated EM with frequent recurrences

## HERPES ZOSTER (SHINGLES)

### Clinical Feature
- unilateral dermatomal eruption occurring 3-5 d after pain and paresthesia of that dermatome
- vesicles, bullae, and pustules on an erythematous, edematous base
- lesions may become eroded/ulcerated and last days to weeks
- pain can be pre-herpetic, synchronous with rash, or post-herpetic
- severe post-herpetic neuralgia often occurs in elderly
- Hutchinson's sign: shingles on the tip of the nose signifies ocular involvement
  - shingles in this area involves the nasociliary branch of the ophthalmic branch of the trigeminal nerve (V1)
- distribution: thoracic (50%), trigeminal (10-20%), cervical (10-20%); disseminated in HIV

Herpes zoster typically involves a single dermatome; lesions rarely cross the midline

### Etiology
- caused by reactivation of VZV
- risk factors: immunosuppression, old age, occasionally associated with hematologic malignancy

### Differential Diagnosis
- before thoracic skin lesions occur, must consider other causes of chest pain
- contact dermatitis, localized bacterial infection, zosteriform HSV (more pathogenic for the eyes than VZV)

### Investigations
- none required, but can do Tzanck test, direct fluorescence antibody test, or viral culture to rule out HSV

### Prevention
- routine vaccination in 50+ yr old with Shingrix® (recombinant zoster vaccine) preferred to in 60+ yr old with Zostavax® (live zoster vaccine)

### Management
- compress with normal saline, Burow's or betadine solution
- oral antivirals: famciclovir, valacyclovir, or acyclovir for 7 d; must initiate within 72 h to be of benefit
- analgesia: NSAIDs, acetaminophen for mild-moderate pain; opioids if severe
- post-herpetic neuralgia: TCAs, anticonvulsants (gabapentin, pregabalin)

## MOLLUSCUM CONTAGIOSUM

### Clinical Feature
- discrete dome-shaped and umbilicated pearly, white papules caused by DNA Pox virus (Molluscum contagiosum virus)
- common sites: eyelids, beard (likely spread by shaving), neck, axillae, trunk, perineum, buttocks

### Etiology
- virus is spread via direct contact, auto-inoculation, sexual contact
- common in children and sexually active young adults (giant molluscum and severe cases can be seen in the setting of HIV)
- virus is self-limited and can take 1-2 yr to resolve

### Investigations
- none required, however can biopsy to confirm diagnosis

### Management
- topical cantharidin (a vesicant)
- cryotherapy
- curettage
- topical retinoids
- Aldara® (imiquimod): immune modulator that produces a cytokine inflammation

## WARTS (VERRUCA VULGARIS) (HUMAN PAPILLOMAVIRUS INFECTIONS)

**Table 19. Different Manifestations of HPV Infection**

| | Definition and Clinical Features | Differential Diagnosis | Distribution | HPV Type |
|---|---|---|---|---|
| **Verruca Vulgaris** (Common Warts) | Hyperkeratotic, elevated discrete epithelial growths with papillated surface caused by HPV<br>Paring of surface reveals punctate, red-brown specks (thrombosed capillaries) | Molluscum contagiosum, seborrheic keratosis | Located at trauma sites: fingers, hands, knees of children and teens | At least 80 types are known |
| **Verruca Plantaris** (Plantar Warts) and **Verruca Palmaris** (Palmar Warts) | Hyperkeratotic, shiny, sharply marginated growths<br>Paring of surface reveals red-brown specks (capillaries), interruption of epidermal ridges | May need to scrape ("pare") lesions to differentiate wart from callus and corn | Located at pressure sites: metatarsal heads, heels, toes | Commonly HPV 1, 2, 4, 10 |
| **Verruca Planae** (Flat Warts) | Multiple discrete, skin coloured, flat topped papules grouped or in linear configuration<br>Common in children | Syringoma, seborrheic keratosis, molluscum contagiosum, lichen planus | Sites: face, dorsa of hands, shins, knees | Commonly HPV 3, 10 |
| **Condyloma Acuminata** (Genital Warts) | Skin-coloured pinhead papules to soft cauliflower like masses in clusters<br>Can be asymptomatic, lasting months to years<br>Highly contagious, transmitted sexually and non-sexually (e.g. Koebner phenomenon via scratching, shaving), and can spread without clinically apparent lesions<br>Investigations: acetowhitening (subclinical lesions seen with 5% acetic acid x 5 min and hand lens)<br>Complications: fairy-ring warts (satellite warts at periphery of treated area of original warts) | Condyloma lata (secondary syphilitic lesion, dark field strongly +ve), molluscum contagiosum | Sites: genitalia and perianal areas | Commonly HPV 6 and 11<br>HPV 16, 18, 31, 33 cause cervical dysplasia, SCC, and invasive cancer |

### Treatment for Warts
- first line therapies
  - salicylic acid preparations (patches, solutions, creams, ointments), cryotherapy, topical cantharidin (Cantharone®)
- second line therapies
  - topical imiquimod, topical 5-fluorouracil, topical tretinoin, podophyllotoxin
- third line therapies
  - curettage, cautery, surgery for non plantar warts, $CO_2$ laser, oral cimetidine (particularly children), intralesional bleomycin (plantar warts), trichloroacetic acid, diphencyprone
- other viruses associated with skin changes, such as measles, roseola, fifth disease, etc.
- see Pediatrics, *Pediatric Exanthems*, P53

## Yeast Infections

### CANDIDIASIS

### Etiology
- many species of Candida (70-80% of infections are from *Candida albicans*)
- opportunistic infection in those with predisposing factors (e.g. trauma, malnutrition, immunodeficiency)

### Candidal Paronychia
- clinical feature: painful red swelling of periungual skin
- management: topical agents not as effective; oral antifungals recommended

### Candidal Intertrigo
- clinical feature
  - macerated/eroded erythematous patches that may be covered with papules and pustules, located in intertriginous areas often under breast, groin, or interdigitally
  - peripheral "satellite" pustules
  - starts as non-infectious maceration from heat, moisture, and friction
- predisposing factors: obesity, DM, systemic antibiotics, immunosuppression, malignancy
- management: keep area dry, terbinafine, ciclopirox olamine, ketoconazole/clotrimazole cream bid until rash clears

Oral Terbinafine (Lamisil®) is not effective because it is not secreted by sweat glands

### PITYRIASIS (TINEA) VERSICOLOR

### Clinical Feature
- asymptomatic superficial fungal infection with brown/white scaling macules
- affected skin darker than surrounding skin in winter, lighter in summer (does not tan)
- common sites: upper chest and back

### Pathophysiology
- microbe produces azelaic acid → inflammatory reaction inhibiting melanin synthesis yielding variable pigmentation
- affinity for sebaceous glands; require fatty acids to survive

### Etiology
- *Pityrosporum ovale* (*Malassezia furfur*)
- also associated with folliculitis and seborrheic dermatitis
- predisposing factors: summer, tropical climates, excessive sweating, Cushing's syndrome, prolonged corticosteroid use

### Investigations
- clinical diagnosis but can perform microscopic examination, KOH prep of scales for hyphae and spores

### Management
- ketoconazole shampoo or cream daily
- topical terbinafine or ciclopirox olamine bid
- systemic fluconazole or itraconazole for 7 d if extensive

## Sexually Transmitted Infections

### SYPHILIS

### Clinical Feature
- characterized initially by a painless ulcer (chancre)
- following inoculation, systemic infection with secondary and tertiary stages

### Etiology
- *Treponema pallidum*
- transmitted sexually, congenitally, or rarely by transfusion

**Table 20. Stages of Syphilis**

| | Clinical Feature | Investigations | Management |
|---|---|---|---|
| **Primary Syphilis** | Single red, indurated, painless chancre, that develops into painless ulcer with raised border and scanty serous exudate<br>Chancre develops at site of inoculation after 3 wk of incubation and heals in 4-6 wk; chancre may also develop on lips or anus<br>Regional non-tender lymphadenopathy appears <1 wk after onset of chancre<br>DDx: chancroid (painful), HSV (multiple lesions) | CANNOT be based on Clinical Feature alone<br>VDRL negative – repeat weekly for 1 mo<br>FTA-ABS test has greater sensitivity and may detect disease earlier in course<br>Dark field examination – spirochete in chancre fluid or lymph node aspirate | Penicillin G, 2.4 million units IM, single dose |
| **Secondary Syphilis** | Presents 2-6 mo after primary infection (patient may not recall presence of primary chancre)<br>Associated with generalized lymphadenopathy, splenomegaly, headache, chills, fever, arthralgias, myalgias, malaise, photophobia<br>Lesions heal in 1-5 wk and may recur for 1 yr<br>3 types of lesions:<br>1. Macules and papules: flat top, scaling, non-pruritic, sharply defined, circular/annular rash (DDx: pityriasis rosea, tinea corporis, drug eruptions, lichen planus)<br>2. Condyloma lata: wart-like moist papules around genital/perianal region<br>3. Mucous patches: macerated patches mainly found in oral mucosa | VDRL positive<br>FTA-ABS +ve; –ve after 1 yr following appearance of chancre<br>Dark field +ve in all secondary | As for primary syphilis |
| **Tertiary Syphilis** | Extremely rare<br>3-7 yr after secondary<br>Main skin lesion: 'Gumma' – a granulomatous non-tender nodule | As in primary syphilis, VDRL can be falsely negative | Penicillin G, 2.4 million units IM weekly x 3 wk |

**Natural History of Untreated Syphilis**
- Inoculation
- Primary syphilis (10-90 d after infection)
- Secondary syphilis (simultaneous to primary syphilis or up to 6 mo after healing of primary lesion)
- Latent syphilis
- Tertiary syphilis (2-20 yr)

**Latent Syphilis**
70% of untreated patients will remain in this stage for the rest of their lives and are immune to new primary infection

## GONOCOCCEMIA

### Clinical Feature
- disseminated gonococcal infection
- hemorrhagic, tender, pustules on a purpuric/petechial background
- common sites: distal aspects of extremities
- associated with fever, arthritis, urethritis, proctitis, pharyngitis, and tenosynovitis
- neonatal conjunctivitis if infected via birth canal

### Etiology
- *Neisseria gonorrhoeae*

### Investigations
- requires high index of clinical suspicion because tests are often negative
- bacterial culture of blood, joint fluid, and skin lesions
- joint fluid cell count and Gram stain

### Management
- notify Public Health authorities
- screen for other STIs
- cefixime 400 mg PO (drug of choice) or ceftriaxone 1 g IM

## HSV
- see *Viral Infections*, D29

## HPV
- see *Viral Infections*, D29

# Pre-Malignant Skin Conditions

## Actinic Keratosis (Solar Keratosis)

### Clinical Feature
- ill-defined, scaly, erythematous papules or plaques on a background of sun-damaged skin (solar heliosis)
- sandpaper-like, gritty sensation felt on palpation, often easier to appreciate on palpation rather than inspection
- sites: areas of sun exposure (face, ears, scalp if bald, neck, sun-exposed limbs)

**Types of AK**
- Erythematous: typical AK lesion
- Hypertrophic: thicker, rough papule/plaque
- Cutaneous horn: firm hyperkeratotic outgrowth
- Actinic cheilitis: confluent AKs on the lip
- Pigmented: flat, tan-brown, scaly plaque
- Spreading pigmented
- Proliferative
- Conjunctival: pinguecula, pterygium

### Pathophysiology
- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of AK to SCC (~1/1000), but higher likelihood if AK is persistent
- UV-induced p53 gene mutation
- risk factors: increased age, light skin/eyes/hair, immunosuppression, syndromes such as albinism or xeroderma pigmenotsum
- risk factors for malignancy: immunosuppression, history of skin cancer, persistence of the AK

### Epidemiology
- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III, rare in darker skin as melanin is protective

### Differential Diagnosis
- SCC in situ, superficial BCC, seborrheic keratosis, cutaneous lupus erythematosus

### Investigations
- biopsy lesions that are refractory to treatment

### Management
- destructive: cryotherapy, electrodessication, and curettage
- topical pharmacotherapy (mechanism: destruction of rapidly growing cells or immune system modulation)
  - topical 5-fluorouracil cream (for 2-4 wk), imiquimod 5% (2x/wk for 16 wk), imiquimod 3.75% (daily for 2 wk then none for 2 wk then daily for 2 wk), ingenol Mmbutate gel 0.015% (daily for 3 d on the head and neck), ingenol mebutate 0.05% gel (daily for 2 d on the body)
- photodynamic therapy
- excision

## Leukoplakia

### Clinical Feature
- a morphologic term describing homogeneous or speckled white plaques with sharply demarcated borders
- sites: oropharynx, most often floor of the mouth, soft palate, and ventral/lateral surfaces of the tongue

### Pathophysiology
- precancerous or premalignant condition
- oral form is strongly associated with tobacco use and alcohol consumption

### Epidemiology
- 1-5% prevalence in adult population after 30 yr of age; peak at age 50
- M>F, fair-skinned
- most common oral mucosal premalignant lesion

### Differential Diagnosis
- lichen planus, oral hairy leukoplakia, white sponge nevus

### Investigations
- biopsy is mandatory due to risk of malignancy

### Management
- low risk sites on buccal/labial mucosal or hard palate: eliminate carcinogenic habits, smoking cessation, follow-up
- moderate/dysplastic lesions: excision, cryotherapy

# Malignant Skin Tumours

## Non-Melanoma Skin Cancers

### BASAL CELL CARCINOMA

#### Subtypes
- noduloulcerative (typical)
  - skin-coloured papule/nodule with rolled, translucent ("pearly") telangiectatic border, and depressed/eroded/ulcerated centre
- pigmented variant
  - flecks of pigment in translucent lesion with surface telangiectasia
  - may mimic malignant melanoma
- superficial variant
  - flat, tan to red-brown plaque, often with scaly, pearly border, and fine telangiectasia at margin
  - least aggressive subtype
- sclerosing (morpheaform) variant
  - flesh/yellowish-coloured, shiny papule/plaque with indistinct borders, indurated

#### Pathophysiology
- malignant proliferation of basal keratinocytes of the epidermis
  - low grade cutaneous malignancy, locally aggressive (primarily tangential growth), rarely metastatic
  - usually due to UVB light exposure, therefore >80% on face
  - may also occur in previous scars, radiation, trauma, arsenic exposure, or genetic predisposition (Gorlin Syndrome)

#### Epidemiology
- most common malignancy in humans
- 75% of all malignant skin tumours >40 yr, increased prevalence in the elderly
- M>F, skin phototypes I and II, chronic cumulative sun exposure, ionizing radiation, immunosuppression, arsenic exposure

#### Differential Diagnosis
- benign: sebaceous hyperplasia, intradermal melanocytic nevus, dermatofibroma
- malignant: nodular malignant melanoma, SCC

#### Management
- imiquimod 5% cream (Aldara®) or cryotherapy is indicated for superficial BCCs on the trunk
- 5-fluorouracil and photodynamic therapy can also be used for superficial BCCs
- shave excision and electrodessication and curettage for most types of BCCs, not including morpheaform
- Mohs surgery: microscopically controlled, minimally invasive, stepwise excision for lesions on the face or in areas that are difficult to reconstruct
- radiotherapy used in advanced cases of BCC
- vismodegib is approved for metastatic BCC, also in syndromes characterized by multiple BCCs (Gorlin Syndrome)
- follow-up for new primary disease or recurrence
- 95% cure rate if lesion <2 cm in diameter or if treated early

**Workup/Investigations of BCC and Other NMSCs**
- **History**: duration, growth rate, family/personal Hx of skin cancer, prior therapy to the lesion
- **Physical**: location, size, whether circumscribed, tethering to deep structures, full skin exam, lymph node exam
- **Biopsy**: if shallow lesion, can do shave biopsy; otherwise punch or excisional biopsy may be more appropriate

**Surgical Margins**
- **Smaller lesions**: electrodessication and curettage with 2-3 mm margin of normal skin
- **Deep infiltrative lesions**: surgical excision with 3-5 mm margins beyond visible and palpable tumour border, which may require skin graft or flap; or Mohs surgery, which conserves tissue and does not require margin control

### BOWEN'S DISEASE (SQUAMOUS CELL CARCINOMA IN SITU)

#### Clinical Feature
- sharply demarcated erythematous patch/thin plaque with scale and/or crusting
- often 1-3 cm in diameter and found on the skin and mucous membranes
- evolves to SCC in 10-20% of cutaneous lesions and >20% of mucosal lesions

#### Management
- same as for BCC
- biopsy required for diagnosis
- topical 5-fluorouracil (Efudex®) or imiquimod (Aldara®) used if extensive and as a tool to identify margins of poorly defined tumours
- cryosurgery
- shave excision with electrodessication and curettage

## SQUAMOUS CELL CARCINOMA

### Clinical Feature
- hyperkeratotic indurated, pink/red/skin-coloured papule/plaque/nodule with surface scale/crust ± ulceration
- more rapid enlargement than BCC
- exophytic (grows outward), may present as a cutaneous horn
- sites: face, ears, scalp, forearms, dorsum of hands

### Pathophysiology
- malignant neoplasm of keratinocytes (primarily vertical growth)
- predisposing factors include: cumulative UV radiation, PUVA, ionizing radiation therapy/exposure, chemical carcinogens (such as arsenic, tar, and nitrogen mustards), HPV 16, 18, immunosuppression
- may occur in previous scar (SCC more commonly than BCC)

### Epidemiology
- second most common type of cutaneous neoplasm
- primarily on sun-exposed skin in the elderly, M>F, skin phototypes I and II, chronic sun exposure
- in organ transplant recipients, SCC is most common cutaneous malignancy, with increased mortality as compared to non-immunocompromised population

### Differential Diagnosis
- benign: nummular eczema, psoriasis, irritated seborrheic keratosis
- pre-malignant: Actinic Keratosis, Bowenoid papulosis
- malignant: keratoacanthoma, Bowen's disease, BCC, amelanotic melanoma

### Management
- surgical excision with primary closure, skin flaps or grafting
- Mohs surgery
- lifelong follow-up (more aggressive treatment than BCC)
- radiation therapy

### Prognosis
- good prognostic factors: early treatment, negative margins, and small size of lesion
- SCCs that arise from AK metastasize less frequently (~1%) than other SCCs arising *de novo* in old burns (2-5% of cases)
- overall control is 75% over 5 yr, rate of metastasis from primary SCC is 2-5%
- metastasis rates are higher if diameter >2 cm, depth >4 mm, recurrent, involvement of bone/muscle/nerve, location on scalp/ears/nose/lips, immunosuppressed, caused by arsenic ingestion, or tumour arose from scar/chronic ulcer/burn/genital tract/sinus tract

## KERATOACANTHOMA

### Clinical Feature
- rapidly growing, firm, dome-shaped, erythematous or skin-coloured nodule with central keratin-filled crater, resembling an erupting volcano
- may spontaneously regress within a year, leaving a scar
- sites: sun-exposed skin

### Pathophysiology
- epithelial neoplasm with atypical keratinocytes in epidermis
- low grade variant of SCC

### Etiology
- HPV, UV radiation, chemical carcinogens (tar, mineral oil)

### Epidemiology
- >50 yr, rare <20 yr

### Differential Diagnosis
- treat as SCC until proven otherwise
- nodular BCC, Merkel cell carcinoma, hypertrophic solar keratosis, verruca vulgaris

### Management
- surgical excision or saucerization (shave biopsy) followed by electrodesiccation of the base, treated similarly to SCC
- intralesional methotrexate injection

**Interventions for Actinic Keratosis**
Cochrane DB Syst Rev 2012;2:C004415
**Purpose**: To assess the efficacy of treatments for actinic keratosis.
**Methods**: Systematic review of RCTs.
**Results**: A total of 83 RCTs (10,036 patients) were included evaluating 24 treatments. Cryotherapy, diclofenac, 5-fluorouracil, imiquimod, ingenol mebutate, photodynamic therapy, resurfacing and trichloroacetic acid peel were all effective at treating actinic keratosis and generally comparable with one another. Skin irritation was more common with diclofenac and 5-fluorouracil. Photodynamic therapy and imiquimod treatment resulted in better cosmetic appearance.
**Conclusion**: For individual lesions, photodynamic therapy is more effective that cryotherapy. For field-directed treatments, 5-fluorouracil, diclofenac imiquimod and ingenol mebutate had comparable efficacy.

# Malignant Melanoma

## Clinical Feature
- malignant characteristics of a mole: "ABCDE" mnemonic
- sites: skin, mucous membranes, eyes, CNS
- ~2/3 arise de novo without an associated nevus

## Clinical Subtypes of Malignant Melanoma
- **lentigo maligna**
  - malignant melanoma *in situ* (normal and malignant melanocytes confined to the epidermis)
  - 2-6 cm, tan/brown/black uniformly flat macule or patch with irregular borders
  - lesion grows radially and produces complex colours
  - often seen in the elderly
  - 10% evolve to lentigo maligna melanoma
- **lentigo maligna melanoma** (15% of all melanomas)
  - older individuals, ~7th decade
  - malignant melanocytes invading into the dermis
  - associated with pre-existing solar lentigo, not pre-existing nevi
  - flat, brown, stain-like, gradually enlarging with loss of skin surface markings
  - with time, colour changes from uniform brown to dark brown with black and blue
  - found on all skin surfaces, especially those often exposed to sun, such as the face and hands
- **superficial spreading melanoma** (60-70% of all melanomas)
  - atypical melanocytes initially spread laterally in epidermis then invade the dermis
  - irregular, indurated, enlarging plaques with red/white/blue discolouration, focal papules or nodules
  - ulcerate and bleed with growth
  - subtype most likely associated with pre-existing nevus
- **nodular melanoma** (30% of all melanomas)
  - atypical melanocytes that initially grow vertically with little lateral spread
  - uniformly ulcerated, blue-black, and sharply delineated plaque or nodule
  - rapidly fatal
  - may be pink or have no colour at all, this is called an amelanotic melanoma
  - EFG = elevated, firm, growing
- **acral lentiginous melanoma** (5% of all melanomas)
  - ill-defined dark brown, blue-black macule
  - palmar, plantar, subungual skin
  - melanomas on mucous membranes have poor prognosis

## Pathophysiology
- malignant neoplasm of pigment-forming cells (melanocytes and nevus cells)

## Epidemiology
- incidence: 1/75 (Canada), 1/50 (US)
- risk factors: increasing age, fair skin, red hair, positive personal/family history, familial dysplastic nevus syndrome, 1 large congenital nevus (>20 cm), any dysplastic nevi, >50 common nevi, immunosuppression, sun exposure with sunburns, tanning beds
- most common sites: back (M), calves (F)
- worse prognosis if: male, on scalp, hands, feet, late lesion, no pre-existing nevus present

## Differential Diagnosis
- benign: nevi, solar lentigo, seborrheic keratosis
- malignant: pigmented BCC

## Management
- excisional biopsy preferable, otherwise incisional biopsy
- remove full depth of dermis and extend beyond edges of lesion only after histologic diagnosis
- beware of lesions that regress – tumour is usually deeper than anticipated
- high dose IFN for stage II (regional), chemotherapy (cis-platinum, BCG) and high dose IFN for stage III (distant) disease
- newer chemotherapeutic, gene therapies, and vaccines starting to be used in metastatic melanoma
- radiotherapy may be used as adjunctive treatment

**Table 21. American Joint Committee on Cancer Staging System Based on Breslow's Thickness of Invasion**

| Tumour Depth | Stage | Approximate 5 Yr Survival |
|---|---|---|
| T1 <1.0 mm | Stage I T1a – T2a | 5-yr survival 90% |
| T2 1.01-2.0 mm | Stage II T2b – T4b | 5-yr survival 70% |
| T3 2.01-4.0 mm | Stage III any nodes | 5-yr survival 45% |
| T4 >4.0 mm | Stage IV any mets | 5-yr survival 10% |

a = no ulceration; b = ulceration

**Does this Patient have a Mole or Melanoma?**

**ABCDE checklist**
**A**symmetry
**B**order (irregular and/or indistinct)
**C**olour (varied)
**D**iameter (increasing or >6 mm)
**E**nlargement, elevation, evolution (i.e. change in colour, size, or shape)

Sensitivity 92% (CI 82-96%)
Specificity 100% (CI 54-100%)

*JAMA* 1998;279:696-701

**Risk Factors for Melanoma**

**no SPF is a SIN**
**S**un exposure
**P**igment traits (blue eyes, fair/red hair, pale complexion)
**F**reckling
**S**kin reaction to sunlight (increased incidence of sunburn)
**I**mmunosuppressive states (e.g. renal transplantation)
**N**evi (dysplastic nevi; increased number of benign melanocytic nevi)

**Node Dissection for Lesions**
>1 mm thick OR <1 mm and ulcerated OR >1 mitoses/mm$^2$ (Stage IB or higher melanoma patients should be offered a sentinel lymph node biopsy)
- Assess sentinel node at time of wide excision

# Other Cutaneous Cancers

### CUTANEOUS T-CELL LYMPHOMA

#### Clinical Feature
- **Mycosis fungoides** (limited superficial type)
  - characterized by erythematous patches/plaques/nodules/tumours, which may be pruritic and poikilodermic (atrophy, telangiectasia, hyperpigmentation, hypopigmentation)
  - common sites include: trunk, buttocks, proximal limbs
  - mildly symptomatic, usually excellent prognosis for early disease
- **Sézary syndrome** (widespread systemic type)
  - rare variant characterized by erythroderma, lymphadenopathy, WBC >20 x $10^9$/L with Sézary cells
  - can be considered to have evolved from MF (not initially meeting diagnostic criteria), but more commonly arises *de novo*
  - associated with intense pruritus, alopecia, palmoplantar hyperkeratosis, and systemic symptoms (fatigue, fever)
  - often fatal

#### Pathophysiology
- clonal proliferation of skin-homing CD4 T-cells

#### Epidemiology
- >50 yr old, M:F 2:1

#### Differential Diagnosis
- tinea corporis, nummular dermatitis, psoriasis, DLE, Bowen's disease, adult T-Cell leukemia-lymphoma (ATL)

#### Investigations
- skin biopsy (histology, "lymphocyte antigen cell" markers, TcR gene arrangement)
- blood smear looking for Sézary cells or flow cytometry (e.g. CD4:CD8 >10 is Sézary)
- imaging (for systemic involvement)

#### Management
- **Mycosis fungoides**
  - depends on stage of disease
  - topical steroids and/or PUVA, NB-UVB (311-313 mm)
- **Sézary syndrome**
  - oral retinoids and IFN
  - extra-corporeal photopheresis
  - may need radiotherapy for total skin electron beam radiation
  - may maintain on UV therapy
  - other chemotherapy agents

# Diseases of Hair Density

## Hair Growth

- hair grows in a cyclic pattern that is defined in 3 stages (most scalp hairs are in anagen phase)
  1. growth stage = anagen phase
  2. transitional stage = catagen stage
  3. resting stage = telogen phase
- total duration of the growth stage reflects the type and location of hair: eyebrow, eyelash, and axillary hairs have a short growth stage in relation to the resting stage
- growth of the hair follicles is also based on the hormonal response to testosterone and DHT; this response is genetically controlled

**Hair Regrowth Potential**
Ability to regrow hair depends on location of inflammatory infiltrates on hair follicle as stem cells are located at the upper part (bulge region) of the hair follicle
- Scarring alopecia: Inflammatory infiltrates found in upper part of hair follicles, destroying stem cells
- Non-scarring alopecia: Hair follicle is not permanently damaged, and therefore spontaneous or treatment-induced regrowth is possible

## Non-Scarring (Non-Cicatricial) Alopecia

### ANDROGENETIC ALOPECIA

#### Clinical Feature
- male- or female-pattern alopecia
- males: fronto-temporal areas progressing to vertex, entire scalp may be bald
- females: widening of central part, "Christmas tree" pattern

#### Pathophysiology
- action of dihydrotestosterone (DHT) on hair follicles

#### Epidemiology
- males: early 20s-30s
- females: 40s-50s

**Hair Loss – TOP HAT**
**T**elogen effluvium, tinea capitis
**O**ut of Fe, Zn
**P**hysical: trichotillomania, "corn-row" braiding
**H**ormonal: hypothyroidism, androgenic
**A**utoimmune: SLE, alopecia areata
**T**oxins: heavy metals, anticoagulants, chemotherapy, vitamin A, SSRIs

### Management
- minoxidil (Rogaine®) solution or foam to reduce rate of loss/partial restoration
- females: spironolactone (anti-androgenic effects), cyproterone acetate (Diane-35®)
- males: finasteride (Propecia®) (5-α-reductase inhibitor) 1 mg/d
- hair transplant

## TELOGEN EFFLUVIUM

### Clinical Feature
- uniform decrease in hair density secondary to hairs leaving the growth (anagen) stage and entering the resting (telogen) stage of the cycle

### Pathophysiology
- variety of precipitating factors (i.e. post-partum, psychological stress, major illness)
- hair loss typically occurs 2-4 mo after exposure to precipitant
- regrowth occurs within a few months but may not be complete

## ANAGEN EFFLUVIUM

### Clinical Feature
- hair loss due to insult of hair follicle impairing its mitotic activity (growth stage)

### Pathophysiology
- precipitated by chemotherapeutic agents (most common), other meds (bismuth, levodopa, colchicine, cyclosporine), exposure to chemicals (thallium, boron, arsenic)
- dose-dependent effect
- hair loss 7-14 d after single pulse of chemotherapy; most clinically apparent after 1-2 mo
- reversible effect; follicles resume normal mitotic activity few weeks after agent stopped

## ALOPECIA AREATA

### Clinical Feature
- autoimmune disorder characterized by patches of complete hair loss often localized to scalp, but can affect eyebrows, beard, eyelashes, etc.
- may be associated with dystrophic nail changes – fine stippling, pitting
- "exclamation mark" pattern (hairs fractured and have tapered shafts, i.e. looks like "!")
- may be associated with pernicious anemia, vitiligo, thyroid disease, Addison's disease
- spontaneous regrowth may occur within months of first attack (worse prognosis if young at age of onset and extensive loss)
- frequent recurrence often precipitated by emotional distress
- alopecia totalis: complete loss of hair on scalp
- alopecia universalis: complete loss of scalp hair, eyelashes, eyebrows, and body hair

### Management
- excellent prognosis for localized disease
- topical corticosteroids and intralesional triamcinolone acetonide (corticosteroids) can be used for isolated patches
- systemic immunosuppressants for refractory or extensive disease
- immunomodulatory (diphencyprone, anthralin)

## OTHER
- trichotillomania: impulse-control disorder characterized by compulsive hair pulling with irregular patches of hair loss, and with remaining hairs broken at varying lengths
- traumatic (e.g. tight "corn-row" braiding of hair, wearing tight pony tails, tight tying of turbans)

# Scarring (Cicatricial) Alopecia

### Clinical Feature
- irreversible loss of hair follicles with fibrosis

### Etiology
- physical: radiation, burns
- infections: fungal, bacterial, TB, leprosy, viral (HSV)
- primary inflammatory – subdivided into lymphocytic, neutrophilic, and mixed
  - lymphocytic:
    - lichen planus (lichen planopilaris) – white scale around hair follicles, up to 50% have lichen planus at other body sites
    - DLE (note that SLE can cause an alopecia unrelated to DLE lesions which are non-scarring)
    - central centrifugal cicatricial alopecia (CCCA): seen in up to 40% of black women, starting at central scalp; one of most commonly diagnosed scarring alopecias, may be associated with hair care practices in this population

**DDx of Non-Scarring (Non-Cicatricial) Alopecia**
- **Autoimmune**
  - Alopecia areata
- **Endocrine**
  - Hypothyroidism
  - Androgens
- **Micronutrient deficiencies**
  - Iron
  - Zinc
- **Toxins**
  - Heavy metals
  - Anticoagulants
  - Chemotherapy
  - Vitamin A
- **Trauma to the hair follicle**
  - Trichotillomania
  - 'Corn-row' braiding
- **Other**
  - Syphilis
  - Severe illness
  - Childbirth

**Precipitants of Telogen Effluvium**
**"SEND"** hair follicles out of anagen and into telogen
**S**tress and **S**calp disease (surgery)
**E**ndocrine (hypothyroidism, post-partum)
**N**utritional (iron and protein deficiency)
**D**rugs (citretin, heparin, lithium, IFN, β-blockers, valproic acid, SSRIs)

**Non-scarring alopecia:** intact hair follicles on exam → biopsy not required (but may be helpful)
**Scarring alopecia:** absent hair follicles on exam → biopsy required

**Alopecia Areata Subtypes**

Alopecia totalis: loss of all scalp hair and eyebrows

Alopecia universalis: loss of all body hair

  - neutrophilic:
    - folliculitis decalvans – discharge of pus and blood, tufting of hair follicles
    - dissecting cellulitis of the scalp – follicular papules, pustutles, nodules, and abscesses develop on the scalp
  - mixed
    - acne keloidalis nuchae – Dome-shaped papules, pustules, and plaques on the occipital scalp
- morphea: "coup de sabre" with involvement of centre of scalp

### Investigations
- biopsy from active border

### Management
- infections: treat underlying infection
- inflammatory: topical/intralesional steroids, anti-inflammatory antibiotics, antimalarials

# Nails and Disorders of the Nail Apparatus

**Table 22. Nail Changes in Systemic and Dermatological Conditions**

| Nail Abnormality | Definition/Etiology | Associated Disease |
|---|---|---|
| **NAIL PLATE CHANGES** | | |
| **Clubbing** | Proximal nail plate has greater than 180° angle to nail fold, watch-glass nails, bulbous digits | Cyanotic heart disease, bacterial endocarditis, pulmonary disorders, GI disorders, etc. |
| **Koilonychia** | Spoon shaped nails | Fe deficiency, malnutrition, DM |
| **Onycholysis** | Separation of nail plate from nail bed | Psoriasis, dermatophytes, thyroid disease |
| **Onychogryphosis** | Hypertrophy of the nail plate producing a curved, claw-like deformity | Poor circulation, chronic inflammation, tinea |
| **Onychohemia** | Subungual hematoma | Trauma to nail bed |
| **Onychomycosis** | Fungal infection of nail (e.g. dermatophyte, yeast, mould) | HIV, DM, peripheral arterial disease |
| **Onychocryptosis** | Ingrown toenail often hallux with congenital malalignment, painful inflammation, granulation tissue | Tight fitting shoes, excessive nail clipping |
| **SURFACE CHANGES** | | |
| **V-Shaped Nicking** | Distal margin has v-shaped loss of the nail plate | Darier's disease (keratosis follicularis) |
| **Pterygium Inversus Unguium** | Distal nail plate does not separate from underlying nail bed | Scleroderma |
| **Pitting** | Punctate depressions that migrate distally with growth | Psoriasis (random pattern), alopecia areata (geometric, grid-shaped arrangement), eczema |
| **Transverse Ridging** | Transverse depressions often more in central portion of nail plate | Serious acute illness slows nail growth (when present in all nails = Beau's lines), eczema, chronic paronychia, trauma |
| **Transverse White Lines** | Bands of white discolouration | Poisons, hypoalbuminemia (Muehrcke's lines) |
| **COLOUR CHANGES** | | |
| **Yellow** | | Tinea, jaundice, tetracycline, pityriasis rubra pilaris, yellow nail syndrome, psoriasis, tobacco use |
| **Green** | | *Pseudomonas* |
| **Black** | | Melanoma, hematoma |
| **Brown** | | Nicotine use, psoriasis, poisons, longitudinal melanonychia (ethnic) |
| **Splinter Hemorrhages** | Extravasation of blood from longitudinal vessels of nail bed, blood attaches to overlying nail plate and moves distally as it grows | Trauma, bacterial endocarditis, blood dyscrasias, psoriasis |
| **Oil Spots** | Brown-yellow discolouration | Psoriasis |
| **NAIL FOLD CHANGES** | | |
| **Herpetic Whitlow** | HSV infection of distal phalanx | HSV infection |
| **Paronychia** | Local inflammation of the nail fold around the nail bed | Acute: painful infection<br>Chronic: constant wetting (e.g. dishwashing, thumbsucking) |
| **Nail Fold Telangiectasias** | Cuticular hemorrhages, roughness, capillary changes | Scleroderma, SLE, dermatomyositis |
| **LOSS OF NAILS** | | |
| **Temporary Loss** | Occurs without scarring | Trauma (especially toenails or fingernails after large subungal hematoma), Beau's lins after severe illness |
| **Permanent Loss** | Occurs with scarring | Lichen planus (pterygium), genetic abnormalities (rare) |

# Skin Manifestations of Systemic Disease

**Table 23. Skin Manifestations of Internal Conditions**

| Disease | Related Dermatoses |
|---|---|
| **AUTOIMMUNE DISORDERS** | |
| **Behçet's Disease** | Painful aphthous ulcers in oral cavity ± genital mucous membranes, erythema nodosum, acneiform papules |
| **Buerger's Disease** | Superficial migratory thrombophlebitis, pallor, cyanosis, gangrene, ulcerations, digital resorptions |
| **Dermatomyositis** | Periorbital and extensor violaceous erythema, heliotrope with edema, Gottron's papules (violaceous flat-topped papules with atrophy), periungual erythema, telangiectasia, calcinosis cutis |
| **Polyarteritis Nodosa** | Subcutaneous nodules, stellate purpura, erythema, gangrene, splinter hemorrhages, livedo reticularis, ulceration |
| **Reactive Arthritis** | Keratoderma blennorrhagica (on feet), balanitis circinata (on male penis) |
| **Rheumatic Fever** | Petechiae, urticaria, erythema nodosum, rheumatic nodules, evanescent rash |
| **Scleroderma** | Raynaud's, nonpitting edema, waxy/shiny/tense atrophic skin (morphea), ulcers, cutaneous calcification, periungual telangiectasia, acrosclerosis, salt-and-pepper pigmentation |
| **SLE** | Malar erythema, discoid rash (erythematous papules or plaques with keratotic scale, follicular plugging, atrophic scarring on face, hands, and arms), hemorrhagic bullae, palpable purpura, urticarial purpura, patchy/diffuse alopecia, mucosal ulcers, photosensitivity |
| **Crohn's Disease/UC** | Pyoderma gangrenosum, erythema nodosum, Sweet's syndrome |
| **ENDOCRINE DISORDERS** | |
| **Addison's Disease** | Generalized hyperpigmentation or limited to skin folds, buccal mucosa, and scars |
| **Cushing's Syndrome** | Moon facies, purple striae, acne, hyperpigmentation, hirsutism, atrophic skin with telangiectasia |
| **Diabetes Mellitus** | Infections (e.g. boils, carbuncles, candidiasis, *S. aureus*, dermatophytoses, tinea pedis and cruris, infectious eczematoid dermatitis), pruritus, eruptive xanthomas, necrobiosis lipoidica diabeticorum, granuloma annulare, diabetic foot, diabetic bullae, acanthosis nigricans, calciphylaxis |
| **Hyperthyroidism** | Moist, warm skin, seborrhea, acne, nail atrophy, hyperpigmentation, toxic alopecia, pretibial myxedema, acropachy, onycholysis |
| **Hypothyroidism** | Cool, dry, scaly, thickened, hyperpigmented skin; toxic alopecia with dry, coarse hair, brittle nails, myxedema, loss of lateral 1/3 eyebrows |
| **HIV-RELATED** | |
| **Infections** | Viral (e.g. HSV, HZV, HPV, CMV, *Molluscum contagiosum*, oral hairy leukoplakia), bacterial (impetigo, acneiform folliculitis, dental caries, cellulitis, bacillary epithelioid angiomatosis, syphilis), fungal (candidiasis, histoplasmosis, cryptococcus, blastomycosis) |
| **Inflammatory Dermatoses** | Seborrhea, psoriasis, pityriasis rosea, vasculitis |
| **Malignancies** | Kaposi's sarcoma, lymphoma, BCC, SCC, MM |
| **MALIGNANCY** | |
| **Adenocarcinoma** | |
| Gastrointestinal | Peutz-Jeghers: pigmented macules on lips/oral mucosa |
| Cervix/anus/rectum | Paget's disease: eroding scaling plaques of perineum |
| **Carcinoma** | |
| Breast | Paget's disease, eczematous and crusting lesions of the skin of the nipple and usually areola of the breast |
| GI | Palmoplantar keratoderma: thickened skin of palms/soles |
| Thyroid | Sipple's syndrome: multiple mucosal neuromas |
| Breast/lung/ovary | Dermatomyositis: heliotrope erythema of eyelids and violaceous plaques over knuckles |
| **Lymphoma/Leukemia** | |
| Hodgkin's | Ataxia Telangiectasia: telangiectasia on pinna, bulbar conjunctiva |
| Acute leukemia | Ichthyosis: generalized scaling especially on extremities, Sweet's syndrome<br>Bloom's syndrome: butterfly erythema on face, associated with short stature |
| **Multiple Myeloma** | Amyloidosis: large, smooth tongue with waxy papules on eyelids, nasolabial folds and lips, as well as facial petechiae |
| **OTHERS** | |
| **Liver Disease** | Pruritus, hyperpigmentation, spider nevi, palmar erythema, white nails (Terry's nails), porphyria cutanea tarda, xanthomas, hair loss, jaundice |
| **Renal Disease** | Pruritus, pigmentation, half and half nails, perforating dermatosis, calciphylaxis |
| **Pruritic Urticarial Papules and Plaques of Pregnancy** | Erythematous papules or urticarial plaques in distribution of striae distensae: buttocks, thighs, upper inner arms, and lower back |
| **Cryoglobulinemia** | Palpable purpura in cold-exposed areas, Raynaud's, cold urticaria, acral hemorrhagic necrosis, bleeding disorders, associated with hepatitis C infection |

**Raynaud's Phenomenon DDx**

**COLD HAND**
**C**ryoglobulins/**C**ryofibrinogens
**O**bstruction/**O**ccupational
**L**upus erythematosus, other connective tissue disease
**D**M/**D**rugs
**H**ematologic problems (polycythemia, leukemia, etc.)
**A**rterial problems (atherosclerosis)
**N**eurologic problems (vascular tone)
**D**isease of unknown origin (idiopathic)

**Acanthosis Nigricans**
An asymptomatic dark thickened velvety hyperpigmentation of flexural skin most commonly around the neck. Associated with DM, obesity, and other endocrine disorders, and malignancy. It is a cutaneous marker of tissue insulin resistance

# Pediatric Exanthems

• see Pediatrics, P53

# Miscellaneous Lesions

## Angioedema and Urticaria

### Angioedema

- deeper swelling of the skin involving subcutaneous tissues; often involves the eyes, lips, and tongue
- may or may not accompany urticaria
- hereditary or acquired forms
- hereditary angioedema (does not occur with urticaria)
  - onset in childhood; 80% have positive family history
  - recurrent attacks; 25% die from laryngeal edema
  - triggers: minor trauma, emotional upset, temperature changes
- types of acquired angioedema
  - acute allergic angioedema (allergens include food, drugs, contrast media, insect venom, latex)
  - non-allergic drug reaction (drugs include ACEI)
  - acquired C1 inhibitor deficiency
- treatment
  - prophylaxis with danazol or stanozolol for hereditary angioedema
  - epinephrine pen to temporize until patient reaches hospital in acute attack

### Urticaria

- also known as "hives"
- transient, red, pruritic well-demarcated wheals
- each individual lesion lasts less than 24 h
- second most common type of drug reaction
- results from release of histamine from mast cells in dermis
- can also result after physical contact with allergen

**Table 24. Classification of Urticaria**

| Type | Etiology |
|---|---|
| **Acute Urticaria**<br>>2/3 of cases<br>Attacks last <6 wk<br>Individual lesions last <24 h | Drugs: especially ASA, NSAIDs<br>Foods: nuts, shellfish, eggs, fruit<br>**Idiopathic**<br>Infection<br>Insect stings (bees, wasps, hornets)<br>Percutaneous absorption: cosmetics, work exposures<br>Stress<br>Systemic diseases: SLE, endocrinopathy, neoplasm |
| **Chronic Urticaria**<br><1/3 of cases<br>Attacks last >6 wk<br>Individual lesion lasts <24 h | IgE-dependent: trigger associated<br>**Idiopathic (90% of chronic urticaria patients)**<br>Aeroallergens<br>Drugs (antibiotics, hormones, local anesthetics)<br>Foods and additives<br>Insect stings<br>Parasitic infections<br>Physical contact (animal saliva, plant resins, latex, metals, lotions, soap)<br>Direct mast cell release<br>Opiates, muscle relaxants, radio-contrast agents<br>Complement-mediated<br>Serum sickness, transfusion reactions<br>Infections, viral/bacterial (>80% of urticaria in pediatric patients)<br>Urticarial vasculitis<br>Arachidonic acid metabolism<br>ASA, NSAIDs<br>Physical<br>Dermatographism (friction, rubbing skin), cold (ice cube, cold water), cholinergic (hot shower, exercise), solar, pressure (shoulder strap, buttocks), aquagenic (exposure to water), adrenergic (stress), heat<br>Other<br>Mastocytosis, urticaria pigmentosa |
| **Urticarial Vasculitis**<br>Individual lesions last >24 h<br>Often painful, less likely pruritic, heals with bruise type lesions<br>Requires biopsy | Idiopathic<br>Infections<br>Hepatitis<br>Autoimmune diseases<br>SLE<br>Drug hypersensitivity<br>Cimetidine and diltiazem |

**DDx for Urticaria**

**D**rugs and foods
**A**llergic
**M**alignancy
**H**ereditary
**I**nfection
**V**asculitis
**E**motions
**S**tings

**Approach to Urticaria**

- Thorough Hx and P/E
- **Acute:** no immediate investigations needed; consider referral for allergy testing
- **Chronic:** further investigations required: CBC and differential, urinalysis, ESR, TSH, LFTs to help identify underlying cause
- **Vasculitic:** biopsy of lesion and referral to dermatology

**Wheal**

- Typically erythematous flat-topped, palpable lesions varying in size with circumscribed dermal edema
- Individual lesion lasts <24 h
- Associated with mast cell release of histamine
- May be pruritic

**Mastocytosis (Urticaria Pigmentosa)**

Rare disease due to excessive infiltration of the skin by mast cells. It manifests as many reddish-brown elevated plaques and macules. Friction to a lesion produces a wheal surrounded by intense erythema (Darier's sign), due to mast cell degranulation; this occurs within minutes

# Erythema Nodosum

### Clinical Feature
- acute or chronic inflammation of subcutaneous fat (panniculitis)
- round, red, tender, poorly demarcated nodules
- sites: asymmetrically arranged on extensor lower legs (typically shins), knees, arms
- associated with arthralgia, fever, malaise

### Etiology
- 40% are idiopathic
- drugs: sulfonamides, OCPs (also pregnancy), analgesics, trans retinoic acid
- infections: GAS, TB, histoplasmosis, *Yersinia*
- inflammation: sarcoidosis, Crohn's > UC
- malignancy: acute leukemia, Hodgkin's lymphoma

### Epidemiology
- 15-30 yr old, F:M 3:1
- lesions last for days and spontaneously resolve in 6 wk

### Investigations
- CXR (to rule out chest infection and sarcoidosis)
- throat culture, ASO titre, PPD skin test

### Management
- symptomatic: bed rest, compressive bandages, wet dressings
- NSAIDs, intralesional steroids
- treat underlying cause

**DDx of Erythema Nodosum**

**NODOSUMM**
**NO** cause (idiopathic) in 40%
**D**rugs (sulfonamides, OCP, etc.)
**O**ther infections (GAS+)
**S**arcoidosis
**UC** and Crohn's
**M**alignancy (leukemia, Hodgkin's lymphoma)
**M**any Infections

# Pruritus

### Clinical Feature
- a sensation provoking a desire to scratch, with or without skin lesions
- lesions may arise from the underlying disease, or from excoriation causing crusts, lichenified plaques, or wheals

**DDx of Pruritus**

**SCRATCHED**
**S**cabies
**C**holestasis
**R**enal
**A**utoimmune
**T**umours
**C**razies (psychiatric)
**H**ematology (polycythemia, lymphoma)
**E**ndocrine (thyroid, parathyroid, Fe)
**D**rugs, Dry skin

### Etiology
- dermatologic – generalized
  - asteatotic dermatitis ("winter itch" due to dry skin)
  - pruritus of senescent skin (may not have dry skin, any time of year)
  - infestations: scabies, lice
  - drug eruptions: ASA, antidepressants, opiates
  - psychogenic states
- dermatologic – local
  - atopic and contact dermatitis, lichen planus, urticaria, insect bites, dermatitis herpetiformis
  - infection: varicella, candidiasis
  - lichen simplex chronicus
  - prurigo nodularis
- systemic disease – usually generalized
  - hepatic: obstructive biliary disease, cholestatic liver disease of pregnancy
  - renal: chronic renal failure, uremia secondary to hemodialysis
  - hematologic: Hodgkin's lymphoma, multiple myeloma, leukemia, polycythemia vera, hemochromatosis, Fe deficiency anemia, cutaneous T-cell lymphoma
  - neoplastic: lung, breast, gastric (internal solid tumours), non-Hodgkin's lymphoma
  - endocrine: carcinoid, DM, hypothyroid/thyrotoxicosis
  - infectious: HIV, trichinosis, echinococcosis, hepatitis C
  - psychiatric: depression, psychosis
  - neurologic: post-herpetic neuralgia, multiple sclerosis

Consider biopsy of any nonhealing wound to rule out cancer

### Investigations
- blood work: CBC, ESR, Cr/BUN, LFT, TSH, fasting blood sugar, stool culture, and serology for parasites

### Management
- treat underlying cause
- cool water compresses to relieve pruritus
- bath oil and emollient ointment (especially if xerosis is present)
- topical corticosteroid and antipruritics (e.g. menthol, camphor, phenol, mirtazapine, capsaicin)
- systemic antihistamines: H1 blockers are most effective, most useful for urticaria
- phototherapy with UVB or PUVA
- doxepin, amitriptyline
- immunosuppressive agents if severe: steroids and steroid-sparing

# Wounds and Ulcers

- see Plastic Surgery, PL8, PL16

# Sunscreens and Preventative Therapy

## Sunburn (Solar Erythema)

- erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
- chronic UVA and UVB exposure leads to photoaging, immunosuppression, photocarcinogenesis
- prevention: avoid peak UVR (10 am-4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
- clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

## Sunscreens

- under ideal conditions an SPF of 10 means that a person who normally burns in 20 min will burn in 200 min following the application of the sunscreen
- topical chemical: absorbs UV light
  - requires application at least 15-30 min prior to exposure, should be reapplied every 2 h (more often if sweating, swimming)
  - UVB absorbers: PABA, salicylates, cinnamates, benzylidene camphor derivatives
  - UVA absorbers: benzophenones, anthranilates, dibenzoylmethanes, benzylidene camphor derivatives
- topical physical: reflects and scatters UV light
  - titanium dioxide, zinc oxide, kaolin, talc, ferric chloride, and melanin
  - all are effective against the UVA and UVB spectrum
  - less risk of sensitization than chemical sunscreens and waterproof, but may cause folliculitis or miliaria
- some sunscreen ingredients may cause contact or photocontact allergic reactions, but are uncommon

## Management

- sunburn: if significant blistering present, consider treatment in hospital; otherwise, symptomatic treatment (cool wet compresses, oral anti-inflammatory, topical corticosteroids)
- antioxidants, both oral and topical are being studied for their abilities to protect the skin; topical agents are limited by their ability to penetrate the skin

# Topical Steroids

**Table 25. Potency Ranking of Topical Steroids**

| Relative Potency | Relative Strength | Generic Names | Trade Names | Usage |
|---|---|---|---|---|
| **Weak** | x1 | hydrocortisone – 2.5% (1% available over-the-counter) | Emo Cort® | Intertriginous areas, children, face, thin skin |
| **Moderate** | x3 | hydrocortisone 17-valerate – 0.2%<br>desonide<br>mometasone furoate | Westcort®<br>Tridesilon®<br>Elocom® | Arm, leg, trunk |
| **Potent** | x6 | betamethasone – 0.1% 17-valerate – 0.1% amcinonide | Betnovate®<br>Celestoderm – V®<br>Cyclocort® | Body |
| **Very Potent** | x9 | betamethasone dipropionate – 0.05%<br>fluocinonide – 0.05%<br>halcinonide | Diprosone®<br>Lidex, Topsyn gel®<br>Lyderm®<br>Halog® | Palms and soles |
| **Extremely Potent** | x12 | clobetasol propionate – 0.05% (most potent)<br>betamethasone dipropionate ointment<br>halobetasol propionate – 0.05% | Dermovate®<br>Diprolene®<br>Ultravate® | Palms and soles |

**Skin Phototypes (Fitzpatrick)**

| Phototype | Colour of Skin | Skin's Response to Sun Exposure (without SPF protection) |
|---|---|---|
| I | White | Always burns, never tans |
| II | White | Always burns, little tan |
| III | White | Slight burn, slow tan |
| IV | Pale brown | Slight burn, faster tan |
| V | Brown | Rarely burns, dark tan |
| VI | Dark brown or black | Never burns, dark tan |

**SPF** = burn time with cream/burn time without cream

**UV Radiation**

**UVA (320-400 nm): Aging**
- Penetrates skin more effectively than UVB or UVC
- Responsible for tanning, burning, wrinkling, photoallergy, and premature skin aging
- Penetrates clouds, glass and is reflected off water, snow, and cement

**UVB (290-320 nm): Burning**
- Absorbed by the outer dermis
- Is mainly responsible for burning and premature skin aging
- Primarily responsible for BCC, SCC
- Does not penetrate glass and is substantially absorbed by ozone

**UVC (200-290 nm)**
- Is filtered by ozone layer

**Body Site: Relative Percutaneous Absorption**

| | |
|---|---|
| Forearm | 1.0 |
| Plantar foot | 0.14 |
| Palm | 0.83 |
| Back | 1.7 |
| Scalp | 3.7 |
| Forehead | 6.0 |
| Cheeks | 13.0 |
| Scrotum | 42.0 |

Calculation of strength of steroid compared to hydrocortisone on forearm: relative strength of steroid x relative percutaneous absorption

**Side Effects of Topical Steroids**
- Local: atrophy, perioral dermatitis, steroid acne, rosacea, contact dermatitis, tachyphylaxis (tolerance), telangectasis, striae, hypertrichosis, hypopigmentation
- Systemic: suppression of HPA axis

# Dermatologic Therapies

## Table 26. Common Topical Therapies

| Drug Name | Dosing Schedule | Indications | Comments |
|---|---|---|---|
| **Calcipotriol** (Dovonex®) | 0.005% cream, ointment, scalp solution, apply bid<br>For maintenance therapy apply OD | Psoriasis | Burning, itching, skin irritation, worsening of psoriasis<br>Avoid face, mucous membranes, eyes; wash hands after application<br>Maximum weekly dosage of cream by age:<br>2-5 yr – 25 g/wk<br>6-10 yr – 50 g/wk<br>11-14 yr – 75 g/wk<br>>14 yr – 100 g/wk<br>Inactivated by light (do not apply before phototherapy) |
| **Imiquimod** (Aldara®) | 5% cream applied 3x/wk<br>Apply at bedtime, leave on 6-10 h, then wash off with mild soap and water<br>Max duration 16 wk | Genital warts<br>Cutaneous warts<br>AK<br>Superficial BCC | Avoid natural/artificial UV exposure<br>Local skin and application site reactions<br>Erythema, ulceration, edema, flu-like symptoms<br>Works best for warts on mucosal surfaces<br>May induce inflammation and erosion |
| **Permethrin** (Kwellada® P Lotion and Nix® Dermal Cream) | 1% or 5% cream, applied once overnight to all skin areas from neck down, repeated one week later | Scabies (Kwellada-P Lotion, Nix® Dermal Cream)<br>Pediculosis (Kwellada-P Crème Rinse®, Nix Crème Rinse®) | Do not use in children <2 yr<br>Hypersensitivity to drug, or known sensitivity to chrysanthemums<br>Local reactions only (resolve rapidly); including burning, pruritus<br>Low toxicity, excellent results<br>Consider second application after 7 d |
| **Pimecrolimus** (Elidel®) | 1% cream bid<br>Use for as long as lesions persist and discontinue upon resolution of symptoms | AD (mild to moderate) | Burning<br>Lacks adverse effects of steroids<br>May be used on all skin surfaces including head, neck, and intertriginous areas<br>Expensive |
| **Tacrolimus Topical** (Protopic®) | 0.03% (children) or 0.1% (adults) ointment bid<br>Continue for duration of disease PLUS 1 wk after clearing | AD (mild to moderate) | Burning<br>Lacks adverse effects of steroids<br>May be used on all skin surfaces including head, neck, and intertriginous areas<br>Expensive |

**Topical Vehicles**
- **Ointment** (water in oil): hydrate, greasy
- **Cream** (oil in water): hydrate, variable
- **Lotion** (powder in water): drying, cosmesis
- **Solutions** (water, alcohol, propylene glycol)
- **Gel** (solution that melts on contact with skin, alcohol): drying
- **Foam** is a newer vehicle and several agents are now available in foam vehicles. Examples include Olux-E (clobetasol), Verdesso (desonide), Luxiq (betamethasone), and Enstilar (betamethasone propionate and calcipotriol)
- **Sprays**: Lamisil (terbinafine) spray, Clobex spray (clobetasol)
- **Laquers**: Penlac (ciclopirox), Jublia (efinaconazole)

**Deciding on the Amount of Steroid to Use**
- 1 palm = 1% BSA
- 1 fingertip unit (FTU) = Amount of topical medication (from 5 mm nozzle) placed on pad of index finger from distal tip to DIP = 500 mg = 2% BSA
- Therefore give 30 g for every 2 palms of area to cover (if applying steroid BID, 1 mo supply)

## Table 27. Common Oral Therapies

| Drug Name | Dosing Schedule | Indications | Comments |
|---|---|---|---|
| **Acitretin** (Soriatane®) | 25-50 mg PO OD; maximum 75 mg/d | Severe psoriasis<br>Other disorders of hyperkeratinization (ichthyosis, Darier's disease) | Monitoring strategies<br>Monitor lipids, LFTs at baseline and q1-2wk until stable<br>Contraindications<br>Women of childbearing potential unless strict contraceptive requirements are met<br>Drug interactions<br>Other systemic retinoids, methotrexate, tetracyclines, certain contraceptives<br>May be combined with PUVA phototherapy (known as re-PUVA) |
| **Antivirals** | famciclovir (Famvir®)<br>250 mg PO tid x 7-10 d (for 1st episode of genital herpes)<br>125 mg PO bid x 5 d (for recurrent genital herpes) | Chickenpox<br>Herpes zoster<br>Genital herpes<br>Acute and prophylactic to reduce transmission in infected patients<br>Herpes labialis | Side effects<br>Headache, nausea, diarrhea, abdominal pain<br>Reduce dose if impaired renal function |
| | valacyclovir (Valtrex®)<br>1000 mg PO bid x 7-10 d<br>(for 1st episode of genital herpes)<br>500 mg PO bid x 5 d<br>(for recurrent genital herpes) | | Side effects<br>Dizziness, depression, abdominal pain<br>Reduce dose if impaired renal function<br>Drug interactions<br>cimetidine |
| **Cyclosporine** (Neoral®) | 2.5-4 mg/kg/d PO divided bid<br>Max 4 mg/kg/d<br>After 4 wk may increase by 0.5 mg/kg/d q2wk<br>Concomitant dose of magnesium may protect the kidneys | Psoriasis<br>May also be effective in:<br>Lichen planus<br>EM<br>Recalcitrant urticaria<br>Recalcitrant AD | Monitoring strategies<br>Blood pressure, renal function<br>Contraindications<br>Abnormal renal function, uncontrolled hypertension, malignancy (except NMSC), uncontrolled infection, immunodeficiency (excluding autoimmune disease), hypersensitivity to drug<br>Long-term effects preclude use of cyclosporine for >2 yr; discontinue earlier if possible<br>May consider rotating therapy with other drugs to minimize adverse effects of each drug |
| **Dapsone** | 50-100-150 mg PO OD tapering to 25-50 mg PO OD to as low as 50 mg 2x/wk | Dermatitis herpetiformis, neutrophilic dermatoses | Monitoring strategies<br>Obtain G6PD levels before initiating; in the initial 2 wk obtain methemoglobin levels and follow the blood counts carefully for the first few months<br>Side effects<br>Neuropathy<br>Hemolysis (Vitamin C and E supplementation can help prevent this)<br>Drug interactions<br>Substrate of CYP2C8/9 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major)<br>Often a dramatic response within hours |

**Table 27. Common Oral Therapies** (continued)

| Drug Name | Dosing Schedule | Indications | Comments |
|---|---|---|---|
| **Doxycycline** | 50 mg PO bid | Acne vulgaris<br>Rosacea<br>Bullous pemphigoid | Contraindications<br>Pregnancy, hepatic impairment, drug hypersensitivity<br>Taking acitretin, isotretinoin, or penicillin antibiotic<br>Oral typhoid vaccine |
| **Isotretinoin** (Accutane®) | 0.5-1 mg/kg/d given OD to achieve a total dose of 120 mg/kg (20-24 wk) | Severe nodular and/or inflammatory acne<br>Acne conglobata<br>Recalcitrant acne<br>Widespread comedonal acne | Monitoring strategies<br>Baseline lipid profile and LFTs before treatment, β-hCG<br>Contraindications<br>Teratogenic – in sexually active females, 2 forms of reliable contraception necessary<br>Generally regarded as unsafe in lactation<br>Side effects<br>Decreased night vision, decreased tolerance to contact lenses, dry mucous membranes<br>May transiently exacerbate acne, dry skin<br>Depression, myalgia<br>Drug interactions<br>Caution if used at the same time as tetracyclinefamily antibiotics – both may cause pseudotumour cerebri<br>Discontinue vitamin A supplements<br>Drug may be discontinued at 16-20 wk when nodule count has dropped by >70%; a second course may be initiated after 2 mo prn<br>Refractory cases may require >3 courses |
| **Itraconazole** (Sporanox®) | 100-400 mg PO OD, depending on infection<br>Tinea corporis/cruris/versicolor: 200 mg PO OD x 7 d<br>Tinea pedis: 200 mg PO bid x 7 d<br>Toenails: 200 mg PO bid x 7 d once per month, repeated 3x<br>Fingernail involvement only: 200 mg bid PO x 7 d once per month, repeated 2x | Onychomycosis<br>Tinea corporis, cruris, pedis, versicolor, capitis | Contraindications<br>CHF<br>Side effects<br>Serious hepatotoxicity<br>Drug Interactions<br>Inhibits CYP3A4<br>Increases concentration of some drugs metabolized by this enzyme (i.e. statins, diabetic drugs)<br>Give capsules with food, capsules must be swallowed whole |
| **Ivermectin** (Mectizan®, Stromectol®) | 200-250 µg/kg PO qweekly x 2<br>Take once as directed; repeat one wk later | Onchocerciasis (USA only)<br>Not licensed for use in Canada<br>Also effective for: scabies | No significant serious side effects<br>Efficacious |
| **Methotrexate** | 10-25 mg qwk, PO, IM, or IV<br>Max: 30 mg/wk<br>To minimize side effects, administer with folic acid supplementation:<br>1-5 mg OD | Psoriasis<br>AD<br>Lymphomatoid papulosis<br>May also be effective in: cutaneous sarcoidosis | Monitoring strategies<br>Baseline renal, liver, and hematological studies<br>Contraindications<br>Pregnancy, lactation, alcohol abuse, liver dysfunction, immunodeficiency syndrome, blood dyscrasias, hypersensitivity to drug<br>Restricted to severe, recalcitrant or disabling psoriasis not adequately responsive to other forms of therapy<br>May be combined with cyclosporine to allow lower doses of both drugs |
| **OCPs** (TriCyclen®, Diane 35®, Alesse®) | 1 pill PO OD | Hormonal acne (chin, jawline)<br>Acne associated with polycystic ovarian syndrome or other endocrine abnormalities | All combined OCPs are helpful in acne but those listed on the left have undergone RCTs<br>Contraindications<br>Smoking, HTN, migraines with aura, pregnancy<br>Routine gynecological health maintenance should be up to date |
| **Spironolactone** | 50-100 mg PO OD alone or with OCPs | Hormonal acne (chin, jawline)<br>Acne with endocrine abnormality | Contraindications<br>Pregnancy<br>Side effects<br>Menstrual irregularities at higher doses if not on OCPs<br>Breast tenderness, mild diuresis common<br>Risk of hyperkalemia – counsel patients to reduce intake of potassium rich foods such as bananas |
| **Terbinafine** (Lamisil®) | 250 mg PO OD x 2 wk<br>Fingernails x 6 wk<br>Toenails x 12 wk<br>Confirm diagnosis prior to treatment | Onychomycosis<br>Tinea corporis, cruris, pedis, capitis | Contraindications<br>Pregnancy, chronic or active liver disease<br>Drug interactions<br>Potent inhibitor of CYP2D6; use with caution when also taking β-blockers, certain anti-arrhythmic agents, MAOI type B, and/or antipsychotics<br>Drug concentrates rapidly in skin, hair, and nails at levels associated with fungicidal activity |
| **Tetracycline** | 250-500 mg PO bid to tid<br>Taken 1 h before or 2 h after a meal | Acne vulgaris<br>Rosacea<br>Bullous pemphigoid | Contraindications<br>Severe renal or hepatic dysfunction |

# Patient Assessment/Management

## 1. Rapid Primary Survey

- **A**irway maintenance with C-spine control
- **B**reathing and ventilation
- **C**irculation (pulses, hemorrhage control)
- **D**isability (neurological status)
- **E**xposure (complete) and **E**nvironment (temperature control)
  - continually reassessed during secondary survey
  - changes in hemodynamic and/or neurological status necessitates a return to the primary survey beginning with airway assessment
- **IMPORTANT**: Always watch for signs of shock while doing primary survey
- addressing the "ABCs" is the hallmark of the emergency department
  - in the setting of cardiac arrest, the approach changes to "the CABs": chest compressions, airway, and breathing
  - CAB can also be applied in massive trauma situations, in the setting of massive blood loss to treat hypovolemic shock

**Approach to the Critically Ill Patient**
1. Rapid Primary Survey (RPS)
2. Resuscitation (often concurrent with RPS)
3. Detailed Secondary Survey
4. Definitive Care

### A. AIRWAY

- first priority is to secure airway
- assume a cervical injury in every trauma patient and immobilize with collar
- assess ability to breathe and speak
- can change rapidly, therefore reassess frequently
- assess for facial fractures/edema/burns (impending airway collapse)

**Signs of Airway Obstruction**
- Agitation, confusion, "universal choking sign"
- Respiratory distress
- Failure to speak, dysphonia, stridor
- Cyanosis

### Airway Management

- anatomic optimization to allow for oxygenation and ventilation

**1. Basic Airway Management**
- protect the C-spine
- head-tilt (if C-spine injury not suspected) or jaw thrust to open the airway
- sweep and suction to clear mouth of foreign material

**2. Temporizing Measures**
- nasopharyngeal airway (if gag reflex present, i.e. conscious)
- oropharyngeal airway (if gag reflex absent, i.e. unconscious)
- "rescue" airway devices (e.g. laryngeal mask airway, Combitube®)
- transtracheal jet ventilation through cricothyroid membrane (last resort)

**3. Definitive Airway Management**
- ETT intubation with in-line stabilization of C-spine
  - orotracheal ± RSI preferred
  - nasotracheal may be better tolerated in conscious patient
- relatively contraindicated with basal skull fracture
  - does not provide 100% protection against aspiration
- surgical airway (if unable to intubate using oral/nasal route and unable to ventilate)
- cricothyroidotomy

**Medications that can be Delivered via ETT**

**NAVEL**
**N**aloxone (Narcan®)
**A**tropine
**V**entolin® (salbutamol)
**E**pinephrine
**L**idocaine

### Contraindications to Intubation

- supraglottic/glottic pathology that would preclude successful intubation

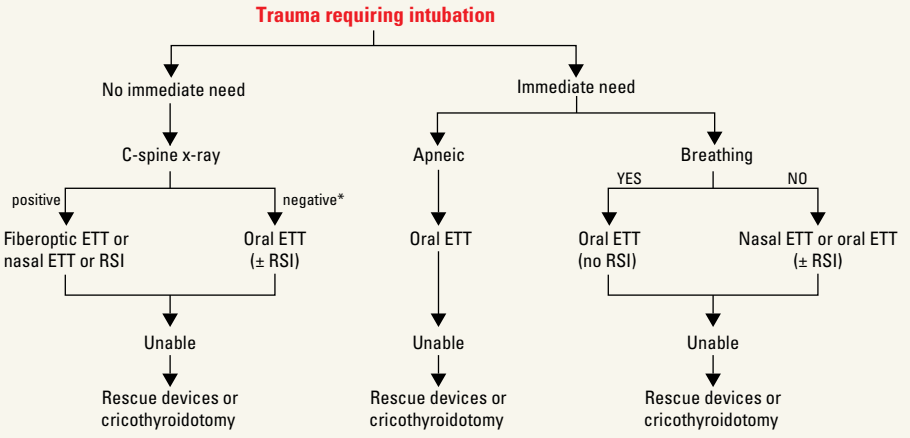

**Figure 1. Approach to endotracheal intubation in an injured patient**

**Indications for Intubation (5 P's)**
- **P**atent airway
- **P**rotects against aspiration
- **P**ositive pressure ventilation
- **P**ulmonary toilet (suction)
- **P**harmacologic administration during hemodynamic instability

**Rescue Techniques in Intubation**
- Bougie (used like a guidewire)
- Glidescope®
- Lighted stylet (uses light through skin to determine if ETT in correct place)
- Fiberoptic intubation – (uses fiberoptic cable for indirect visualization)

## B. BREATHING

- **Look**
  - mental status (anxiety, agitation, decreased LOC), colour, chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring
- **Listen**
  - auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping
- **Feel**
  - tracheal shift, chest wall for crepitus, flail segments, sucking chest wounds, subcutaneous emphysema

Noisy breathing is obstructed breathing until proven otherwise

### Breathing Assessment

- objective measures of respiratory function: rate, oximetry, ABG, A-a gradient

### Management of Breathing

- nasal prongs → simple face mask → non-rebreather mask → CPAP/BiPAP (in order of increasing $FiO_2$)
- Bag-Valve mask and CPAP to supplement inadequate ventilation

**$O_2$ Delivery Methods**

| | $FiO_2$ | Amount Given |
|---|---|---|
| Nasal Prongs | 25-40% | 1-6 L/min |
| Face Mask | 40-60% | 5-10 L/min |
| Non-re-breather | 80-90% | 15 L/min |
| CPAP/ BiPAP | up to 100% | |

## C. CIRCULATION

### Definition of Shock

- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities)

**Table 1. Major Types of Shock**

| Hypovolemic | Cardiogenic | Distributive (vasodilation) | Obstructive |
|---|---|---|---|
| Hemorrhage (external and internal)<br>Severe burns<br>High output fistulas<br>Dehydration (diarrhea, DKA) | Myocardial ischemia<br>Dysrhythmias<br>CHF<br>Cardiomyopathies<br>Cardiac valve problems | Septic<br>Anaphylactic<br>Neurogenic (spinal cord injury) | Cardiac tamponade<br>Tension pneumothorax<br>PE<br>Aortic stenosis<br>Constrictive pericarditis |

Shock in a trauma patient is hemorrhagic until proven otherwise

### Clinical Evaluation

- early: tachypnea, tachycardia, narrow pulse pressure, reduced capillary refill, cool extremities, and reduced central venous pressure
- late: hypotension and altered mental status, reduced urine output

**Table 2. Estimation of Degree of Hemorrhagic Shock**

| Class | I | II | III | IV |
|---|---|---|---|---|
| **Blood Loss** | <750 cc | 750-1500 cc | 1500-2000 cc | >2000 cc |
| **% of Blood Volume** | <15% | 15-30% | 30-40% | >40% |
| **Pulse** | <100 | >100 | >120 | >140 |
| **Blood Pressure** | Normal | Normal | Decreased | Decreased |
| **Respiratory Rate** | 20 | 30 | 35 | >45 |
| **Capillary Refill** | Normal | Decreased | Decreased | Decreased |
| **Urinary Output** | 30 cc/h | 20 cc/h | 10 cc/h | None |
| **Fluid Replacement** | Crystalloid | Crystalloid | Crystalloid + blood | Crystalloid + blood |

**Causes of Shock**

**SHOCKED**
**S**eptic, spinal/neurogenic
**H**emorrhagic
**O**bstructive (e.g. tension pneumothorax, cardiac tamponade, PE)
**C**ardiogenic (e.g. blunt myocardial injury, dysrhythmia, MI)
anaphylacti**K**
**E**ndocrine (e.g. Addison's, myxedema, coma)
**D**rugs

### Management of Hemorrhagic Shock
- clear airway and assess breathing either first or simultaneously
- apply direct pressure on external wounds while elevating extremities. Do not remove impaled objects in the emergency room setting as they may tamponade bleeds
- start TWO LARGE BORE (14-16G) IVs in the brachial/cephalic vein of each arm
- run 1-2 L bolus of IV Normal Saline/Ringer's Lactate (warmed, if possible)
- if continual bleeding or no response to crystalloids, consider pRBC transfusion, ideally crossmatched. If crossmatched blood is unavailable, consider O- for women of childbearing age and O+ for men. Use FFP, platelets or tranexamic acid in early bleeding
- consider common sites of internal bleeding (abdomen, chest, pelvis, long bones) where surgical intervention may be necessary

**3:1 Rule**
Since only 30% of infused isotonic crystalloids remains in intravascular space, you must give 3x estimated blood loss

### D. DISABILITY
- assess LOC using GCS
- pupils
  - assess equality, size, symmetry, reactivity to light
- unequal or sluggish suggests local eye problem or lateralizing CNS lesion
- relative afferent pupillary defect (swinging light test) – optic nerve damage
  - extraocular movements and nystagmus
  - fundoscopy (papilledema, hemorrhages)
  - reactive pupils + decreased LOC: metabolic or structural cause
  - non-reactive pupils + decreased LOC: structural cause (especially if asymmetric)

**Common Sites of Bleeding**
- External (e.g. scalp)
- Chest
- Abdomen (peritoneum, retroperitoneum)
- Pelvis
- Long bones

### Glasgow Coma Scale
- for use in trauma patients with decreased LOC; good indicator of severity of injury and neurosurgical prognosis
- most useful if repeated; change in GCS with time is more relevant than the absolute number
- less meaningful for metabolic coma
- patient with deteriorating GCS needs immediate attention
- prognosis based on best post-resuscitation GCS
- reported as a 3 part score: Eyes + Verbal + Motor = Total
- if patient intubated, GCS score reported out of 10 + T (T = tubed, i.e. no verbal component)

**Fluid Resuscitation**
- Give bolus until HR decreases, urine output increases, and patient stabilizes
  - Maintenance: 4:2:1 rule
  - 0-10 kg: 4 cc/kg/h
  - 10-20 kg: 2 cc/kg/h
  - Remaining weight: 1 cc/kg/h
  - Replace ongoing losses and deficits (assume 10% of body weight)

**Table 3. Glasgow Coma Scale**

| Eyes Open | | Best Verbal Response | | Best Motor Response | |
|---|---|---|---|---|---|
| Spontaneously | 4 | Answers questions appropriately | 5 | Obeys commands | 6 |
| To voice | 3 | Confused, disoriented | 4 | Localizes to pain | 5 |
| To pain | 2 | Inappropriate words | 3 | Withdraws from pain | 4 |
| No response | 1 | Incomprehensible sounds | 2 | Decorticate (flexion) | 3 |
| | | No verbal response | 1 | Decerebrate (extension) | 2 |
| | | | | No response | 1 |

13-15 = mild injury, 9-12 = moderate injury, ≤8 = severe injury

See Table 36, ER57 for *Modified GCS for infants* and *children*

**Unilateral, Dilated, Non-Reactive Pupil, Think**
- Focal mass lesion
- Epidural hematoma
- Subdural hematoma

### E. EXPOSURE/ENVIRONMENT
- expose patient completely and assess entire body for injury; log roll to examine back
- DRE
- keep patient warm with a blanket ± radiant heaters; avoid hypothermia
- warm IV fluids/blood
- keep providers safe (contamination, combative patient)

## 2. Resuscitation
- done concurrently with primary survey
- attend to ABCs
- manage life-threatening problems as they are identified
- vital signs q5-15 min
- ECG, BP, and $O_2$ monitors
- Foley catheter and NG tube if indicated
- tests and investigations: CBC, electrolytes, BUN, Cr, glucose, amylase, INR/PTT, β-hCG, toxicology screen, cross and type

**Contraindications to Foley Insertion**
- Blood at urethral meatus
- Scrotal hematoma
- High-riding prostate on DRE

**NG Tube Contraindications**
- Significant mid-face trauma
- Basal skull fracture

**Table 4. 2010 AHA CPR Guidelines with 2015 updates**

| Step/Action | Adult: >8 yr | Child: 1-8 yr | Infant: <1 yr |
|---|---|---|---|
| **Airway** | Head tilt-chin lift | | |
| **Breaths** | 2 breaths at 1 s/breath – stop once see chest rise | | |
| **Foreign-Body Airway Obstruction** | Abdominal thrust | | Back slaps and chest thrusts |
| **Compressions** | | | |
| Compression landmarks | In the centre of the chest, between nipples | | Just below nipple line |
| Compression method: push hard and fast, and allow for complete recoil | 2 hands: heel of 1 hand with second hand on top | 2 hands: heel of 1 hand with second on top, or<br>1 hand: heel of 1 hand only | 2 fingers, or thumbs |
| Compression depth | 2-2.4 inches | About 1/3 to 1/2 the depth of the chest | |
| Compression rate | 100-120/min with complete chest wall recoil between compressions | | |
| Compression-ventilation ratio | 30 compressions to 2 ventilations | | |
| Compression-only CPR | Hands-only CPR is preferred if the bystander is not trained or does not feel confident in their ability to provide conventional CPR or if the bystander is trained but chooses to use compressions only | | |
| **Defibrillation** | Immediate defibrillation for all rescuers responding to a sudden witnessed collapse<br>Compressions (5 cycles/2 min) before AED is considered if unwitnessed arrest<br>Manual defibrillators are preferred for children and infants but can use adult dose AED if a manual defibrillator is not available | | |

See Anesthesia and Perioperative Medicine, A32 for *ACLS Guidelines*

# 3. Secondary Survey

- done after primary survey once patient is hemodynamically and neurologically stabilized
- identifies major injuries or areas of concern
- full physical exam and x-rays (C-spine, chest, and pelvis – required in blunt trauma, consider T-spine and L-spine if indicated)

## HISTORY

- "**SAMPLE**": **S**igns and symptoms, **A**llergies, **M**edications, **P**ast medical history, **L**ast meal, **E**vents related to injury

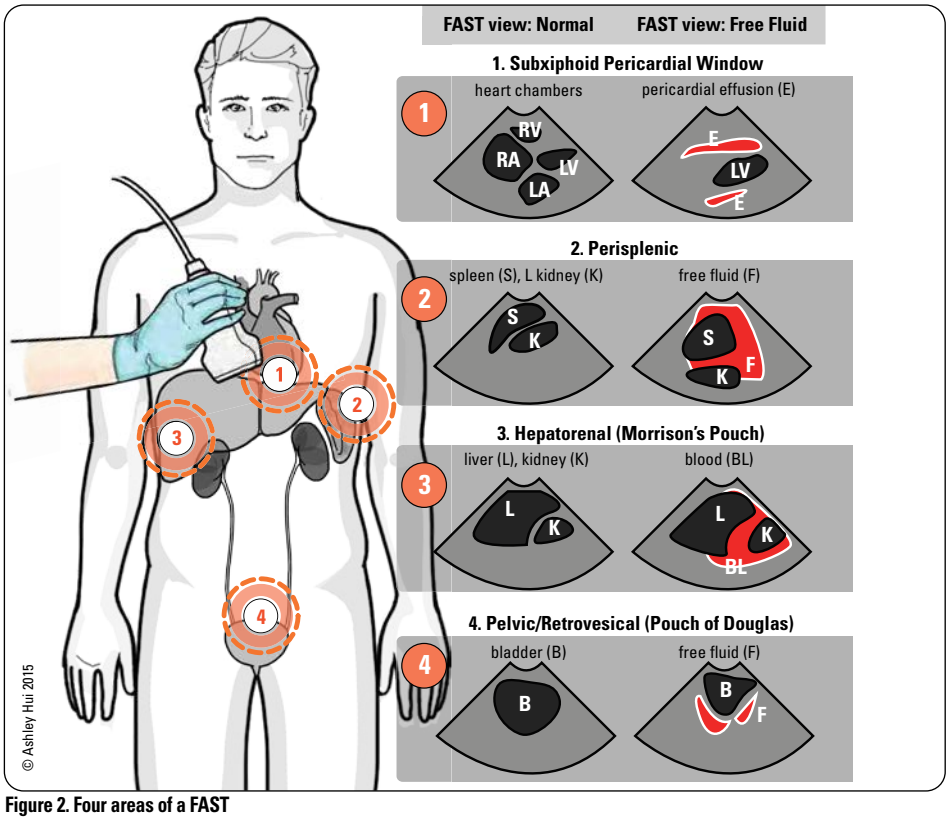

**Figure 2. Four areas of a FAST**

## PHYSICAL EXAM

### Head and Neck
- palpation of facial bones, scalp

### Chest
- inspect for midline trachea and flail segment: ≥2 rib fractures in ≥2 places; if present look for associated hemothorax, pneumothorax, and contusions
- auscultate lung fields
- palpate for subcutaneous emphysema

### Abdomen
- assess for peritonitis, abdominal distention, and evidence of intra-abdominal bleeding
- DRE for GI bleed, high riding prostate, and anal tone

### Musculoskeletal
- examine all extremities for swelling, deformity, contusions, tenderness, ROM
- check for pulses (using Doppler probe) and sensation in all injured limbs
- log roll and palpate thoracic and lumbar spines
- palpate iliac crests and pubic symphysis and assess pelvic stability (lateral, AP, vertical)

### Neurological
- GCS
- full cranial nerve exam
- alterations of rate and rhythm of breathing are signs of structural or metabolic abnormalities with progressive deterioration in breathing indicating a failing CNS
- assess spinal cord integrity
- conscious patient: assess distal sensation and motor function
- unconscious patient: response to painful or noxious stimulus applied to extremities

**Signs of Increased ICP**
- Deteriorating LOC (hallmark)
- Deteriorating respiratory pattern
- Cushing reflex (high BP, low heart rate, irregular respirations)
- Lateralizing CNS signs (e.g. cranial nerve palsies, hemiparesis)
- Seizures
- Papilledema (occurs late)
- N/V and headache

## INITIAL IMAGING
- non-contrast CT head/face/C-spine (rule out fractures and bleeds)
- chest x-ray
- FAST (see Figure 2) or CT abdomen/pelvis (if stable)
- pelvis x-ray

Non-contrast head CT is the best imaging modality for intracranial injury

# Ethical Considerations

### Consent to Treatment: Adults
- see Ethical, Legal, and Organizational Medicine, ELOM7
- Emergency Rule: consent is not needed when a patient is at imminent risk from a serious injury AND obtaining consent is either: a) not possible, OR b) would increase risk to the patient
  - assumes that most people would want to be saved in an emergency
- any capable and informed patient can refuse treatment or part of treatment, even if it is life-saving
- exceptions to the Emergency Rule – treatment cannot be initiated if:
  - a competent patient has previously refused the same or similar treatment and there is no evidence to suggest the patient's wishes have changed
  - an advanced directive is available (e.g. do not resuscitate order)
  - NOTE: refusal of help in a suicide situation is NOT an exception; care must be given
- if in doubt, initiate treatment
- care can be withdrawn if necessary at a later time or if wishes are clarified by family

### Consent to Treatment: Children
- treat immediately if patient is at imminent risk
- parents/guardians have the right to make treatment decisions
- if parents refuse treatment that is life-saving or will potentially alter the child's quality of life, CAS must be contacted – consent of CAS is needed to treat

### Other Issues of Consent
- need consent for HIV testing, as well as for administration of blood products
- however, if delay in substitute consent for blood transfusions puts patient at risk, transfusions can be given

### Duty to Report
- law may vary depending on province and/or state
- examples: gunshot wounds, suspected child abuse, various communicable diseases, medical unsuitability to drive, risk of substantial harm to others

**Jehovah's Witnesses**
- Capable adults have the right to refuse medical treatment
- May refuse whole blood, pRBCs, platelets, and plasma even if life-saving
- Should be questioned directly about the use of albumin, immunoglobulins, hemophilic preparations
- Do not allow autologous transfusion unless there is uninterrupted extra corporeal circulation
- Usually ask for the highest possible quality of care without the use of the above interventions (e.g. crystalloids for volume expansion, attempts at bloodless surgery)
- Patient will generally sign hospital forms releasing medical staff from liability
- Most legal cases involve children of Jehovah's Witnesses; if life-saving treatment is refused, contact CAS

# Traumatology

- epidemiology
  - leading cause of death in patients <45 yr
  - 4th highest cause of death in North America
  - causes more deaths in children/adolescents than all diseases combined
- trimodal distribution of death
  - minutes: death usually at the scene from lethal injuries
  - early: death within 4-6 h – "golden hour" (decreased mortality with trauma care)
  - days-weeks: death from multiple organ dysfunction, sepsis, VTE, etc.
- injuries fall into two categories
  - blunt (most common): MVC, pedestrian-automobile impact, motorcycle collision, fall, assault, sports
  - penetrating (increasing in incidence): gunshot wound, stabbing, impalement

Always completely expose and count the number of wounds

## Considerations for Traumatic Injury

- important to know the mechanism of injury to anticipate traumatic injuries
- always look for an underlying cause (alcohol, medications, illicit substances, seizure, suicide attempt, medical problem)
- always inquire about HI, loss of consciousness, amnesia, vomiting, headache, and seizure activity

**Cardiac Box:** sternal notch, nipples, and xiphoid process; injuries inside this area should increase suspicion of cardiac injury

**Table 5. Mechanisms and Considerations of Traumatic Injuries**

| Mechanism of Injury | Special Considerations | Associated Injuries |
|---|---|---|
| **MVC** | Vehicle(s) involved: weight, size, speed, damage<br>Location of patient in vehicle<br>Use and type of seatbelt<br>Ejection of patient from vehicle<br>Entrapment of patient under vehicle<br>Airbag deployment<br>Helmet use in motorcycle collision | Head-on collision: head/facial, thoracic (aortic), lower extremity<br>Lateral/T-bone collision: head, C-spine, thoracic, abdominal, pelvic, and lower extremity<br>Rear-end collision: hyper-extension of C-spine (whiplash injury)<br>Rollover |
| **Pedestrian-Automobile Impact** | High morbidity and mortality<br>Vehicle speed is an important factor<br>Site of impact on car | Children at increased risk of being run over (multisystem injuries)<br>Adults tend to be struck in lower legs (lower extremity injuries), impacted against car (truncal injuries), and thrown to ground (HI) |
| **Falls** | 1 storey = 12 ft = 3.6 m<br>Distance of fall: 50% mortality at 4 storeys and 95% mortality at 7 storeys<br>Landing position (vertical vs. horizontal) | Vertical: lower extremity, pelvic, and spine fractures; HI<br>Horizontal: facial, upper extremity, and rib fractures; abdominal, thoracic, and HI |

**High Risk Injuries**
- MVC at high speed, resulting in ejection from vehicle
- Motorcycle collisions
- Vehicle vs. pedestrian crashes
- Fall from height >12 ft (3.6 m)

**Vehicle vs. Pedestrian Crash**
In adults look for triad of injuries (Waddle's triad)
- Tibia-fibula or femur fracture
- Truncal injury
- Craniofacial injury

## Head Trauma

- see Neurosurgery, NS30
- 60% of MVC-related deaths are due to HI

### Specific Injuries

- **fractures**
  - Dx: non-contrast head CT and physical exam

A. skull fractures
- vault fractures
  - linear, non-depressed
    - most common
    - typically occur over temporal bone, in area of middle meningeal artery (commonest cause of epidural hematoma)
  - depressed
    - open (associated overlying scalp laceration and torn dura, skull fracture disrupting paranasal sinuses or middle ear) vs. closed
- basal skull fractures
  - typically occur through floor of anterior cranial fossa (longitudinal more common than transverse)
  - generally a clinical diagnosis (poorly visualized on CT)
  - associated with battle signs or racoon eyes

B. facial fractures (see Plastic Surgery, PL31)
- neuronal injury
- beware of open fracture or sinus fractures (risk of infection)
- severe facial fractures may pose risk to airway from profuse bleeding

**Signs of Basal Skull Fracture**
- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF rhinorrhea/otorrhea

- **scalp laceration**
  - can be a source of significant bleeding
  - achieve hemostasis, inspect and palpate for skull bone defects ± CT head (rule-out skull fracture)
- **neuronal injury**

A. diffuse
- mild TBI = concussion
  - transient alteration in mental status that may involve loss of consciousness
  - hallmarks of concussion: confusion and amnesia, which may occur immediately after the trauma or minutes later
  - loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15, and post-traumatic amnesia must be less than 24 h
- diffuse axonal injury
  - mild: coma 6-24 h, possibly lasting deficit
  - moderate: coma >24 h, little or no signs of brainstem dysfunction
  - severe: coma >24 h, frequent signs of brainstem dysfunction

B. focal injuries
- contusions
- intracranial hemorrhage (epidural, subdural, intracerebral)

## ASSESSMENT OF BRAIN INJURY

### History
- pre-hospital status
- mechanism of injury

### Physical Exam
- assume C-spine injury until ruled out
- vital signs
  - shock (not likely due to isolated brain injury, except in infants)
  - Cushing's response to increasing ICP (bradycardia, HTN, irregular respirations)
- severity of injury determined by

1. LOC
   - GCS ≤8 intubate, any change in score of 3 or more = serious injury
   - mild TBI = 13-15, moderate = 9-12, severe = 3-8
2. pupils: size, anisocoria >1 mm (in patient with altered LOC), response to light
3. lateralizing signs (motor/sensory)
   - may become subtler with increasing severity of injury
   - reassess frequently

**Warning Signs of Severe Head Injury**
- GCS <8
- Deteriorating GCS
- Unequal pupils
- Lateralizing signs

**N.B.** Altered LOC is a hallmark of brain injury

### Investigations
- labs: CBC, electrolytes, INR/PTT, glucose, toxicology screen
- CT scan head and neck (non-contrast) to exclude intracranial hemorrhage/hematoma
- C-spine imaging

**Canadian CT Head Rule**
Lancet 2001;357:1391-96

**CT Head is only required for patients with minor HI with any one of the following**

**High Risk** (for neurological intervention)
- GCS score <15 at 2 h after injury
- Suspected open or depressed skull fracture
- Any sign of basal skull fracture (hemotympanum, "raccoon" eyes, CSF otorrhea/rhinorrhea, Battle's sign)
- Vomiting ≥2 episodes
- Age ≥65 yr

**Medium Risk** (for brain injury on CT)
- Amnesia before impact >30 min (i.e. cannot recall events just before impact)
- Dangerous mechanism (pedestrian struck by MVC, occupant ejected from motor vehicle, fall from height >3 ft or five stairs)

**Minor HI** is defined as witnessed loss of consciousness, definite amnesia, or witnessed disorientation in a patient with a GCS score of 13-15.

**NB:** Canadian CT Head Rule does not apply for non-trauma cases, for GCS<13, age <16, for patients on Coumadin® and/or having a bleeding disorder, or having an obvious open skull fracture.

### Management
- goal in ED: reduce secondary injury by avoiding hypoxia, ischemia, decreased CPP, seizure
- general
  - ABCs
  - ensure oxygen delivery to brain through intubation and prevent hypercarbia
  - maintain BP (sBP >90)
  - treat other injuries
- early neurosurgical consultation for acute and subsequent patient management
- seizure treatment/prophylaxis
  - benzodiazepines, phenytoin, phenobarbital
  - steroids are of no proven value
- treat suspected raised ICP, consider if HI with signs of increased ICP:
  - intubate
  - calm (sedate) if risk for high airway pressures or agitation
  - paralyze if agitated
  - hyperventilate (100% $O_2$) to a $pCO_2$ of 30-35 mmHg
  - elevate head of bed to 20°
  - adequate BP to ensure good cerebral perfusion
  - diurese with mannitol 1g/kg infused rapidly (contraindicated in shock/renal failure)

### Disposition
- neurosurgical ICU admission for severe HI
- in hemodynamically unstable patient with other injuries, prioritize most life-threatening injuries and maintain cerebral perfusion
- for minor HI not requiring admission, provide 24 h HI protocol to competent caregiver, follow-up with neurology as even seemingly minor HI may cause lasting deficits

# Mild Traumatic Brain Injury

### Epidemiology
- TBI results in 1.7 million deaths, hospitalizations, and ED visits each year (US)
- 75% are estimated to be mild TBI; remainder are moderate or severe (see Neurosurgery, NS31)
- highest rates in children 0-4 yr, adolescents 15-19 yr, and elderly >65 yr

### Clinical Features
- somatic: headache, sleep disturbance, N/V, blurred vision
- cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
- emotion and behaviour: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils

Extent of retrograde amnesia correlates with severity of injury

### Etiology
- falls, MVC, struck by an object, assault, sports

### Investigations
- neurological exam
- concussion recognition tool (see thinkfirst.ca)
- imaging – CT as per Canadian CT Head Rules, or MRI if worsening symptoms despite normal CT

**Every Patient with One or More of the Following Signs or Symptoms should be Placed in a C-Spine Collar**
- Midline tenderness
- Neurological symptoms or signs
- Significant distracting injuries
- HI
- Intoxication
- Dangerous mechanism
- History of altered LOC

### Treatment
- close observation and follow-up; for patients at risk of intracranial complications, give appropriate discharge instructions to patient and family; watch for changes to clinical features above, and if change, return to ED
- hospitalization with normal CT (GCS <15, seizures, bleeding diathesis), or with abnormal CT
- pharmacological management of pain, depression, headache
- follow Return to Play guidelines

### Prognosis
- most recover with minimal treatment
  - athletes with previous concussion are at increased risk of cumulative brain injury
- repeat TBI can lead to life-threatening cerebral edema or permanent impairment

# Spine and Spinal Cord Trauma

- assume cord injury with significant falls (>12 ft), deceleration injuries, blunt trauma to head, neck, or back
- spinal immobilization (cervical collar, spine board during patient transport only) must be maintained until spinal injury has been ruled out (see Figure 3)
- vertebral injuries may be present without spinal cord injury; normal neurologic exam does not exclude spinal injury
- cord may be injured despite normal C-spine x-ray (spinal cord injury without radiologic abnormality)
- injuries can include: complete/incomplete transection, cord edema, spinal shock

Of the investigations, the lateral C-spine x-ray is the single most important film; 95% of radiologically visible abnormalities are found on this film

### History
- mechanism of injury, previous deficits, SAMPLE
- neck pain, paralysis/weakness, paresthesia

Cauda Equina Syndrome can occur with any spinal cord injury below T10 vertebrae. Look for incontinence, anterior thigh pain, quadriceps weakness, abnormal sacral sensation, decreased rectal tone, and variable reflexes

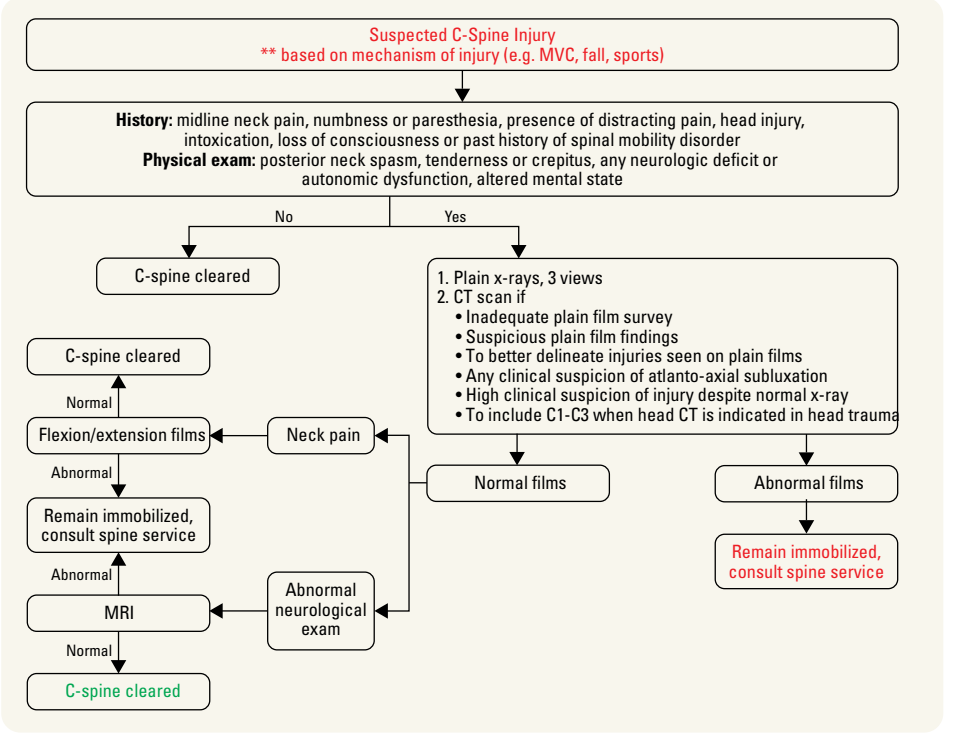
### Physical Exam
- ABCs
- abdominal: ecchymosis, tenderness
- neurological: complete exam, including mental status
- spine: maintain neutral position, palpate C-spine; log roll, then palpate T-spine and L-spine, assess rectal tone
  - when palpating, assess for tenderness, muscle spasm, bony deformities, step-off, and spinous process malalignment
- extremities: check capillary refill, suspect thoracolumbar injury with calcaneal fractures

### Investigations
- bloodwork: CBC, electrolytes, Cr, glucose, coagulation profile, cross and type, toxicology screen
- imaging
  - full C-spine x-ray series for trauma (AP, lateral, odontoid)
- thoracolumbar x-rays
  - AP and lateral views

**The Canadian C-Spine Rule vs. the NEXUS Low-Risk Criteria in Patients with Trauma**
NEJM 2003;349:2510-18
**Purpose:** To compare the clinical performance of the Canadian C-Spine Rule (CCR) and the National Emergency X-Radiography Utilization Study (NEXUS) Low-Risk Criteria (NLC).

**Study:** Trauma patients (n=8283) in stable condition were prospectively evaluated by both the CCR and NLC by 394 physicians before radiography. 2% of these patients had a C-spine injury.
**Results:** Compared to the NLC, the CCR was more sensitive (99.4 vs. 90.7%) and more specific (45.1 vs. 36.8%) after exclusion of indeterminate cases. The number of missed patients would be 1 for the CCR and 16 for the NLC. The ROM was not evaluated in some CCR cases likely because physicians were not comfortable with the procedure and this may slightly lower the sensitivity or specificity of the CCR in practice.
**Summary:** The CCR is superior to the NLC in alert and stable patients with trauma. The use of the CCR can result in lower radiography rates.

- indications
  - C-spine injury
  - unconscious patients (with appropriate mechanism of injury)
  - neurological symptoms or findings
  - deformities that are palpable when patient is log rolled
  - back pain
  - bilateral calcaneal fractures (due to fall from height)
    - concurrent burst fractures of the lumbar or thoracic spine in 10% (T11-L2)
  - consider CT (for subtle bony injuries), MRI (for soft tissue injuries) if appropriate



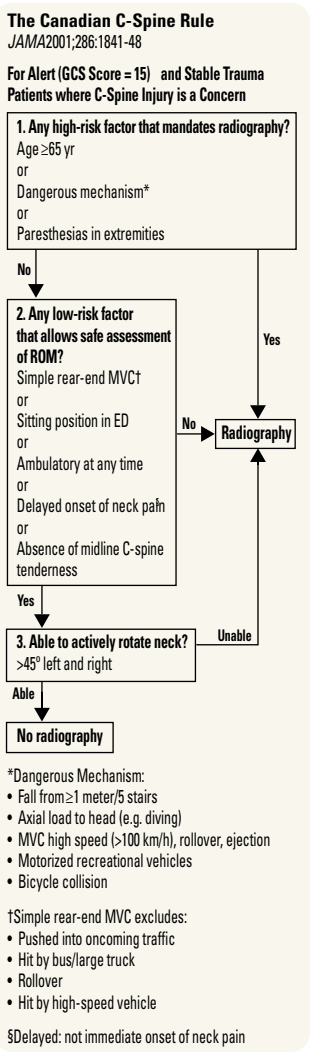


**Figure 3. Approach to clearing the C-spine**

## Can Clear C-Spine if:

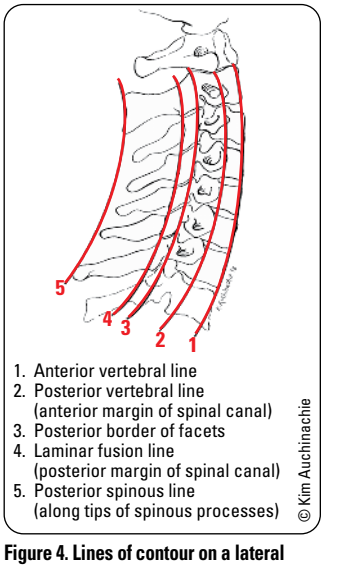
- oriented to person, place, time, and event
- no evidence of intoxication
- no posterior midline cervical tenderness
- no focal neurological deficits
- no painful distracting injuries (e.g. long bone fracture)

## Management of Cord Injury

- immobilize
- evaluate ABCs
- treat neurogenic shock (maintain sBP >100 mmHg)
- insert NG and Foley catheter
- complete imaging of spine and consult spine service if available
- continually reassess high cord injuries as edema can travel up cord
- if cervical cord lesion, watch for respiratory insufficiency
  - low cervical transection (C5-T1) produces abdominal breathing (phrenic innervation of diaphragm still intact but loss of innervation of intercostals and other accessory muscles of breathing)
  - high cervical cord injury (above C4) may require intubation and ventilation
- treatment: warm blanket, Trendelenburg position (occasionally), volume infusion, consider vasopressors

## Approach to C-Spine X-Rays

- 3-view C-spine series is the screening modality of choice
  1. lateral C1-T1 ± swimmer's view
     - lateral view is best, identifies 90-95% of injuries
  2. odontoid view (open mouth or oblique submental view)
     - examine the dens for fractures
       - if unable to rule out fracture, repeat view or consider CT or plain film tomography
     - examine lateral aspects of C1 and spacing relative to C2



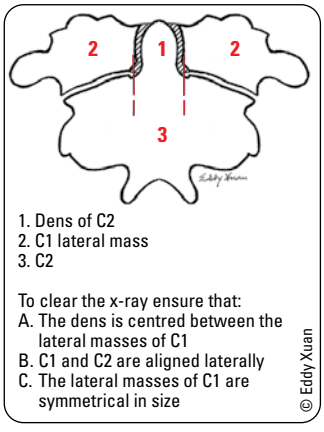


**Figure 4. Lines of contour on a lateral C-spine x-ray**

Prevertebral soft tissue swelling is only 49% sensitive for injury

3. AP view
   - alignment of spinous processes in the midline
   - spacing of spinous processes should be equal
   - check vertebral bodies and facet dislocations

**Table 6. Interpretation of Lateral View: The ABCS**

| | |
|---|---|
| **A** | **Adequacy and Alignment**<br>Must see C1 to C7-T1 junction; if not, downward traction of shoulders, swimmer's view, bilateral supine obliques, or CT scan needed<br>Lines of contour in children <8 yr of age, can see physiologic subluxation of C2 on C3, and C3 on C4, but the spino-laminal line is maintained<br>Fanning of spinous processes suggests posterior ligamentous disruption<br>Widening of facet joints<br>Check atlanto-occipital joint<br>Line extending inferiorly from clivus should transect odontoid<br>Atlanto-axial articulation, widening of predental space (normal: <3 mm in adults, <5 mm in children) indicates injury of C1 or C2 |
| **B** | **Bones**<br>Height, width, and shape of each vertebral body<br>Pedicles, facets, and laminae should appear as one – doubling suggests rotation |
| **C** | **Cartilage**<br>Intervertebral disc spaces – wedging anteriorly or posteriorly suggests vertebral compression |
| **S** | **Soft Tissues**<br>Widening of retropharyngeal (normal: <7 mm at C1-4, may be wide in children <2 yr on expiration) or retrotracheal spaces (normal: <22 mm at C6-T1, <14 mm in children <5 yr) |

1. Dens of C2
2. C1 lateral mass
3. C2

To clear the x-ray ensure that:
A. The dens is centred between the lateral masses of C1
B. C1 and C2 are aligned laterally
C. The lateral masses of C1 are symmetrical in size

© Eddy Xuan

**Figure 5. C-spine x-ray; odontoid view**

## Sequelae of C-Spine Fractures

- see Neurosurgery, NS34
- acute phase of SCI
  - spinal shock: absence of all voluntary and reflex activity below level of injury
    - decreased reflexes, no sensation, flaccid paralysis below level of injury, lasting days to months
  - neurogenic shock: loss of vasomotor tone, SNS tone
    - watch for: hypotension (lacking SNS), bradycardia (unopposed PNS), poikilothermia (lacking SNS so no shunting of blood from extremities to core)
    - occurs within 30 min of SCI at level T6 or above, lasting up to 6 wk
    - provide airway support, fluids, atropine (for bradycardia), vasopressors for BP support
- chronic phase of SCI
  - autonomic dysreflexia: in patients with an SCI at level T6 or above
    - signs and symptoms: pounding headache, nasal congestion, feeling of apprehension or anxiety, visual changes, dangerously increased sBP and dBP
    - common triggers
      - GU causes: bladder distention, urinary tract infection, and kidney stones
      - GI causes: fecal impaction or bowel distension
    - treatment: monitoring and controlling BP, prior to addressing causative issue

**Supine Oblique Views**
- Rarely used
- Better visualization of posterior element fractures (lamina, pedicle, facet joint)
- Good to assess patency of neural foramina
- Can be used to visualize the C7-T1 junction

20% of C-spine fractures are accompanied by other spinal fractures, so ensure thoracic and lumbar spine x-rays are normal before proceeding to OR

# Chest Trauma

- two types: those found and managed in 1° survey and those found and managed in 2° survey

**Table 7. Life-Threatening Chest Injuries Found in 1° Survey**

| | Physical Exam | Investigations | Management |
|---|---|---|---|
| **Airway Obstruction** | Anxiety, stridor, hoarseness, altered mental status<br>Apnea, cyanosis | Do not wait for ABG to intubate | Definitive airway management<br>Intubate early<br>Remove foreign body if visible with laryngoscope prior to intubation |
| **Tension Pneumothorax**<br>Clinical diagnosis<br>One-way valve causing accumulation of air in pleural space | Respiratory distress, tachycardia, distended neck veins, cyanosis, asymmetry of chest wall motion<br>Tracheal deviation away from pneumothorax<br>Percussion hyperresonance<br>Unilateral absence of breath sounds | Non-radiographic diagnosis | Needle thoracostomy – large bore needle, 2nd ICS mid clavicular line, followed by chest tube in 5th ICS, anterior axillary line |

Trauma to the chest accounts for 50% of trauma deaths

80% of all chest injuries can be managed non-surgically with simple measures such as intubation, chest tubes, and pain control

**Table 7. Life-Threatening Chest Injuries Found in 1º Survey** (continued)

| | Physical Exam | Investigations | Management |
|---|---|---|---|
| **Open Pneumothorax**<br>Air entering chest from wound rather than trachea | Gunshot or other wound (hole >2/3 tracheal diameter) ± exit wound<br>Unequal breath sounds | ABG: decreased $pO_2$ | Air-tight dressing sealed on 3 sides<br>Chest tube<br>Surgery |
| **Massive Hemothorax**<br>>1500 cc blood loss in chest cavity | Pallor, flat neck veins, shock<br>Unilateral dullness<br>Absent breath sounds<br>Hypotension | Usually only able to do supine CXR – entire lung appears radioopaque as blood spreads out over posterior thoracic cavity | Restore blood volume<br>Chest tube<br>Thoracotomy if:<br>>1500 cc total blood loss<br>≥200 cc/h continued drainage |
| **Flail Chest**<br>Free-floating segment of chest wall due to >2 rib fractures, each at 2 sites<br>Underlying lung contusion (cause of morbidity and mortality) | Paradoxical movement of flail segment<br>Palpable crepitus of ribs<br>Decreased air entry on affected side | ABG: decreased $pO_2$, increased $pCO_2$<br>CXR: rib fractures, lung contusion | $O_2$ + fluid therapy + pain control<br>Judicious fluid therapy in absence of systemic hypotension<br>Positive pressure ventilation ± intubation and ventilation |
| **Cardiac Tamponade**<br>Clinical diagnosis<br>Pericardial fluid accumulation impairing ventricular function | Penetrating wound (usually)<br>Beck's triad: hypotension, distended neck veins, muffled heart sounds<br>Tachycardia, tachypnea<br>Pulsus paradoxus<br>Kussmaul's sign (increased JVP with inspiration) | Echocardiogram<br>FAST | IV fluids<br>Pericardiocentesis<br>Open thoracotomy |

**3-way Seal for Open Pneumothorax (i.e. sucking chest wound)**
Allows air to escape during the expiratory phase (so that you do not get a tension pneumothorax) but seals itself to allow adequate breaths during the inspiratory phase

**Pulsus Paradoxus:** a drop in BP of >10 mmHg with inspiration. Recall that BP normally drops with inspiration, but what's "paradoxical" about this is that it drops more than it should

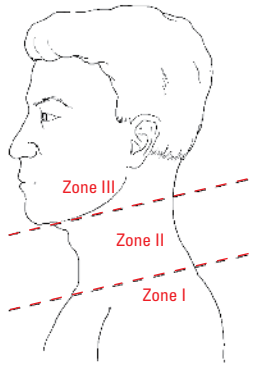
**Table 8. Potentially Life-Threatening Chest Injuries Found in 2º Survey**

| | Physical Exam | Investigations | Management |
|---|---|---|---|
| **Pulmonary Contusion** | Blunt trauma to chest<br>Interstitial edema impairs compliance and gas exchange | CXR: areas of opacification of lung within 6 h of trauma | Maintain adequate ventilation<br>Monitor with ABG, pulse oximeter, and ECG<br>Chest physiotherapy<br>Positive pressure ventilation if severe |
| **Ruptured Diaphragm** | Blunt trauma to chest or abdomen (e.g. high lap belt in MVC) | CXR: abnormality of diaphragm/lower lung fields/NG tube placement<br>CT scan and endoscopy: sometimes helpful for diagnosis | Laparotomy for diaphragm repair and associated intra-abdominal injuries |
| **Esophageal Injury** | Usually penetrating trauma (pain out of proportion to degree of injury) | CXR: mediastinal air (not always)<br>Esophagram (Gastrografin®)<br>Flexible esophagoscopy | Early repair (within 24 h) improves outcome but all require repair |
| **Aortic Tear**<br>90% tear at subclavian (near ligamentum arteriosum), most die at scene<br>Salvageable if diagnosis made rapidly | Sudden high speed deceleration (e.g. MVC, fall, airplane crash), complaints of chest pain, dyspnea, hoarseness (frequently absent)<br>Decreased femoral pulses, differential arm BP (arch tear) | CXR, CT scan, transesophageal echo, aortography (gold standard) | Thoracotomy (may treat other severe injuries first) |
| **Blunt Myocardial Injury (rare)** | Blunt trauma to chest (usually in setting of multi-system trauma and therefore difficult to diagnose)<br>Physical exam: overlying injury e.g. fractures, chest wall contusion | ECG: dysrhythmias, ST changes<br>Patients with a normal ECG and normal hemodynamics never get dysrhythmias | $O_2$<br>Antidysrhythmic agents<br>Analgesia |

Ruptured diaphragm is more often diagnosed on the left side, as liver conceals right side defect

**Aortic Tear**

**ABC WHITE**
X-ray features of **A**ortic tear
Depressed left mainstem **B**ronchus
pleural **C**ap
**W**ide mediastinum (most consistent)
**H**emothorax
**I**ndistinct aortic knuckle
**T**racheal deviation to right side
**E**sophagus (NG tube) deviated to right
(Note: present in 85% of cases, but cannot rule out)



**If Penetrating Neck Trauma Present, DON'T:**
- Clamp structures (can damage nerves)
- Probe
- Insert NG tube (leads to bleeding)
- Remove weapon/impaled object

## Other Potentially Life-Threatening Injuries Related to the Chest

### Penetrating Neck Trauma

- includes all penetrating trauma to the three zones of the neck
- management: injuries deep to platysma require further evaluation by angiography, contrast CT, or surgery
- do not explore penetrating neck wounds except in the OR

### Airway Injuries
- always maintain a high index of suspicion
- larynx
  - history: strangulation, direct blow, blunt trauma, any penetrating injury involving platysma
  - triad: hoarseness, subcutaneous emphysema, palpable fracture
  - other symptoms: hemoptysis, dyspnea, dysphonia
  - investigations: CXR, CT scan, arteriography (if penetrating)
  - management
    - airway: manage early because of edema
    - C-spine may also be injured, consider mechanism of injury
    - surgical: tracheotomy vs. repair
- trachea/bronchus
  - frequently missed
  - history: deceleration, penetration, increased intra-thoracic pressure, complaints of dyspnea, hemoptysis
  - examination: subcutaneous air, Hamman's sign (crunching sound synchronous with heart beat)
  - CXR: mediastinal air, persistent pneumothorax or persistent air leak after chest tube inserted for pneumothorax
  - management
    - surgical repair if >1/3 circumference

**Zone III:** Superior aspect of neck
**Zone II:** Midportion of neck (cricoid to the angle of mandible)
**Zone I:** Base of neck (thoracic inlet to cricoid cartilage)

**Figure 6. Zones of the neck in trauma**

## Abdominal Trauma

- two mechanisms
  - blunt: usually causes solid organ injury (spleen = most common, liver = 2nd)
  - penetrating: usually causes hollow organ injury or liver injury (most common)

### BLUNT TRAUMA
- results in two types of hemorrhage: intra-abdominal and retroperitoneal
- adopt high clinical suspicion of bleeding in multi-system trauma

### History
- mechanism of injury, SAMPLE history

### Physical Exam
- often unreliable in multi-system trauma, wide spectrum of presentations
  - slow blood loss not immediately apparent
  - tachycardia, tachypnea, oliguria, febrile, hypotension
  - other injuries may mask symptoms
  - serial examinations are required
- abdomen
  - inspect: contusions, abrasions, seat-belt sign, distention
  - auscultate: bruits, bowel sounds
  - palpate: tenderness, rebound tenderness, rigidity, guarding
  - DRE: rectal tone, blood, bone fragments, prostate location
  - placement of NG, Foley catheter should be considered part of the abdominal exam
- other systems to assess: cardiovascular, respiratory (possibility of diaphragm rupture), genitourinary, pelvis, back/neurological

### Investigations
- labs: CBC, electrolytes, coagulation, cross and type, glucose, Cr, CK, lipase, amylase, liver enzymes, ABG, blood EtOH, β-hCG, U/A, toxicology screen

**Table 9. Imaging in Abdominal Trauma**

| Imaging | Strengths | Limitations |
|---|---|---|
| **X-Ray** | Chest (looking for free air under diaphragm, diaphragmatic hernia, air-fluid levels), pelvis, cervical, thoracic, lumbar spines | Soft tissue not well visualized |
| **CT Scan** | Most specific test | Radiation exposure 20x more than x-ray<br>Cannot use if hemodynamic instability |
| **Diagnostic Peritoneal Lavage (rarely used)** | Most sensitive test<br>Tests for intra-peritoneal bleed | Cannot test for retroperitoneal bleed or diaphragmatic rupture<br>Cannot distinguish lethal from trivial bleed<br>Results can take up to 1 h |
| **Ultrasound: FAST** | Identifies presence/absence of free fluid in peritoneal cavity<br>RAPID exam: less than 5 min<br>Can also examine pericardium and pleural cavities | NOT used to identify specific organ injuries<br>If patient has ascites, FAST will be falsely positive |

**Seatbelt Injuries May Cause**
- Retroperitoneal duodenal trauma
- Intraperitoneal bowel transection
- Mesenteric injury
- L-spine injury

**Indications for Foley and NG Tube in Abdominal Trauma**

**Foley catheter:** unconscious or patient with multiple injuries who cannot void spontaneously or is unconscious
**NG tube:** used to decompress the stomach and proximal small bowel. Contraindicated if suspected facial or basal skull fractures

**Criteria for Positive Lavage**
- >10 cc gross blood
- Bile, bacteria, foreign material
- RBC count >100,000 x $10^6$/L
- WBC >500 x $10^6$/L,
- Amylase >175 IU

**Point-of-care ultrasonography for diagnosing thoracoabdominal injuries in patients with blunt trauma**
Cochrane DB Syst Rev 2018:CD012669
**Objectives**: Determine the diagnostic accuracy of POCUS for detecting and excluding free fluid, organ injuries, vascular lesions, and other injuries compared to diagnostic reference standard in patients with blunt trauma.
**Methods**: Systematic review of prospective or retrospective diagnostic cohort studies of patients with any type of blunt trauma.
**Results**: 34 studies, 8635 participants. For abdominal trauma, POCUS had a sensitivity of 0.68 (95% CI 0.59-0.75) and a specificity of 0.95 (95% CI 0.92-0.97). In children, pooled sensitivity of POCUS was 0.63 (95% CI 0.46-0.77), as compared to 0.78 (95% CI 0.69-0.84) in an adult/mixed population. For chest injuries, POCUS had a sensitivity of 0.96 (95% CI 0.88-0.99) and a specificity of 0.95 (95% CI 0.97-1.00).
**Conclusions**: In patients with blunt thoracoabdominal trauma, positive POCUS findings are helpful for guiding treatment decisions. However, with regard to abdominal trauma, a negative POCUS does not rule out injuries and must be verified. This is of particular importance in paediatric trauma, where the sensitivity of POCUS is poor. Based on a small number of studies in a mixed population, POCUS may have a higher sensitivity in chest injuries.

- imaging must be done if:
  - equivocal abdominal examination, altered sensorium, or distracting injuries (e.g. head trauma, spinal cord injury resulting in abdominal anesthesia)
  - unexplained shock/hypotension
  - patients have multiple traumas and must undergo general anesthesia for orthopedic, neurosurgical, or other injuries
  - fractures of lower ribs, pelvis, spine
  - positive FAST

### Management
- general: ABCs, fluid resuscitation, and stabilization
- surgical: watchful waiting vs. laparotomy
- solid organ injuries: decision based on hemodynamic stability, not the specific injuries
- hemodynamically unstable or persistently high transfusion requirements: laparotomy
- hollow organ injuries: laparotomy
- even if low suspicion of injury: admit and observe for 24 h

**Laparotomy is Mandatory if Penetrating Trauma and:**
- Shock
- Peritonitis
- Evisceration
- Free air in abdomen
- Blood in NG tube, Foley catheter, or on DRE

### PENETRATING TRAUMA
- high risk of gastrointestinal perforation and sepsis
- history: size of blade, calibre/distance from gun, route of entry
- local wound exploration under direct vision may determine lack of peritoneal penetration (not reliable in inexperienced hands) with the following exceptions:
  - thoracoabdominal region (may cause pneumothorax)
  - back or flanks (muscles too thick)

**"Rule of Thirds" for Stab Wounds**
- 1/3 do not penetrate peritoneal cavity
- 1/3 penetrate but are harmless
- 1/3 cause injury requiring surgery

### Management
- general: ABCs, fluid resuscitation, and stabilization
- gunshot wounds always require laparotomy

## Genitourinary Tract Injuries

- see Urology, U34

### Etiology
- blunt trauma: often associated with pelvic fractures
  - upper tract
    - renal
      - contusions (minor injury – parenchymal ecchymoses with intact renal capsule)
      - parenchymal tears/laceration: non-communicating (hematoma) vs. communicating (urine extravasation, hematuria)
    - ureter: rare, at uretero-pelvic junction
  - lower tract
    - bladder
      - extraperitoneal rupture of bladder from pelvic fracture fragments
      - intraperitoneal rupture of bladder from trauma and full bladder
    - urethra
      - posterior urethral injuries: MVCs, falls, pelvic fractures
      - anterior urethral injuries: blunt trauma to perineum, straddle injuries/direct strikes
  - external genitalia
- penetrating trauma
  - damage to: kidney, bladder, ureter (rare), external genitalia
- acceleration/deceleration injury
  - renal pedicle injury: high mortality rate (laceration and thrombosis of renal artery, renal vein, and their branches)
- iatrogenic
  - ureter and urethra (from instrumentation)

### History
- mechanism of injury
- hematuria (microscopic or gross), blood on underwear
- dysuria, urinary retention
- history of hypotension

Gross hematuria suggests bladder injury

### Physical Exam
- abdominal pain, flank pain, CVA tenderness, upper quadrant mass, perineal lacerations
- DRE: sphincter tone, position of prostate, presence of blood
- scrotum: ecchymoses, lacerations, testicular disruption, hematomas
- bimanual exam, speculum exam
- extraperitoneal bladder rupture: pelvic instability, suprapubic tenderness from mass of urine or extravasated blood
- intraperitoneal bladder rupture: acute abdomen
- urethral injury: perineal ecchymosis, scrotal hematoma, blood at penile meatus, high riding prostate, pelvic fractures

### Investigations
- urethra: retrograde urethrography
- bladder: U/A, CT scan, urethrogram ± retrograde cystoscopy ± cystogram (distended bladder + post-void)
- ureter: retrograde ureterogram
- renal: CT scan (best, if hemodynamically stable), intravenous pyelogram

In the case of gross hematuria, the GU system is investigated from distal to proximal (i.e. urethrogram, cystogram, etc.)

### Management
- urology consult
- renal
  - minor injuries: conservative management
    - bedrest, hydration, analgesia, antibiotics
  - major injuries: admit
    - conservative management with frequent reassessments, serial U/A ± re-imaging
    - surgical repair (exploration, nephrectomy): hemodynamically unstable or continuing to bleed >48 h, major urine extravasation, renal pedicle injury, all penetrating wounds and major lacerations, infections, renal artery thrombosis
- ureter
  - ureterouretostomy
- bladder
  - extraperitoneal
    - minor rupture: Foley drainage x 10-14 d
    - major rupture: surgical repair
  - intraperitoneal
- drain abdomen and surgical repair
- urethra
  - anterior: conservative, if cannot void, Foley or suprapubic cystostomy and antibiotics
  - posterior: suprapubic cystostomy (avoid catheterization) ± surgical repair

# Orthopedic Injuries

- see Orthopedic Surgery (see *Shoulder* OR11, *Knee* OR32, *Wrist* OR21, *Ankle* OR38)

### Goals of ED Treatment
- diagnose potentially life/limb threatening injuries
- reduce and immobilize fractures (cast/splint) as appropriate
- provide adequate pain relief
- arrange proper follow-up if necessary

**Description of Fractures**

**SOLARTAT**
**S**ite
**O**pen vs. closed
**L**ength
**A**rticular
**R**otation
**T**ranslation
**A**lignment/Angulation
**T**ype e.g. Salter-Harris, etc.

### History
- use SAMPLE, mechanism of injury may be very important

### Physical Exam
- look (inspection): "SEADS" swelling, erythema, atrophy, deformity, and skin changes (e.g. bruises)
- feel (palpation): all joints/bones for local tenderness, swelling, warmth, crepitus, joint effusions, and subtle deformity
- move: joints affected plus those above and below injury – active ROM preferred to passive
- neurovascular status: distal to injury (before and after reduction)

### LIFE- AND LIMB-THREATENING INJURIES

**Table 10. Life- and Limb-Threatening Orthopedic Injuries**

| **Life-Threatening Injuries** (usually blood loss) | **Limb-Threatening Injuries** (usually interruption of blood supply) |
|---|---|
| Major pelvic fractures | Fracture/dislocation of ankle (talar AVN) |
| Traumatic amputations | Crush injuries |
| Massive long bone injuries and associated fat emboli syndrome | Compartment syndrome |
| Vascular injury proximal to knee/elbow | Open fractures |
| | Dislocations of knee/hip |
| | Fractures above knee/elbow |

### Open Fractures
- communication between fracture site and external surface of skin – increased risk of osteomyelitis
- remove gross debris, irrigate, cover with sterile dressing – formal irrigation and debridement often done in the OR
- control bleeding with pressure (no clamping)
- splint
- antibiotics (1st generation cephalosporin and aminoglycoside) and tetanus prophylaxis
- standard of care is to secure definitive surgical management within 6 h, time to surgery may vary from case-to-case

**When Dealing with an Open Fracture, Remember "STAND"**
**S**plint
**T**etanus prophylaxis
**A**ntibiotics
**N**eurovascular status (before and after)
**D**ressings (to cover wound)

## Vascular Injuries
- realign limb/apply longitudinal traction and reassess pulses (e.g. Doppler probe)
- surgical consult
- direct pressure if external bleeding

## Compartment Syndrome
- when the intracompartmental pressure within an anatomical area (e.g. forearm or lower leg) exceeds the capillary perfusion pressure, eventually leading to muscle/nerve necrosis
- clinical diagnosis: maintain a high index of suspicion
  - pain out of proportion to the injury
  - pain worse with passive stretch
  - tense compartment
  - look for "the 6 Ps" (note: radial pulse pressure is 120/80 mmHg while capillary perfusion pressure is 30 mmHg, seeing any of the 6ps indicates advanced compartment syndrome, therefore do not wait for these signs to diagnose and treat)
- requires prompt decompression: remove constrictive casts, dressings; emergent fasciotomy may be needed

Vascular injury/compartment syndrome is suggested by **"The 6 Ps" Injury**
**Compartment Syndrome - 6 Ps**
**P**ulse discrepancies
**P**allor
**P**aresthesia/hypoesthesia
**P**aralysis
**P**ain (especially when refractory to usual analgesics)
**P**olar (cold)

## UPPER EXTREMITY INJURIES
- anterior shoulder dislocation
  - axillary nerve (lateral aspect of shoulder) and musculocutaneous nerve (extensor aspect of forearm) at risk
  - seen on lateral view: humeral head anterior to glenoid
  - reduce (traction, scapular manipulation), immobilize in internal rotation, repeat x-ray, out-patient follow-up with orthopedics
  - with forceful injury, look for fracture
- Colles' fracture
  - distal radius fracture with dorsal displacement from "Fall on Outstretched Hand" (FOOSH)
  - AP film: shortening, radial deviation, radial displacement
  - lateral film: dorsal displacement, volar angulation
  - reduce, immobilize with splint, out-patient follow-up with orthopedics or immediate orthopedic referral if complicated fracture
  - if involvement of articular surface, emergent orthopedic referral
- scaphoid fracture
  - tenderness in anatomical snuff box, pain on scaphoid tubercle, pain on axial loading of thumb
  - negative x-ray: thumb spica splint, repeat x-ray in 1 wk ± CT scan/bone scan
  - positive x-ray: thumb spica splint x 6-8 wk, repeat x-ray in 2 wk
  - risk of AVN of scaphoid if not immobilized
  - outpatient orthopedics follow-up

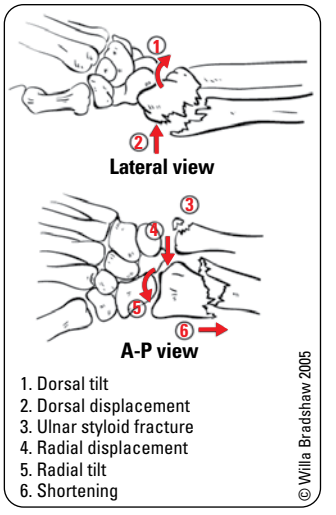


**Figure 7. Colles' fracture**

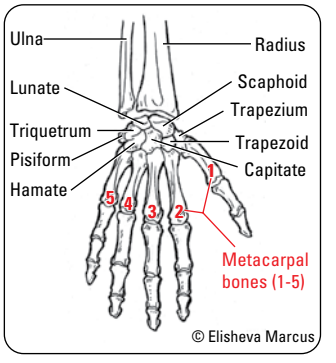
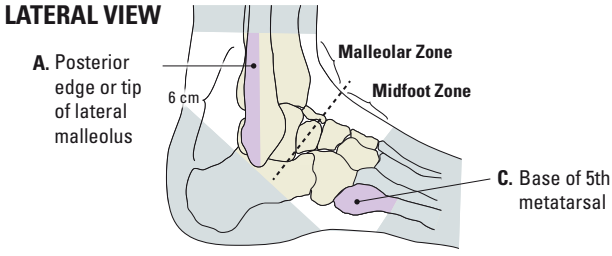
## LOWER EXTREMITY INJURIES
- ankle and foot fractures
  - see Ottawa Ankle and Foot Rules
- knee injuries
  - see Ottawa Knee Rules
- avulsion of the base of 5th metatarsal
  - occurs with inversion injury
  - supportive tensor or below knee walking cast for 3 wk
- calcaneal fracture
  - associated with fall from height
  - associated with axial loading (other injuries may involve ankles, knees, hips, pelvis, lumbar spine)





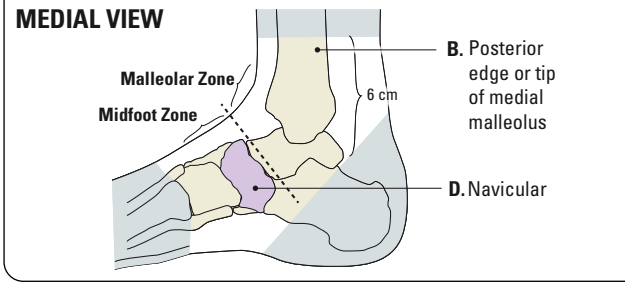


**Figure 8. Carpal bones**

**A knee x-ray examination is required only for acute injury patients with one or more of:**
- Age 55 yr or older
- Tenderness at head of fibula
- Isolated tenderness of patella
- Inability to flex to 90°
- Inability to bear weight both immediately and in the ED (four steps)

**Figure 9. Ottawa knee rules**
Adapted from: Stiell IG, et al. JAMA 1997;278:2075-2079.

An ankle radiographic series is required only if there is any pain in malleolar zone and any of these findings:

1. Bony tenderness at A
or
2. Bony tenderness at B
or
3. Inability to bear weight both immediately and in ED

A radiographic series is required only if there is any pain in midfoot zone and any of these findings:

1. Bony tenderness at C
or
2. Bony tenderness at D
or
3. Inability to bear weight both immediately and in ED

©Natalie Cormier 2016

**Figure 10. Ottawa ankle and foot rules**
Adapted from: Stiell IG, et al. JAMA 1994;271:827-832.

# Wound Management

## Goals of ED Treatment

- identify injuries and stop any active bleeding – direct pressure
- manage pain
- wound examination and exploration (history and physical)
- cleansing ± antibiotic and tetanus prophylaxis
- closure and dressing

## Tetanus Prophylaxis

- both tetanus toxoid (Td) and immunoglobulin (TIG) are safe in pregnancy

**Table 11. Guidelines for Tetanus Prophylaxis for Wounds**

| | Clean, Minor Wounds | | All Other Wounds* | |
|---|---|---|---|---|
| **Vaccination History** | Tdap or Td† | TIG | Tdap or Td† | TIG |
| **Unknown or fewer than 3 doses** | Yes | No | Yes | Yes |
| **3 or more doses** | No§ | No | No¶ | No |

*Such as, but not limited to, wounds contaminated with dirt, feces, soil, and saliva; puncture wounds; avulsions; and wounds resulting from missiles, crushing, burns, and frostbite
†Tdap is preferred to Td for adults who have never received Tdap. Single antigen tetanus toxoid (TT) is no longer available in the United States
§Yes, if more than ten years since the last tetanus toxoid-containing vaccine dose
¶Yes, if more than five years since the last tetanus toxoid-containing vaccine dose
Source: *MMWR* 1991;40(No. RR-10):1-28

## Bruises

- non-palpable = ecchymosis
- palpable collection (not swelling) = hematoma following blunt trauma
- assess for coagulopathy (e.g. liver disease), anticoagulant use

## Abrasions

- partial to full thickness break in skin
- management
  - clean thoroughly with brush to prevent foreign body impregnation ± local anesthetic antiseptic ointment (Polysporin® or Vaseline®) for 7 d for facial and complex abrasions tetanus prophylaxis

## Lacerations

- see Plastic Surgery, PL23
- consider every structure deep to a laceration injured until proven otherwise
- in hand injury patients, include the following in history: handedness, occupation, mechanism of injury, previous history of injury

**Acute Treatment of Contusions**

**RICE**
**R**est
**I**ce
**C**ompression
**E**levation

**High Risk Factors for Infection**
**Wound Factors**
- Puncture wounds
- Crush injuries
- Wounds >12 h old
- Hand or foot wounds

**Patient Factors**
- Age >50 yr
- Prosthetic joints or valves (risk of endocarditis)
- Immunocompromised

**Suture Use and Duration**

| Suture to: | Close with Nylon or Other Non-absorbable Suture | Approx. Duration (days) |
|---|---|---|
| Face | 6-0 | 5 |
| Not Joint | 4-0 | 7 |
| Joint | 3-0 | 10 |
| Scalp | 4-0 | 7 |
| Mucous Membrane | absorbable (vicryl) | N/A |

N.B. Patients on steroid therapy may need sutures for longer periods of time

- physical exam
  - think about underlying anatomy
  - examine tendon function actively against resistance and neurovascular status distally
  - clean and explore under local anesthetic; look for partial tendon injuries
  - x-ray or U/S wounds if a foreign body is suspected (e.g. shattered glass) and not found when exploring wound (remember: not all foreign bodies are radioopaque), or if suspect intra-articular involvement
- management
  - disinfect skin/use sterile techniques
  - irrigate copiously with normal saline
  - analgesia ± anesthesia
  - maximum dose of lidocaine
    - 7 mg/kg with epinephrine
    - 5 mg/kg without epinephrine
- in children, topical anesthetics such as LET (lidocaine, epinephrine, and tetracaine), and in selected cases a short-acting benzodiazepine (midazolam or other agents) for sedation and amnesia are useful
- secure hemostasis
- evacuate hematomas, debride non-viable tissue, remove hair and foreign bodies
- ± prophylactic antibiotics (consider for animal/human bites, intra-oral lesion, or puncture wounds to the foot)
- suture unless: delayed presentation (>6-8 h), puncture wound, mammalian bite, crush injury, or retained foreign body
- take into account patient and wound factors when considering suturing
- advise patient when to have sutures removed
- cellulitis and necrotizing fasciitis (see Plastic Surgery, PL15)

Early wound irrigation and debridement are the most important factors in decreasing infection risk

**Alternatives to Sutures**
- Tissue glue
- Steristrips®
- Staples

# Approach to Common ED Presentations

## Abdominal Pain

**Table 12. Selected Differential Diagnosis of Abdominal Pain**

| | Emergent | Usually Less Emergent |
|---|---|---|
| **GI** | Perforated viscus, bowel obstruction, ischemic bowel, appendicitis, strangulated hernia, IBD flare, esophageal rupture, peptic ulcer disease | Diverticulitis, gastroenteritis, GERD, esophagitis, gastritis, IBS |
| **Hepatobiliary** | Hepatic/splenic injury, pancreatitis, cholangitis, spontaneous bacterial peritonitis | Biliary colic, cholecystitis, hepatitis |
| **Genital** | Female: Ovarian torsion, PID, ectopic pregnancy<br>Male: Testicular torsion | Female: tubo-ovarian abscess, ovarian cyst, salpingitis, endometriosis<br>Male: epididymitis, prostatitis |
| **Urinary** | Pyelonephritis | Renal colic, cystitis |
| **CVS** | MI, aortic dissection, AAA | Pericarditis |
| **Respirology** | PE, empyema | Pneumonia |
| **Metabolic** | DKA, sickle cell crisis, toxin, Addisonian crisis | Lead poisoning, porphyria |
| **Other** | Significant trauma, acute angle closure glaucoma | Abdominal wall injury, herpes zoster, psychiatric, abscess, hernia, mesenteric adenitis |

Be vigilant: alcoholics, very young or elderly patients, and immunosuppressed patients often present atypically
Old age, pregnancy (T3), and chronic corticosteroid use can blunt peritoneal findings, so have an increased level of suspicion for an intra-abdominal process in these individuals

Unstable patients should not be sent for imaging

- differential can be focused anatomically by location of pain: RUQ, LUQ, RLQ, LLQ, epigastric, periumbilical, diffuse

### History
- pain: OPQRST
- review symptoms from GU, gynecological, GI, respiratory, and CV systems
- abdominal trauma/surgeries, most recent colonoscopy

### Physical Exam
- vitals, abdominal (including DRE, CVA tenderness), pelvic/genital, respiratory, and cardiac exams as indicated by history

### Investigations
- ABCs, do not delay management and consultation if patient unstable
- labs: CBC, electrolytes, glucose, BUN/Cr, U/A ± liver enzymes, LFTs, lipase, β-hCG, ECG, troponins, ± VBG/lactate
- AXR: look for calcifications, free air, gas pattern, air fluid levels
- CXR upright: look for pneumoperitoneum (free air under diaphragm), lung disease
- U/S: biliary tract, ectopic pregnancy, AAA, free fluid
- CT: trauma, AAA, pancreatitis, nephro-/urolithiasis, appendicitis, and diverticulitis

**If elevated AST and ALT**
Think hepatocellular injury
AST > ALT: alcohol-related
ALT > AST: viral, drug, toxin

**If elevated ALP and GGT**
Think biliary tree obstruction

### Management
- NPO, IV, NG tube, analgesics, consider antibiotics and anti-emetics
- growing evidence that small amounts of opioid analgesics improve diagnostic accuracy of physical exam of surgical abdomen
- consult as necessary: general surgery, vascular surgery, gynecology, etc.

### Disposition
- admission: surgical abdomen, workup of significant abnormal findings, need for IV antibiotics or pain control
- discharge: patients with a negative lab and imaging workup who improve clinically during their stay; instruct the patient to return if severe pain, fever, or persistent vomiting develops

## Acute Pelvic Pain

### Etiology
- gynecological
  - ovaries: ruptured ovarian cysts (most common cause of pelvic pain), ovarian abscess, ovarian torsion (rare, 50% will have ovarian mass)
  - fallopian tubes: salpingitis, tubal abscess, hydrosalpinx
  - uterus: leiomyomas (uterine fibroids) – especially with torsion of a pedunculated fibroid or in a pregnant patient (degeneration), PID, endometriosis
  - other: ectopic pregnancy (ruptured/expanding/leaking), spontaneous abortion (threatened or incomplete), endometriosis and dysmenorrhea, sexual or physical abuse
- non-gynecological (see causes of lower abdominal pain above)

**Gynecological Causes of Pelvic Pain**
- Ovarian cyst
- Dysmenorrhea
- Mittelschmerz
- Endometriosis
- Ovarian torsion
- Uterine fibroids/neoplasm
- Adnexal neoplasm
- PID + cervicitis

### History and Physical Exam
- pain: OPQRST
- associated symptoms: vaginal bleeding, discharge, dyspareunia, bowel and/or bladder symptoms
- pregnancy and sexual history
- vitals
- gynecological exam: assess for cervical motion tenderness/"chandelier sign" (suggests PID)
- abdominal exam

### Investigations
- β-hCG for all women of childbearing age
- CBC and differential, electrolytes, glucose, Cr, BUN, G&S, PTT/INR
- urinalysis to rule out urologic causes
- vaginal and cervical swabs for C&S during physical exam
- pelvic and abdominal U/S: evaluate adnexa, thickness of endometrium, pregnancy, free fluid or masses in the pelvis
- Doppler flow studies for ovarian torsion

U/S is the preferred imaging modality in the assessment of acute pelvic pain

### Management
- general: analgesia, determine if admission and consults are needed
- specific:
  - ovarian cysts
    - unruptured or ruptured, and hemodynamically stable: analgesia and follow-up
    - ruptured with significant hemoperitoneum: may require surgery
  - ovarian torsion: surgical detorsion or removal of ovary
  - uncomplicated leiomyomas, endometriosis, and secondary dysmenorrhea can usually be treated on an outpatient basis, discharge with gynecology follow-up
  - PID: broad spectrum antibiotics

### Disposition
- referral: gynecological or obstetrical causes requiring surgical intervention, requiring admission, or oncological in nature
- admission: patients requiring surgery, IV antibiotics/pain management
- discharge: negative workup and resolving symptoms; give clear instructions for appropriate follow-up

## Altered Level of Consciousness

### Definitions
- altered mental status: collective, non-specific term referring to change in cognitive function, behaviour, or attentiveness, including:
  - delirium (see Psychiatry, PS22)
  - dementia (see Psychiatry, PS23)
  - lethargy: state of decreased awareness and alertness (patient may appear wakeful)
  - stupor: unresponsiveness but rousable
  - coma: a sleep-like state, not rousable to consciousness

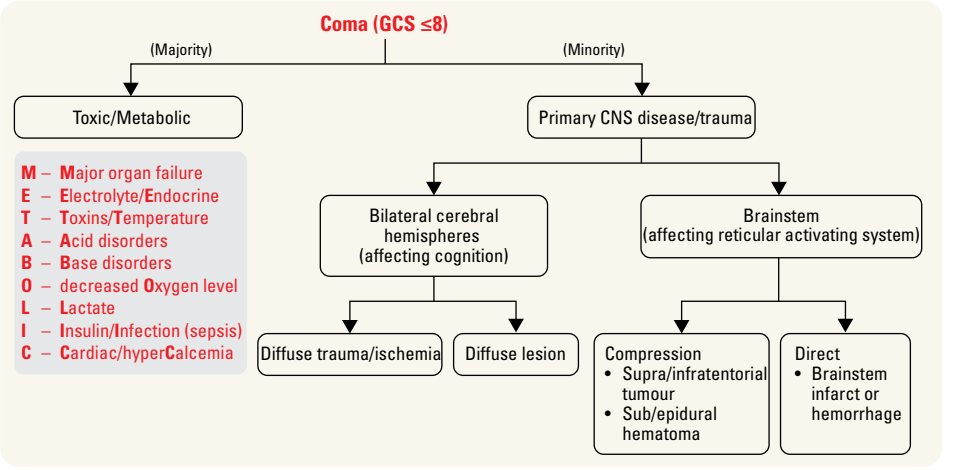

**Figure 11. Etiology of coma**

**Possible Causes of Coma**

**AEIOU TIPS**
**A**cidosis/**A**lcohol
**E**pilepsy
**I**nfection
**O**xygen (hypoxia)/**O**piates
**U**remia
**T**emperature/**T**rauma (especially head)
**I**nsulin (too little or too much)
**P**sychogenic/**P**oisoning
**S**troke

## MANAGEMENT OF ALTERED LOC

### History
- obtain collateral from family, friends, police, paramedics, old chart, MedicAlert® bracelet, etc.
- onset and progression
  - antecedent trauma, seizure activity, fever
  - abrupt onset suggests CNS hemorrhage/ischemia, cardiac cause, or poisoning
  - progression over hours to days suggests progressive CNS lesion or toxic/metabolic cause
- determine patient's baseline LOC
- past medical history (e.g. similar episode(s), depression, overdose)

### Physical Exam
- ABCs, vitals including temperature; cardiac, respiratory, abdominal exams
- complete neurological exam; in particular, examination of the eyes ("PEARL" pupils equal and reactive to light)
  - use the GCS to evaluate LOC (see *Patient Assessment/Management*, ER4)

In general, intubate if GCS <8; but ability to protect airway is primary consideration

### Investigations
- blood work
  - serum glucose level, electrolytes, Cr, BUN, LFTs, serum osmolality, CBC, VBG, PT/PTT/INR, troponins
  - serum acetaminophen, and salicylate levels
- imaging
  - CXR, CT head
- other tests
  - ECG, U/A, UTox

### Diagnosis
- administer appropriate universal antidotes
  - thiamine 100 mg IV if history of EtOH or patient looks malnourished
  - 50 mL D50W if hypoglycemic on finger-prick
  - naloxone 0.4 mg, up to 10 mg IV if opiate overdose suspected
- distinguish between structural and toxic-metabolic coma
  - structural coma
    - pupils, extraocular movements, and motor findings, if present, are usually asymmetric
    - look for focal or lateralizing abnormalities
  - toxic-metabolic coma
    - dysfunction at lower levels of the brainstem (e.g. caloric unresponsiveness)
    - respiratory depression in association with an intact upper brainstem (e.g. equal and reactive pupils; see exceptions in Table 13)
    - extraocular movements and motor findings are symmetric or absent
    - essential to re-examine frequently because status can change rapidly
- diagnosis may become apparent only with the passage of time
  - delayed deficit after head trauma suggestive of epidural hematoma (characteristic "lucid interval")

**Table 13. Toxic-Metabolic Causes of Fixed Pupils**

| Dilated | Dilated to Normal | Constricted |
|---|---|---|
| Anoxia<br>Anticholinergic agents (e.g. atropine, tricyclic antidepressants)<br>Methanol (rare)<br>Cocaine<br>Opioid withdrawal<br>Amphetamines<br>Hallucinogens<br>Serotonin syndrome (MAOI + SSRI) | Hypothermia<br>Barbiturates<br>Antipsychotics | Cholinergic agents (e.g. organophosphates)<br>Opioids (e.g. heroin), except meperidine |

### Disposition
- admission: if ongoing decreased LOC, admit to service based on tentative diagnosis, or transfer patient if appropriate level of care not available
- discharge: readily reversible alteration of LOC; ensure adequate follow-up care available

# Chest Pain

**Table 14. Differential Diagnosis for Chest Pain**

| | Emergent | Usually Less Emergent |
|---|---|---|
| **CVS** | MI, unstable angina, aortic dissection, cardiac tamponade, arrhythmia | Stable angina, pericarditis, myocarditis |
| **Respirology** | PE, pneumothorax | Pneumonia, pleural effusion, malignancy |
| **GI** | Esophageal rupture, pneumomediastinum | Peptic ulcer disease, esophagitis, GERD, esophageal spasm, pancreatitis, cholecystitis |
| **MSK** | | Rib fracture, costochondritis |
| **Other** | | Herpes zoster, psychiatric/panic attack |

**Life-Threatening Causes of Chest Pain**

**PET MAP**
**P**E
**E**sophageal rupture
**T**amponade
**MI**/angina
**A**ortic dissection
**P**neumothorax

### History and Physical Exam
- OPQRST, previous episodes and change in pattern
- cardiac risk factors (HTN, DM, dyslipidemia, smoking, FHx)
- vitals, cardiac, respiratory, peripheral vascular, abdominal exams

Imaging is necessary for all suspected aortic dissections, regardless of BP

### Investigations
- CBC, electrolytes, Cr, BUN, glucose, PTT/INR, cardiac biomarkers (troponins, CK)
- ECG: always compare with previous; may be normal in up to 50% of PE and acute MI
- CXR: compare with previous
- CT: if indicated (e.g. aortic dissection, PE)

**Angina Characteristics**
1. Retrosternal location
2. Provoked by exertion
3. Relieved by rest or nitroglycerin

**Risk for Coronary Artery Disease**
3/3 = "typical angina" - high risk
2/3 = intermediate risk for women >50 yr, all men
1/3 = Intermediate risk in men >40 yr, women >60 yr

### Management and Disposition
- ABCs, $O_2$, cardiac monitors, IV access
- treat underlying cause and involve consultants as necessary
- consider further observation/monitoring if unclear diagnosis or risk of dysrhythmia
- discharge: patients with a low probability of life-threatening illness due to resolving symptoms and negative workup; arrange follow-up and instruct to return if SOB or increased chest pain develops

**Table 15. Comparison of Chest Pain Diagnoses**

| | Classic History | Classic Findings | Diagnostic Investigations | Management and Disposition |
|---|---|---|---|---|
| **Acute Coronary Syndrome** | New or worsening pattern of retrosternal squeezing/pressure pain, radiation to arm/neck, dyspnea, worsened by exercise, relieved by rest; N/V; syncope | New or worsened murmur, hypotension, diaphoresis, pulmonary edema | ECG: ischemia (15-lead if hypotensive, AV node involvement or inferior MI), serial troponin I (sensitive 6-8 h after onset), CK-MB, CXR | ABCs, aspirin, anticoagulation and emergent cardiology consult to consider percutaneous intervention or thrombolytic |
| **Pulmonary Embolism** | Pleuritic chest pain (75%), dyspnea; risk factors for venous thromboembolism | Tachycardia, hypoxemia; evidence of DVT | Wells' criteria: D-dimer, CT pulmonary angiogram*, V/Q scan; leg Doppler, CXR | ABCs, anticoagulation; consider airway management and thrombolysis if respiratory failure |
| **Acute Pericarditis** | Viral prodrome, anterior precordial pain, pleuritic, relieved by sitting up and leaning forward | Triphasic friction rub | ECG: sinus tachycardia, diffuse ST elevation, PR depression in II, III, avF and V4-6; reciprocal PR elevation and ST depression in aVR ±V1; echocardiography | ABCs, rule out MI, high dose NSAIDs ± colchicine; consult if chronic/recurrent or non-viral cause (e.g. SLE, renal failure, requires surgery) |
| **Pneumothorax** | Trauma or spontaneous pleuritic chest pain often in tall, thin, young male athlete | Hemithorax with decreased/absent breath sounds, hyper-resonance; deviated trachea and hemodynamic compromise | Clinical diagnosis CXR: PA, lateral, expiratory views – lung edge, loss of lung markings, tracheal shift; deep sulcus sign on supine view | ABCs, if unstable, needle to 2nd ICS at MCL; urgent surgical consult / thoracostomy 4th ICS and chest tube |
| **Aortic Dissection** | Sudden severe tearing retrosternal or midscapular pain ± focal pain/neurologic loss in extremities in context of HTN | HTN; systolic BP difference >20 mmHg or pulse deficit between arms; aortic regurgitant murmur | CT angio; CXR - wide mediastinum, left pleural effusion, indistinct aortic knob, >4 mm separation of intimal calcification from aortic shadow, 20% normal | ABCs, reduce BP and HR; classify type A (ascending aorta, urgent surgery) vs. B (not ascending aorta, medical) on CT angio and urgent consult |
| **Cardiac Tamponade** | Dyspnea, cold extremities, ± chest pain; often a recent cardiac intervention or symptoms of malignancy, connective tissue disease | Beck's triad - hypotension, elevated JVP, muffled heart sounds; tachycardia, pulsus paradoxus >10 mmHg | Clinical diagnosis CXR: may show cardiomegaly, evidence of trauma | ABCs, cardiac surgery or cardiology consult, pericardiocentesis if unstable, treat underlying cause |
| **Esophageal Rupture** | Sudden onset severe pain after endoscopy, forceful vomiting, labour, or convulsion, or in context of corrosive injury or cancer | Subcutaneous emphysema, findings consistent with sepsis | CXR: pleural effusion (75%), pneumomediastinum; CT or water soluble contrast esophagogram | ABCs, early antibiotics, resuscitation, thoracics consult, NPO, consider chest tube |
| **Esophagitis or GERD** | Frequent heartburn, acid reflux, dysphagia, relief with antacids | Oral thrush or ulcers (rare) | None acutely | ABCs, PPI, avoid EtOH, tobacco, trigger foods |
| **Herpes Zoster** | Abnormal skin sensation – itching/tingling/pain – preceding rash by 1-5 d | None if early; maculopapular rash developing into vesicles and pustules that crust | Clinical diagnosis; direct immunofluorescence assay | ABCs, anti-virals, analgesia ±steroids, dressing; r/o ocular involvement/refer if necessary |
| **MSK** | History of injury | Reproduction of symptoms with movement or palpation (not specific – present in 25% of MI) | MSK injury or fracture on X-rays | ABCs, NSAIDs, rest, orthopedics consultation for fractures |
| **Anxiety** | Symptoms of anxiety, depression, history of psychiatric disorder; may coexist with physical disease | Tachycardia, diaphoresis, tremor | Diagnosis of exclusion | ABCs, arrange social supports, rule out suicidality and consider psychiatry consult |

ACS more likely to be atypical in females, diabetics, and >80 yr. Anginal equivalents include dyspnea, diaphoresis, fatigue, non-retrosternal pain

**Signs of PE on CXR**
**Westermark's sign**: abrupt tapering of a vessel on chest film
**Hampton's hump**: a wedge-shaped infiltrate that abuts the pleura
Effusion, atelectasis, or infiltrates 50% normal

It is important to look for reciprocal changes in STEMI in order to differentiate from pericarditis (diffuse elevations)

Tracheal deviation is away from tension or towards non-tension pneumothorax

**Does this patient with chest pain have acute coronary syndrome?: The rational clinical examination systematic review**
JAMA 2015;314:1955-1965
**Objective**: To review accuracy of the initial history, physical examination, electrocardiogram, and risk scores incorporating these elements with the first cardiac-specific troponin.
**Methods**: Systematic review of prospective studies among patients admitted to emergency department with symptoms suggesting ACS.
**Results**: Prior abnormal stress test (specificity 96%; LR 3.1, 95% CI 2.0-4.7), peripheral artery disease (specificity 97%; LR 2.7, 95% CI 1.5-4.8), and pain radiating to both arms (specificity 96%; LR 2.6, 95% CI 1.8-3.7) were most suggestive of ACS. The most suggestive electrocardiogram findings were ST-segment depression and any evidence of ischemia. The History, Electrocardiogram, Age, Risk Factors, Troponin (HEART) (LR 13, 95% CI 7-24) and the Thrombolysis in Myocardial Infarction (TIMI) risk scores (LR 6.8, 95% CI, 5.2-8.9) were both predictive of ACS in the high-risk scores.
**Conclusions**: Among patients with suspected ACS presenting to emergency departments, the initial history, physical examination, and electrocardiogram alone did not confirm or exclude the diagnosis of ACS. Instead, the HEART or TIMI risk scores, which incorporate the first cardiac troponin, provided more diagnostic information

**Table 16. Common Life-Threatening ECG Changes**

| Pathology | ECG Findings |
|---|---|
| **Dysrhythmia** | |
| Torsades de pointes | Ventricular complexes in upward-pointing and downward-pointing continuum (160-250 bpm) |
| Ventricular tachycardia | 6 or more consecutive premature ventricular beats (>100bpm, QRS >120ms) |
| Ventricular flutter | Smooth sine wave pattern of similar amplitude (>200bpm) |
| Ventricular fibrillation | Erratic ECG tracing, no identifiable waves |
| **Conduction** | |
| 2nd degree heart block (Mobitz Type II) | PR interval stable, some QRSs dropped |
| 3rd degree heart block | Prolonged QRS complex (>0.12 s)<br>RSR' in V5 or V6<br>Total AV dissociation, but stable P-P and R-R intervals |
| Left bundle branch block | Monophasic I and V6<br>May see ST elevation<br>Difficult to interpret, new LBBB is considered STEMI equivalent |
| **Ischemia** | |
| STEMI | ST elevation in leads associated with injured area of heart and reciprocal lead changes (depression) |
| **Metabolic** | |
| Hyperkalemia | Tall T waves |
| Hypokalemia | P wave flattening<br>QRS complex widening and flattening<br>U waves appear<br>Flattened T waves |
| **Digitalis Toxicity** | Gradual downward curve of ST<br>At risk for AV blocks and ventricular irritability |
| **Syndromes** | |
| Brugada | RBBB with ST elevation in V1, V2, and V3<br>Susceptible to deadly dysrhythmias, including VFib |
| Wellens | Marked T wave inversion in V2 and V3<br>Left anterior descending coronary stenosis |
| Long QT syndrome | QT interval longer than ½ of cardiac cycle<br>Predisposed to ventricular dysrhythmias |

**Immediate Treatment of Acute MI**

**BEMOAN**
β-blocker
**E**noxaparin
**M**orphine
**O**xygen
**A**SA
**N**itroglycerin

**Common Therapeutic Approach to Severe Migraine**
- 1 L bolus of NS
- prochlorperazine 10 mg IV
- diphenhydramine 25 mg IV
- ketorolac 30 mg IV
- dexamethasone 10 mg IV
- Other options include haloperidol, metoclopramide, ergotamine, sumatriptan, analgesics

**Ottawa SAH Rule**
JAMA 2013;310(12): 1248-55
- Use for alert patients older than 15 yr with new severe non-traumatic headache reaching maximum intensity within 1 h
- Not for patients with new neurologic deficits, previous aneurysms, SAH, brain tumours, or history of recurrent headaches (≥3 episodes over the course of ≥6 mo)
- Investigate if ≥1 high-risk variables present:
  - Age ≥40 yr
  - Neck pain or stiffness
  - Witnessed loss of consciousness
  - Onset during exertion
  - Thunderclap headache (instantly peaking pain)
  - Limited neck flexion on examination

Subarachnoid hemorrhage can be predicted with 100% sensitivity using this rule.

**Validation of the Ottawa Subarachnoid Hemorrhage Rule in Patients with Acute Headache**
CMAJ 2017;189:E1379-E1385
**Objectives**: Validate the Ottawa SAH Rule in emergency department patients. Methods: Prospective cohort study at 6 university-affiliated tertiary-care hospital emergency departments in Canada from 2010-2014. Included alert, neurologically intact adult patients with headache peaking within 1 hour of onset. The rule was scored before investigations.
**Results**: 1153/1743 potentially eligible patients were enrolled, 67 had subarachnoid hemorrhage. Ottawa SAH rule had 100% sensitivity and 13.6% specificity with similar neuroimaging rates (87%).
**Conclusions**: The Ottawa SAH Rule was sensitive for identifying subarachnoid hemorrhage in otherwise alert and neurologically intact patients.

**Meningitis**
- Do not delay IV antibiotics for LP
- Deliver first dose of dexamethasone with or before first dose of antibiotic therapy

# Headache

- see Neurology, N44

## Etiology

- **common and less serious**
  - common migraine (without aura)/classic migraine (with aura)
    - common: unilateral, throbbing, aggravated by activity, moderate/severe intensity, N/V, photo-/phonophobia
    - classic: fully reversible aura symptoms that precede headache, e.g. flashing lights, pins and needles (paresthesia), loss of vision, dysarthria
    - treatment: simple analgesics (NSAIDs, acetaminophen, aspirin), antiemetics, triptans
    - family doctor to consider prophylactic treatment
  - tension headache
    - bilateral, non-throbbing, not aggravated by routine physical activity, mild-moderate intensity.
    - can last between 30 min to 7 d
    - triggered with stress, sleep deprivation
    - treatment: modify stressor(s), simple analgesics (NSAIDs, acetaminophen, aspirin)
- **less common but potentially fatal**
  - subarachnoid hemorrhage (SAH) (see Neurosurgery, NS18)
    - sudden onset, "worst headache of life," maximum intensity within minutes
    - increased pain with exertion, N/V, meningeal signs
    - diagnosis
      - new generation CT 100% sensitive within 6 h of onset (hyperattentuating signal around Circle of Willis)
      - LP if suspected SAH and normal CT after 6 h
    - management: urgent neurosurgery consult

- increased ICP
  - worse in morning, when supine or bending down, with cough or Valsalva
  - physical exam: neurological deficits, cranial nerve palsies, papilledema
  - diagnosis: CT head
  - management: consult neurosurgery
- meningitis (see Infectious Diseases, ID15)
  - flu-like symptoms (fever, N/V, malaise), meningeal signs, petechial rash
  - altered LOC and confusion
  - rule out increased ICP; if CT head and mental status normal, if no neurological signs and no papilledema, then do LP for diagnosis
  - treatment: early empiric antibiotics ± acyclovir, steroid therapy
- temporal arteritis (causes significant morbidity, blindness) (see Ophthalmology, OP35)
  - vasculitis of large and mid-sized arteries, gender 3:1 F:M, most commonly age >70 yr
  - headache, scalp tenderness, jaw claudication, arthralgia, myalgia, fever, malaise or weight loss
  - temporal artery tender on palpation, relative afferent pupillary defect (RAPD), optic disc edema on fundoscopy
  - labs: elevated ESR, CRP
  - temporal artery biopsy is gold standard for diagnosis
  - associated with polymyalgia rheumatica
  - treatment: high-dose steroids immediately if suspected, no need to hold treatment until pathology results

**Parenteral Dexamethasone for Preventing Recurrence of Acute Severe Migraine Headache**
BMJ 2008;336(7657):1359
**Purpose:** To examine effectiveness of parenteral corticosteroids for relief of acute sevaere migraine headache and prevention of recurrent headaches.
**Methods:** Meta-analysis of RCTs comparing corticosteroids (alone or in combination with standard abortive therapy) to placebo or any other standard treatment for acute migraine in adults.
**Results:** Seven RCTs met eligibility criteria, all of which used standard abortive therapy and subsequently compared single dose parenteral dexamethasone to placebo. All trials examined pain relief and recurrence of headache within 72 hr. While dexamethasone and placebo were comparable for acute pain reduction (mean difference 0.37, 95% CI -0.20 to 0.94) and side effect profiles, dexamethasone provided lower recurrence rates (relative risk 0.75, 0.60 to 0.90; number needed to treat 9).
**Conclusion:** Single dose parenteral dexamethasone with standard abortive therapy is associated with a 26% relative reduction in headache recurrence within 72 h.

### Disposition
- admission: if underlying diagnosis is critical or emergent, if there are abnormal neurological findings, if patient is elderly or immunocompromised (atypical presentation), or if pain is refractory to oral medications
- discharge: assess for risk of narcotic misuse; most patients can be discharged with appropriate analgesia and follow-up with their family physician; instruct patients to return for fever, vomiting, neurologic changes, or increasing pain

## Joint and Back Pain

### JOINT PAIN (see Rheumatology, RH3)
- rule out life threatening causes e.g. septic joint (see Orthopedic Surgery, OR11)

### History and Physical Exam
- history: recent trauma, drug use (anticoagulants, glucocorticoids)
- associated symptoms: fever, constitutional symptoms, skin lesions, conjunctivitis, urethritis
- patterns of joint involvement: polyarticular vs. monoarticular, symmetric vs. asymmetric
- inflammatory symptoms: morning stiffness ≥30 min, pain/stiffness that ease with activity, mid-day fatigue, soft tissue swelling
- non-inflammatory symptoms: morning stiffness <30 min, stiffness short-lived after inactivity, increasing pain with activity
- assess for pain with ROM, localized joint pain, effusion, erythema, warmth, swelling, inability to bear weight, fever; may indicate presence of septic joint

### Investigations
- blood work: CBC, ESR, CRP, WBC, INR/PTT, blood cultures, urate
- joint x-ray ± contralateral joint for comparison
- bedside U/S to identify effusion
- test joint aspirate for: culture, WBC, polynuclear cells, glucose, Gram stain, crystals

### Management
- septic joint: empiric IV antibiotics ± joint decompression and drainage
- crystalline synovitis: NSAIDs at high dose, colchicine within first 24 h, corticosteroids
  - do not use allopurinol, as it may worsen acute attack
- acute polyarthritis: NSAIDs, analgesics (acetaminophen ± opioids), local or systemic corticosteroids
- osteoarthritis: NSAIDs, acetaminophen
- soft tissue pain: allow healing with enforced rest ± immobilization
  - non-pharmacologic treatment: local heat or cold, electrical stimulation, massage
  - pharmacologic: oral analgesics, NSAIDs, muscle relaxants, corticosteroid injections, topical agents

### BACK PAIN (see Family Medicine, FM37)
- rule out extraspinal emergencies: aortic dissection, AAA, PE, MI, retroperitoneal bleed, pancreatitis
- rule out spinal emergencies: osteomyelitis, cauda equina, epidural abscess or hematoma, spinal fracture

### History and Physical Exam
- evaluate risk for fracture (osteoporosis, age), infection (IV drug user, recent spinal intervention, immunosuppression), cancer, vascular causes (cardiac risk factors)
- typical musculoskeletal back pain is moderate, worse with movement or cough with no visceral symptoms
- assess vital signs, perform precordial, abdominal, and neurologic examination of lower extremities

### Investigations
- reserve imaging for suspicion of emergencies, metastases, and patients at high risk of fracture, infection, cancer, or vascular causes
- WBC, ESR, CRP, U/A

### Management
- treat underlying cause
- lumbosacral strain and disc herniation: analgesia and continue daily activities as much as tolerated; discuss red flags and organize follow-up
- spinal infection: early IV antibiotics and ID consultation
- cauda equina: dexamethasone, early neurosurgical consultation

**Red Flags for Back Pain**
**B**owel or bladder dysfunction
**A**nesthesia (saddle)
**C**onstitutional symptoms
**K - C**hronic disease, Constant pain
**P**aresthesia
**A**ge >50 and mild trauma
**I**V drug use/infection
**N**euromotor deficits

## Seizures

- see Neurology, N18

### Definition
- paroxysmal alteration of behaviour and/or EEG changes resulting from abnormal, excessive activity of neurons
- status epilepticus: continuous or intermittent seizure activity for greater than 5 min without regaining consciousness (life threatening)

### Categories
- generalized seizure (consciousness always lost): tonic/clonic, absence, myoclonic, atonic
- partial seizure (focal): simple partial, complex partial
- causes: primary seizure disorder, structural (trauma, intracranial hemorrhage, infection, increased ICP), metabolic disturbance (hypo-/hyperglycemia, hypo-/hypernatremia, hypocalcemia, hypomagnesemia, toxins/drugs)
- differential diagnosis: syncope, stroke/TIA, pseudoseizures, migraines, movement disorders, narcolepsy/cataplexy

### History and Physical Exam
- history of seizures, identify potential precipitants (illness, alcohol use, sleep deprivation)
- preceding aura, rapid onset, brief duration, alterations in consciousness, tonic-clonic movements, and post-ictal symptoms would suggest a seizure
- common signs include loss of bladder/bowel control, tongue biting, emesis and aspiration
- perform vitals, complete neurologic examination and look for injuries to head, spine, and shoulder (dislocations)

**Table 17. Concurrent Investigation and Management of Status Epilepticus**

| Timing | Steps |
|---|---|
| **Immediate** | Protect airway with positioning; intubate if airway compromised or elevated ICP<br>Monitor: vital signs, ECG, oximetry; bedside blood glucose<br>Establish IV access<br>Benzodiazepine - IV lorazepam 2 mg at 2mg/min up to 10 mg or IM midazolam 5mg up to 10mg; repeat at 10 min if ineffective<br>Fluid resuscitation<br>IV dextrose if glucose <60 mg/dL<br>Give 50 mL 50% glucose (preceded by thiamine 100 mg IM in adults)<br>Obtain blood samples for glucose, CBC, electrolytes, $Ca^{2+}$, $Mg^{2+}$, toxins, and antiepileptic drug levels; consider prolactin, β-hCG<br>Vasopressor support if sBP <90 or MAP <70 mmHg |
| **Urgent** | Establish second IV line, urinary catheter<br>If status persists, phenytoin 20 mg/kg IV at 25-50 mg/min in adults; may give additional 10 mg/kg IV 10 min after loading infusion<br>If seizure resolves, antiepileptic drug still required to prevent recurrence<br>EEG monitoring to evaluate for non-convulsive status epilepticus |
| **Refractory** | If status persists after maximum doses above, consult ICU and start one or more of:<br>Phenobarbital 20 mg/kg IV at 50 mg/min<br>Midazolam 0.2 mg/kg IV loading dose and 0.1-0.4 mg/kg/h<br>Propofol 2 mg/kg IV at 2-5 mg/kg/h then loading dose then 2-10 mg/kg/h |
| **Post-Seizure** | Investigate underlying cause: consider CT, LP, MRI, intracranial pressure monitoring |

Note: All interventions should be done as soon as possible
Adapted from Brophy et al. Guidelines for the Evaluation and Management of Status Epilepticus. *Neurocrit Care* 2012;17:3-23

**Minimum Workup in an Adult with 1st Time Seizure**
CBC and differential
Electrolytes including $Ca^{2+}$, $Mg^{2+}$, $PO_4^{3-}$
Head CT

If administering phenytoin, patient must be on a cardiac monitor as dysrhythmias and/or hypotension may occur

If IV access is not feasible, midazolam 0.2 mg/kg IM up to 10 mg can be used for initial control of seizure in adults

### Disposition
- decision to admit or discharge should be based on the underlying disease process identified
  - if a patient has returned to baseline function and is neurologically intact, then consider discharge with outpatient follow-up
- first-time seizure patients being discharged should be referred to a neurologist for follow-up
- admitted patients should generally have a neurology consult
- patient should not drive until medically cleared (local regulations vary)
  - complete notification form to appropriate authority regarding ability to drive
- warn regarding other safety concerns (e.g. no swimming, bathing children alone, etc.)

# Shortness of Breath

- see Respirology, R3 and Cardiology and Cardiac Surgery, C5

**Table 18. Differential Diagnosis for Dyspnea**

| | High Mortality/Morbidity | Usually Less Emergent |
|---|---|---|
| **Respiratory** | Airway obstruction (foreign body, epiglottitis, abscess, anaphylaxis)<br>Pneumo/hemothorax<br>Gas exchange – pulmonary edema, PE, pneumonia,<br>Acute exacerbations of COPD | Chronic obstructive, interstitial or restrictive lung disease<br>Pleural effusion |
| **Cardiac** | CHF, MI, valvular disease, tamponade, arrhythmia | Chronic CHF, angina |
| **Metabolic** | Metabolic acidosis NYD, carbon monoxide inhalation | Anemia, Hemoglobinopathy |
| **Neuromuscular** | Myasthenia gravis, diaphragmatic paralysis | CNS lesion, primary muscle weakness |
| **Other** | | Anxiety, deconditioning |

## History and Physical Exam

- acute SOB is often due to a relatively limited number of conditions; associated symptoms and signs are key to the appropriate diagnosis
  - substernal chest pain with cardiac ischemia
  - fever, cough, and sputum with respiratory infections
  - urticaria with anaphylaxis
  - wheezing with acute bronchospasm
  - environmental or occupational exposures
- dyspnea may be the sole complaint and the physical exam may reveal few abnormalities (e.g. PE, pneumothorax)
- vitals including pulse oximetry
  - wheeze and stridor (airway) vs. crackles (parenchymal), JVP, and murmurs

## Investigations

- blood work
  - CBC and differential (hematocrit to exclude anemia), electrolytes, consider ABG/VBG
  - serial cardiac enzymes and ECG if considering cardiac source
  - Wells scores to consider appropriateness of D-dimer
- imaging
  - CXR (hyperinflation and bullous disease suggestive of obstructive lung disease, or changes in interstitial markings consistent with inflammation, infection, or interstitial fluid)
  - CT chest usually is not indicated in the initial evaluation of patients with dyspnea, but can be valuable in patients with interstitial lung disease, occult emphysema, or chronic thromboembolic disease (i.e. PE)

## Management of Life-Threatening Dyspnea NYD

- see *Primary and Secondary Surveys*, ER2
- treat underlying cause

## Disposition

- the history and physical exam lead to accurate diagnoses in patients with dyspnea in approximately two-thirds of cases; the decision to admit or discharge should be based on the underlying disease process identified
  - consider intubation in $CO_2$ retainers (e.g. COPD)
- if discharging, organize follow-up and educate regarding signs to return to hospital

# Syncope

## Definition

- sudden, transient loss of consciousness and postural tone with spontaneous recovery
- usually caused by generalized cerebral or reticular activating system (brainstem) hypoperfusion

## Etiology

- cardiogenic: dysrhythmia, outflow obstruction (e.g. PE, pulmonary HTN), MI, valvular disease
- non-cardiogenic: peripheral vascular (hypovolemia), vasovagal, cerebrovascular disorders, CNS, metabolic disturbances (e.g. EtOH intoxication)

## History

- gather details from witnesses, and clarify patient's experience (e.g. dizziness, ataxia, or true syncope)
  - two key historical features: prodrome and situation (setting, patient posture)
- distinguish between syncope and seizure (see Neurology, N19)

  - some patients may have myoclonic jerks with syncope – NOT a seizure
    - signs and symptoms during presyncope, syncope, and postsyncope
    - past medical history, drugs
    - think anatomically in differential; pump (heart), blood, vessels, brain
- syncope is cardiogenic until proven otherwise if
  - there is sudden loss of consciousness with no warning or prodrome
  - syncope is accompanied by chest pain

### Physical Exam
- postural BP and HR
- cardiac, respiratory, and neurological exams
- examine for signs of secondary injury caused by syncopal episode (e.g. head injury)

### Investigations
- ECG (tachycardia, bradycardia, blocks, Wolff-Parkinson White, long QT interval, Brugada Syndrome, RV strain), bedside glucose
- consider blood work: CBC, electrolytes, BUN/Cr, ABGs, troponin, $Ca^{2+}$, $Mg^{2+}$, β-hCG, D-dimer
- consider toxicology screen

### Management
- ABCs, IV, $O_2$, monitor
- cardiogenic syncope: admit to medicine/cardiology
- low risk syncope: discharge with follow-up as indicated by cause (non-cardiogenic syncope may still be admitted)

### Disposition
- decision to admit is based on etiology
- most patients will be discharged
- on discharge, instruct patient to follow-up with family physician
  - educate about avoiding orthostatic or situational syncope
  - evaluate the patient for fitness to drive or work
  - patients with recurrent syncope should avoid high-risk activities (e.g. driving)

**Causes of Syncope by System**

**HEAD, HEART, VeSSELS**
**H**ypoxia/Hypoglycemia
**E**pilepsy
**A**nxiety
**D**ysfunctional brainstem
**H**eart attack
**E**mbolism (PE)
**A**ortic obstruction
**R**hythm disturbance
**T**achycardia
**V**asovagal
**S**ituational
**S**ubclavian steal
**E**NT (glossopharyngeal neuralgia)
**L**ow systemic vascular resistance
**S**ensitive carotid sinus

**San Francisco Syncope Rule: High risk of adverse outcomes in syncope patients if:**

**CHESS**
**C**HF: Hx of CHF
**H**ct: Low
**E**CG: Abnormal
**S**OB: Hx of dyspnea
**S**BP: sBP <90 at triage

# Sexual Assault

### Epidemiology
- 1 in 5 women and 1 in 71 men will be sexually assaulted in their lifetime; only 7% are reported

### General Approach
- ABCs, treat acute, serious injuries; physician priority is to treat medical issues and provide clearance
- ensure patient is not left alone and provide ongoing emotional support
- obtain consent for medical exam and treatment, collection of evidence, disclosure to police (notify police as soon as consent obtained)
- Sexual Assault Kit (document injuries, collect evidence) if <72 h since assault
- label samples immediately and pass directly to police
- offer community crisis resources (e.g. shelter, hotline)
- do not report unless victim requests or if <16 yr old (legally required)

### History
- ensure privacy for the patient – others should be asked to leave
- questions to ask: who, when, where did penetration occur, what happened, any weapons, or physical assault?
- post-assault activities (urination, defecation, change of clothes, shower, douche, etc.)
- gynecologic history
  - gravidity, parity, last menstrual period
  - contraception use
  - last voluntary intercourse (sperm motile 6-12 h in vagina, 5 d in cervix)
- medical history: acute injury/illness, chronic diseases, psychiatric history, medications, allergies, etc.

### Physical Exam
- never re-traumatize a patient with the examination
- general examination
  - mental status
  - sexual maturity
  - patient should remove clothes and place in paper bag
  - document abrasions, bruises, lacerations, torn frenulum/broken teeth (indicates oral penetration)

Interprofessional teams are key; many centres or regions have sexual assault teams who specialize in the assessment and treatment of sexual assault victims, leaving emergency physicians responsible only for significant injuries and medical clearance

- pelvic exam and specimen collection
  - ideally before urination or defecation
  - examine for seminal stains, hymen, signs of trauma
  - collect moistened swabs of dried seminal stains
  - pubic hair combings and cuttings
  - speculum exam
    - lubricate with water only
    - vaginal lacerations, foreign bodies
    - Pap smear, oral/cervical/rectal culture for gonorrhea and chlamydia
    - posterior fornix secretions if present or aspiration of saline irrigation
    - immediate wet smear for motile sperm
    - air-dried slides for immotile sperm, acid phosphatase, ABO group
- fingernail scrapings and saliva sample from victim

### Investigations
- Venereal Disease Research Lab (VDRL): repeat in 3 mo if negative
- serum β-hCG
- blood for ABO group, Rh type, baseline serology (e.g. hepatitis, HIV)

### Management
- involve local/regional sexual assault team (sexual assault forensic examiner or sexual assault nurse examiner)
- medical
  - suture lacerations, tetanus prophylaxis
  - gynecology consult for foreign body, complex lacerations
  - assume positive for gonorrhea and chlamydia
    - management: azithromycin 1 g PO x 1 dose (alt: doxycycline 100 mg PO bid x 10 d) and ceftriaxone 250 mg IM x 1 dose
  - may start prophylaxis for hepatitis B and HIV
  - pre and post counselling for HIV testing
  - pregnancy prophylaxis offered
    - levonorgestrel 1.5 g PO STAT (Plan B®)
- psychological
  - high incidence of psychological sequelae
  - have victim change and shower after exam completed

### Disposition
- discharge if injuries/social situation permit
- follow-up with physician in rape crisis centre within 24 h for repeat pregnancy and STI testing.
- best if patient does not leave ED alone

## DOMESTIC VIOLENCE
- women are usually the victims, but male victimization also occurs
- identify the problem (need high index of suspicion)
  - suggestive injuries (bruises, sprains, abrasions, occasionally fractures, burns, or other injuries; often inconsistent with history provided)
  - somatic symptoms (chronic and vague complaints)
  - psychosocial symptoms
  - clinician impression (your 'gut feeling', e.g. overbearing partner that won't leave patient's side)
- if disclosed, be supportive and assess danger
- patient must consent to follow-up investigation/reporting (unless for children)

### Management
- treat injuries and document findings
- ask about sexual assault and children at home (encourage notification of police)
- safety plan with good follow-up with family physician/social worker

# Medical Emergencies

## Anaphylaxis and Allergic Reactions

### Etiology
- anaphylaxis is an exaggerated immune mediated hypersensitivity reaction that leads to systemic histamine release, increased vascular permeability, and vasodilation; regardless of the etiology, the presentation and management of anaphylactic reactions are the same
- allergic (re-exposure to allergen)
- non-allergic (e.g. exercise induced)

**Most Common Triggers for Anaphylaxis**
- Foods (nuts, shellfish, etc.)
- Stings
- Drugs (penicillin, NSAIDs, ACEI)
- Radiographic contrast media
- Blood products
- Latex

### Diagnostic Criteria
- anaphylaxis is highly likely with any of:
  1. acute onset of an illness (min to hrs) with involvement of the skin, mucosal tissue and at least one of
     - respiratory compromise (e.g. dyspnea, wheeze, stridor, hypoxemia)
     - hypotension/end-organ dysfunction (e.g. hypotonia, collapse, syncope, incontinence)
  2. two or more of the following after exposure to a LIKELY allergen for that patient (min to hrs)
     - involvement of the skin-mucosal tissue
     - respiratory compromise
     - hypotension or associated symptoms
     - persistent gastrointestinal symptoms (e.g. crampy abdominal pain, vomiting)
  3. hypotension after exposure to a KNOWN allergen for that patient (min to h)
     - management is also appropriate in cases which do not fulfill criteria, but who have had previous episodes of anaphylaxis
     - life-threatening differentials for anaphylaxis include asthma and septic shock
     - angioedema may mimic anaphylaxis but tends not to improve with standard anaphylaxis treatment

Anaphylaxis should be suspected if airway, breathing, or especially circulation compromise is present after exposure to a known allergen

Hypotension is defined as systolic BP >30% decrease from baseline or
- ≥11 yr: <90 mmHg
- 1-10 yr: <70 mmHg + (2 x age)
- 1 mo-1 yr: <70 mmHg

### Management
- moderate reaction: generalized urticaria, angioedema, wheezing, tachycardia
  - epinephrine (1:1000) 0.3-0.5 mg (IM in anterolateral thigh)
  - antihistamines: diphenhydramine (Benadryl®) 25-50 mg PO/IV
  - salbutamol (Ventolin®) 1 cc via MDI
- severe reaction/evolution: severe wheezing, laryngeal/pulmonary edema, shock
  - ABCs, may need definitive airway (e.g. ETT) due to airway edema
  - epinephrine (1:1000) 1-10 µg/min IV (or via ETT if no IV access) titrated to desired effect
  - antihistamines: diphenhydramine (Benadryl®) 50 mg IV (~1 mg/kg)
  - glucocorticoids: methylprednisolone 125-250 mg IV or prednisone/prednisolone 40-60 mg PO
  - large volumes of crystalloid may be required

Early epinephrine is lifesaving and there are no absolute contraindications

**Pediatric Dosing**
- Epinephrine: 0.01 mg/kg IM up to 0.5mg q5-10min
- Initial crystalloid bolus: 20-30 mL/kg, reassess
- Epinephrine infusion: 0.1-1.5 µg/kg/min
- Diphenhydramine: 1 mg/kg PO/IV q4-6h
- Ranitidine: 1 mg/kg PO/IV
- Methylprednisolone: 1-2 mg/kg IV

### Disposition
- monitor for 4-8 h in ED (minimum) and arrange follow-up with family physician in 24-48 h
- can have second phase (biphasic) reaction up to 72 h later, patient may need to be supervised
- educate patient on avoidance of allergens
- medications
  - H1 antagonist (cetirizine 10 mg PO OD or Benadryl® 50 mg PO q4-6h x3d)
  - H2 antagonist (ranitidine 150 mg PO OD x3d)
  - corticosteroid (prednisone 50 mg PO OD x5d) to prevent secondary reaction

## Asthma

- see Respirology, R7
- chronic inflammatory airway disease with episodes of bronchospasm and inflammation resulting in reversible airflow obstruction

### History and Physical
- find cause(s) of asthma exacerbation (viral, environmental, etc.)
- history of asthma control; severity of exacerbations (ICU, intubation history)
- signs of respiratory distress
- vitals, specifically $O_2$

### Investigations
- peak flow metre
- ± ABG if in severe respiratory distress
- CXR if diagnosis in doubt to rule out pneumonia, pneumothorax, etc.

Beware of the silent chest in asthma exacerbations. This is a medical emergency and may require emergency intubation

**Elements of Well-Controlled Asthma**
Can Respir J 2010;17(1):15-24
- Daytime symptoms <4x/wk
- Nocturnal symptoms <1x/wk
- No limitation in activity
- No absence from work/school
- Rescue inhaler use <4x/wk
- $FEV_1$ <90% personal best
- PEF <10-15% diurnal variation
- Mild infrequent exacerbations

**Table 19. Asthma Assessment and Management**

| Classifications | History and Physical Exam | Management |
|---|---|---|
| **Respiratory Arrest Imminent** | Exhausted, confused, diaphoretic, cyanotic<br>Silent chest, ineffective respiratory effort<br>Decreased HR, RR>30, $pCO_2$>45 mmHg<br>$O_2$ sat <90% despite supplemental $O_2$ | 100% $O_2$, cardiac monitor, IV access<br>Intubate (consider induction with ketamine)<br>Short acting β-agonist (Ventolin®): nebulizer 5 mg continually<br>Short-acting anticholinergic (Atrovent®): nebulizer 0.5 mg x 3<br>IV steroids: methylprednisolone 125 mg |
| **Severe Asthma** | Agitated, diaphoretic, laboured respirations<br>Speaking in words<br>No relief from β-agonist<br>$O_2$ sat <90%, $FEV_1$ <50% | Anticipate need for intubation<br>Similar to above management<br>Magnesium sulphate 2 g IV<br>$O_2$ to achieve $O_2$ sat >92% |
| **Moderate Asthma** | SOB at rest, cough, congestion, chest tightness<br>Speaking in phrases<br>Inadequate relief from β-agonist<br>$FEV_1$ 50-80% | $O_2$ to achieve $O_2$ sat >92%<br>Short-acting β-agonist (Ventolin®): MDI or nebulizer q5min<br>Short-acting Anticholinergic (Atrovent®): MDI or nebs x 3<br>Steroids: prednisone 40-60 mg PO |
| **Mild Asthma** | Exertional SOB/cough with some nocturnal symptoms<br>Difficulty finishing sentences<br>$FEV_1$ >80% | β-agonist<br>Monitor $FEV_1$<br>Consider steroids (MDI or PO) |

### Disposition

- discharge safe in patients with $FEV_1$ or PEF >60% predicted, and may be safe if $FEV_1$ or PEF 40-60% predicted based on patient's risk factors for recurrence of severe attack
  - risk factors for recurrence: frequent ED visits, frequent hospitalizations, recent steroid use, recent exacerbation, poor medication compliance, prolonged use of high dose β-agonists
- β-agonist MDI with aerochamber 2-4 puffs q2-4h until symptoms controlled, then prn
- initiate inhaled corticosteroids with aerochamber if not already prescribed
- if moderate to severe attack, administer prednisone 30-60 mg/d for 5-10 d with no taper
- counsel on medication adherence and educate on use of aerochamber
  - follow-up with primary care physician or asthma specialist

**Combined Inhaled Beta-Agonist and Anticholinergic Agents for Emergency Management in Adults with Asthma**
Cochrane DB Syst Rev 2017:CD001284
**Objectives**: Determine the effectiveness of combined SAAC + SABA inhaled therapy vs. SABA alone to reduce hospitalization in adult patients presenting to emergency department with an exacerbation of asthma.
**Methods**: Systematic review of RCTs.
**Results**: 23 trials, 2724 patients. Combination inhaled therapy was associated with reduced likelihood of hospitalization (RR 0.72, 95% CI 0.59-0.87) for severe but not mild or moderate asthma exacerbations. Combination therapy was also associated with improved FEV1 (MD 0.25L, 95% CI 0.02-0.48) and PEF (MD 24.88, 95% CI 14.83-34.93) and patients were less likely to return to ED for additional care (RR 0.80, 95% CI 0.66-0.98). In contrast, patients receiving combination therapy were more likely to experience adverse events than those treated with SABA alone (OR 2.03, 95% CI 1.28-3.20).
**Conclusions**: Combination SAAC + SABA therapy reduces hospitalizations and improves pulmonary function in adults presenting to the emergency department with acute asthma. However, adults receiving combination therapy were more likely experience adverse events, such as tremor, agitation, and palpitations, compared to patients receiving SABA alone.

# Cardiac Dysrhythmias

- see Cardiology and Cardiac Surgery, C18

### Bradydysrhythmias and AV Conduction Blocks

- AV conduction blocks
  - 1st degree: prolonged PR interval (>200 msec), no treatment required
  - 2nd degree
    - Mobitz I: gradual prolongation of PR interval then dropped QRS complex, usually benign
    - Mobitz II: PR interval constant with dropped QRS complex, can progress to 3rd degree AV block
  - 3rd degree: P wave unrelated to QRS complex, PP and RR intervals constant
    - atropine and transcutaneous pacing (atropine with caution)
    - if transcutaneous pacing fails consider IV dopamine, epinephrine
  - long-term treatment for Mobitz II and 3rd degree block – internal pacemaker
- sinus bradycardia (rate <60 bpm)
  - can be normal (especially in athletes)
  - causes: vagal stimulation, vomiting, myocardial infarction/ischemia, increased ICP, sick sinus node, hypothyroidism, drugs (e.g. β-blockers, calcium channel blockers)
  - treat if symptomatic (hypotension, chest pain)
    - acute: atropine ± transcutaneous pacing
    - sick sinus: transcutaneous pacing
    - drug induced: discontinue/reduce offending drug, consider antidotes

**Adenosine Versus Intravenous Calcium Channel Antagonists For Supraventricular Tachycardia**
Cochrane DB Syst Rev 2017: CD005154
**Objectives**: Compare adenosine versus calcium channel antagonists in terminating supraventricular tachycardia.
**Methods**: Systematic review of RCTs for any patient presenting with an supraventricular tachycardia.
**Results**: 7 RCTs, 622 participants. Moderate-quality evidence shows no differences in the number or people reverting to sinus rhythm who were treated with adenosine or calcium channel antagonist (89.7% vs. 92.9%, OR 1.51). Low-quality evidence suggests no differences in major adverse event rates.
Conclusions: Moderate-quality evidence shows no differences in effects of adenosine and calcium channel antagonists for treatment of supraventricular tachycardia on reverting to sinus rhythm, and low-quality evidence suggests no differences in the incidence of hypotension

### Supraventricular Tachydysrhythmias (narrow QRS)

- sinus tachycardia (rate >100 bpm)
  - causes: increased sympathetic tone, drugs, fever, hypotension, anemia, thyrotoxicosis, MI, PE, emotional, pain, etc.
  - search for and treat underlying cause, consider β-blocker if symptomatic
- regular rhythm (i.e. not sinus tachycardia)
  - vagal maneuvers (carotid massage, Valsalva), adenosine 6 mg IV push, if no conversion give 12 mg, can repeat 12 mg dose once
  - rhythm converts: probable re-entry tachycardia (AVNRT more common than AVRT)
    - monitor for recurrence
    - treat recurrence with adenosine or longer acting medications
  - rhythm does not convert: atrial flutter, ectopic atrial tachycardia, junctional tachycardia
    - rate control (diltiazem, β-blockers) and consult cardiology
- irregular rhythm
  - probable AFib, atrial flutter, or multifocal atrial tachycardia
  - rate control (diltiazem, β-blockers)

If the patient with tachydysrhythmia is unstable, perform immediate synchronized cardioversion

### Atrial Fibrillation

- most common sustained dysrhythmia; no organized P waves (atrial rate >300/min), irregularly irregular heart rate, narrow QRS (typically)
- etiology: HTN, CAD, thyrotoxicosis, EtOH (holiday heart), valvular disease, pericarditis, cardiomyopathy, sick sinus syndrome
- treatment principles: stroke prevention, treat symptoms, identify/treat underlying cause
- decreases cardiac output by 20-30% (due to loss of organized atrial contractions)
- acute management
  - if unstable: immediate synchronized cardioversion
  - if onset of AFib is >48 h: rate control, anticoagulate 3 wk prior to and 4 wk after cardioversion, or do transesophageal echocardiogram to rule out clot
  - if onset <48 h or already anticoagulated: may cardiovert
- electrical cardioversion: synchronized direct current (DC) cardioversion
- chemical cardioversion: procainamide, flecainide, propafenone
- long-term management: rate or rhythm control, consider anticoagulation (see Cardiology and Cardiac Surgery, *CHADS2 score* C20)

If patient has Wolff-Parkinson-White and is in AFib use amiodarone or procainamide; avoid AV nodal blocking agents (adenosine, digoxin, diltiazem, verapamil, β-blockers), as this can increase conduction through bypass tract, leading to cardiac arrest

**Causes of Atrial Fibrillation**

**C ("sea") PIRATES**
**C**HF, Cardiomyopathy
**P**ulmonary embolism
**I**schemic heart disease
**R**heumatic or valvular disease
**A**nemia
**T**hyroid
**E**tOH, Elevated blood pressure
**S**ick Sinus, Stress - surgery, sepsis

### Ventricular Tachydysrhythmias (wide QRS)

- VTach (rate usually 140-200 bpm)
  - definition: 3 or more consecutive ventricular beats at >100 bpm
  - etiology: CAD with MI is most common cause
  - treatment: sustained VTach (>30 s) is an emergency
    - hemodynamic compromise: synchronized DC cardioversion
    - no hemodynamic compromise: synchronized DC cardioversion, amiodarone, procainamide
- VFib: call a code blue, follow ACLS for pulseless arrest
- Torsades de pointes
  - looks like VTach but QRS 'rotates around baseline' with changing axis and amplitude (twisted ribbon)
  - etiology: prolonged QT due to drugs (e.g. quinidine, TCAs, erythromycin, quinolones), electrolyte imbalance (hypokalemia, hypomagnesemia), congenital
  - treatment
    - IV $Mg^{2+}$, temporary overdrive pacing, isoproterenol
    - correct cause of prolonged QT

## Acute Exacerbation of COPD (AECOPD)

- see Respirology, *Chronic Management of COPD* R9
- progressive development of irreversible airway obstruction, typically caused by smoking

### History and Physical Exam

- cardinal symptoms of AECOPD: increased dyspnea, increased coughing frequency or severity, increased sputum volume or purulence
- triggers: virus, pneumonia, urinary tract infection, PE, CHF, MI, drugs
- characterize previous episodes and hospitalizations, smoking history
- vital signs, LOC, signs of respiratory distress, respiratory exam

**Physical Exam Findings in COPD**
- Wheeze
- Maximum laryngeal height ≤4 cm
- Forced expiratory time ≥6 s
- Decreased breath sounds
- Decreased cardiac dullness

### Investigations

- CBC, electrolytes, CXR, ECG, consider ABG
- PFTs are NOT useful in managing acute exacerbations

**Need to Rule Out with COPD Exacerbation**
- Pneumothorax
- CHF exacerbation
- Acute MI
- Pneumonia and other infectious causes
- PE

### Management

- oxygen: keep $O_2$ sat 88-92% (be aware when giving $O_2$ to chronic hypercapnic/$CO_2$ retainers but do not withhold $O_2$ if hypoxic)
- bronchodilators: short-acting β-agonist (salbutamol 4-8 puffs via MDI with spacer q15min x3 prn) ± short-acting anticholinergic (ipratropium 0.5 mg via MDI q30min x3 prn)
- steroids: prednisone 40-60 mg PO for 7-14 d, or methylprednisolone 1-2 mg/kg IV if severe exacerbation, or unable to take PO
- antibiotics: TMP-SMX, cephalosporins, respiratory quinolones (given if all 3 cardinal symptoms present or 2 cardinal symptoms with increased sputum purulence or mechanical ventilation)
- ventilation: apply noninvasive positive-pressure ventilation (CPAP or BiPAP) if severe distress or signs of fatigue, arterial pH <7.35, or hypercapnic
- if life-threatening, ICU admission for intubation and ventilation (chance of ventilation dependency)

### Disposition

- no guidelines for admission - based on clinical judgement and comorbidities
- lower threshold to admit if comorbid illness (diabetes, CHF, CAD, alcohol abuse)
- if discharging, use antibiotics, taper steroids, up to 4-6 puffs qid of ipratropium and salbutamol and organize follow-up

# Acute Decompensated Heart Failure (ADHF)

- see Cardiology and Cardiac Surgery, C34

## Etiology

- causes of CHF: decreased myocardial contractility (ischemia, infarction, cardiomyopathy, myocarditis), pressure overload states (HTN, valve abnormalities, congenital heart disease), restricted cardiac output (myocardial infiltrative disease, cardiac tamponade)
- precipitants of acute decompensation of CHF
  - cardiac (ischemia, infarction, arrhythmia - Afib)
  - medications (β-blockers, CCBs, NSAIDs, steroids, non-compliance)
  - dietary (increased sodium and/or water intake)
  - high output (anemia, infection, pregnancy, hyperthyroid)
  - other (renal failure, hypertensive crisis, iatrogenic fluid overload - blood transfusions or IV fluids)

## Presentation

- left-sided heart failure
  - dyspnea, SOBOE, orthopnea, PND, nocturia, fatigue, altered mental status, presyncope/syncope, angina, systemic hypotension
  - hypoxia, decreased air entry to lungs, crackles, S3 or S4, pulmonary edema (on CXR), pleural effusion (usually right-sided)
- right-sided heart failure
  - dependent bilateral pitting edema, JVP elevation and positive AJR, ascites, hepatomegaly
- patients often present with a combination of right-sided and left-sided symptoms

## Investigations

- blood work: CBC, electrolytes, AST, ALT, bilirubin, Cr, BUN, cardiac enzymes, brain natriuretic peptide
- CXR: most useful test (see sidebar)
- ECG: look for MI, ischemia (ST elevation/depression, T-wave inversion), LVH, atrial enlargement, conduction abnormalities
- bedside ultrasound: wall motion abnormalities, ejection fraction, rule out cardiac tamponade
- echocardiogram: LV function, structural heart disease
- rule out other serious diagnoses: PE, pneumothorax, pneumonia/empyema, acute exacerbations COPD

## Management

- ABCs, may require intubation if severe hypoxia
- sit upright, cardiac monitoring, and continuous pulse oximetry
- saline lock IV, Foley catheter due to diuretic therapy
- 100% $O_2$ by mask
  - if poor response, may require BiPAP or intubation
- medical
  - diuretic (if volume overloaded): furosemide 0.5-1 mg/kg IV
  - vasodilators (if sBP >100): nitroglycerin 0.4 mg SL q5min prn ± topical Nitrodur® patch (0.4-0.8 mg/h)
    - if patient not responding to treatment or showing signs of ischemia (angina): nitroglycerine 5-10 µg/min IV, titrate to response
  - inotropes/vasopressors (if sBP <90)
    - without signs of shock: dobutamine 2.5 µg/kg/min IV, titrate up to sBP >90 mmHg
    - with signs of shock: norepinephrine 8-12 µg/min, titrate up to sBP >90 mmHg
- treat precipitating factor - e.g. rate control (β-blocker, calcium channel blockers) or rhythm-control (electrical or chemical cardioversion) if new Afib
- cardiology or medicine consult

**Precipitants of CHF Exacerbation**

**FAILURE**
**F**orgot medication
**A**rrhythmia (Dysrhythmia)/**A**nemia
**I**schemia/**I**nfarction/**I**nfection
**L**ifestyle (e.g. high salt intake)
**U**pregulation of cardiac output (pregnancy, hyperthyroidism)
**R**enal failure
**E**mbolism (pulmonary)

**CHF on CXR**
- Pulmonary vascular redistribution
- Perihilar infiltrates
- Interstitial edema, Kerley B lines
- Alveolar edema, bilateral infiltrates
- May see cardiomegaly, pleural effusions
- Peribronchial cuffing
- Fissural thickening (fluid in fissure)

**Acute Treatment of CHF**

**LMNOP**
**L**asix® (furosemide)
**M**orphine
**N**itroglycerin
**O**xygen
**P**osition (sit upright), **P**ressure (BiPAP)

**Hospital Management Required if**
- Acute MI
- Pulmonary edema or severe respiratory distress
- Severe complicating medical illness (e.g. pneumonia)
- Anasarca
- Symptomatic hypotension or syncope
- Refractory to outpatient therapy
- Thromboembolic complications requiring interventions
- Clinically significant dysrhythmias
- Inadequate social support for safe outpatient management
- Persistent hypoxia requiring supplemental oxygen

# Venous Thromboembolism (VTE)

• see Respirology, R19

## Risk Factors

- Virchow's triad: alterations in blood flow (venous stasis), injury to endothelium (smoking, HTN, surgery, catheter, trauma), hypercoagulable state (including pregnancy, use of OCP, malignancy)
- clinical risk factors (see sidebar)

## DEEP VEIN THROMBOSIS (DVT)

### Presentation

- calf pain, unilateral leg swelling/erythema/edema, palpable cord along the deep venous system on exam; can be asymptomatic
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT; investigation often needed

### Investigations

- use Wells' criteria for DVT to guide investigations (see Figure 12)
- D-dimer is only useful for ruling out DVT, and a D-dimer test result should only be considered in cases where a low-moderate risk patient has a negative test (high sensitivity)
  - high risk of false positives in: elderly, infection, recent surgery, trauma, hemorrhage, late in pregnancy, liver disease, cancer
- U/S has high sensitivity & specificity for proximal clot but only 73% sensitivity for calf DVT (may need to repeat in 1 wk)
  - if positive – treat for DVT regardless of risk
  - if negative and low risk – rule out DVT
  - if negative and moderate to high risk – repeat U/S in 5-7 d to rule out DVT

### Management

- DOAC can be used in acute management of symptomatic DVT
  - rivaroxaban: 15 mg PO bid for first 21 d; 20 mg PO daily for remaining treatment (taken with food at the same time each day)
  - apixaban: 10 mg PO bid for first 7 d; 5 mg PO bid for remaining treatment
- LMWH unless patient also has renal failure
  - dalteparin 200 IU/kg SC q24h or enoxaparin 1 mg/kg SC q24h
- warfarin started at same time as LMWH (5 mg PO OD initially followed by dosing based on INR)
- LMWH discontinued when INR has been therapeutic (2-3) for 2 consecutive days
- consider thrombolysis if extensive DVT threatening limb compromise
- IVC filter or surgical thrombectomy considered if anticoagulation is contraindicated
- duration of anticoagulation: 3 mo if transient coagulopathy; 6 mo if unprovoked DVT; life-long if ongoing coagulopathy

## PULMONARY EMBOLISM (PE)

### Presentation

- dyspnea, pleuritic chest pain, hemoptysis, tachypnea, cyanosis, hypoxia, fever
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT; investigation often needed

### Investigations

- use Wells' criteria for PE to guide investigations (see Figure 13)
- PERC score alone can rule out PE in low risk patients (as determined by Wells' criteria) unless patient is pregnant
- ECG and CXR are useful to rule out other causes (e.g. ACS, pneumonia, pericarditis) or to support diagnosis of PE
  - ECG changes in PE: sinus tachycardia, right ventricular strain (S1Q3T3), T wave inversions in anterior and inferior leads
  - CXR findings in PE: Hampton's hump (triangular density extending from pleura) or Westermark's sign (dilatation of vessels proximal to an obstruction, with collapse of vessels distal to obstruction, often with a sharp cutoff)
- D-dimer is only useful at ruling out a PE if it is negative in low-moderate risk patients (highly sensitive)
  - if positive D-dimer or high-probability patient, then pursue CT angiography or V/Q scan
- CT angiography has high sensitivity and specificity for PE, may also indicate an alternative diagnosis
- V/Q scan useful in pregnancy, when CT angiography not available, or IV contrast contraindicated

### Management of PE

- treatment of PE with anticoagulation and duration of treatment is the same as for DVT (see above)
- consider thrombolysis if extensive PE causing hemodynamic compromise or cardiogenic shock
- catheter-directed thrombolysis or surgical thrombectomy may be considered in massive PE or if anticoagulation is contraindicated
- often can be treated as outpatient, may require analgesia for chest pain (narcotic or NSAID)

**Risk Factors for VTE**

**THROMBOSIS**
**T**rauma, travel
**H**ypercoagulable, HRT
**R**ecreational drugs (IVDU)
**O**ld (age >60 yr)
**M**alignancy
**B**irth control pill
**O**besity, obstetrics
**S**urgery, smoking
**I**mmobilization
**S**ickness (CHF, MI, nephrotic syndrome, vasculitis)

**Wells' Criteria for DVT**

| | |
|---|---|
| Active cancer | +1 |
| Paralysis, paresis or recent immobilization of leg | +1 |
| Recently bedridden x 3 d or major surgery within 4 wk | +1 |
| Local tenderness | +1 |
| Entire leg swollen | +1 |
| Calf swelling 3cm > asymptomatic leg | +1 |
| Unilateral pitting edema | +1 |
| Collateral superficial veins | +1 |
| Alternative Dx more likely | -2 |

0: Low probability
1-2: Moderate probability
>3: High probability

**Wells' Criteria for PE**

| | |
|---|---|
| Previous Hx of DVT/PE | +1.5 |
| HR >100 | +1.5 |
| Recent immobility or surgery | +1.5 |
| Clinical signs of DVT | +3 |
| Alternate Dx less likely than PE | +3 |
| Hemoptysis | +1 |
| Cancer | +1 |

<2: Low probability
2-6: Intermediate probability
>6: High probability

**PERC Score**

- Age >50 yr
- HR >100 bpm
- $O_2$ sat on RA <95%
- Prior history DVT/PE
- Recent trauma or surgery
- Hemoptysis
- Exogenous estrogen
- Clinical signs suggesting DVT

Score 1 for each question; a score 0/8 means patient has <1.6% chance having a PE and avoids further investigation. Caution using the PERC score in pregnant women as the original study excluded pregnant women

D-dimer is only useful if it is negative; negative predictive value >99%

- admit if hemodynamically unstable, require supplemental $O_2$, major comorbidities, lack of sufficient social supports, unable to ambulate, need invasive therapy
  - referral to medicine for coagulopathy and malignancy workup

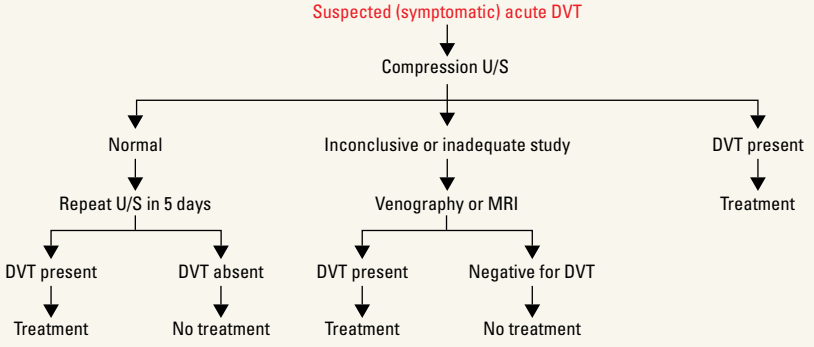

**Figure 12. Approach to suspected DVT**

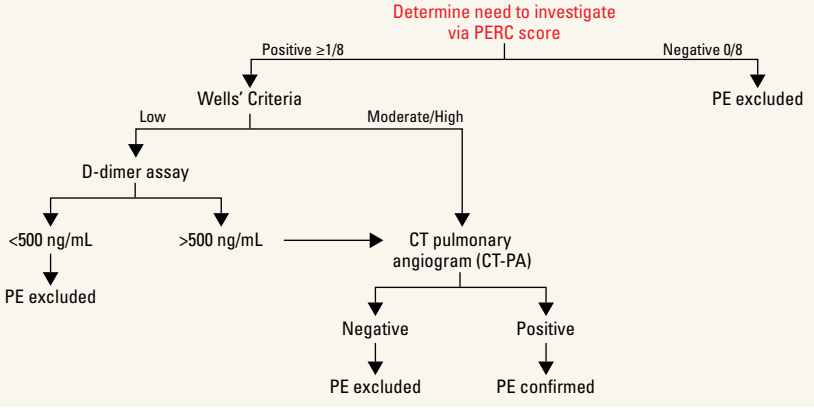

**Figure 13. Approach to suspected PE**

50% of patients with symptomatic proximal DVT will develop PE, often within days to weeks of the event

**Oral Direct Thrombin Inhibitors Or Oral Factor Xa Inhibitors For The Treatment Of Pulmonary Embolism**
Cochrane DB Syst Rev 2015:CD010957
**Objectives**: Assess effectiveness of oral direct thrombin inhibitors and oral factor Xa inhibitors for long-term treatment of PE.
**Methods**: Systematic review of RCTs in patients with confirmed PE receiving oral direct thrombin inhibitors or factor Xa inhibitors for minimum 3 mo.
**Results**: 5 RCTs, 7897 participants. No difference in the effectiveness of oral direct thrombin inhibitors vs. standard anticoagulation in preventing recurrent PE (OR 1.02, 95% CI 0.50-2.04), recurrent VTE (OR 0.93, 95% CI 0.52-1.66), DVT (OR 0.72, 95% CI 0.39-1.32), all-cause mortality (OR 1.16, 95% CI 0.79-1.70), or major bleeding (OR 0.97, 95% CI 0.59-1.62).
**Conclusions**: High quality evidence suggests there is no difference between oral direct thrombin inhibitors and standard anticoagulation in the prevention of recurrent pulmonary embolism. Moderate-high evidence suggests there is no difference in recurrent VTE, DVT, all-cause mortality, and major bleeding between DOACs and standard anticoagulation.

# Diabetic Emergencies

- see Endocrinology, E12

## Diabetic Ketoacidosis

- triad of hyperglycemia, ketosis, and acidosis due to severe insulin deficiency and counter-regulatory hormone excess
- clinical feature
  - often young, Type 1 DM patients (may rarely be first presentation of undiagnosed Type 2 DM), with symptoms evolving within a day
  - early signs and symptoms: polyuria, polydipsia, malaise, nocturia, weight loss
  - late signs and symptoms
    - GI: anorexia, nausea, vomiting, abdominal pain
    - neurological: fatigue, drowsiness, stupor, coma
    - respiratory: Kussmaul's respiration, dyspnea (often due to acidosis), fruity ketotic breath
- investigations
  - blood work: CBC, electrolytes, $Ca^{2+}$, $Mg^{2+}$, $PO_4^{3-}$, Cr, BUN, glucose, ketones, osmolality, AST/ALT/ALP, amylase, troponin
  - urine: glucose and ketones
  - ABG or VBG
  - ECG (MI is possible precipitant; electrolyte disturbances may predispose to dysrhythmia)
- management
  - rehydration
    - bolus of NS, then high rate NS infusion (beware of overhydration and cerebral edema, especially in pediatric patients)
    - beware of a pseudohyponatremia due to hyperglycemia (add 3 $Na^+$ per 10 glucose over 5.5 mmol/L)

- potassium
  - essential to avoid hypokalemia: replace KCl (20 mEq/L if adequate renal function and initial $K^+$ <5.5 mmol/L)
  - use cardiac monitoring if potassium levels normal or low
- insulin
  - critical, as this is the only way to inhibit gluconeogenesis/ketosis
  - do not give insulin if $K^+$ <3.3 mmol/L
  - followed by continuous infusion at 5-10 U (or 0.1 U/kg) per h
  - once the blood glucose <14 mmol/L, patient should receive their regular insulin SC injection and the infusion should be stopped in 1 h
  - add D5W to IV fluids when blood glucose <15 mmol/L to prevent hypoglycemia
- bicarbonate is not given unless patient is at risk of death or shock (typically pH <7.0)

**4 Criteria for DKA Dx**
- Hyperglycemia
- Metabolic acidosis
- Hyperketonemia
- Ketonuria

**Signs and Symptoms of DKA**
D: Diuresis, dehydration, drowsy, delirium, dizziness
K: Kusmaul's breathing, ketotic breath
A: Abdominal pain, anorexia

## Hyperosmolar Hyperglycemic State

- state of extreme hyperglycemia (44-133.2 mmol/L) due to relative insulin deficiency, counter-regulatory hormones excess, gluconeogenesis, and dehydration (due to osmotic diuresis)
- clinical feature
  - often older, Type 2 DM patients with more co-morbid illnesses and larger fluid losses with symptoms evolving over days to weeks, fewer GI symptoms and more neurological deficits than DKA including: mental disturbances, coma, delirium, seizures
  - polyuria, N/V
- investigations
  - blood work: CBC, electrolytes, $Ca^{2+}$, $Mg^{2+}$, $PO_4^{3-}$, Cr, BUN, glucose, ketones, osmolality
  - urine: glucose and ketones
  - ABG or VBG
  - find underlying cause: ECG, CXR, blood and urine C&S
- management
  - rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
  - $O_2$, cardiac monitoring, frequent electrolyte, and glucose monitoring
  - insulin is controversial
  - identify and treat precipitating factors, if present (the 5 Is)

**Precipitating Factors in DKA**

**The 5 Is**
**I**nfection
**I**schemia
**I**nfarction
**I**ntoxication
**I**nsulin missed

## Hypoglycemia

- characterized by Whipple's triad: low plasma glucose, symptoms suggestive of hypoglycemia, prompt resolution of symptoms when glucose administered
- clinical feature
  - neuroglycopenic symptoms: headaches, confusion, seizures, coma
  - autonomic symptoms: diaphoresis, nausea, hunger, tachycardia, palpitations
- history and physical exam
  - last meal, known DM, prior similar episodes, drug therapy, and compliance
  - liver/renal/endocrine/neoplastic disease
  - depression, alcohol or drug use
- management
  - IV access and rapid blood glucose measurement
  - D50W 50 mL IV push, glucose PO if mental status permits
  - if IV access not possible, glucagon 1-2 mg IM, repeat x 1 in 10-20 min
  - $O_2$, cardiac, frequent blood glucose monitoring
  - thiamine 100 mg IM (if alcohol abuse is suspected)
  - full meal as soon as mental status permits
  - if episode due to long-acting insulin, or sulfonylureas, watch for prolonged hypoglycemia due to long t1/2 (may require admission for monitoring)
  - search for cause (common causes include exogenous insulin, alcohol, or sulfonylureas)

**Causes of Hypoglycemia**
Most common: excessive insulin use in setting of poor PO intake
Common: alcohol intoxication, sepsis, liver disease, oral anti-hyperglycemics
Rare: insulinomas, hypopituitarism, adrenal insufficiency, med side effects

Cerebral edema may occur if hyperosmolality is treated too aggressively

# Electrolyte Disturbances

- see Nephrology, NP7

**Table 20. Electrolyte Disturbances**

| Electrolyte Disturbance | Common Causes | Symptoms | Treatment | Special Considerations |
|---|---|---|---|---|
| **Hypernatremia** | Inadequate $H_2O$ intake (elderly/disabled) or inappropriate excretion of $H_2O$ (diuretics, Li, and diabetes insipidus) | Lethargy, weakness, irritability, and edema; seizures and coma occur with severe elevations of $Na^+$ levels (>158 mmol/L) | Salt restrict and give normal saline until hemodynamically stable. Use half-normal saline once vitals are stable | No more than 12 mmol/L in 24 h drop in $Na^+$ (0.5 mmol/L/h) due to risk of cerebral edema, seizures, death |
| **Hyponatremia** | Hypovolemic (GI, renal, skin, blood fluid loss), euvolemic (SIADH/stress, adrenal insufficiency, hypothyroid, diet/intake), hypervolemic (CHF, cirrhosis, nephrotic syndrome) | Neurologic symptoms 2° to cerebral edema, headache, decreased LOC, depressed reflexes; chronic milder than acute | Hypovolemic: normal saline<br>Euvolemic: restrict water, eliminate underlying cause<br>Hypervolemic: restrict fluid and sodium, loop diuretic if severe.<br><br>3% hypertonic saline if seizure or coma | Limit total rise to 8 mmol/L in 24 h (0.25 mmol/L/h maximum) as patients are at risk of osmotic demyelinating syndrome (ODS) |
| **Hyperkalemia** | Rhabdomyolysis, insulin deficiency, metabolic acidosis (e.g. acute renal failure, missed dialysis) | Nausea, palpitations, muscle stiffness, areflexia | Protect heart: calcium gluconate<br>Shift $K^+$ into cells: D50W + Insulin, $NaHCO_3$, salbutamol<br>Remove $K^+$: Fluids+furosemide, dialysis | High risk of dysrhythmia - ECG: peaked/narrow T wave, decreased P wave, prolonged PR interval, widening of QRS, AV block, VFib |
| **Hypokalemia** | Metabolic alkalosis (e.g. diarrhea), insulin, diuretics, anorexia, salbutamol | N/V, fatigue, muscle cramps, constipation | K-Dur®, $K^+$ sparing diuretics, IV solutions with 20-40 mEq/L KCl over 3-4 h | ECG: U waves most important, flattened/inverted T waves, prolonged QT, depressed ST<br>May need to restore $Mg^{2+}$ |
| **Hypercalcemia** | Hyper-PTH and malignancy account for ~80% of cases | Multisystem including CVS, GI (groans), renal (stones), rheumatological, MSK (bones), psychiatric (moans) | Isotonic saline (+ furosemide if hypervolemic)<br>Bisphosphonates, dialysis, chelation (EDTA or oral $PO_4^{3-}$) | Patients with more severe or symptomatic hypercalcemia are usually dehydrated and require saline hydration as initial therapy |
| **Hypocalcemia** | Iatrogenic, hypoalbuminemia, liver dysfunction,1° hypo-parathyroid hormone | Laryngospasm, hyperreflexia, paresthesia, tetany, Chvostek's and Trousseau's sign | Acute (ionized $Ca^{2+}$ <0.7 mM) requires immediate treatment: IV calcium gluconate 1-2 g in 10-20 min followed by slow infusion | Prolonged QT interval can arise (leading to dysrhythmia as can upper airway obstruction) |

# Hypertensive Emergencies

## Hypertensive Emergency (Hypertensive Crisis)

- definition: severe elevation of BP with evidence of end-organ damage (CNS, retinal, CVS, renal, GI)
- etiology
  - essential HTN, emotional exertion, pain, use of sympathomimetic drugs (cocaine, amphetamine, etc.), MAOI use with ingestion of tyramine-containing food (cheese, red wine, etc.), pheochromocytoma, pregnancy
- clinical feature

**Table 21. Signs and Symptoms of Hypertensive Emergencies**

| | CNS | Retinal | Renal | Cardiovascular | Gastrointestinal |
|---|---|---|---|---|---|
| **Complication** | Stroke/TIA, headache, altered mental status, seizures, hemorrhage | Vision change, hemorrhage, exudates, papilledema | Nocturia, elevated Cr, proteinuria, hematuria, oliguria | Ischemia/angina, infarction, dissection (back pain), CHF | N/V, abdominal pain, elevated liver enzymes |

**HELLP Syndrome** (seen only in preeclampsia/eclampsia)
**H**emolytic anemia
**E**levated **L**iver enzymes
**L**ow **P**latelet count

**Catecholamine-Induced Hypertensive Emergencies**
Avoid use of non-selective β-blockers as they inhibit β-mediated vasodilation and leave α-adrenergic vasoconstriction unopposed

- investigations
  - blood work: CBC, electrolytes, BUN, Cr
  - urinalysis
  - peripheral blood smear: to detect microangiopathic hemolytic anemia
  - CXR: if SOB or chest pain
  - ECG, troponins, CK: if chest pain
  - CT head: if neurological findings or severe headache
  - toxicology screen if sympathomimetic overdose suspected
- management
  - in general, strategy is to gradually and progressively reduce BP in 24-48 h
  - lower BP by 25% over the initial 60 min by initiating antihypertensive therapy (usually nitroprusside and labetatol)
  - if preeclampsia, immediately consult OB/GYN (see Obstetrics, OB24)
  - establish arterial line; transfer to ICU for further reduction in BP under monitored setting
  - in case of ischemic stroke: do no rapidly reduce BP, maintain BP >150/100 for 5 d
  - in case of aortic dissection: rapid reduction of sBP to 110-120 STAT (do not resuscitate with IV fluids)
  - in case of excessive catecholamines: avoid β-blockers (except labetalol)
  - in case of ACS: address ischemia initially, then BP

### Hypertensive Urgency

- definition: severely elevated BP (usually sBP >180, dBP >110) with no evidence of end-organ damage
- most often caused by non-adherence to prescriptions
- treatment: re-initiate antihypertensive therapy, acute BP reduction not indicated
- goal: differentiate hypertensive emergencies from hypertensive urgencies

With CNS manifestations of severe HTN, it is often difficult to differentiate causal relationships (i.e. HTN could be secondary to a cerebral event with an associated Cushing reflex)

**Table 22. Commonly Used Agents for the Treatment of Hypertensive Crisis**

| Drug | Dosage | Onset of Action | Duration of Action | Adverse Effects* | Special Indications |
|---|---|---|---|---|---|
| **VASODILATORS** | | | | | |
| **Sodium Nitroprusside** (vascular smooth muscle dilator) 1st line | 0.25-10 µg/kg/min | Immediate | 3-5 min | N/V, muscle twitching, sweating, cyanide intoxication, coronary steal syndrome | Most hypertensive emergencies (especially CHF, aortic dissection)<br>Use in combination with β-blockers (e.g. esmolol) in aortic dissection<br>Caution with high ICP and azotemia |
| **Nicardipine** (CCB) | 2 mg IV bolus, then 4 mg/kg/h IV | 15-30 min | 40 min | Tachycardia, headache, flushing, local phlebitis (e.g. encephalopathy, renal failure, eclampsia, sympathetic crisis) | Most hypertensive emergencies<br>Caution with acute CHF |
| **Fenoldopam Mesylate** (dopamine receptor antagonist) | 0.05-0.1 µm/kg/min IV | <5 min | 8-10 min | Tachycardia, headache, nausea, flushing (e.g. acute RF) | Most hypertensive emergencies<br>Caution with glaucoma |
| **Enalapril** (ACEI) | 0.625-1.25 mg IV q6h | 15-30 min | 12-24 h | Theoretical fall in pressure in high renin states not seen in studies | Acute LV failure<br>Avoid in acute MI, pregnancy, acute RF |
| **Nitroglycerin** | 5-20 µg/min IV | 1-2 min | 3-5 min | Hypotension, bradycardia, headache, lightheadedness, dizziness | MI/pulmonary edema |
| **Hydralazine** | 5-10 mg IV/IM q20min (max 20 mg) | 5-20 min | 2-6 h | Dizziness, drowsiness, headache, tachycardia, $Na^+$ retention | Eclampsia |
| **ADRENERGIC INHIBITORS** | | | | | |
| **Labetalol** | 20 mg IV bolus q10min or 0.5-2 mg/min | 5-10 min | 3-6 h | Vomiting, scalp tingling, burning in throat, dizziness, nausea, heart block, orthostatic hypotension | Most hypertensive emergencies (especially eclampsia)<br>Avoid in acute CHF, heart block >1st degree |
| **Esmolol** | 250-500 µg/kg/min 1 min, then 50 µg/kg/min for 4 min; repeat | 1-2 min | 10-20 min | Hypotension, nausea, bronchospasm | Aortic dissection, acute MI SVT dysrhythmias, perioperative HTN<br>Avoid in acute CHF, heart block >1st degree |
| **Phentolamine** | 5-15 mg q5-15min | 1-2 min | 3-10 min | Tachycardia, headache, flushing | Catecholamine excess (e.g. pheochromocytoma) |

*Hypotension may occur when using any of these agents

## Acute Coronary Syndrome

- see Cardiology and Cardiac Surgery, C27
- definition: new onset of chest pain, or acute worsening of previous chest pain, or chest pain at rest with:
  - negative cardiac biomarkers and no ECG changes = Unstable angina (UA)
  - positive cardiac biomarkers (elevated troponin) and NSTEMI (or ECG changes without ST elevation)
  - positive cardiac biomarkers (elevated troponin) and ST segment elevation on ECG = STEMI
- investigations
  - ECG STAT (as soon as history suggests possible ACS), troponin (2-6 h after symptom onset), CXR (to rule out other causes of the patient's presentation)
- management
  - stabilize: ABCs, oxygen, IV access, cardiac monitors, oximetry
  - ASA 162-325 mg chewed and swallowed
  - nitroglycerin 0.3 mg SL q5min x 3; IV only if persistent pain, CHF, or hypertensive
    - contraindications: hypotension, phosphodiesterase inhibitor use, right ventricular infarctions (1/3 of all inferior MIs)

- anticoagulation: choice of anticoagulation (unfractionated heparin, LMWH, or fondaparinux) and additional antiplatelet therapy (clopidogrel, ticagrelor, or prasugrel) depends on STEMI vs. NSTEMI and reperfusion strategy
- early cardiology consult for reperfusion therapy
  - UA/NSTEMI: early coronary angiography recommended if high TIMI risk score
  - STEMI: primary percutaneous coronary intervention (within 90 min) preferred; thrombolytics if PCI unavailable within 120 min of medical contact, symptoms <12 h and no contraindications
- atorvastatin 80 mg to stabilize plaques
- β-blocker if no signs of CHF, hemodynamic compromise, bradycardia, or severe reactive airway disease
- ACEI initiated within 24 h

# Sepsis

- see Infectious Diseases, ID19 and Respirology, R30
- definitions
  - sepsis: life-threatening organ dysfunction caused by a dysregulated host response to infection
- organ dysfunction defined as a change in baseline SOFA score ≥2 points
  - septic shock: profound circulatory, cellular, and metabolic abnormalities with greater risk of mortality than with sepsis alone
- require vasopressors to maintain MAP ≥65 mmHg
- associated with serum lactate ≥2 mmol/L without hypovolemia
- management
  - early recognition of sepsis and investigations to locate source of infection
  - identify severe sepsis with lactate or evidence of tissue hypoperfusion
  - early "goal-directed" therapy: ensure adequate organ perfusion
  - treatment priorities:
    - ABCs, monitors, lines
    - aggressive fluid resuscitation; consider ventilatory and inotropic support
    - cultures, then early empiric appropriate antibiotics - consider broad spectrum and atypical coverage
    - source control - e.g. remove infected Foley or surgery for ischemic gut
    - monitor adequate resuscitation with vital signs, inferior vena cava on U/S, and serial measurement of serum lactate

# Stroke and Transient Ischemic Attack

- see Neurology, N48
- definitions
  - stroke: sudden loss of brain function due to ischemia (87%) or hemorrhage (13%) with persistence of symptoms >24 h or neuroimaging evidence
  - TIA: transient episode of neurologic dysfunction from focal ischemia without acute infarction or neuroimaging evidence
- clinical feature

**Table 23. Signs and Symptoms of Stroke**

| | General | Language/ Throat | Vision | Coordination | Motor | Sensation | Reflex |
|---|---|---|---|---|---|---|---|
| **Signs/ Symptoms** | Decreased LOC, changed mental status, confusion, neglect | Dysarthria, aphasia, swallowing difficulty | Diplopia, eye deviation, asymmetric pupils, visual field defect | Ataxia, intention tremor, lack of coordination | Increased tone, loss of power, spasticity | Loss of sensation | Hyper-reflexia, clonus |

- patients with hemorrhagic stroke can present with sudden onset thunderclap headache that is usually described as "worst headache of life"
- stroke mimickers: seizure, migraine, hypoglycemia, Todd's paresis, peripheral nerve injury, Bell's palsy, tumour, syncope

**Table 24. Stroke Syndromes**

| Region of Stroke | Stroke Syndrome |
|---|---|
| **ACA** | Contralateral hemianesthesia and hemiparesis (legs > arms/face), gait apraxia, altered mental status, impaired judgement |
| **MCA** | Contralateral hemianesthesia and hemiparesis (arms/face > legs), contralateral homonymous hemianopsia, ipsilateral gaze |
| **PCA** | Contralateral homonymous hemianopsia, cortical blindness, impaired memory |
| **VBA** | Wide variety of cranial nerve, cerebellar, and brainstem deficits: vertigo, nystagmus, diplopia, visual field deficits, dysphagia, dysarthria, facial hypoesthesia, syncope, ataxia<br>Loss of pain and temperature sensation in ipsilateral face and contralateral body |

**7 Causes of Emboli from the Heart**
- AFib
- MI
- Endocarditis
- Valvular disease
- Dilated cardiomyopathy
- Left heart myxoma
- Prosthetic valves

**Differentiation of UMN Disease vs. LMN Disease**

| Category | UMN Disease | LMN Disease |
|---|---|---|
| Muscular deficit | Muscle groups | Individual muscles |
| Reflexes | Increased | Decreased/ absent |
| Tone | Increased | Decreased |
| Fasciculations | Absent | Present |
| Atrophy | Absent/ minimal | Present |
| Plantar Response | Upgoing | Downgoing |

### Investigations
- CBC, electrolytes, blood glucose, coagulation studies ± cardiac biomarkers ± toxicology screen
- non-contrast CT head: look for hemorrhage, ischemia
- ECG ± echocardiogram: rule out AFib, acute MI as source of emboli
- other imaging: carotid Doppler, CTA, MRA as appropriate

### Management
- ABCs; intubation with RSI if GCS ≤8, rapidly decreasing GCS, or inadequate airway protection reflexes
- thrombolysis: immediate assessment for eligibility; need acute onset, <4.5 h from drug administration time AND compatible physical findings AND normal CT with no bleed
- elevating head of bed if risk of elevated ICP, aspiration, or worsening cardiopulmonary status
- NPO, IV ± cardiac monitoring
  - judge fluid rate carefully to avoid overhydration (cerebral edema) as well as underhydration (underperfusion of the ischemic penumbra)
- BP control: only treat severe HTN (sBP >200 mmHg, dBP >120 mmHg, mean arterial BP >140 mmHg) or HTN associated with hemorrhagic stroke transformation, cardiac ischemia, aortic dissection, or renal damage; use IV nitroprusside or labetalol
- glycemic control: keep fasting glucose <6.5% in acute phase (5 d)
- cerebral edema control: hyperventilation, mannitol to decrease ICP if necessary
- consult neurosurgery, neurology, medicine as indicated

### Medications
- acute ischemic stroke: thrombolytics (rt-PA, e.g. alteplase) if within 4.5 h of symptom onset with no evidence of hemorrhage on CT scan
- antiplatelet agents: prevent recurrent stroke or stroke after TIAs, e.g. Aspirin® (1st line); clopidogrel, Aggrenox® (2nd line)
- anticoagulation: DVT prophylaxis if immobile; treat AFib if present
- follow-up for consideration of carotid endarterectomy, cardiovascular risk optimization

If patient presents within 4.5 h of onset of disabling neurological deficits greater than 60 min with no signs of resolution, they may be a candidate for thrombolysis. Do brief assessment and order stat CT head

**Absolute Exclusion Criteria for tPA**
- Suspected subarachnoid hemorrhage
- Previous intracranial hemorrhage
- Cerebral infarct or severe HI within the past 3 mo
- BP >185 mmHg systolic, or >110 mmHg diastolic
- Bleeding diathesis
- Prolonged PT >15 s or INR >1.7
- Platelet count <100,000
- Heparin received within last 48 h
- Current use of thrombin inhibitors or direct factor Xa inhibitors
- Blood glucose <2.8 mmol/L (<50 mg/dL)
- Intracranial hemorrhage on CT or large volume infarct

**Relative Exclusion Criteria for tPA**
- Only minor or rapidly improving symptoms
- Pregnancy
- GI or urinary hemorrhage within the past 21 d
- Seizure at onset causing postictal impairments

# Otolaryngological Presentations and Emergencies

- see Otolaryngology, OT6
- ear symptoms: otalgia, aural fullness, otorrhea, hearing loss, tinnitus, vertigo, pruritis, fever
- risk factors for hearing loss: Q-tip use, hearing aids, headphones, occupational noise exposure

### Dizziness and Vertigo
- distinguish four types of dizziness: vertigo ("room spinning"), lightheadedness ("disconnected from environment"), presyncope ("almost blacking out"), dysequilibrium ("unstable, off-balance")
- broad differential and diverse management (see Family Medicine, FM25 and Otolaryngology, OT12)
- consider adverse drug events

### Otalgia (see Otolaryngology, OT6)
- differential diagnosis
  - infections: acute otitis externa, acute otitis media, otitis media with effusion, mastoiditis, myringitis, malignant otitis externa in diabetics, herpes simplex/zoster, auricular cellulitis, external canal abscess, dental disease
  - others: trauma, temporomandibular joint dysfunction, neoplasm, foreign body, cerumen impactions, trigeminal neuralgia, granulomatosis with polyangiitis
- inspect for otorrhea, palpate outer ear/mastoid, otoscopic examination to look for bulging erythematous tympanic membrane, perforation, membrane retraction, infiltration, vesicles, ulcers, masses, lesions
- C&S of ear canal discharge, if present
- CT head if suspicion of mastoiditis, malignant otitis externa
- antibiotics/antifungals/antivirals for respective infections

### Hearing Loss (see Otolaryngology, OT7)
- differentiate conductive vs. sensorineural hearing loss
- rule out sudden sensorineural hearing loss (SSNHL), a medical emergency requiring high dose steroids and urgent referral
- an elderly patient presenting with unilateral tinnitus or SNHL must be presumed to have an acoustic neuroma (vestibular schwannoma) until proven otherwise
- consider audiogram and referral to or follow-up with family physician

# Epistaxis

- see Otolaryngology, OT26
- 90% of nosebleeds stem from the anterior nasal septum (Kiesselbach's plexus located in Little's area)
- can be life-threatening

### Etiology
- most cases of epistaxis are caused by trauma (digital, blunt, foreign bodies)
- other causes: barometric changes, nasal dryness, chemicals (cocaine, Otrivin®), or systemic disease (coagulopathies, HTN, etc.)

### Investigations
- blood work: CBC, PT/PTT (as indicated)
- imaging: X-ray, CT as needed

### Treatment
- goals of treatment: localize bleeding and achieve hemostasis
- first-aid: ABCs, clear clots by blowing nose or suctioning, lean forward, pinch cartilaginous portion of nose for 20 min twice
- assess blood loss: vitals, IV NS, cross match 2 units pRBC if significant
- if first aid measures fail twice, proceed to packing
- apply an anterior pack
  - clear nose of any clots
  - apply topical anesthesia/vasoconstrictors (lidocaine with epinephrine, cocaine, or soaked pledgets)
  - insert either a traditional Vaseline® gauze pack or a commercial nasal tampon or balloon
  - if bleeding stops, arrange follow-up in 48-72 h for reassessment and pack removal
  - if packing both nares, prophylactic anti-staphylococcal antibiotics to prevent sinusitis or toxic shock syndrome
  - if bleeding is not controlled with anterior pressure, cautery with silver nitrate can be performed if the site of bleeding is identified (only cauterize one side of the septum because if both are cauterized this can lead to septal perforation)
- if suspect posterior bleed or anterior packing does not provide hemostasis, consult ENT for posterior packing and further evaluation
  - posterior packing requires monitoring; can cause significant vagal response and posterior bleeding source can lead to significant blood loss, therefore usually requires admission

### Disposition
- discharge: discharged upon stabilization and appropriate follow-up; educate patients about prevention (e.g. humidifiers, saline spray, avoiding irritants, managing HTN)
- admission: severe cases of refractory bleeding, and most cases of posterior packing

Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack

**Complications of Nasal Packing**
- Hypoxemia
- Toxic-shock syndrome
- Aspiration
- Pharyngeal fibrosis/stenosis
- Alar/septal necrosis

**Tranexamic Acid For Patients With Nasal Haemorrhage (Epistaxis)**
Cochrance DB Syst Rev 2018:CD004328
**Objectives**: Determine the effects of tranexamic acid compared to placebo, no additional intervention or any other haemostatic agent in the management of patients with epistaxis.
**Methods**: Systematic review of RCTs comparing tranexamic acid, in addition to standard care, compared to usual care plus placebo in adults and children.
**Results**: 6 RCTs, 692 participants. Oral (RR 0.73, 95% CI 0.55-0.96) and topical (RR 0.66, 95% CI 0.41-1.05) reduced risk of re-bleeding compared to placebo. There was no difference in time to stop initial bleeding. The proportion of patients whose bleeding stopped within 10 minutes was higher with topical tranexamic acid than other hemostatic agents (RR 2.35, 95% CI 1.90-2.92).
**Conclusions**: Moderate-quality evidence that risk of re-bleeding with oral or topical tranexamic acid, in addition to usual care, is lower in adult patients with epistaxis, compared to placebo with usual care. Further, topical tranexamic acid is probably better than other topical agents in stopping bleeding in the first 10 minutes.

# Gynecologic/Urologic Emergencies

## Vaginal Bleeding

- see Gynecology, GY9 and Obstetrics, OB13

### Etiology
- pregnant patient
  - 1st/2nd trimester: ectopic pregnancy, abortion (threatened, incomplete, complete, missed, inevitable, septic), molar pregnancy, implantation bleeding, friable cervix (most common cause)
  - 2nd/3rd trimester: placenta previa, placental abruption, premature rupture of membranes, preterm labour
  - other: trauma, bleeding cervical polyp, passing of mucous plug
- postpartum
  - postpartum hemorrhage, uterine inversion, retained placental tissue, endometritis
- non-pregnant patients
  - structural (PALM- polyps, adenomyosis, leiomyoma, malignancies/hyperplasia)
  - non-structural (COEIN - coagulopathy, ovulatory, endometrial, iatrogenic, NYD)

### History
- characterize bleeding (frequency, duration, number of pads/tampons, types of pads used, cyclicity)
- pain, if present (OPQRSTUV)
- menstrual history, sexual history, STI history, syncope/pre-syncope, malignancy history, family history, hematological history, cardiac history, abdo history
- details of pregnancy, including gush of fluid and fetal movement (>20 wk)

### Physical Exam
- ABC (especially noting postural BP/HR and mucous membranes)
- abdominal examination (signs of peritoneal pathology, tenderness, distension, mass)
- speculum examination (NOT IF 2nd/3rd trimester bleeding; perform only if placenta previa has been ruled out with U/S)
  - look for active bleeding, trauma/anomaly, and cervical dilatation
- bimanual examination (cervical motion tenderness, size of uterus, cervical length/dilatation)
- sterile gloves and speculum if pregnant
- POCUS: rule in intra-uterine or ectopic pregnancy, check for free fluid in pelvis/RUQ/LUQ, consider assessment of fluid responsiveness (intra-hepatic IVC collapsibility, carotid flow measurement)

### Investigations
- β-hCG test for all patients with childbearing potential
- CBC, blood and Rh type, quantitative β-hCG, PTT, INR
- type & cross if significant blood loss
- transvaginal U/S (rule out ectopic pregnancy and spontaneous abortion)
- abdominal U/S (rule out placenta previa, fetal demise, or retained products post-partum)

### Management
- ABCs
- pulse oximeter and cardiac monitors if unstable
- Rh immune globulin (Rhogam®) for vaginal bleeding in pregnancy and Rh-negative mother
- 1st/2nd trimester pregnancy
  - ectopic pregnancy: definitive treatment with surgery or methotrexate
  - intrauterine pregnancy, no concerns of coexistent ectopic: discharge patient with obstetrics follow-up
  - U/S indeterminate or β-hCG >1000-2000 IU: further workup and/or gynecology consult
  - abortions: if complete, discharge if stable; for all others, consult gynecology
- 2nd/3rd trimester pregnancy
  - placenta previa or placental abruption: obstetrics consult for possible admission
- postpartum
  - manage ABCs: start 2 large bore IV rapid infusion, type & cross 4 units of blood, consult OB/GYN immediately
- non-pregnant
  - if unstable admit to gynecology for IV hormonal therapy, possible D&C
  - non-structural abnormalities
    - tranexamic acid to stabilize clots
    - medroxyprogesterone acetate 10 mg PO OD x 10d, warn patient of a withdrawal bleed
  - stable structural abnormalities (fibroids, polyps, endometrial thickening, adenomyosis), outpatient gynecology referral once stable

### Disposition
- decision to admit or discharge should be based on the stability of the patient, as well as the nature of the underlying cause; consult OB/GYN for patients requiring admission
- if patient can be safely discharged, ensure follow-up with family physician or gynecologist
- instruct patient to return to ED for increased bleeding, presyncope

Vaginal bleeding can be life-threatening Always start with ABCs and ensure your patient is stable

Need β-hCG ≥1200 to see intrauterine changes on transvaginal U/S

An ectopic pregnancy can be ruled out by confirming an intrauterine pregnancy by bedside U/S unless the patient is using IVF due to the high risk of heterotopic pregnancy

Vaginal bleeding (and its underlying causes) can be a very distressing event for patients; ensure appropriate support is provided

## Pregnant Patient in the ED

**Table 25. Complications of Pregnancy**

| Trimester | Fetal | Maternal |
|---|---|---|
| **First**<br>**1-12 wk** | Pregnancy failure<br>Spontaneous abortion<br>Fetal demise<br>Gestational trophoblastic disease | Ectopic pregnancy<br>Anemia<br>Hyperemesis gravidarum<br>UTI/pyelonephritis |
| **Second**<br>**13-27 wk** | Disorders of fetal growth<br>IUGR<br>Oligo/polyhydramnios | Gestational DM<br>Rh incompatibility<br>UTI/pyelonephritis |
| **Third**<br>**28-41 wk** | Vasa previa | Preterm labour/PPROM<br>Preeclampsia (hypertension in pregnancy)/eclampsia<br>Placenta previa<br>Placental abruption<br>Uterine rupture<br>DVT/PE |

# Nephrolithiasis (Renal Colic)

• see Urology, U18

### Epidemiology and Risk Factors
- 10% of population (twice as common in males)
- recurrence 50% at 5 yr
- peak incidence 30-50 yr of age
- 75% of stones <5 mm pass spontaneously within 2 wk, larger stones may require consultation

**Kidney Stones**
- 80% Calcium oxalate
- 10% Struvite
- 10% Uric acid

### Clinical Features
- urinary obstruction → upstream distention of ureter or collecting system → severe colicky pain
- may complain of pain at flank, groin, testes, or tip of penis
- writhing, N/V, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- fever, chills, rigors in secondary pyelonephritis
- peritoneal findings/anterior abdominal tenderness usually absent

**Obstruction + Infection**
= Urological Emergency
Urgent urology consult

### Differential Diagnosis of Renal Colic
- acute ureteric obstruction
- acute abdomen: biliary, bowel, pancreas, AAA
- urogynecological: ectopic pregnancy, torsion/rupture of ovarian cyst, testicular torsion
- pyelonephritis (fever, chills, pyuria, vomiting)
- radiculitis (L1): herpes zoster, nerve root compression

### Investigations
- CBC: elevated WBC in presence of fever may support an infectious cause
- electrolytes, Cr, BUN to assess renal function
- U/A: R&M (WBCs, RBCs, crystals), C&S
- non-contrast spiral CT is the study of choice
- abdominal U/S may demonstrate stone(s), hydronephrosis (consider in females of childbearing age or if patient has another contraindication to CT scanning), debris in the collecting system, reduced cortical vascularity, abnormal renal parenchyma
- AXR will identify large radioopaque stones (calcium, struvite, and cystine stones) but may miss smaller stones, uric acid stones, or stones overlying bony structures; consider as an initial investigation in patients who have a history of radioopaque stones and similar episodes of acute flank pain (CT necessary if film is negative)
- strain all urine for stone analysis

**Indications for Admission to Hospital**
- Intractable pain
- Fever (suggests infection) or other evidence of pyelonephritis
- Single kidney with ureteral obstruction
- Bilateral obstructing stones
- Intractable vomiting
- Compromised renal function

### Management
- analgesics: NSAIDs (usually ketorolac [Toradol®], preferable over opioids), antiemetics, IV fluids if indicated
- urology consult may be indicated, especially if stone >5 mm, or if patient has signs of obstruction or infection
- α-blocker (e.g. tamsulosin) may be helpful to increase stone passage in select cases

### Disposition
- most patients can be discharged
- ensure patient is stable, has adequate analgesia, and able to tolerate oral medications
- may advise hydration and limitation of protein, sodium, oxalate, and alcohol intake

# Ophthalmologic Emergencies

• see Ophthalmology, OP5

### History and Physical Exam
- patient may complain of pain, tearing, itching, redness, photophobia, foreign body sensation, trauma
- mechanism of foreign body insertion – if high velocity injury suspected (welding, metal grinding, metal striking metal), must obtain orbital X-rays, U/S, or CT scan to exclude presence of intraocular metallic foreign body
- ask about sexual partners and exposure of eye(s) to bodily fluids (semen, urine, blood, vaginal fluids, saliva, etc.)
- visual acuity in both eyes, pupils, extraocular structures, fundoscopy, tonometry, slit lamp exam

Visual acuity is the "vital sign" of the eyes and should ALWAYS be assessed and documented in both eyes when a patient presents to the ER with an ophthalmologic complaint

### Management of Ophthalmologic Foreign Body
- copious irrigation with saline for any foreign body
- remove foreign body under slit lamp exam with cotton swab or sterile needle
- antibiotic drops qid until healed
- patching may not improve healing or comfort – do not patch contact lens wearers
- limit use of topical anesthetic to examination only (the evidence for this is mixed; if uncertain, ask ophthalmology)
- consider tetanus prophylaxis
- ophthalmology consult if globe penetration suspected

**Table 26. Differential Diagnosis of Red Eye in the Emergency Department**

| Symptom | Possible Serious Etiology |
|---|---|
| **Light Sensitivity** | Iritis, keratitis, abrasion, ulcer |
| **Unilateral** | Above + herpes simplex, acute angle closure glaucoma |
| **Significant Pain** | Above + scleritis |
| **White Spot on Cornea** | Corneal ulcer |
| **Non-Reactive Pupil** | Acute glaucoma, iritis |
| **Copious Discharge** | Gonococcal conjunctivitis |
| **Blurred Vision** | All of the above |

**Contraindications to Pupil Dilation**
- Shallow anterior chamber
- Iris-supported lens implant
- Potential neurological abnormality requiring pupillary evaluation
- Caution with CV disease – mydriatics can cause tachycardia

**Table 27. Select Ophthalmologic Emergencies**

| Condition | Signs and Symptoms | Management |
|---|---|---|
| **Acute Angle Closure Glaucoma** | Unilateral red, painful eye<br>Decreased visual acuity, halos around lights<br>Fixed, mid-dilated pupil<br>N/V<br>Marked increase in IOP (>40 mmHg)<br>Shallow anterior chamber ± cells | Ophthalmology consult for laser iridotomy<br>Medications: AABCDE/EAT PAL<br>Alpha agonist: epinephrine<br>Alpha2 agonist: apraclonide<br>Beta blocker: timolol<br>Cholinomimetic: pilocarpine<br>Diuretic: acetazolamide, mannitol<br>Eicosanoid: latanoprost |
| **Chemical Burn** | Known exposure to acids or alkali (worse)<br>Pain, decreased visual acuity<br>Vascularization or defects of cornea<br>Iris and lens damage | Irrigate site of accident with NS with eyelid retracted until neutral pH achieved.<br>Sweep fornices<br>Cycloplegic drops and topical antibiotics |
| **Orbital Cellulitis** | Red, painful eye, decreased visual acuity<br>Headache, fever<br>Lid erythema, edema, and difficulty opening eye<br>Conjunctival injection and chemosis<br>Proptosis, opthalmoplegia ± RAPD | Admission, ophthalmology consult<br>Blood cultures, orbital CT<br>IV antibiotics (ceftriaxone+ vancomycin)<br>Drainage of abscess |
| **Retinal Artery Occlusion** | Sudden, painless, monocular vision loss<br>RAPD<br>Cherry red spot and retinal pallor on fundoscopy if central retinal artery occlusion | Restore blood flow <2 h<br>Massage globe<br>Decrease IOP (topical β-blockers, inhaled $O_2$/$CO_2$ mix, IV Diamox®, IV mannitol, drain aqueous fluid) |
| **Retinal Detachment** | Flashes of light, floaters, and curtains of blackness/ peripheral vision loss<br>Painless<br>Loss of red reflex, decreased IOP<br>Detached areas are grey<br>Visible detachment orbital POCUS<br>± RAPD | Ophthalmology consult for scleral buckle/ pneumatic retinoplexy |

**Other Ophthalmologic Emergencies**
**Infectious**: Red eye, endophthalmitis, hypopyon
**Trauma**: Globe rupture, orbital blow-out fractures, corneal injuries, eyelid laceration, hyphema, lens dislocation, retrobulbar hemorrhage
**Painful vision loss**: Acute iritis, corneal abrasion, globe rupture, lens dislocation, retrobulbar hemorrhage, optic neuritis, temporal arteritis, endophthalmitis, keratitis
**Painless vision loss**: Central retinal vein occlusion, amaurosis fugax, occipital stroke

# Dermatologic Emergencies

## Rash Characteristics

### A. Diffuse Rashes

- Staphylococcal Scalded Skin Syndrome (SSSS)
  - caused by an exotoxin from infecting strain of coagulase-positive S. aureus
  - mostly occurs in children
  - prodrome: fever, irritability, malaise, and skin tenderness
  - sudden onset of diffuse erythema: skin is red, warm, and very tender
  - flaccid bullae that are difficult to see, then desquamate in large sheets
- Steven-Johnson Syndrome (SJS) and Toxic Epidermal Necrolysis (TEN)
  - see Dermatology, D22
  - caused by drugs (e.g. phenytoin, sulfas, penicillins, and NSAIDs), bone marrow transplantation, and blood product transfusions
  - usually occurs in adults
  - diffuse erythema followed by necrosis
  - severe mucous membrane blistering
  - entire epidermis desquamation
  - high mortality (>50%)
- Toxic Shock Syndrome (TSS)
  - see Infectious Diseases, ID21
  - caused by superantigen from S. aureus or GAS activating T-cells and cytokines
  - patient often presents with onset of shock and multi-organ failure, fever
  - diffuse erythematous macular rash
  - at least 3 organ systems involved: CNS, respiratory, GI, muscular, mucous membranes, renal, liver, hematologic, and skin (necrotizing fasciitis, gangrene)

- vesicobullous lesions
- Erythema Multiforme (EM)
  - immunologic reaction to herpes simplex
  - viral prodrome 1-14 d before rash
  - target lesion: central grey bulla or wheal surrounded by concentric rings of erythema and normal skin

**B. Discrete Lesions**

- pyoderma gangrenosum
  - often associated with IBD, rheumatoid conditions, leukemia, and monoclonal gammopathies.
  - often occurs in arms, hands, feet, or perineal region
  - usually begins as painless macule/vesicle/pustule/bulla on red/blue base sloughing, leaving a gangrenous ulcer
- disseminated gonococcal infection
  - see Dermatology, D32
  - fever, skin lesions (pustules/vesicles on erythematous base ~5 mm in diameter), arthritis (joint swelling and tenderness), and septic arthritis (in larger joints, such as knees, ankles, and elbows)
  - most commonly in gonococcus-positive women during menstruation or pregnancy
  - skin lesions usually appear in extremities and resolve quickly (<7 d)
- meningococcemia
  - flu-like symptoms of headache, myalgia, N/V
  - petechial, macular, or maculopapular lesions with grey vesicular centres
  - usually a few millimeters in size, but may become confluent and hemorrhagic
  - usually appear in extremities, but may appear anywhere
  - look for signs of meningeal irritation: positive jolt accentuation test, Brudzinski, Kernig

## History and Physical Exam

- determine onset, course, and location of skin lesions
- fever, joint pain
- associated symptoms: CNS, respiratory, GU, GI, renal, liver, mucous membranes
- medications, sexual encounters, living environment, occupational exposures
- vitals, physical exam based on relevant history

## Investigations

- immediate consultation if patient unstable
- case-dependent, consider: CBC, electrolytes, Cr, AST, ALT, ALP, blood culture, skin biopsy, serum immunoglobulin levels (serum IgE)

Thorough dermatologic examinations are required; examination of asymptomatic skin may identify more lesions; ensure adequate draping during dermatologic examinations

## Management

- general: judicious IV fluids and electrolyte control, consider vasopressors if hypotensive, prevention of infection
- determine if admission and consult needed: dermatology or infectious diseases
- specific management is determined by etiology
  - SSSS, TSS, DGI, and meningococcemia
    - IV antibiotics
  - EM, SJS, and TEN
    - stop precipitating medication
    - fluids
    - symptomatic treatment: antihistamines, antacids, topical corticosteroids, systemic corticosteroids (controversial), prophylactic oral acyclovir, consider IVIG, plasmapheresis
    - TEN: debride necrotic tissue

SJS = <10% of BSA
SJS/TEN = 10-30% BSA
TEN = >30% BSA

## Disposition

- most cases will require urgent care and hospitalization
- SJS & TEN: early transfer to burn centre improves outcome

# Environmental Injuries

## Heat Exhaustion and Heat Stroke

### HEAT EXHAUSTION

- clinical features relate to loss of circulating volume caused by exposure to heat stress
- "water depletion": heat exhaustion occurs if lost fluid not adequately replaced
- "salt depletion": heat exhaustion occurs when losses replaced with hypotonic fluid

Heat exhaustion may closely resemble heat stroke; heat exhaustion may eventually progress to heat stroke, so if diagnosis is uncertain treat as heat stroke

### HEAT STROKE

- life-threatening emergency resulting from failure of normal compensatory heat-shedding mechanisms
- divided into classical and exertional subtypes
- if patient does not respond relatively quickly to cooling treatments, consider other possible etiologies of hyperpyrexia (e.g. meningitis, thyroid storm, anticholinergic poisoning, delirium tremens, infections), adverse drug events (including drug interactions)

**Table 28. Heat Exhaustion vs. Heat Stroke**

| | Heat Exhaustion | Classical Heat Stroke | Exertional Heat Stroke |
|---|---|---|---|
| **Clinical Features** | Non-specific malaise, headache, fatigue<br>Body temp <40.5°C (usually normal)<br>No coma or seizures<br>Dehydration (HR, orthostatic hypotension) | Occurs in setting of high ambient temperatures (e.g. heat wave, poor ventilation)<br>Often patients are older, poor, and sedentary or immobile<br>Dry, hot skin<br>Temp usually >40.5°C<br>Altered mental status, seizures, delirium, or coma<br>May have elevated AST, ALT | Occurs with high endogenous heat production (e.g. exercise) that overwhelms homeostatic mechanisms<br>Patients often younger, more active<br>Skin often diaphoretic<br>Other features as for classical heat stroke, but may also have DIC, acute renal failure, rhabdomyolysis, marked lactic acidosis |
| **Treatment** | Rest in a cool environment<br>IV NS if orthostatic hypotension; otherwise replace losses slowly PO | Cool body temperature with water mist (e.g. spray bottle) and standing fans<br>Ice water immersion also effective; monitor body temperature closely to avoid hypothermic overshoot<br>Secure airway because of seizure and aspiration risk<br>Give fluid resuscitation if still hypotensive after above therapy<br>Avoid β-agonists (e.g. epinephrine), peripheral vasoconstriction, and antipyretics (e.g. ASA) | |

## Hypothermia and Cold Injuries

### HYPOTHERMIA

- hypothermia is defined as a core temperature below 35°C, in which the body's heat loss is greater than heat production
- predisposing risk factors: ethanol use, homelessness, psychiatric disease, and older age (the elderly have increased risk due to decreased physiological reserve, chronic diseases, medication side effects, and social isolation)
- treatment based on re-warming and supporting cardiorespiratory function
- complications: coagulopathy, acidosis, ventricular dysrhythmias (VFib), asystole, volume, and electrolyte depletion
- labs: CBC, electrolytes, ABG, serum glucose, Cr/BUN, $Mg^{2+}$, $Ca^{2+}$, amylase, coagulation profile
- imaging: CXR (aspiration pneumonia, pulmonary edema are common)
- monitors: ECG, rectal thermometer, Foley catheter, NG tube, monitor metabolic status frequently

**Afterdrop Phenomenon**
Warming of extremities causes vasodilation and movement of cool pooled blood from extremities to core, resulting in a drop in core temperature leading to cardiac arrest

**Table 29. Classification of Hypothermia**

| Class | Temp | Symptoms/Signs |
|---|---|---|
| **Mild** | 32-34.9°C | Tachypnea, tachycardia, ataxia, dysarthria, shivering |
| **Moderate** | 28-31.9°C | Loss of shivering, dysrhythmias, Osborne (J) waves on ECG, decreased LOC, combative behaviour, muscle rigidity, dilated pupils |
| **Severe** | <28°C | Coma, hypotension, acidemia, VFib, asystole, flaccidity, apnea |

### Re-warming Options

- gentle fluid and electrolyte replacement in all (due to cold diuresis)
- **passive external re-warming**
  - suitable for most stable patients with core temperature >32.2°C
  - involves covering patient with insulating blanket; body generates heat and re-warms through metabolic process, shivering

- **active external re-warming**
  - involves use of warming blankets
  - beware of "afterdrop" phenomenon
  - safer when done in conjunction with active core re-warming
- **active core re-warming**
  - generally for patients with core temperature <32.2°C, and/or with cardiovascular instability
  - avoids "afterdrop" seen with AER alone
  - re-warm core by using
    - warmed humidified oxygen, IV fluids
    - peritoneal dialysis with warm fluids
    - gastric/colonic/pleural irrigation with warm fluids
    - external circulation (cardiopulmonary bypass machine) is most effective and fastest

### Approach to Cardiac Arrest in the Hypothermic Patient

- do all procedures gently or may precipitate VFib
- check pulse and rhythm for at least 1 min; may have profound bradycardia
- if any pulse at all (even very slow) do NOT do CPR
- if in VFib try to defibrillate up to maximum 3 shocks if core temperature <30°C
- intubate if required, ventilate with warmed, humidified $O_2$
- medications (vasopressors, antidysrhythmics) may not be effective at low temperatures controversial; may try one dose
- focus of treatment is re-warming

## FROSTBITE

### Classification

- ice crystals form between cells
- classified according to depth – similar to burns (1st to 3rd degree)
- 1st degree
  - symptoms: initial paresthesia, pruritus
  - signs: erythema, edema, hyperemia, no blisters
- 2nd degree
  - symptoms: numbness
  - signs: blistering (clear), erythema, edema
- 3rd degree
  - symptoms: pain, burning, throbbing (on thawing); may be painless if severe
  - signs: hemorrhagic blisters, skin necrosis, edema, no movement
- 4th degree
  - extension into subcuticular, osseous, and muscle tissues

### Management

- treat for hypothermia: $O_2$, IV fluids, maintenance of body warmth
- remove wet and constrictive clothing
- immerse in 40-42°C agitated water for 10-30 min (very painful; administer adequate analgesia)
- clean injured area and leave it open to air
- consider aspiration/debridement of blisters (controversial)
- debride skin
- tetanus prophylaxis
- consider penicillin G as frost bite injury has high risk of infection
- surgical intervention may be required to release restrictive eschars
- never allow a thawed area to re-chill/freeze

# Burns

- see Plastic Surgery, PL18

### Clinical Feature/Physical Exam Findings

- burn size
  - rule of nines; does not include 1st degree burns
- burn depth
  - superficial (1st degree): epidermis only (e.g. sunburn), painful and tender to palpation
  - superficial partial thickness (2nd degree): extends to epidermis and superficial dermis, blister formation occurs, very painful
  - deep partial thickness (2nd degree): involves hair follicles, sebaceous glands; skin is blistered, exposed dermis is white to yellow, absent sensation
  - full thickness (3rd degree): epidermis and all dermal layers; skin is pale, insensate, and charred or leathery
  - deep (4th degree): involvement of fat, muscle, even bone

### Management

- remove noxious agent/stop burning process
- establish airway if needed (indicated with burns >40% BSA or smoke inhalation injury)
- resuscitation for 2nd and 3rd degree burns (after initiation of 2 large bore IVs)

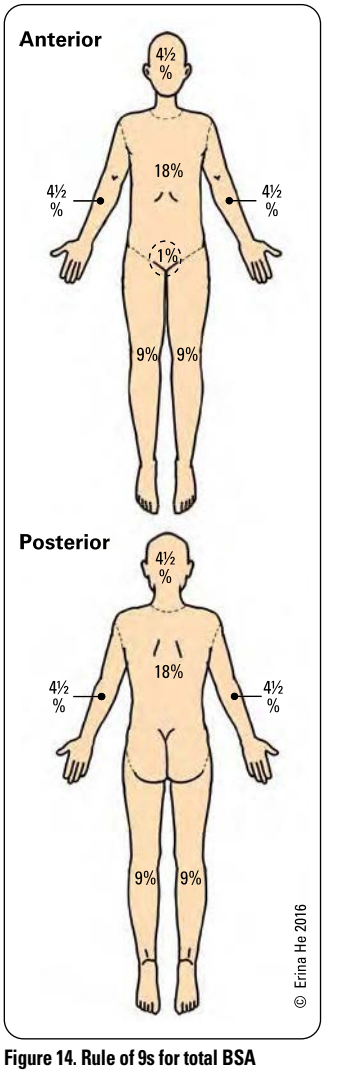

**Figure 14. Rule of 9s for total BSA**

- fluid boluses if unstable
  - Parkland Formula: Ringer's lactate 4 cc/kg/%BSA burned; give half in first 8 h, half in next 16 h; maintenance fluids are also required if patient cannot tolerate PO hydration
  - urine output is best measure of resuscitation, should be 40-50 cc/h or 0.5 cc/kg/h; avoid diuretics
- pain relief: continuous morphine infusion with breakthrough bolus
- investigations: CBC, electrolytes, U/A, CXR, ECG, ABG, carboxyhemoglobin
- burn wound care: prevent infection, clean/debride with mild soap and water, sterile dressings
- escharotomy or fasciotomy for circumferential burns (chest, extremities)
- topical antibiotics, burn victims are highly susceptible to infection (portal of entry with reduced immune function) – systemic antibiotics are often required
- tetanus prophylaxis if burn is deeper than superficial dermis

Use palm of the patient's hand to estimate 1% of BSA affected

### Disposition
- admit
  - 2nd degree burns >10% BSA, or any significant 3rd degree burns
  - 2nd degree burns on face, hands, feet, perineum, or across major joints
  - electrical, chemical burns, and inhalation injury
  - burn victims with chronic medical conditions or immunosuppressed patients

**Burn Causes**
- Thermal (flame, scald)
- Chemical
- Radiation (UV, medical/therapeutic)
- Electrical

## Inhalation Injury

### Etiology
- carbon monoxide or cyanide poisoning
- direct thermal injury: limited to upper airway (above the vocal cords)
- smoke causes bronchospasm and edema from particulate matter and toxic inhalants (tissue asphyxiates, pulmonary irritants, systemic toxins)

Always look for inhalational injury in patients with burns. Intubate early if you suspect inhalation injury, as airway can become obstructed due to edema

### History and Physical Exam
- risk factors: closed space fires, period of unconsciousness, noxious chemicals involved
- cherry red skin (unreliable, usually post-mortem finding)
- singed nasal hairs, soot on oral/nasal membranes, sooty sputum
- hoarseness, stridor, dyspnea
- decreased LOC, confusion
- $PO_2$ normal but $O_2$ saturation low suggests CO poisoning

### Investigations
- measure carboxyhemoglobin levels, co-oximetry
- ABG
- CXR ± bronchoscopy

### Management
- CO poisoning: 100% $O_2$ ± hyperbaric $O_2$ (controversial)
- direct thermal injury: humidified oxygen, early intubation, pulmonary toilet, bronchodilators, and mucolytics (N-acetylcysteine)

## Bites

### MAMMALIAN BITES
- see Plastic Surgery, PL11

### History
- time and circumstances of bite, symptoms, allergies, tetanus immunization status, comorbid conditions, risk of rabies exposure/transmission, HIV/hepatitis risk (human bite)
- high morbidity associated with clenched fist injuries, "fight bites"

### Physical Exam
- assess type of wound: abrasion, laceration, puncture, crush injury
- assess for direct tissue damage: skin, bone, tendon, neurovascular status

### Investigations
- if bony injury or infection suspected, check for fracture and gas in tissue with x-rays
- get skull films in children with scalp bite wounds ± CT to rule out cranial perforation
- ultrasound may be helpful for identifying abscess formation as well as locating radiolucent foreign bodies in infected wounds

### Initial Management
- wound cleaning and copious irrigation as soon as possible
- irrigate/debride puncture wounds if feasible, but not if sealed or very small openings; avoid hydrodissection along tissue planes
- debridement is important in crush injuries to reduce infection and optimize cosmetic and functional repair

- culture wound if signs of infection (erythema, necrosis, or pus); obtain anaerobic cultures if wound foul smelling, necrotizing, or abscess; notify lab that sample is from bite wound
- suturing
  - vascular structures (i.e. face and scalp) are less likely to become infected, therefore consider suturing
  - allow avascular structures (i.e. pretibial regions, hands, and feet) to heal by secondary intention
- tetanus immunization if >10 yr or incomplete primary series

### Prophylactic Antibiotics

- types of infections resulting from bites: cellulitis, lymphangitis, abscesses, tenosynovitis, osteomyelitis, septic arthritis, sepsis, endocarditis, meningitis
- a 3-5 d course of antibiotics is recommended for all bite wounds to the hand and should be considered in other bites if any high-risk factors present
- dog and cat bites (pathogens: Pasteurella multocida, S. aureus, S. viridans)
  - 10-50% of cat bites, 5% of dog bites become infected
  - 1st line: amoxicillin + clavulanic acid
- human bites (pathogens: Eikenella corrodens, S. aureus, S. viridans, oral anaerobes)
  - 1st line: amoxicillin + clavulanic acid
- rabies (see Infectious Diseases, ID18)
  - reservoirs: warm-blooded animals except rodents, lagomorphs (e.g. rabbits)
  - post-exposure vaccine is effective; treatment depends on local prevalence

### INSECT BITES

- bee stings
  - 5 types of reactions to stings (local, large local, systemic, toxic, unusual)
  - history and physical exam key to diagnosis; no lab test will confirm
  - investigations: CBC, electrolytes, BUN, Cr, glucose, ABGs, ECG
  - ABC management, epinephrine 0.1 mg IV over 5 min if shock, antihistamines, cimetidine 300 mg IV/IM/PO, steroids, β-agonists for SOB/wheezing 3 mg in 5 mL NS via nebulizer, local site management
- West Nile virus (see Infectious Diseases, ID22)

## Near Drowning

- most common in children <4 yr and teenagers
- causes lung damage, hypoxemia, and may lead to hypoxic encephalopathy
- must also assess for shock, C-spine injuries, hypothermia, and scuba-related injuries (barotrauma, air emboli, lung re-expansion injury)
- complications: volume shifts, electrolyte abnormalities, hemolysis, rhabdomyolysis, renal, DIC

### Physical Exam

- ABCs, vitals: watch closely for hypotension
- respiratory: rales (ARDS, pulmonary edema), decreased breath sounds (pneumothorax)
- CVS: murmurs, dysrhythmias, JVP (CHF, pneumothorax)
- H&N: assess for C-spine injuries
- neurological: GCS or AVPU, pupils, focal deficits

### Investigations

- labs: CBC, electrolytes, ABGs, Cr, BUN, INR, PTT, U/A (drug screen, myoglobin)
- imaging: CXR (pulmonary edema, pneumothorax) ± C-spine imaging
- ECG

### Management

- ABCs, treat for trauma, shock, hypothermia
- cardiac and $O_2$ monitors, IV access
- intensive respiratory care
  - ventilator assistance if decreased respirations, $pCO_2$ >50 mmHg, or $pO_2$ <60 mmHg on maximum $O_2$
  - may require intubation for airway protection, ventilation, pulmonary toilet
  - high flow $O_2$/CPAP/BiPAP may be adequate but some may need mechanical ventilation with positive end-expiratory pressure
- dysrhythmias: usually respond to corrections of hypoxemia, hypothermia, and acidosis
- vomiting: very common, NG suction to avoid aspiration
- convulsions: usually respond to $O_2$; if not, diazepam 5-10 mg IV slowly
- bronchospasm: bronchodilators
- bacterial pneumonia: prophylactic antibiotics not necessary unless contaminated water or hot tub (*Pseudomonas*)
- always initiate CPR in drowning-induced cardiac arrest even if patient hypothermic; continue CPR until patient is fully rewarmed

### Disposition

- non-significant submersion: discharge after short observation
- significant submersion (even if asymptomatic): long period of observation (72 h) as pulmonary edema may appear late
- CNS symptoms or hypoxemia: admit
- severe hypoxemia, decreased LOC: ICU

"Secondary drowning" where the onset of symptoms, as a result of pulmonary edema or infection, can be insidious, developing over hours, or possibly even days, must be anticipated in the near drowning patient

# Toxicology

## "ABCD$_3$EFG" of Toxicology

- basic axiom of care is symptomatic and supportive treatment
- address underlying problem only once patient is stable

**A** **A**irway (consider stabilizing C-spine)
**B** **B**reathing
**C** **C**irculation
**D1** **D**rugs
  - ACLS as necessary to resuscitate the patient
  - universal antidotes

**D2** **D**raw bloods
**D3** **D**econtamination (decrease absorption)
**E** **E**xpose (look for specific toxidromes)/Examine the patient
**F** **F**ull vitals, ECG monitor, Foley, X-rays
**G** **G**ive specific antidotes and treatments

- reassess
- call Poison Information Centre
- obtain corroborative history from family, bystanders

**Principles of Toxicology**
4 principles to consider with all ingestions:
- Resuscitation (ABCD$_3$EFG)
- Screening (toxidrome? clinical clues?)
- Decrease absorption of drug
- Increase elimination of drug

## D1 – Universal Antidotes

- treatments that will not harm patients and may be essential

### Dextrose (glucose)
- give to any patient presenting with altered LOC
- measure blood glucose prior to glucose administration if possible
- adults: 0.5-1.0 g/kg (1-2 mL/kg) IV of D50W
- children: 0.25 g/kg (2-4 mL/kg) IV of D25W

### Oxygen
- do not deprive a hypoxic patient of oxygen no matter what the antecedent medical history (i.e. even COPD with $CO_2$ retention)
- if depression of hypoxic drive, intubate and ventilate
- exception: paraquat or diquat (herbicides) inhalation or ingestion (oxygen radicals increase morbidity)

### Naloxone (central μ-receptor competitive antagonist, shorter t1/2 than naltrexone)
- antidote for opioids: administration is both diagnostic and therapeutic (1 min onset of action)
- used for the undifferentiated comatose patient
- loading dose
  - adults
    - response to naloxone can be drastic, so stepwise delivery of initial 2 mg bolus is recommended
    - draw up 2 mg to deliver IV/IM/SL/SC or via ETT (ETT dose = 2-2.5x IV dose)
      - 1st dose 0.4 mg (for a chronic opioid user, the initial dose may be much smaller)
      - if no response, deliver second dose 0.6 mg
      - if still no response, deliver remaining 1 mg
  - child
    - 0.01 mg/kg initial bolus IV/IO/ETT (max 2mg per dose)
    - children over 20 kg can receive naloxone 2 mg IV
  - maintenance dose
    - may be required because half-life of naloxone (30-80 min) is much shorter than many opioids
    - hourly infusion rate at 2/3 of initial dose that allowed patient to be roused

### Thiamine (Vitamin B1)
- 100 mg IV/IM with IV/PO glucose to all patients
- given to prevent/treat Wernicke's encephalopathy
- a necessary cofactor for glucose metabolism (may worsen Wernicke's encephalopathy if glucose given before thiamine), but do not delay glucose if thiamine unavailable
- must assume all undifferentiated comatose patients are at risk

**Universal Antidotes**

**DONT**
**D**extrose
**O**xygen
**N**aloxone
**T**hiamine (must give BEFORE dextrose)

Administration of naloxone can cause opioid withdrawal in chronic users:
**Minor** withdrawal may present as lacrimation, rhinorrhea, diaphoresis, yawning, piloerection, HTN, and tachycardia
**Severe** withdrawal may present as hot and cold flashes, arthralgias, myalgias, N/V, and abdominal cramps

Thiamine is deficient in the malnourished. Consider in patients with alcohol use disorder, anorexia, or malnutrition states

# D2 – Draw Bloods

- essential tests
  - CBC, electrolytes, BUN/Cr, glucose, INR/PTT, osmolality
  - ABGs, $O_2$ sat
  - ASA, acetaminophen, EtOH levels
- potentially useful tests
  - drug levels – this is NOT a serum drug screen
  - $Ca^{2+}$, $Mg^{2+}$, $PO_4^{3-}$
  - protein, albumin, lactate, ketones, liver enzymes, CK – depending on drug and clinical feature

## Serum Drug Levels

- treat the patient, not the drug level
- negative toxicology screen does not rule out a toxic ingestion – signifies only that the specific drugs tested were not detectable in the specimen
- specific drugs available on general screen vary by institution; check before ordering
- urine screens also available (qualitative only; not often thought to change management)

Urine drug screen is costly and generally not helpful in the ED management of the poisoned patient

### Table 30. Toxic Gaps (see Nephrology, NP16)

**METABOLIC ACIDOSIS**

**Increased AG**: "**GOLDMARK**" (* = toxic)
**G**lycols* (ethylene glycol, propylene glycol)
**O**xoproline (metabolite of acetaminophen)*
**L**-lactate
**D**-lactate (acetaminophen, short bowel syndrome, propylene glycol infusions for lorazepam & phenobarbital)
**M**ethanol*
**A**SA*
**R**enal failure
**K**etoacidosis (DKA, EtOH*, starvation)

**Increased osmolar gap: "MAE DIE"** (if it ends in "-ol", it will likely increase the osmolar gap)
**M**ethanol
**A**cetone
**E**thanol
**D**iuretics (glycerol, mannitol, sorbitol)
**I**sopropanol
**E**thylene glycol

Note: normal osmolar gap does not rule out toxic alcohol; only an elevated gap is helpful

**Decreased AG**
Electrolyte imbalance (increased $Na^+/K^+/Mg^{2+}$)
Hypoalbuminemia (50% fall in albumin ~5.5 mmol/L decrease in the AG)
Lithium, bromine elevation
Paraproteins (multiple myeloma)

**Increased $O_2$ saturation gap**
Carboxyhemoglobin
Methemoglobin
Sulfmethemoglobin

**Normal AG**
Renal HCO3- loss: renal tubular acidosis, hyperparathyroidism
GI HCO3- loss: diarrhea, fistula
Other: NS infusion, acetazolamide, hyperkalemia, hypoaldosteronism

**Anion Gap**
$= Na^+ - Cl^- - HCO_3^-$
Normal AG ≤12 mM/L

### Table 31. Use of the Clinical Laboratory in the Initial Diagnosis of Poisoning

| Test | Finding | Selected Causes |
|---|---|---|
| **ABG** | Hypoventilation (high $pCO_2$) | CNS depressants (opioids, sedative-hypnotic agents, phenothiazines, EtOH) |
| | Hyperventilation (low $pCO_2$) | Salicylates, CO, other asphyxiants |
| **Electrolytes** | AG metabolic acidosis | "**GOLDMARK**": see Table 30 |
| | Hyperkalemia | Digitalis glycosides, fluoride, potassium |
| | Hypokalemia | Theophylline, caffeine, β-adrenergic agents, soluble barium salts, diuretics, insulin |
| **Glucose** | Hypoglycemia | Oral hypoglycemic agents, insulin, EtOH, ASA |
| **Osmolality and Osmolar Gap** | Elevated osmolar gap | "**MAE DIE**": see Table 30 |
| **ECG** | Wide QRS complex | TCAs, quinidine, other class Ia and Ic antidysrhythmic agents |
| | Prolonged QT interval | Terfenadine, astemizole, antipsychotics |
| | Atrioventricular block | $Ca^{2+}$ antagonists, digitalis glycosides, phenylpropanolamine |
| **Abdominal X-Ray** | Radioopaque pills or objects | "**CHIPES**": **C**alcium, **C**hloral hydrate, **C**$Cl_4$, **H**eavy metals, **I**ron, **P**otassium, **E**nteric coated **S**alicylates, and some foreign bodies |
| **Serum Acetaminophen** | Elevated level (>140 mg/L or 1000 µmol/L 4 h after ingestion) | May be only sign of acetaminophen poisoning |

# D3 – Decontamination and Enhanced Elimination

## Ocular Decontamination
- saline irrigation to neutralize pH; alkali exposure requires ophthalmology consult

## Dermal Decontamination (Wear Protective Gear)
- remove clothing, brush off toxic agents, irrigate all external surfaces

## Gastrointestinal Decontamination
- single dose activated charcoal
  - use of activated charcoal is a source of much debate amongst toxicologists. Evidence of effectiveness is not strong, and risk of aspiration is high.
  - adsorption of drug/toxin to activated charcoal decreases toxin bioavailability
  - contraindications: unprotected airway, late presentation after ingestion, small bowel obstruction, poor toxin adsorption
  - dose: 10 g/g drug ingested or 1g/kg body weight (may vary depending on ingestion)
  - odourless, tasteless, prepared as slurry with $H_2O$
- whole bowel irrigation (very rarely used)
  - 500 mL/h (child) to 2000 mL/h (adult) of polyethylene glycol solution by mouth until clear effluent per rectum
    - start slow (500 mL in an adult) and aim to increase rate hourly as tolerated
  - indications
    - awake, alert, can be nursed upright OR intubated and airway protected
    - delayed release product
    - drug/toxin not bound to charcoal
    - drug packages (if any evidence of breakage emergency surgery)
    - recent toxin ingestion
  - contraindications
    - evidence of ileus, perforation, or obstruction
- multidose activated charcoal
  - may be used for: carbamazepine, phenobarbital, quinine, theophylline for toxins which undergo enterohepatic recirculation
  - removes drug that has already been absorbed by drawing it back into GI tract
  - various regimens: 12.5 g (1/4 bottle) PO q1h or 25 g (1/2 bottle) PO q2h until non-toxic
- surgical removal in extreme cases
  - surgical indicated for drugs that are toxic, form concretions, or cannot be removed by conventional means
- use of cathartics (i.e. ipecac) and gastric lavage in the ED is not recommended

## Lipid Emulsification
- new therapy used in cardiogenic shock due to toxins
- may be used for: anesthetics, β-blocker and calcium channel blocker overdose
- initial bolus 1.5mL/kg 20% lipid solution over 2-3 min then infusion of 0.25mL/kg/min

## Urine Alkalinization
- may be used for: ASA, methotrexate, phenobarbital, chlorpropamide
- weakly acidic substances can be trapped in alkali urine (pH >7.5) to increase elimination

## Hemodialysis
- indications/criteria for hemodialysis
  - toxins that have high water solubility, low protein binding, low molecular weight, adequate concentration gradient, small volume of distribution, or rapid plasma equilibration
  - clinical deterioration despite maximal medical support
- useful for the following toxins
  - methanol
  - ethylene glycol
  - salicylates
  - lithium
  - phenobarbital
  - chloral hydrate ( trichloroethanol)
- others include theophylline, carbamazepine, valproate, methotrexate

# E – Expose and Examine the Patient

- vital signs (including temperature), skin (needle tracks, colour), mucous membranes, pupils, odours, and CNS
- head-to-toe survey including
  - C-spine
  - signs of trauma, seizures (incontinence, "tongue biting", etc.), infection (meningismus), or chronic alcohol/drug misuse (track marks, nasal septum erosion)
  - feel the patient's axillae; in the average patient, should be somewhat moist (if dry, may indicate anticholinergic toxicity)
- mental status

**Table 32. Specific Toxidromes**

| Toxidrome | Overdose Signs and Symptoms | | Examples of Drugs |
|---|---|---|---|
| **Anticholinergic** | Hyperthermia<br>Dilated pupils<br>Dry skin<br>Vasodilation<br>Agitation/hallucinations<br>Ileus<br>Urinary retention<br>Tachycardia | "Hot as a hare"<br>"Blind as a bat"<br>"Dry as a bone"<br>"Red as a beet"<br>"Mad as a hatter"<br>"The bowel and bladder lose their tone and the heart goes on alone" | Antidepressants (e.g. TCAs)<br>Cyclobenzaprine (Flexeril®)<br>Carbamazepine<br>Antihistamines (e.g. diphenhydramine)<br>Antiparkinsonians<br>Antipsychotics<br>Antispasmodics<br>Belladonna alkaloids (e.g. atropine) |
| **Cholinergic** | **"DUMBELS"**<br>**D**iaphoresis, **D**iarrhea, **D**ecreased BP<br>**U**rination<br>**M**iosis<br>**B**ronchospasm, **B**ronchorrhea, **B**radycardia<br>**E**mesis, **E**xcitation of skeletal muscle<br>**L**acrimation<br>**S**alivation, **S**eizures | | Natural plants: mushrooms, trumpet flower<br>Anticholinesterases: physostigmine<br>Insecticides (organophosphates, carbamates)<br>Nerve gases |
| **Extrapyramidal** | Dysphonia, dysphagia<br>Rigidity and tremor<br>Motor restlessness, crawling sensation (akathisia)<br>Constant movements (dyskinesia)<br>Dystonia (muscle spasms, laryngospasm, trismus, oculogyric crisis, torticollis) | | Major tranquilizers<br>Antipsychotics |
| **Hemoglobin Derangements** | Increased respiratory rate<br>Decreased LOC<br>Seizures<br>Cyanosis unresponsive to $O_2$<br>Lactic acidosis | | CO poisoning (carboxyhemoglobin)<br>Drug ingestion (methemoglobin, sulfmethemoglobin) |
| **Opioid, Sedative/ Hypnotic, EtOH** | Hypothermia<br>Hypotension<br>Respiratory depression<br>Dilated or constricted pupils (pinpoint in opioid)<br>CNS depression | | EtOH<br>Benzodiazepines<br>Opioids (morphine, heroin, fentanyl, etc.)<br>Barbiturates<br>GHB ("G," "liquid gold") |
| **Sympathomimetic** | Increased temperature<br>CNS excitation (including seizures)<br>Tachycardia, HTN<br>N/V<br>Diaphoresis<br>Dilated pupils | | Amphetamines, caffeine, cocaine, LSD, phencyclidine<br>Ephedrine and other decongestants<br>Thyroid hormone<br>Sedative or EtOH withdrawal |
| **Serotonin Syndrome** | Mental status changes, autonomic hyperactivity, neuromuscular abnormalities, hyperthermia, diarrhea, HTN | | MAOI, TCA, SSRI, opiate analgesics<br>Cough medicine, weight reduction medications |

Note: ASA poisoning and hypoglycemia mimic sympathomimetic toxidrome

# F – Full Vitals, ECG Monitor, Foley, X-Rays

# G – Give Specific Antidotes and Treatments

### Urine Alkalinization Treatment for ASA Overdose

- urine pH >7.5
- fluid resuscitate first, then 3 amps $NaHCO_3$/L of D5W at 1.5x maintenance
- add 20-40 mEq/L KCl if patient is able to urinate

### Table 33. Protocol for Warfarin Overdose

| INR | **Management**: Consider Prothrombin Complex Concentrate (Octaplex®, Beriplex®) for any elevated INR, AND either life-threatening bleeding, or a plan for the patient to undergo a surgical procedure within the next 6 h |
|---|---|
| **<5.0** | Cessation of warfarin administration, observation, serial INR/PT |
| **5.1–9.0** | If no risk factors for bleeding, hold warfarin x 1-2 d and reduce maintenance dose<br>OR<br>Vitamin K 1-2 mg PO if patient at increased risk of bleeding |
| **9.1–20.0** | Hold warfarin, vitamin K 2-4 mg PO, serial INR/PT, additional vitamin K if necessary |
| **>20.0** | Hold warfarin, vitamin K 10 mg IV over 10 min, increase vitamin K dosing (q4h) if needed |

### Table 34. Specific Antidotes and Treatments for Common Toxins*

| Toxin | Treatment | Considerations |
|---|---|---|
| **Acetaminophen** | Decontaminate (activated charcoal)<br>N-acetylcysteine | Often clinically silent; evidence of liver/renal damage delayed >24 h<br>Toxic dose >200 mg/kg (>7.5 g adult)<br>Monitor drug level 4 h post-ingestion; also liver enzymes, INR, PTT, BUN, Cr<br>Hypoglycemia, metabolic acidosis, encephalopathy poor prognosis<br>Dialysis may be required to manage in very high overdoses |
| **Acute Dystonic Reaction** | Benztropine: 1-2 mg IM/IV then 2 mg PO x 3 d<br>OR Diphenhydramine 1-2 mg/kg IV,<br>then 25 mg PO qid x 3 d | Benztropine (Cogentin®) has euphoric effect and the potential for misuse |
| **Anticholinergics** | Consider decontamination (activated charcoal)<br>Supportive care | Special antidotes available; consult Poison Information Centre |
| **ASA** | Consider decontamination (activated charcoal)<br>Alkalinize urine; want urine pH >7.5 | Monitor serum pH and drug levels closely<br>Monitor $K^+$ level; may require supplement for urine alkalinization<br>Hemodialysis may be needed if intractable metabolic acidosis, very high levels, or end-organ damage (i.e. unable to diurese) |
| **Benzodiazepines** | Consider decontamination (activated charcoal)<br>Flumazenil<br>Supportive care | |
| **β-blockers** | Consider decontamination (activated charcoal, consider whole bowel irrigation for extended-release ingestion)<br>IV glucagon, IV calcium chloride, IV high-dose insulin (with dextrose), IV intralipid | |
| **Calcium Channel Blockers** | Consider decontamination (activated charcoal, consider whole bowel irrigation for extended-release ingestion)<br>IV glucagon, IV calcium chloride, IV high-dose insulin (with dextrose), IV intralipid | Order ECG, electrolytes (especially $Ca^{2+}$, $Mg^{2+}$, $Na^+$, $K^+$) |
| **Cocaine** | Decontaminate (activated charcoal) if oral<br>Aggressive supportive care | β-blockers are contraindicated in acute cocaine toxicity<br>Intralipid for life-threatening symptoms |
| **CO Poisoning** | See *Inhalation Injury*, ER47<br>Supportive care<br>100% $O_2$ ; may require hyperbaric $O_2$ | Order ECG, VBG. Consider lactate and troponin depending on specific presentation |
| **Cyanide** | Hydroxocobalamin | |
| **Digoxin** | Consider decontamination (activated charcoal)<br>Digoxin-specific Ab fragments<br>10-20 vials IV if acute; 3-6 if chronic<br>1 vial (40 mg) neutralizes 0.5 mg of toxin | Use for life-threatening dysrhythmias unresponsive to conventional therapy, 6 h serum digoxin >12 nmol/L, initial $K^+$ >5 mmol/L, ingestion >10 mg (adult)/>4 mg (child)<br>Common dysrhythmias include VFib, VTach, and conduction blocks |
| **Ethanol** | Thiamine 100 mg IM/IV<br>Manage airway and circulatory support | Mouthwash = 70% EtOH; perfumes and colognes = 40-60% EtOH<br>Order serum EtOH level and glucose level; treat glucose level appropriately |
| **Ethylene Glycol/ Methanol** | Fomepizole (4-methylpyrazole)<br>15 mg/kg IV load over 30 min,<br>then 10 mg/kg q12h OR<br>Ethanol (10%) 10 mL/kg over 30 min, then 1.5 mL/h | CBC, electrolytes, glucose, ethanol level<br>Consider hemodialysis |
| **Heparin** | Protamine sulfate 25-50 mg IV | For unfractionated heparin overdose only |
| **Insulin IM/SC/ Oral Hypoglycemic** | Glucose IV/PO/NG tube<br>Glucagon: 1-2 mg IM (if no access to glucose) | Glyburide carries highest risk of hypoglycemia among oral agents<br>Consider octreotide for oral hypoglycemics (50-100 μg SC q6h) in these cases; consult local Poison Information Centre |
| **MDMA** | Consider decontamination (activated charcoal)<br>Supportive care | Monitor CK; treat rhabdomyolysis with high flow fluids: aggressive external cooling for hyperthermia<br>Review medical history if possible for serotonergic use |
| **Opioids** | See *Universal Antidotes*, ER49 | |
| **TCAs** | Consider decontamination (activated charcoal)<br>Aggressive supportive care<br>$NaHCO_3$ bolus for wide QRS/seizures | Flumazenil antidote contraindicated in combined TCA and benzodiazepine overdose<br>Also consider cardiac and hypotension support, seizure control<br>Intralipid therapy |

* Call local Poison Information Centre for reporting of cases, specific doses, and treatment recommendations. Most toxicology cases should involve communication with your local Poison Information Centre.

# Alcohol Related Emergencies

- see Psychiatry, PS26

## Acute Intoxication

- slurred speech, CNS depression, disinhibition, lack of coordination
- nystagmus, diplopia, dysarthria, ataxia, may progress to coma
- hypotension (peripheral vasodilation)
- if obtunded, rule out
  - head trauma/intracranial hemorrhage
  - associated depressants, toxic alcohols
- may also contribute to respiratory/cardiac depression
  - hypoglycemia (screen with bedside glucometer)
  - hepatic encephalopathy: confusion, altered LOC, coma
- precipitating factors: GI bleed, infection, sedation, electrolyte abnormalities, protein meal
  - Wernicke's encephalopathy (ataxia, ophthalmoplegia, delirium)
  - post-ictal state, basilar stroke

Alcohol levels correlate poorly with intoxication

Alcohol intoxication may invalidate informed consent

## Withdrawal

- beware of withdrawal signs
- treatment
  - diazepam 10-20 mg IV/PO or lorazepam 2-4 mg IV/PO q1h until calm
- frequency of dosing may have to be increased depending on clinical response
  - may use CIWA protocol and give benzodiazepines as above until CIWA <10
  - thiamine 100 mg IM/IV then 50-100 mg/d
  - magnesium sulfate 4 g IV over 1-2 h (if hypomagnesemic)
  - admit patients with delirium tremens or multiple seizures

**CIWA Withdrawal Symptoms**
- N/V
- Tremor
- Paroxysmal sweats
- Anxiety
- Agitation
- Visual disturbances
- Tactile disturbances
- Auditory disturbances
- Headache
- Disorientation

10 symptoms each scored out of 7 except orientation, which is scored out of 4

**Table 35. Alcohol Withdrawal Signs**

| Time Since Last Drink | Syndrome | Description |
|---|---|---|
| **6-8 h** | Mild withdrawal | Generalized tremor, anxiety, agitation, but no delirium<br>Autonomic hyperactivity (sinus tachycardia), insomnia, N/V |
| **1-2 d** | Alcoholic hallucinations | Visual (most common), auditory, and tactile hallucinations<br>Vitals often normal |
| **8 h-2 d** | Withdrawal seizures | Typically brief generalized tonic-clonic seizures<br>May have several within a few hours<br>CT head if focal seizures have occurred |
| **3-5 d** | DT | 5% of untreated withdrawal patients<br>Severely confused state, fluctuating LOC<br>Agitation, insomnia, hallucinations/delusions, tremor<br>Tachycardia, hyperpyrexia, diaphoresis<br>High mortality rate |

## Cardiovascular Complications

- HTN
- cardiomyopathy: SOB, edema
- dysrhythmias ("holiday heart")
- AFib (most common), atrial flutter, SVT, VTach (especially Torsades if hypomagnesemic/hypokalemic)

## Metabolic Abnormalities

- alcoholic ketoacidosis
  - antigen metabolic acidosis, urine ketones, low glucose, and normal osmolality
  - history of chronic alcohol intake with abrupt decrease/cessation
  - malnourished, abdominal pain with N/V
  - treatment: dextrose, thiamine (100 mg IM/IV prior to dextrose), volume repletion (with NS)
  - generally resolves in 12-24 h
- other alcohols
  - ethylene glycol: CNS, CVS, renal findings
  - methanol
    - early: lethargy, confusion
    - late: headache, visual changes, N/V, abdominal pain, tachypnea
  - both ethylene glycol and methanol produce severe metabolic acidosis with anion gap (as the alcohol is metabolized) and osmolar gap (initially after ingestion but before metabolism)
  - EtOH co-ingestion is protective

  - treatment
    - urgent hemodialysis required
    - fomepizole 15 mg/kg IV bolus (treatment of choice) or EtOH 10% IV bolus and infusion to achieve blood level of 22 mmol/L (EtOH loading may be done PO)
    - consider folic acid for methanol, and pyridoxine and thiamine for ethylene glycol – both help reduce conversion to active metabolites
- other abnormalities associated with alcohol: hypomagnesemia, hypophosphatemia, hypocalcemia, hypoglycemia, hypokalemia

### Gastrointestinal Abnormalities
- gastritis
  - common cause of abdominal pain and GI bleed in chronic alcohol users
- pancreatitis
  - serum amylase very unreliable in patients with chronic pancreatitis, may need serum lipase
  - hemorrhagic form (15%) associated with increased mortality
  - fluid resuscitation very important
- hepatitis
  - AST/ALT ratio >2 suggests alcohol as the cause as well as elevated GGT with acute ingestion
- peritonitis/spontaneous bacterial peritonitis
  - leukocytosis, fever, generalized abdominal pain/tenderness
  - occasionally accompanies cirrhosis
  - paracentesis for diagnosis (common pathogens: E. coli, Klebsiella, Streptococcus)
  - albumin shown to improve outcomes in SBP patients
- GI bleeds
  - most commonly gastritis or ulcers, even if patient known to have varices
  - consider Mallory-Weiss tear secondary to retching
  - often complicated by underlying coagulopathies
  - minor: treat with antacids
  - severe or recurrent: endoscopy

### Disposition
- before patient leaves ED ensure stable vital signs, can walk unassisted, and fully oriented
- offer social services to find shelter or detox program
- ensure patient can obtain any medications prescribed and can complete any necessary follow-up

## Approach to the Overdose Patient

**Indications to Suspect Overdose**
- Altered LOC/coma
- Young patient with life-threatening dysrhythmia
- Trauma patient
- Bizarre or puzzling clinical feature

### History
- age, weight, underlying medical problems, medications
- substance, route, and quantity
- time and symptoms since exposure determines prognosis and need for decontamination
- route
- intention, suicidality

### Physical Exam
- focus on: ABCs, LOC/GCS, vitals, pupils

### Disposition from the Emergency Department
- methanol, ethylene glycol
  - delayed onset, admit, and watch clinical and biochemical markers
- TCAs
  - prolonged/delayed cardiotoxicity warrants admission to monitored ICU bed
  - if asymptomatic and no clinical signs of intoxication: 6 h ED observation adequate with proper decontamination and no ECG abnormalities
  - sinus tachycardia alone (most common finding) with history of overdose warrants observation in ED
- hydrocarbons/smoke inhalation
  - pneumonitis may lag 6-8 h
  - consider observation for repeated clinical and radiographic examination
- ASA, acetaminophen
  - if borderline level, get second level 2-4 h after first
  - for ASA, must have at least 2 measurements showing decreasing toxin serum concentration before discharge (3 levels minimum)
- oral hypoglycemics
  - admit all patients for minimum 24 h if hypoglycemic and 12 h after last octreotide dose
  - observe asymptomatic patient for at least 8 h

### Psychiatric Consultation
- once patient medically cleared, arrange psychiatric intervention if required
- beware – suicidal ideation may not be expressed

# Psychiatric Emergencies

## Approach to Common Psychiatric Presentations

- see Psychiatry, PS2
- before seeing patient, ensure your own safety; have security/police available if necessary

### History

- safety
  - assess suicidality: suicidal ideation (SI), intent, plan, lethal means, past attempts, protective factors
  - assess homicidality: homicidal ideation (HI), access to weapons, intended victim, and history of violence
  - driving and children
  - command hallucinations
- identify current stressors and coping strategies
- mood symptoms: manic, depressive
- anxiety: panic attacks, generalized anxiety, phobias, obsessive-compulsive disorder, post-traumatic stress disorder
- psychotic symptoms: delusions, hallucinations, disorganized speech, disorganized or catatonic behaviour, negative symptoms (affective flattening, alogia, avolition)
- substance use history: most recent use, amount, previous withdrawal reactions
- past psychiatric history, medications, adherence with medications
- medical history: obtain collateral if available

**Key Functions of Emergency Psychiatric Assessment**

- Is the patient medically stable?
- Rule out medical cause
- Is psychiatric consult needed?
- Are there safety issues (SI, HI)?
- Is patient certifiable? (must demonstrate risk [present/past test] and apparent mental illness [future test])

### Physical Exam

- complete physical exam focusing on: vitals, neurological exam, signs of head trauma, signs of drug toxicity, signs of metabolic disorder
- mental status exam: general appearance, behaviour, cooperation, speech, mood and affect, thought content and form, perceptual disturbances, cognition (including MMSE if indicated), judgment, insight, reliability

**Psychiatric Review of Systems**

**MOAPS**
**M**ood
**O**rganic
**A**nxiety
**P**sychosis
**S**afety

### Investigations

- investigations vary with age, established psychiatric diagnosis vs. first presentation, history and physical suggestive of organic cause
- as indicated: blood glucose, urine and serum toxicology screen, pregnancy test, electrolytes, TSH, AST/ALT, bilirubin, serum Cr, BUN, and osmolality
- blood levels of psychiatric medications
- CT head if suspect neurological etiology
- LP if indicated

## Acute Psychosis

### Differential Diagnosis

- primary psychotic disorder (e.g. schizophrenia)
- secondary to medical condition (e.g. delirium)
- drugs: substance intoxication or withdrawal, medications (e.g. steroids, anticholinergics)
- infectious (CNS)
- metabolic (hypoglycemic, hepatic, renal, thyroid)
- structural (hemorrhage, neoplasm)

### Management

- violence prevention
  - remain calm, empathic, and reassuring
  - ensure safety of staff and patients, have extra staff and/or security on hand
  - patients demonstrating escalating agitation or overt violent behaviour may require physical restraint and/or chemical restraint
- treat agitation: whenever possible, offer medication to patients as opposed to administering with force (helps calm and engage patient)
  - benzodiazepines: lorazepam 2 mg PO/IM/SL
  - antipsychotics: olanzapine 5 mg PO, haloperidol 5 mg PO/IM
- treat underlying medical condition
- psychiatry or Crisis Intervention Team consult

# Suicidal Patient

## Epidemiology
- attempted suicide F>M, completed suicide M>F
- second leading cause of death in people <24 yr
- risk is significantly increased in indigenous and LGBTQ Canadians, particularly trans individuals

## Management
- ensure patient safety: close observation, remove potentially dangerous objects from person and room
- assess thoughts (ideation), means, action (preparatory, practice attempts), previous attempts, protective factors
- admit if there is evidence of active intent and organized plan, access to lethal means, psychiatric disorder, intoxication (suicidal ideation may resolve with few days of abstinence)
- patient may require certification if unwilling to stay voluntarily
- do not start long-term medications in the ED
- psychiatry or Crisis Intervention Team consult

See Psychiatry, *Common Forms*, PS53 for certification (involuntary assessment/admission) considerations

**High Risk Patients**

**SAD PERSONS**
**S**ex = male
**A**ge >45 yr old
**D**epression
**P**revious attempts
**E**thanol use
**R**ational thinking loss
**S**uicide in family
**O**rganized plan
**N**o spouse, no support system
**S**erious illness

# Common Pediatric ED Presentations

# Modified Glasgow Coma Score

**Table 36. Modified GCS**

| Modified GCS for Infants | | |
|---|---|---|
| **Eye Opening** | **Verbal Response** | **Motor Response** |
| 4 – spontaneously | 5 – coos, babbles | 6 – normal, spontaneous movement |
| 3 – to speech | 4 – irritable cry | 5 – withdraws to touch |
| 2 – to pain | 3 – cries to pain | 4 – withdraws to pain |
| 1 – no response | 2 – moans to pain | 3 – decorticate flexion |
| | 1 – no response | 2 – decerebrate extension |
| | | 1 – no response |
| **Modified GCS for Children <4 years** | | |
| **Eye Opening** | **Verbal Response** | **Motor Response** |
| 4 – spontaneously | 5 – oriented, social, speaks, interacts | 6 – normal, spontaneous movement |
| 3 – to speech | 4 – confused speech, disoriented, consolable | 5 – localizes to pain |
| 2 – to pain | 3 – inappropriate words, not consolable/aware | 4 – withdraws to pain |
| 1 – no response | 2 – incomprehensible, agitated, restless, not aware | 3 – decorticate flexion |
| | 1 – no response | 2 – decerebrate extension |
| | | 1 – no response |

Any trauma or suspected trauma patient <1 yr of age with a large, boggy scalp hematoma requires U/S or CT

# Respiratory Distress

- see Pediatrics, P70

## History and Physical Exam
- infants not able to feed, older children not able to speak in full sentences
- anxious, irritable, lethargic – may indicate hypoxia
- tachypnea >60 (>40 if preschool age, >30 if school age), retractions, tracheal tug
  - see Pediatrics, P3 for age specific vital signs
- pulsus paradoxus
- wheezing, grunting, vomiting

**Table 37. Stridorous Upper Airway Diseases: Diagnosis**

| Feature | Croup | Bacterial Tracheitis | Epiglottitis[1] |
|---|---|---|---|
| **Age Range (yr)** | 0.5-4 | 5-10 | 2-8 |
| **Prodrome** | Days | Hours to days | Minutes to hours |
| **Temperature** | Low grade | High | High |
| **Radiography** | Steeple sign | Exudates in trachea | Thumb sign |
| **Etiology** | Parainfluenza | *S. aureus/GAS* | *H. influenzae type b* |
| **Barky Cough** | Yes | Yes | No |
| **Drooling** | Yes | No | Yes |
| **Appear Toxic** | No | Yes | Yes |
| **Intubation/ICU** | No | Yes | Yes |
| **Antibiotics** | No | Yes | Yes |
| **NOTE** | Oral exam | Oral exam | No oral exam, consult ENT |

[1]Now rare with Hib vaccine in common use

### Management
- croup (usually laryngotracheitis caused by parainfluenza viruses)
  - dexamethasone x 1 dose
  - if moderate-severe, add nebulized epinephrine (racemic has limited availability)
  - consider bacterial tracheitis/epiglottitis if unresponsive to croup therapy
  - humidified $O_2$ has no evidence for efficacy
- bacterial tracheitis
  - airway maintenance - usually require intubation, ENT consult, ICU
  - start antibiotics (e.g. cloxacillin), pending C&S
- epiglottitis
  - 4 D's: drooling, dyspnea, dysphagia, dysphonia + tripod sitting
  - do not examine oropharynx or agitate patient
  - immediate anesthesia, ENT call – intubate
  - then IV fluids, antibiotics, blood cultures
- asthma
  - supplemental $O_2$ if saturation <90% or $PaO_2$ <60%
  - bronchodilator therapy: salbutamol (Ventolin®) 0.15 mg/kg x3 by masks q20min
  - give corticosteroid therapy as soon as possible after arrival (prednisolone 2 mg/kg, dexamethasone 0.6 mg/kg, 2 doses 24 h apart)
  - if severe, add 250-500 μg ipratropium (Atrovent®) to first 3 doses salbutamol if critically ill, not responding to inhaled bronchodilators or steroids: give IV bolus, then infusion of MgSO4
  - IV β2-agonists if critically ill and not responding to above

# Febrile Infant and Febrile Seizures

## FEBRILE INFANT
- for fever >38°C without obvious focus
  - <28 d
    - admit
    - full septic workup (CBC and differential, blood C&S, urine C&S, LP ± stool C&S, CXR if indicated)
    - treat empirically with broad spectrum IV antibiotics
  - 28-90 d
    - as above unless infant meets Rochester criteria, partial septic workup (CBC and differential, blood C&S, urine C&S, CXR if indicated)
  - >90 d
    - toxic: admit, treat, full septic workup
    - non-toxic and no focus: investigate as indicated by history and physical

**Rochester Criteria for Febrile Infants Age 28-90 Days Old**
- Non-toxic looking
- Previously well (>37 wk gestational age, home with mother, no hyperbilirubinemia, no prior antibiotics or hospitalizations, no chronic/underlying illness)
- No skin, soft tissue, bone, joint, or ear infection on physical exam
- WBC 5000-15,000, bands <1500, urine <10 WBC/HPF, stool <5 WBC/HPF

## FEBRILE SEIZURES
- see Pediatrics, P78

### Etiology
- children aged 6 mo-6 yr with fever or history of recent fever
- typical vs. atypical febrile seizures
- normal neurological exam afterward
- no evidence of intracranial infection or history of previous non-febrile seizures
- often positive family history of febrile seizures
- relatively well-looking after seizure

### Investigations and Management
- if confirmed febrile seizure: treat fever and look for source of fever
- if not a febrile seizure: treat seizure and look for source of seizure
  - note: may also have fever but may not meet criteria for febrile seizure
- ± EEG (especially if first seizure), head U/S (if fontanelle open)

**Table 38. Typical vs. Atypical Febrile Seizures**

| Characteristic | Typical | Atypical |
|---|---|---|
| **Duration** | <15 min | >15 min |
| **Type of Seizure** | Generalized | Focal features |
| **Frequency** | 1 in 24 h | >1 in 24 h |

# Abdominal Pain

• see Pediatrics, P41

### History
- neuro, infections, autoimmune, hematology, trauma, abuse Hx questions
- nature of pain, associated fever
- associated GI, GU symptoms
- anorexia, decreased fluid intake

### Physical Exam
- HEENT, respiratory, abdominal exam including DRE, testicular/genital exam

**Table 39. Differential Diagnosis of Abdominal Pain in Infants/Children/Adolescents**

| Medical | Surgical |
|---|---|
| Colic | Malrotation with volvulus |
| UTI | Hirschsprung's disease |
| Constipation | Necrotizing enterocolitis |
| Gastroenteritis | Incarcerated hernia |
| Sepsis | Intussusception |
| Henoch-Schönlein purpura | Duodenal atresia |
| IBD | Appendicitis |
| Hemolytic uremic syndrome | Cholecystitis |
| Pneumonia | Pancreatitis |
| Strep throat | Testicular torsion |
| Sickle cell disease crisis | Ectopic pregnancy |
| DKA | Trauma |
| Functional | Pyloric stenosis |

*Remember to keep an index of suspicion for child abuse

**Red Flags for Abdominal Pain**
- Significant weight loss or growth retardation (need growth chart)
- Fever
- Joint pain with objective physical findings
- Rash
- Rectal bleeding
- Rebound tenderness and radiation of pain to back, shoulders, or legs
- Pain wakes from sleep
- Severe diarrhea and encopresis

# Common Infections

• see Pediatrics, P53

**Table 40. Antibiotic Treatment of Pediatric Bacterial Infections**

| Infection | Pathogens | Treatment |
|---|---|---|
| **MENINGITIS SEPSIS** | | |
| **Neonatal** | GBS, *E. coli, Listeria*, Gram-negative bacilli | ampicillin + cefotaxime |
| **1-3 mo** | Same pathogens as above and below | ampicillin + cefotaxime + vancomycin |
| **>3 mo** | *S. pneumoniae, H. influenzae* type b (>5 yr), meningococcus | ceftriaxone + vancomycin |
| **OTITIS MEDIA** | | |
| **1st Line** | *S. pneumoniae, H. influenzae* type b, *M. catarrhalis* | amoxicillin 80-90 mg/kg/d |
| **2nd Line** | | clarithromycin 15 mg/kg/d bid (for penicillin allergy) |
| **Treatment Failure** | | 90 mg/kg/d amoxicillin and 6.4 mg/kg/d clavulanate divided into bid dosage |
| **STREP PHARYNGITIS** | | |
| | Group A β-hemolytic *Streptococcus* | penicillin/amoxicillin or erythromycin (penicillin allergy) |
| **UTI** | | |
| | *E. coli, Proteus, H. influenzae, Pseudomonas, S. saprophyticus, Enterococcus*, GBS | Oral: cephalexin (older children)<br>IV: ampicillin and aminoglycoside |
| **PNEUMONIA** | | |
| **1-3 mo** | Viral, *S. pneumoniae, C. trachomatis, B. pertussis, S. aureus, H. influenzae* | cefuroxime ± macrolide (erythromycin)<br>OR ampicillin ± macrolide |
| **3 mo-5 yr** | Viral, *S. pneumoniae, S. aureus, H. influenzae, Mycoplasma pneumoniae* | ampicillin/amoxicillin or cefuroxime |
| **>5 yr** | As above | ampicillin/amoxicillin + macrolide<br>OR cefuroxime + macrolide |

# Child Abuse and Neglect

- see Pediatrics, P15
- obligation to report any suspected/known case of child abuse or neglect to CAS yourself (do not delegate)
- document injuries
- consider skeletal survey x-rays (especially in non-ambulatory child), ophthalmology consult, CT head
- injury patterns associated with child abuse
  - HI: torn frenulum, dental injuries, bilateral black eyes, traumatic hair loss, diffuse severe CNS injury, retinal hemorrhage
  - Shaken Baby Syndrome: diffuse brain injury, subdural/SAH, retinal hemorrhage, minimal/no evidence of external trauma, associated bony fractures
  - skin injuries: bites, bruises/burns in shape of an object, glove/stocking distribution of burns, bruises of various ages, bruises in protected areas
  - bone injuries: rib fractures without major trauma, femur fractures age <1 yr, spiral fractures of long bones in non-ambulatory children, metaphyseal fractures in infants, multiple fractures of various ages, complex/multiple skull fractures
  - GU/GI injuries: chronic abdominal/perineal pain, injury to genitals/rectum, STI/pregnancy, recurrent vomiting or diarrhea

**Presentation of Neglect**
- Failure to thrive, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents

**Procedures that may Require Sedation**
- Setting fractures
- Reducing dislocations
- Draining abscesses
- Exploring wounds/ulcers/superficial infections
- Endoscopic examination
- Reduce patient anxiety/agitation for imaging/procedures

# Common Medications

**Table 41. Commonly Used Medications**

| Drug | Dosing Schedule | Indications | Comments |
|---|---|---|---|
| **Acetaminophen** | 325-650 mg PO q4-6h prn | Pain control | Max 4 g daily |
| **Activated charcoal** | 30-100 g PO in 250 mL $H_2O$ | Poisoning/overdose | Efficacy and safety are case-dependent and are a source of debate |
| **ASA** | 325-650 mg PO q4h max 4g/d<br>stroke/MI risk: 81-325 mg PO OD<br>160 mg chewed | Pain control<br>Prevention of adverse cardiac events<br>ACS | |
| **β-blockers (metoprolol)** | 5 mg slow IV q5min x 3 if no contraindications<br>Or<br>25mg PO BID up to 100mg PO BID | Acute MI | |
| **Diazepam** | anxiety: 2-10 mg PO tid/qid<br>alcohol withdrawal: 10-20 mg PO/IV q1h titrated to signs/symptoms | Anxiety<br>Alcohol withdrawal | |
| **Enoxaparin** | 1 mg/kg SC bid | Acute MI | |
| **Epinephrine** | anaphylaxis: 0.3-0.5 mg IM;<br>ACLS cardiac arrest: 1mg IV q3-5 min<br>ACLS bradycardia: 2-10mcg/min IV infusion | Anaphylaxis, ACLS cardiac arrest, ACLS bradycardia | Max 1 mg/dose |
| **Fentanyl** | 0.5-1.0 µg/kg IV | Procedural sedation | Very short acting narcotic (complication=apnea) |
| **Flumazenil** | 0.3 mg IV bolus q5min x 3 doses | Reversal of procedural sedation | Benzodiazepine antagonist<br>Can cause seizures/status epilepticus in chronic benzodiazepine users |
| **Furosemide (Lasix®)** | CHF: 40-80 mg IV<br>HTN: 10-40 mg PO bid | CHF<br>HTN | Monitor for electrolyte imbalances |
| **Glucose** | 0.5-1.0 g/kg (1-2 mL/kg) IV of D50W | Hypoglycemia/DKA | |
| **Haloperidol** | 2.5-5.0 mg PO/IM initial effective dose<br>6-20 mg/d | Psychosis<br>Cannabis Hyperemesis Syndrome | Monitor for side effects if prescribing to a patient with Parkinson's disease (extrapyramidal side effects); results in CNS depression |
| **Ibuprofen** | 200-800 mg PO tid prn max 1200 mg/d | Mild to moderate acute pain<br>Analgesic and anti-inflammatory properties | |
| **Insulin** | bolus 5-10 U (0.2 U/kg)<br>then 5-10 U (0.1 U/kg) per h | Hyperglycemia | Monitor blood glucose levels<br>Consider $K^+$ replacement, also measure blood glucose levels before administration |
| **Ipratropium bromide** | 2-3 puffs inhaled tid-qid, max 12 puffs/d | Asthma | Contraindications include: peanut/soy allergy<br>Caution with narrow-angle glaucoma |
| **Lidocaine with epi** | max 7 mg/kg SC | Local anesthetic | Not to be used in fingers, nose, toes, penis, ears |
| **Lidocaine w/o epi** | max 5 mg/kg SC | Local anesthetic | |
| **Lorazepam** | anxiety: 0.5-2 mg PO/IM/IV q6-8h<br>status epilepticus: 4 mg IV repeat up to q5min | Anxiety<br>Status epilepticus<br>Alcohol withdrawal | |
| **Midazolam** | 50 µg/kg IV | Procedural sedation | Short acting benzodiazepine (complication=apnea when used with narcotic)<br>Fentanyl and midazolam often used together for procedural sedation |

**Table 41. Commonly Used Medications** (continued)

| Drug | Dosing Schedule | Indications | Comments |
|---|---|---|---|
| **Morphine** | 10-30 mg PO q4h<br>2.5-5mg IV q4h | Mild to moderate acute/chronic pain<br>Prescribed in combination with NSAIDs or acetaminophen | GI and constipation side effects<br>DO NOT CRUSH, CUT, or CHEW<br>Risk of tolerance |
| **Naloxone** | 0.5-2 mg or 0.01-0.02 mg/kg initial bolus IV/IM/SL/SC or via ETT (2-2.5x IV dose), increase dose by 2 mg until response/max 10 mg | Comatose patient<br>Opioid overdose<br>Reversal in procedural sedation | If patient is a chronic opioid user begin with very small doses, and go up with small increments as needed |
| **Nitroglycerin** | acute angina: 0.3-0.6 mg SL q5min, OR 5 µg/min IV increasing by 5-20 µg/min q3-5min | Angina<br>Acute MI | Not to be used with other antihypertensives<br>Not in right ventricular MI |
| **Percocet 10/325®** | 1-2 tabs PO q6h prn | Moderate pain control | Oxycodone + acetaminophen<br>Max 4 g acetaminophen daily |
| **Phenytoin** | Status epilepticus: see Table 17 | Status epilepticus | Begin maintenance dose 12 h after loading dose<br>Continuous ECG, BP monitoring mandatory |
| **Polysporin®** | Apply to affected area bid-tid | Superficial infections | |
| **Propofol** | 0.25-1 mg/kg IV | Procedural sedation, also refractory status epilepticus | Short acting<br>Anesthetic/sedative (complication=apnea, decreased BP) |
| **Salbutamol** | 2 puffs inhaled q4-6h max 12 puffs/d | Asthma<br>Reactive airways | Caution with cardiac abnormalities |
| **Thiamine** | 100 mg IV/IM initially, then 50-100 mg IM/IV/PO OD x 3d | To treat/prevent Wernicke's encephalopathy | Caution use in pregnancy |
| **Tylenol #3®** | 1-2 tabs PO q4-6h prn | Pain control | Acetaminophen + Codeine<br>Metabolism of codeine is highly variable<br>Max 4 g acetaminophen daily |

| WC | waist circumference |

# Basic Anatomy Review

## Major Endocrine Organs

*ADH and oxytocin are produced in the hypothalamus and stored in the posterior pituitary gland.

**Figure 1. Endocrine system**

**GENERAL FUNCTION OF ORGANS**

**The Hypothalamic-Pituitary Axis**
External environmental signals (e.g. temperature and light), internal environmental inputs (e.g. glycemia, blood osmolality), and peripheral hormonal feedback are integrated at the coordinating centre of the endocrine system, the hypothalamus. This small region of the brain, which is fundamental to maintaining homeostasis, then sends signals to the pituitary to release hormones that affect the function of the thyroid, adrenals, and gonads as well as influence uterine contraction, lactation, growth, and water balance. On the other hand, the pituitary is regulated by hypothalamic and target organ inputs as well as by its own secretions

**Anatomy ⟷ Function**
Hypothalamic hormones: small peptides, non-binding protein → rapid degradation
High [ ] in pituitary-portal blood system
Low [ ] in peripheral circulation
Proximity of axis preserves the pulsatile output signals from the hypothalamic neurons

**Thyroid**
Thyroid hormone is critical to 1) brain and somatic development in fetus and infants, 2) metabolic activity in adults, and 3) function of virtually every organ system

**Adrenal**
Adrenal glands (6-8g) produce a variety of hormones. Structure, each gland has an outer cortex (3 layers: zona glomerulosa → aldosterone; zona fasciculata → cortisol; zona reticularis → androgen and estrogen precursors) and inner medulla (stores and synthesizes epinephrine and noradrenaline)

**Gonads**
Bifunctional: sex steroid synthesis and gamete production
Sex steroids control sexuality and affect metabolic and brain functions

**Parathyroid**
Synthesize and secrete PTH, a principle regulator of ECF $Ca^{2+}$, regulated by $[Ca^{2+}]$, $[Mg^{2+}]$, $1,25(OH)_2D$ (active metabolite of vitaminD), and phosphate

**Pancreas**
Endocrine islet β-cells produce insulin: oppose glucose production (glycogenolysis, gluconeogenesis), increase glucose uptake into muscle and fat. Glucagon, epinephrine, cortisol, and GH are the counterregulatory hormones

# Dyslipidemias

### Definition
- metabolic disorders characterized by elevations of fasting plasma LDL-cholesterol, and/or triglycerides (TG), and/or low HDL-cholesterol

## Overview of Lipid Transport

- lipoproteins are spherical complexes that consist of a lipid core surrounded by a shell of water-soluble cholesterol, apolipoproteins, and phospholipids
- lipoproteins transport lipids within the body
- apolipoproteins serve as enzyme co-factors, promote clearance of the particle by interacting with cellular receptors, and stabilize the lipoprotein micelle

**Table 1. Lipoproteins**

| Lipoprotein | Function |
|---|---|
| **Chylomicron** | Transports dietary TG from gut to adipose tissue and muscle |
| **VLDL** | Transports hepatic synthesized TG from liver to adipose tissue and muscle |
| **IDL** | Product of hydrolysis of TG in VLDL by lipoprotein lipase resulting in depletion of TG core<br>Enriched in cholesterol esters |
| **LDL** | Cholesterol rich atherogenic particles<br>Formed by further removal of residual TG from IDL core by hepatic lipase |
| **HDL** | Transports cholesterol from peripheral tissues to liver<br>Acts as a reservoir for apolipoproteins |

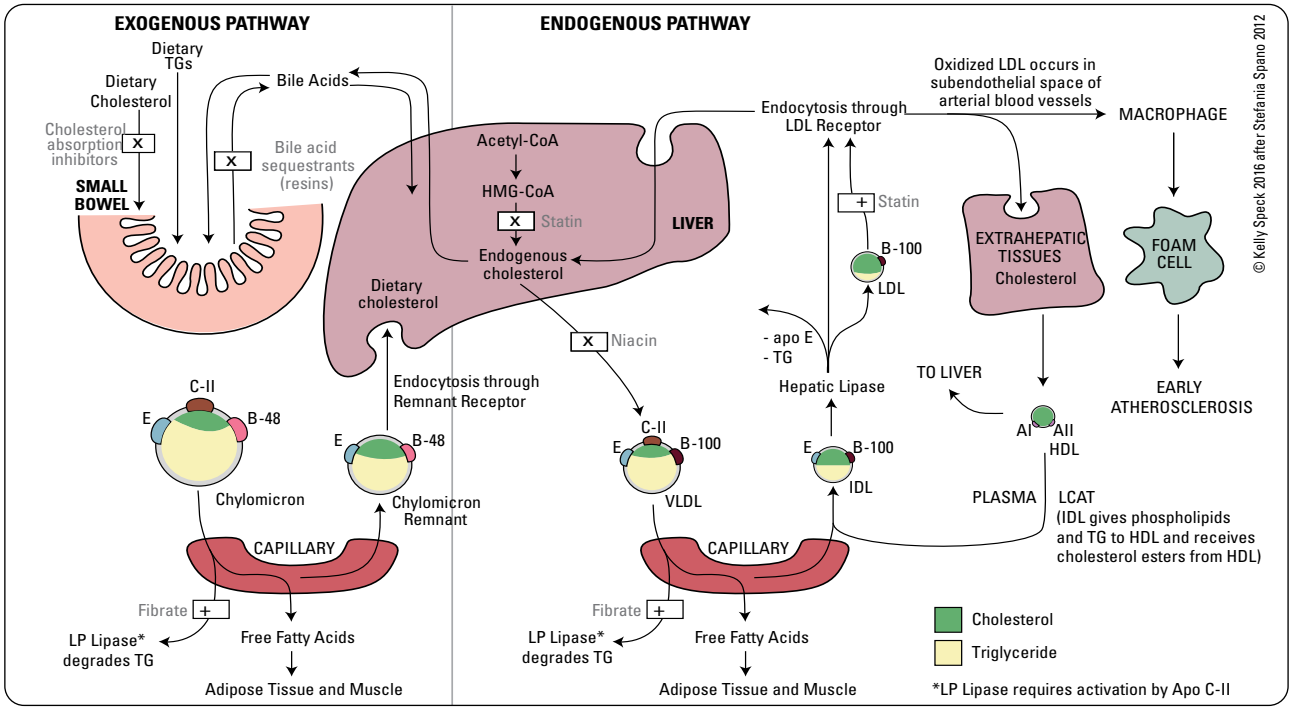

**Figure 2. Exogenous and endogenous biosynthetic lipid pathways**

# Primary Dyslipidemias (rare)

## Definition

- caused by a genetic defect in lipid metabolism

**Table 2. Primary Dyslipidemias**

| Condition | Main Lab Abnormality | Mechanism | Clinical Feature | Treatment |
|---|---|---|---|---|
| **Familial Hypercholesterolemia** | ↑ Total cholesterol<br>↑ LDL cholesterol | Genetic defect in LDLR<br>Can be homozygous or heterozygous inhibiting liver's ability to clear LDL from the circulation | Tendinous xanthomatosis (achilles, patellar, and extensor tendons of hand)<br>Arcus cornealis<br>Xanthelasmata<br>Heterozygotes: premature CAD, 50% risk of MI in men by age 30<br>Homozygotes: manifest CAD and other vascular disease early in childhood and can be fatal (in <20 yr olds) | Maximally tolerated statin as initial drug therapy, addition of second drug (ezitimibe and/or PCSK9 inhibitor) as second line, third line for homozygotes is portacaval shunt or LDL apheresis; potential liver transplant<br>Refer to lipid specialist in drug-resistant hypercholesterolemia |
| **Hereditary Chylomicronemia**<br>**Familial lipoprotein lipase deficiency**<br>**ApoC2 deficiency** | ↑ TG from excess chylomicron particles) | Lipoprotein lipase deficiency: Prevents proper digestion and storage of fats leading to massive accumulation of triglyceride rich chylomicron particles<br>$ApoC_2$ deficiency: prevents activation of lipoprotein lipase leading to massive accumulation of triglyceride rich chylomicron particles | Presents at infancy (LPL), adolescence to adulthood ($APOC_2$)<br>Abdominal complaints (pain, hepatosplenomegaly, pancreatitis)<br>Lipemia retinalis<br>Eruptive xanthomata | <10-15% of calories from fat<br>Supplement with essential fatty acids, fat-soluble vitamins<br>Plasma transfusion may help individuals with $APOC_2$ mutation |
| **Familial Hypoalphalipoproteinemia** | ↓ HDL cholesterol | Autosomal dominant inheritance of a mutation in the ABCA1 or the APOA1 gene | Premature atherosclerosis<br>Cerebrovascular disease | Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present |
| **Tangier Disease** | ↓ HDL cholesterol | Autosomal recessive inheritance of mutations in the ABCA1 gene<br>Impaired HDL-mediated cholesterol efflux from macrophages and impaired intracellular lipid trafficking | Mild hypertriglyceridemia<br>Neuropathy<br>Enlarged, orange-coloured tonsils<br>Premature atherosclerosis<br>Splenomegaly<br>Hepatomegaly<br>Corneal clouding<br>T2DM | Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present |

# Secondary Dyslipidemias

## Definition

- caused by acquired medical conditions or lifestyle factors that affect lipid metabolism

**Table 3. Etiology Secondary Dyslipidemias**

| Hypercholesterolemia | Low HDL | Hypertriglyceridemia |
|---|---|---|
| Endocrine: hypothyroidism (small dense LDL with T2DM and obesity, with normal LDL level)<br><br>Renal: nephrotic syndrome<br><br>Immunologic: monoclonal gammopathy<br><br>Hepatic: cholestatic liver disease (e.g. primary biliary cirrhosis)<br><br>Nutritional: anorexia nervosa<br><br>Drugs: cyclosporin, carbamazepine | Endocrine: obesity/metabolic syndrome, DM<br><br>Drugs: β-blockers, anabolic steroids<br><br>Other: acute infections, inflammatory conditions | Endocrine: Obesity/metabolic syndrome Diabetes<br><br>Lifestyle: Alcohol, high carbohydrate/ high fat diet<br><br>Drugs: corticosteroids, estrogen, hydrochlorothiazide, retinoic acid, β-blockers without intrinsic sympathomimetic action (ISA), anti-retroviral drugs, atypical antipsychotics, oral contraceptive pills<br><br>Other: pregnancy |

# Dyslipidemia and the Risk for Coronary Artery Disease

- increased LDL is a major risk factor for atherosclerosis and CAD as LDL is the major atherogenic lipid particle
- increased HDL is associated with decreased cardiovascular disease and mortality
- moderate hypertriglyceridemia (triglyceride level 2.3-9 mmol/L) is an independent risk factor for CAD, especially in people with DM and in post-menopausal women
- treatment of hypertriglyceridemia has not been shown to reduce CAD risk

## Screening

- screen men and women >40 yr or post-menopausal
- if following risk factors present, screen at any age:
  - DM
  - current cigarette smoking or COPD
  - HTN (sBP >140, dBP >90), hypertensive diseases of pregnancy
  - obesity (BMI 30 kg/m$^2$)
  - family history of premature CVD
  - clinical signs of hyperlipidemia (xanthelasma, xanthoma, arcus cornealis)
  - clinical evidence of abdominal aneurysm
  - clinical evidence of atherosclerosis
  - inflammatory disease (rheumatoid arthritis, SLE, psoriatic arthritis, ankylosing spondylitis, inflammatory bowel disease)
  - HIV infection on highly active anti-retroviral therapy (HAART)
  - chronic kidney disease (estimated GFR <60 mL/min/1.73 m$^2$)
  - erectile dysfunction
  - high risk ethnicity: south Asian, First Nations
- screen children with a family history of hypercholesterolemia or chylomicronemia
- apolipoprotein B (apo B)
  - each atherogenic particle (VLDL, IDL, LDL, and lipoprotein A) contains one molecule of apo B
  - serum [apo B] reflects the total number of particles and may be useful in assessing cardiovascular risk and adequacy of treatment in high risk patients and those with metabolic syndrome
- Lipoprotein A, (Lp(a)), levels may help stratifying those at intermediate risk
- coronary artery calcium (CAC) may help stratifying those at intermediate risk
- C-reactive protein (hs-CRP) levels
  - highly sensitive acute phase reactant
  - may be clinically useful in identifying those at a higher risk of cardiovascular disease than predicted by the global risk assessment

## CVD Risk Assessment

- Framingham Risk Score (FRS): 10 yr risk of major CVD event. Calculated based on gender, age, total cholesterol, HDL, sBP, and smoking (>20%: high risk; 10-19%: moderate risk; <10% low risk)
- Reynolds Risk Score: 10 yr risk of major CVD event. Calculated based on age, SBP, total cholesterol, HDL, high sensitivity CRP, family history of MI

**Familial Hypercholesterolemia and Cardiovascular Risk Calculators**

- Risk calculators such as Framingham and SCORE do not apply to patients with familial hypercholesterolemia
- Consider all adults with FH as "high risk"

**Treatment Effect**

Each 1.0 mmol/L decrease in LDL corresponds to 20-25% relative risk reduction in cardiovascular disease

**6% Rule**

If the dose of a statin is doubled, there is approximately a 6% increase in the LDL lowering efficacy

**For Statin Follow-Up**

- Liver enzymes and lipid profile: liver enzymes measured at the beginning of treatment then once after therapy initiated. Lipids (once stabilized) measured annually. Order both if patient complains of jaundice, RUQ pain, dark urine
- CK at baseline and if patient complains of myalgia
- D/C statin if CK >10x upper limit of normal or patient has persistent myalgia

**The American Approach to LDL Lowering A Report of the American College of Cardiology/ American Heart Association Task Force on Practice Guidelines**

Circulation 2013;00:000-000

**Purpose**: To examine the evidence supporting specific end-point LDL targets in statin therapy.

**Study**: Systematic review, searching 1995-2009 inclusive identified 19 RCTs.

**Results**: None of the trials examined demonstrated better cardiovascular outcomes for a particular target LDL. Moreover, many trials showed best outcomes from maximum tolerated dose of statin, irrespective of the treated LDL level.

**Conclusion**: Based on systematic review, the ACC/AHA is no longer recommending a "Treat to Target" approach for statin therapy. Primary prevention in patients with increased risk should be treated with moderate to high intensity statin therapy without tracking LDL targets. Similarly, patients needing secondary prevention should receive high intensity statin therapy without attention to LDL targets.

# Treatment of Dyslipidemias

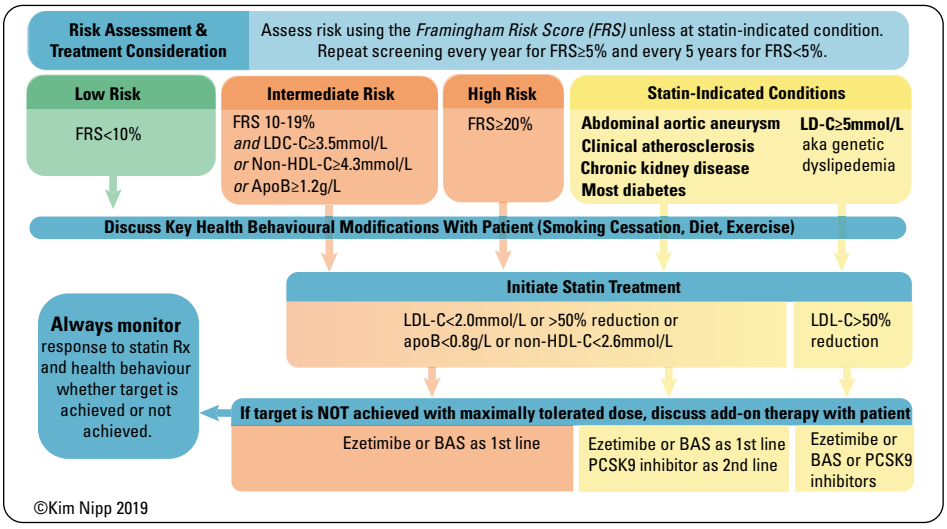

**Figure 3. Dyslipidemia management for the prevention of cardiovascular disease in the adult**
Adapted from 2016 Canadian Cardiovascular Society Guidelines for the Management of Dyslipidemia for the Prevention of Cardiovascular Disease in the Adult. Canadian Cardiovascular Society.

## Approach to Treatment

For clinical guidelines see Can J Cardiol 2016;32:1263-1282

- consider treatment for patients with statin-indicated conditions (e.g. Type II DM); risk assessment is not required
- risk stratification and treatment: The primary target of therapy is to achieve an LDL <2.0 mmol/L or a 50% reduction in LDL from baseline

**Table 4. Treatment of Dyslipidemia**

| Category | Consider initiating pharmacotherapy if: | Target |
|---|---|---|
| **Primary Prevention** | High Risk (FRS ≥20%)<br>Intermediate Risk<br>((FRS 10-19% and LDL-C ≥ 3.5 mmol/L)<br>Or non-HDL-C ≥ 4.3 mmol/L or ApoB ≥ 1.2 g/L or<br>Men ≥ 50 and women ≥ 60 with one additional risk factor: low HDL-c, impaired fasting glucose, high waist circumference, smoker, HTN) | LDL-C <2.0 mmol/L<br>Or<br>50% reduction from baseline |
| **Statin-Indicated Conditions** | Clinical atherosclerosis (MI, ACS, stroke, TIA, carotid disease, peripheral artery disease)<br>Abdominal aortic aneurysm (>3 cm) or previous aneurysm surgery<br>DM ≥40 yr<br>15 yr duration for age ≥30 yr (T1DM)<br>Microvascular disease<br>Chronic kidney disease (age ≥50 yr)<br>eGFR <60 mL/min/1.73m$^2$ or<br>ACR >3 mg/mmol<br>LDL-C ≥5.0 mmol/L | LDL-C <2.0 mmol/L<br>Or<br>50% reduction from baseline |

# Disorders of Glucose Metabolism

## Overview of Glucose Regulation

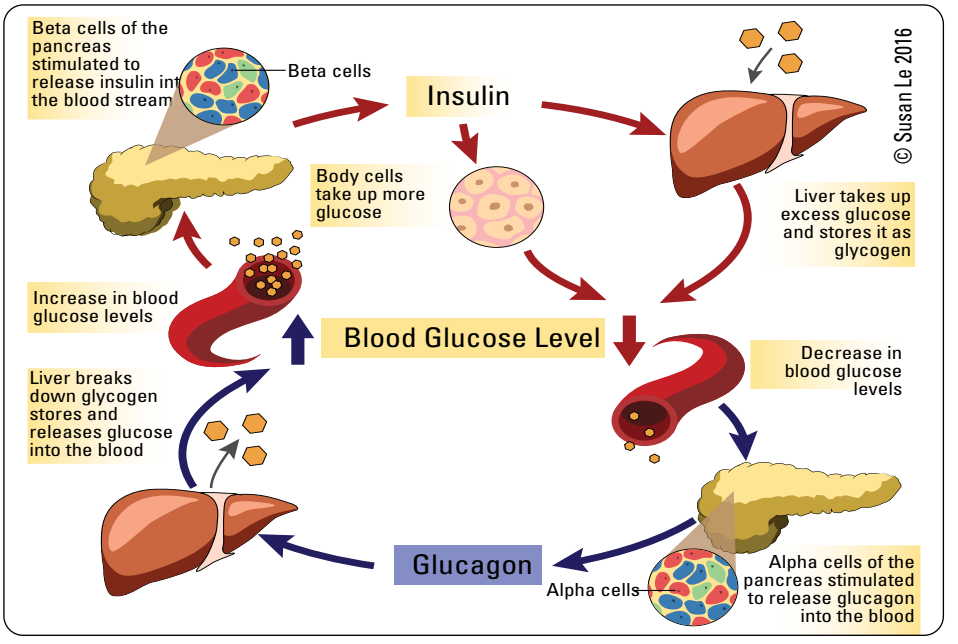

**Figure 4. Blood glucose regulation**

## Pre-Diabetes (Impaired Glucose Tolerance/ Impaired Fasting Glucose)

- 1-5% per yr go on to develop DM
- 50-80% revert to normal glucose tolerance
- weight loss may improve glucose tolerance (5-10% of body weight)
- increased risk of developing macrovascular complications (IGT >IFG)
- lifestyle modifications decrease progression to DM by 58%

### Diagnostic Criteria (CDA Guidelines)

- impaired fasting glucose (IFG): fasting plasma glucose (FPG) 6.1-6.9 mmol/L
- impaired glucose tolerance (IGT): 2h 75 g oral glucose tolerance test (OGTT) 7.8-11.0 mmol/L
- HbA1c: 6.0-6.4%

## Diabetes Mellitus

### Definition

- diabetes mellitus is a heterogeneous metabolic disorder characterized by the presence of hyperglycemia due to impairment of insulin secretion, defective insulin action, or both
- chronic hyperglycemia of diabetes is associated with relatively specific long-term microvascular complications affecting the eyes, kidneys and nerves, as well as an increased risk for macrovascular complications such as cardiovascular, stroke, and peripheral vascular disease

**Rosuvastatin to Prevent Vascular Events in Men and Women with Elevated C-Reactive Protein (Jupiter Study)**
NEJM 2008;359(21):2195-207
**Study**: Randomized Control Trial
**Intervention**: Statin Therapy
**Results**: Rosuvastatin reduced LDL cholesterol levels by 50% and high-sensitivity C-reactive protein levels by 37%. The rates of the primary end point were 0.77 and 1.36 per 100 person-years of follow-up in the rosuvastatin and placebo groups, respectively (hazard ratio for rosuvastatin, 0.56; 95% confidence interval [CI], 0.46-0.69; P<0.00001), with corresponding rates of 0.17 and 0.37 for myocardial infarction (hazard ratio, 0.46; 95% CI, 0.30-0.70; P=0.0002), 0.18 and 0.34 for stroke (hazard ratio, 0.52; 95% CI, 0.34-0.79; P=0.002), 0.41 and 0.77 for revascularization or unstable angina (hazard ratio, 0.53; 95% CI, 0.40-0.70; P<0.00001), 0.45 and 0.85 for the combined end point of myocardial infarction, stroke, or death from cardiovascular causes (hazard ratio, 0.53; 95% CI, 0.40-0.69; P<0.00001), and 1.00 and 1.25 for death from any cause (hazard ratio, 0.80; 95% CI, 0.67-0.97; P=0.02)
**Conclusion**: Statins reduce the incidence of major cardiovascular events even in healthy people without hyperlipidemia but with elevated C-reactive protein.

**Three Year Efficacy of Complex Insulin Regimens in T2DM: 4T Trial**
NEJM 2009;361:1736-1747
**Study**: Randomized unblinded trial with 3 yr of follow-up.
**Population**: 708 patients with T2DM, not on insulin or thiazolidinedione therapy on maximal metformin and sulfonylurea therapy.
Intervention: Thrice-daily prandial insulin aspart, versus twice-daily biphasic insulin aspart, versus once-daily basal insulin detemir. Sulfonylurea therapy was replaced with a secondary insulin regime specific to each arm if there was persistent hyperglycemia.
**Primary Outcome:** Three yr hemoglobin HbA1c.
**Results**: Significant difference in rates of patient withdrawal from the study: 5.1% biphasic, 11.7% prandial, 8.5% basal regimens (p=0.04). There were no significant differences in median HbA1c levels between all three arms from yr 1-3. A smaller proportion of patients reached HbA1c <6.5% or <7.0% in the biphasic arm. The basal arm had least weight gain and least weight circumference increase, but highest rate of secondary insulin requirement. The basal arm had fewest severe hypoglycemic events per patient year, while the biphasic had the most serious adverse effects.
**Conclusion**: Basal insulin regime provides the best glycemic control over a 3 yr study, with better HbA1c control, fewer hypoglycemic events, and less weight gain.

## Diagnostic Criteria (as per Diabetes Canada 2018 Clinical Practice Guidelines)

- any one of the following is diagnostic:

### Table 5. Diagnosis of Diabetes

**FPG ≥7.0 mmol/L**
Fasting = no caloric intake for at least 8 hours

or

**HbA1C ≥6.5% (in adults)**
Not for diagnosis of suspected T1DM, children, adolescents, or pregnant women

or

**2hPG in a 75g OGTT ≥11.1mmol/L**

or

**Random PG ≥11.1 mmol/L**
Random = any time of the day, without regard to the interval since last meal

- in the presence of hyperglycemia symptoms (polyuria, polydipsia, polyphagia, weight loss, blurry vision), a confirmatory test is not required
- in the absence of hyperglycemic symptoms, a repeat confirmatory test (FPG, A1C, 2hPG in a 75 g OGTT) done on another day is required for diagnosis of diabetes

## Etiology and Pathophysiology

### Table 6. Etiologic Classification of Diabetes Mellitus

**I. T1DM** (immune-mediated β cell destruction, usually leading to absolute insulin deficiency)

**II. T2DM** (Type 2 diabetes occurs when the pancreas does not produce enough insulin or when the body does not effectively use the insulin that is produced)

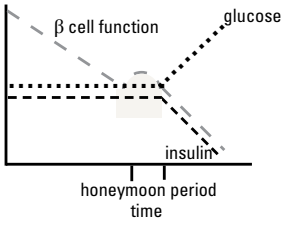
**III. Other Specific Causes of DM**

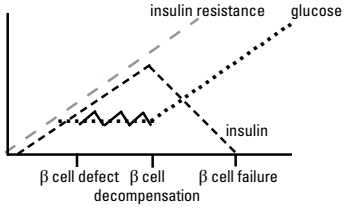
a. Genetic defects of β cell function (e.g. MODY – Maturity-Onset Diabetes of the Young (also known as monogenic diabetes) or insulin action
b. Diseases of the exocrine pancreas:
Pancreatitis, pancreatectomy, neoplasia, cystic fibrosis, hemochromatosis ("bronze diabetes")
c. Endocrinopathies:
Acromegaly, Cushing's syndrome, glucagonoma, pheochromocytoma, hyperthyroidism
d. Drug-induced:
Glucocorticoids, thyroid hormone, β-adrenergic agonists, thiazides, phenytoin, antipsychotics
e. Infections:
Congenital rubella, CMV, coxsackie
f. Genetic syndromes associated with DM:
Down's syndrome, Klinefelter's syndrome, Turner's syndrome

**IV. Gestational Diabetes Mellitus** (see Obstetrics, OB26)

### Table 7. Comparison of Type 1 and Type 2 Diabetes Mellitus

| | Type 1 | Type 2 |
|---|---|---|
| **Onset** | Usually <30 yr of age | Usually >40 yr of age<br>Increasing incidence in pediatric population 2º to obesity |
| **Epidemiology** | Traditionally more common in European populations<br>Less common in Asians, Hispanics, Aboriginals, and Blacks<br>Accounts for 5-10% of all DM | More common in Blacks, Hispanics, Aboriginals, and Asians<br>Accounts for >90% of all DM |
| **Etiology** | Autoimmune | Complex and multifactorial |
| **Genetics** | Monozygotic twin concordance is 30-40%<br>Associated with HLA class II DR3 and DR4, with either allele present in up to 95% of T1DM<br>Certain DQ alleles also confer a risk | Greater heritability than T1DM<br>Monozygotic twin concordance is 70-90%<br>Polygenic<br>Non-HLA associated |





**Effects of Intensive Treatment of T1DM on the Development and Progression of Long-Term Complications: The DCCT Study**
NEJM 1993;329:977-986
**Study:** Multicentre RCT, with 6.5 yr of mean follow-up
**Patients:** 1441 patients (aged 13-39 yr) with T1DM with no cardiovascular history or severe diabetic complications
**Intervention:** Intensive therapy (3 or more daily insulin injections or treatment with an insulin pump with dose adjustments as needed, BG monitoring minimum qid, monthly visits, strict BG targets) vs. conventional therapy (1 or 2 insulin injections per day with no dose adjustments, daily BG monitoring, visits q3mo).
**Outcomes:** Primary outcome was development or progression of retinopathy. Secondary outcomes were development or progression of renal, neurological, cardiovascular, and neuropsychological outcomes.
**Results:** Intensive treatment of T1DM significantly reduced the risk for the development and progression of retinopathy in the primary- and secondary-intervention cohorts, respectively. Intensive therapy also reduced the occurrence of microalbuminuria, albuminuria, and clinical neuropathy. The chief adverse event associated with intensive therapy was an increase in the occurrence of severe hypoglycemia.
**Conclusions:** Intensive treatment of T1DM significantly reduces the development and progression of diabetic retinopathy, nephropathy, and neuropathy in patients with T1DM.

**Blood Glucose Control in T2DM – UKPDS 33**
Lancet 1998;352:837-853
**Study:** RCT (mean follow-up 10 yr).
**Patients:** 3867 patients with newly diagnosed T2DM (mean age 53 yr, 61% men, 81% white, mean fasting plasma glucose [FPG] 6.1-15.0 mmol/L). Exclusions included severe cardiovascular disease, renal disease, retinopathy, and others.
Intervention: Intensive treatment with a sulfonylurea or insulin (target FPG <6 mmol/L) vs. conventional treatment with diet alone (target FPG <15 mmol/L without hyperglycemic symptoms).
**Main Outcomes:** DM-related endpoints (MI, angina, heart failure, stroke, renal failure, amputation, retinopathy, blindness, death from hyperglycemia or hypoglycemia), DM-related death, and all-cause mortality.
**Results:** Patients allocated to intensive treatment had lower median HbA1c levels (p<0.001).

| Outcome | RRR % (p value) |
|---|---|
| DM-related endpoint | 12 (0.029) |
| DM-related death | 10 (0.34) |
| All-cause mortality | 6 (0.44) |

Patients allocated to intensive therapy had more hypoglycemic episodes and greater weight gain.
**Conclusion:** Intensive blood glucose control reduces microvascular, but not macrovascular complications in T2DM.

**Table 7. Comparison of Type 1 and Type 2 Diabetes Mellitus** (continued)

| | Type 1 | Type 2 |
|---|---|---|
| **Pathophysiology** | Synergistic effects of genetic, immune, and environmental factors that cause β cell destruction resulting in impaired insulin secretion<br>Autoimmune process is believed to be triggered by environmental factors (e.g. viruses, bovine milk protein, urea compounds)<br>Pancreatic cells are infiltrated with lymphocytes resulting in islet cell destruction<br>80% of β cell mass is destroyed before features of DM present | Impaired insulin secretion, peripheral insulin resistance (likely due to receptor and post-receptor abnormality), and excess hepatic glucose production |
| **Natural History** |  <br>After initial presentation, honeymoon period often occurs where glycemic control can be achieved with little or no insulin treatment as residual cells are still able to produce insulin<br>Once these cells are destroyed, there is complete insulin deficiency |  <br>Early on, glucose tolerance remains normal despite insulin resistance as β cells compensate with increased insulin production<br>As insulin resistance and compensatory hyperinsulinemia continue, the β cells are unable to maintain the hyperinsulinemic state which results in glucose intolerance and DM |
| **Circulating Autoantibodies** | Islet cell Ab present in up to 60-85%<br>Most common islet cell Ab is against glutamic acid decarboxylase (GAD)<br>Up to 60% have Ab against insulin | <10% |
| **Risk Factors** | Personal history of other autoimmune diseases including Graves' disease, myasthenia gravis, autoimmune thyroid disease, celiac disease, and pernicious anemia<br>Family history of autoimmune diseases | Age >40 yr<br>Schizophrenia<br>Abdominal obesity/overweight<br>Fatty liver<br>First-degree relative with DM<br>Hyperuricemia<br>Race/ethnicity (Black, Aboriginal, Hispanic, Asian-American, Pacific Islander)<br>Hx of IGT or IFG<br>HTN<br>Dyslipidemia<br>Medications e.g. 2nd generation antipsychotics<br>PCOS<br>Hx of gestational DM or macrosomic baby (>9 lb or >4 kg) |
| **Body Habitus** | Normal to thin | Typically overweight with increased central obesity |
| **Treatment** | Insulin | Lifestyle modification<br>Non-insulin antihyperglycemic agents - unless contraindicated, metformin should be the initial antihyperglycemic agent of choice. Additional agents to be selected on the basis of clinically relevant issues, such as glucose-lowering effectiveness, risk of hypoglycemia, and effect on body weight<br>Insulin therapy |
| **Acute Complication** | Diabetic ketoacidosis (DKA) in severe cases | Hyperosmolar hyperglycemic state (HHS)<br>DKA in severe cases |
| **Screening** | Subclinical prodrome can be detected in first and second-degree relatives of those with T1DM by the presence of pancreatic islet autoantibodies | Screen individuals with risk factors |

**Diabetes Canada 2018 Clinical Practice Guidelines**

| | Target |
|---|---|
| HbA1c | <7.0% (most adults) |
| Fasting plasma glucose | 4-7 mmol/L (72-126 mg/dL) |
| 2h post-prandial glucose | 5-10 mmol/L (90-180 mg/dL)<br>5-8 mmol/L (90-144 mg/dL) if not meeting target A1c and can be safely achieved |
| Lipids | As per high risk group if age >40 or age >30 if DM duration >15 yr |
| Blood pressure | <130/80 |

# Treatment of Diabetes

## Glycemic Targets

- HbA1c reflects glycemic control over 3 mo and is a measure of patient's long-term glycemic control
- therapy in most individuals with T1DM or T2DM (especially younger patients) should be targeted to achieve a HbA1c ≤7.0% in order to reduce the risk of microvascular and if implemented early in the course of disease, macrovascular complications
- more intensive glucose control, HbA1c <6.5%, may be targeted in patients with a shorter duration of DM with no evidence of significant CVD and longer life expectancy, to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia
- less stringent HbA1c targets (7.1-8.5%) may be more appropriate in patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple comorbidities, extensive CAD, or a failure to acheive an HbA1c <7.0% despite intensified basal and bolus insulin therapy
- there may be harm associated with strategy to target HbA1c <6.0% (see sidebar ACCORD Trial, E9)

**ABCDES of Diabetes Care**
**A**1c targets (<7.0%)
**B**lood pressure (<130/80)
**C**holesterol (LDL-C <2.0 mmol/L)
**D**rugs for CVD risk reduction
**E**xercise goals and healthy eating
**S**moking cessation and screening for complications

## Diet
- daily carbohydrate intake 45-60% of energy, protein 15-20% of energy, and fat <35% of energy
- intake of saturated fats <7% and polyunsaturated fats <10% of total calories each
- limit sodium, alcohol, and caffeine intake
- Type 1: carbohydrate counting is used to titrate prandial insulin dose
- Type 2: weight reduction to help control blood glucose levels

## Lifestyle
- regular physical exercise to improve insulin sensitivity, lower lipid concentrations, and control blood pressure. At least 150 minutes per week of aerobic exercise and at least 2 sessions per week of resistance exercise are recommended
- smoking cessation

## Medical Treatment: Non-Insulin Antihyperglycemic Agents (T2DM)
- initiate non-insulin antihyperglycemic therapy within 2-3 mo if lifestyle management does not result in glycemic control
- if initial HbA1c >8.5% at the time of diagnosis, initiate pharmacologic therapy with metformin immediately, and consider combination of therapies or insulin immediately
- continue to add additional pharmacologic therapy in a timely fashion to achieve target HbA1C within 3-6 mo of diagnosis
- see *Common Medications*, E52 for details on antihyperglycemic agents

## Medical Treatment: Insulin
- used for T1DM at onset, may be used in T2DM at any point in treatment
- routes of administration: subcutaneous injections, continuous subcutaneous insulin infusion pump, IV infusion (regular insulin only)
- basal insulin: control blood sugar (produced by liver) during periods of fasting; slow onset of action, lasts a long time
- bolus insulin: required to dispose of glucose from a meal; rapid onset of action, short acting
- bolus insulins: short-acting (Insulin regular), rapid-acting analogue (Insulin aspart, Insulin glulisine, Insulin lispro)
- basal insulins: intermediate-acting (Insulin NPH), long-acting analogue (Insulin detemir, glargine, degludec)
- premixed insulins (combination of basal and bolus insulins), 30/70 insulin mixture, Humalog® mix 25, Novorapid® mix 30
- estimated total daily insulin requirement: often start with 0.3-0.5 units/kg/d

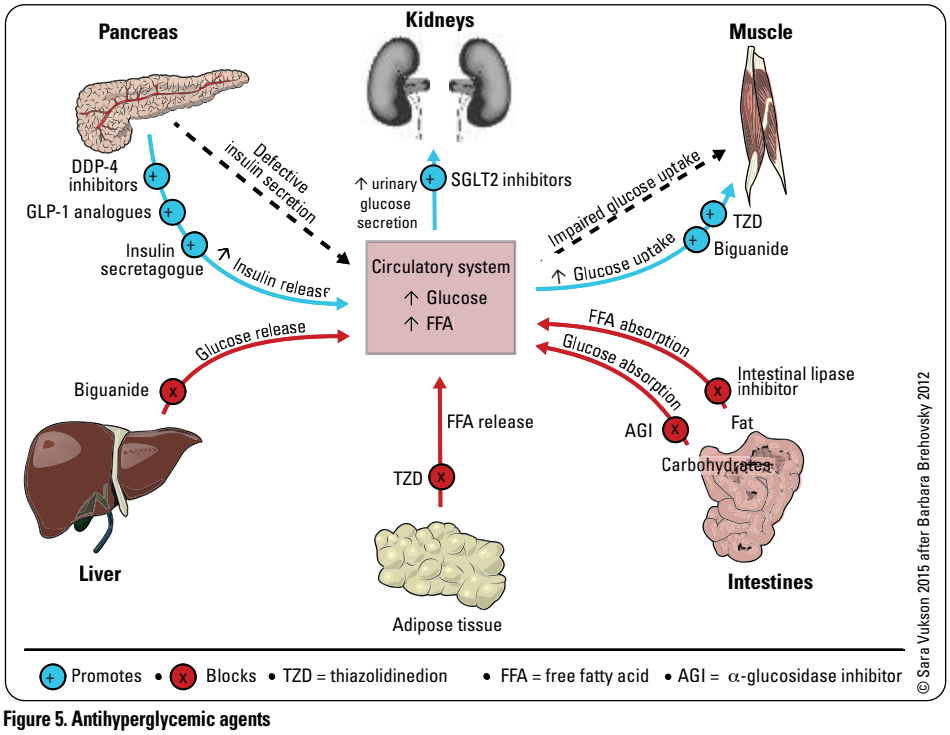


**Figure 5. Antihyperglycemic agents**

**Effects of Intensive Glucose Lowering in T2DM: The ACCORD Trial**
NEJM 2008;358:2545-2559
**Study**: Multicentre RCT.
**Patients**: 10,251 patients (mean age 62.2) with T2DM, and cardiovascular risk factors.
**Intervention**: Intensive therapy targeting a HbA1c level of <6.0% or standard therapy targeting 7.0-7.9%.
**Outcomes**: First occurrence of nonfatal MI, nonfatal stroke, or death from CV causes.
**Results**: The intensive therapy arm was stopped early (3.5 yr vs. 5.6 yr planned) due to evidence of increased mortality. There was no difference in primary outcome for either study arm. There was a significant increase in all-cause mortality, CV mortality, nonfatal MI, and CHF in the intensive therapy group. There were increased rates of all hypoglycemic events, any nonhypoglycemic serious adverse events, fluid retention, and weight gain >10 kg, but lower systolic and diastolic blood pressure in the intensive therapy group. There was an increased incidence of elevated ALT (>3x upper limit) and ACE drug use in the standard therapy group.
**Conclusions**: Intensive glucose lowering therapy in T2DM does not improve clinic outcomes and actually increases the risk of mortality with more adverse events compared to standard therapy. Additional research is required to discern the cause.

**Effects of Intensive Blood Pressure Control in T2DM: The ACCORD Trial**
NEJM 2010;362:1575-1585
**Study**: RCT, unblinded with 4.7 yr of mean follow-up.
**Population**: 4733 patients with T2DM, risk factors for cardiovascular (CV) disease, systolic blood pressure (sBP) between 130-180 mmHg.
**Intervention**: sBP control less than 120 mmHg (intensive) or 140 mmHg (standard).
**Primary Outcomes**: Major CV event (composite nonfatal MI, nonfatal stroke, or CV-related death).
**Results**: Mean number of medications at 1 yr for intensive therapy was 3.4 (95% CI 3.4-3.5) versus 2.1 (95% CI 2.1-2.2) for standard therapy. There was a significant increase in all serious adverse events in the intensive treatment arm (3.3% vs. 1.27%, p=<0.001); especially bradycardia or arrhythmia (0.5% vs. 0.13%, p=0.02) and hyperkalemia (0.4% vs. 0.04%, p=0.01). There was no significant difference in primary outcomes in the two study arms, or all-cause mortality. There was a significant reduction in any stroke (0.32%/yr vs. 0.53%/yr, p=0.01) and nonfatal stroke incidences (0.30%/yr vs. 0.47%/yr, p=0.03) in the intensive therapy arm.
**Conclusions**: Intensive BP lowering to less than 120 mmHg vs. 140 mmHg in patients with T2DM and CV risk factors does not reduce major CV event risk reduction except for stroke events.

### Table 8. Available Insulin Formulations

| Insulin Type (trade name) | Onset | Peak | Duration |
|---|---|---|---|
| **PRANDIAL (BOLUS) INSULINS** | | | |
| Rapid-acting insulin analogues | | | |
| Insulin aspart (NovoRapid®) | 10-15 min | 1-1.5 h | 3-5 h |
| Insulin faster aspart (Fiasp®) | 4 min | 1 h | 3-4 h |
| Insulin lispro (Humalog®, Humalog 200 units/mL) | 10-15 min | 1-2 h | 3.5-4.75 h |
| Insulin glulisine (Apidra®) | 10-15 min | 1-1.5 h | 3-5 h |
| Short-acting insulins | | | |
| Humulin R®<br>Novolin Toronto® | 30 min | 2-3 h | 6.5 h |
| **BASAL INSULINS** | | | |
| Intermediate-acting | | | |
| Humulin N®<br>Novolin NPH® | 1-3 h | 5-8 h | Up to 18 h |
| Long-acting basal insulin analogues | | Not applicable | |
| Insulin detemir (Levemir®) | 90 min | | Up to 24 h (detemir 16-24 h) |
| Insulin glargine 100 units/mL (Lantus®/ Basaglar®) | 90 min | | Up to 24 h (glargine 24 h) |
| Insulin glargine 300 units/mL (Toujeo®) | Up to 6 h | | Up to 30 h |
| Insulin glargine (Basaglar®) | 90 min | | Up to 24 h (glargine 24 h) |
| Insulin degludec (Tresiba®) | 60 min | | Ultralong acting (42 h) |
| **PRE-MIXED INSULINS** | | | |
| Premixed regular insulin – NPH<br>Humulin 30/70®<br>Novolin 30/70® | A single vial or cartridge contains a fixed ratio of insulin (% of rapid acting or short-acting insulin to % of intermediate-acting insulin) | | |
| Premixed insulin analogues<br>Biphasic insulin aspart (NovoMix 30®)<br>Insulin lispro/lispro protamine (Humulin 30/70, Novolin 30/70, Novomix 30 and Humalog Mix 25) | | | |

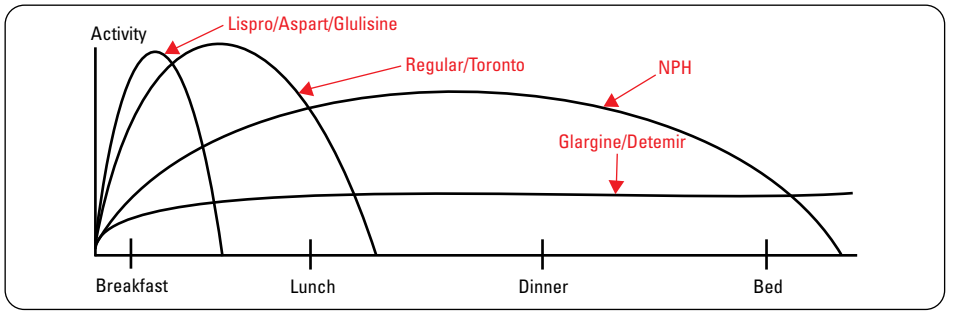

**Figure 6. Duration of activity of different insulins**

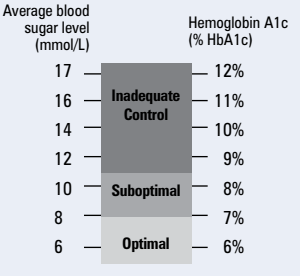
## Insulin Regimens

### Table 9. Insulin Regimens for Type 2 DM and Type 1 DM

| | Regimen | Administration |
|---|---|---|
| **T2DM** | Non-insulin antihyperglycemic agent + basal insulin | Start with 10 units of basal insulin at bedtime<br>Titrate up by 1 unit until FPG <7.0 mmol/L |
| **T1DM** | Basal-bolus (multiple daily injections [MDI]) | Estimated total insulin requirement is 0.5-0.7 U/kg<br>40% is given as basal insulin at bedtime<br>20% is given as bolus insulin before breakfast, lunch, and dinner |
| | Premixed | Estimated total insulin requirement is 0.5-0.7 U/kg<br>2/3 dose is given as pre-mixed insulin before breakfast<br>1/3 dose is given as pre-mixed insulin before dinner |

*Bolus insulin: Aspart, Glulisine, Lispro; *Basal insulin: Gargine, Detemir, NPH; *Pre-mixed insulin: Humulin 30/70, Novolin 30/70, Novomix 30, and Humalog Mix2

### Table 10. Titrating Insulin Doses



| Hyperglycemic Reading | Insulin Correction |
|---|---|
| High AM sugar | Increase bedtime basal insulin |
| High lunch sugar | Increase AM rapid/regular insulin |
| High supper sugar | Increase lunch rapid/regular insulin, or increase AM basal insulin |
| High bedtime sugar | Increase supper rapid/regular insulin |

**Effects of Combination Lipid Therapy in T2DM: the ACCORD Trial**
NEJM 2010;362:1563-1574
**Study**: RCT, double-blinded trial with 4.7 yr of mean follow-up.
**Population**: 5518 patients with T2DM.
**Intervention**: Statin with or without fibrate therapy.
**Primary Outcome**: Major cardiovascular (CV) event (composite nonfatal MI, nonfatal stroke, or CV-related death).
**Results**: No significant differences in primary outcome between the two arms. No difference in all MI, all stroke, or all-cause mortality between study arms.
**Conclusions**: The addition of fibrate therapy to statin therapy in patients with T2DM does not reduce major CV event risk.

**Effects of a Mediterranean Diet in Preventing Cardiovascular Events in T2DM: The PREDIMED Trial**
NEJM 2013;368:1279-1290
**Study**: RCT, with 4.8 yr of median follow-up.
**Population**: 7447 patients with T2DM or other high cardiovascular risk factors.
**Intervention**: Mediterranean diet supplemented with extra-virgin olive oil, Mediterranean diet supplemented with mixed nuts, or control diet with advice to reduce dietary fat.
**Primary Outcome**: Major cardiovascular (CV) event (MI, stroke, or death from CV causes).
**Results**: Both Mediterranean diets were associated with a reduced incidence of major CV events compared to the control diet.
**Conclusions**: A Mediterranean diet with extra-virgin olive oil or nuts reduces rates of MI, stroke, and CV death in those at high risk for CV disease.

**Sick Day Management**
If patient is ill and is unable to maintain adequate fluid intake, or has an acute decline in renal function, they should hold the following medications:
**SAD MANS** – Sulfonylureuas, ACEIs. Diuretics and direct renin inhibitors, Metformin, ARBs, NSAIDs, SGLT2i

**Conversion Chart for Percentage HbA1c to Average Blood Sugar Control**

Conversion chart adapted from Nathan DM, et al. The clinical information value of a glycosylated hemoglobin assay. *NEJM* 1984;310:341-346

**The 8 Is Precipitating DKA**
**I**nfection
**I**schemia or **I**nfarction
**I**atrogenic (glucocorticoids)
**I**ntoxication
**I**nsulin missed
**I**nitial presentation
**I**ntra-abdominal process (e.g. pancreatitis, cholecystitis)
**I**ntraoperative/perioperative stress

## Insulin Dose Schedules

**Table 11. Insulin Titration and Titration Suggestions for Type 2 DM ' (as per Diabetes Canada 2018 Clinical Practice Guidelines)**

| **Basal Insulin Only – Add-on to Anti-hyperglycemic Agents** | |
|---|---|
| See above summary for A1C, BG targets<br>Most patients will need 40-50 units/d to achieve target but there is no maximum dose<br>Start at a low dose of 10U at bedtime (lower for lean patients <50 kg)<br>Titrate dose accordingly until fasting BG target is achieved (see CDA guidelines for appropriate titration)<br>If fasting hypoglycemia, dose of bedtime basal should be reduced<br>If daytime hypoglycemia, reduce dose of oral anti-hyperglycemic agents (especially secretagogues) | Dosing and Titration Example<br>Starting dose – 10 U at bedtime<br>Increase dose by 1 U every 1 night until fasting BG has reached target of 4-7 mmol/L |
| **Basal-Bolus Insulins** | |
| When addition of basal insulin to anti-hyperglycemic agents is insufficient to reach target BG, bolus (prandial) insulin should be added before meals<br>Option exists to only add bolus insulin to the meal with the highest postprandial BG as a starting point<br>Insulin secretagogues typically stopped when bolus (prandial) insulin added; metformin is continued<br>Maintain the basal dose and add bolus insulin with each meal at a dose equivalent to 10% of basal dose<br>Total Daily Insulin (TDI) = 0.3-0.5 U/kg; 40% TDI = basal, 20% TDI = prandial (bolus) prior to each meal<br>Adjust basal insulin to achieve target fasting BG, bolus insulin to achieve postprandial BG levels (5-10 mmol/L) or preprandial BG levels for subsequent meal (4-7 mmol/L) | Dosing and Titration Example<br><br>TDI = 0.5 U/kg: 0.5 x 100 kg = 50 U<br><br>Basal insulin = 40% of TDI<br>40% x 50 U = 20 U; basal bedtime = 20 U<br><br>Bolus insulin = 60% of TDI<br>60% x 50 U = 30 U; 10 U dosed with each meal |
| **Premixed Insulin Before Breakfast and Before Dinner** | |
| Target fasting and pre-dinner BG levels of 4-7 mmol/L<br>Most patients with T2DM need 40-50 U BID to achieve target, but no maximum dose<br>Start at a low dose of 5-10 U BID (before breakfast and before dinner)<br>Patients can self-titrate by increasing insulin dose by 1 U/d until pre-dinner (breakfast dose) or fasting BG (dinner dose) at target<br>Continue metformin and consider stopping secretagogue | Dosing and Titration Example<br><br>10 U ac breakfast, 10 U ac dinner<br><br>Increase breakfast dose by 1 U/d until pre-dinner BG has reached target<br><br>Increase dinner dose by 1 U/d until fasting BG has reached target |

- Correction Factor (CF) = 100/Total Daily Dose of insulin (TDD) = change in blood glucose per unit insulin
  - BG <4: call MD and give 15 g carbohydrates
  - BG between 4 to 8: no additional insulin
  - BG between 8 to (8 + CF): give one additional unit
  - BG between (8 + CF) to (8 + 2CF): give two additional units
  - BG between (8 + 2CF) to (8 + 3CF): give three additional units

## Insulin Pump Therapy: Continuous Subcutaneous Insulin Infusion (CSII)

- external battery-operated device provides continuous basal dose of rapid-acting insulin analogue (aspart, glulisine, or lispro) through small subcutaneous catheter
- at meals, patient programs pump to deliver insulin bolus
- provides improved quality of life and flexibility
- risk of DKA if pump is inadvertently disconnected
- coverage available for insulin pumps for individuals with T1DM varies by province

# Acute Complications

**Table 12. Acute Complications of Diabetes Mellitus: Hyperglycemic Comatose States**

| | Diabetic Ketoacidosis (DKA) | Hyperosmolar Hyperglycemic State (HHS) |
|---|---|---|
| **Pathophysiology** | • Usually occurs in T1DM<br>• Insulin deficiency with ↑ counterregulatory hormones (glucagon, cortisol, catecholamines, GH)<br>• Can occur with lack of insulin (non-adherence, inadequate dosage, 1st presentation) or increased stress (surgery, infection, exercise)<br>• Unopposed hepatic glucose production → hyperglycemia → osmotic diuresis → dehydration and electrolyte disturbance → ↓ $Na^+$ (water shift to ECF causing pseudohyponatremia)<br>• Fat mobilization → ↑ FFA→ ketoacids → metabolic acidosis<br>• Severe hyperglycemia exceeds the renal threshold for glucose and ketone reabsorption → glucosuria and ketonuria<br>• Total body $K^+$ depletion but serum $K^+$ may be normal or elevated, 2º to shift from ICF to ECF due to lack of insulin, ↑ plasma osmolality | • Occurs in T2DM<br>• Often precipitated by sepsis, stroke, MI, CHF, renal failure, trauma, drugs (glucocorticoids, immunosuppressants, phenytoin, diuretics), dialysis, recent surgery, burns<br>• Partial or relative insulin deficiency decreases glucose utilization in muscle, fat, and liver while inducing hyperglucagonemia and hepatic glucose production<br>• Presence of a small amount of insulin prevents the development of ketosis by inhibiting lipolysis<br>• Characterized by hyperglycemia, hyperosmolality, and dehydration without ketosis<br>• More severe dehydration compared to DKA due to more gradual onset and ↑ duration of metabolic decompensation plus impaired fluid intake which is common in bedridden or elderly<br>• Volume contraction → renal insufficiency → ↑ hyperglycemia, ↑ osmolality → shift of fluid from neurons to ECF → mental obtundation and coma |
| **Clinical Features** | • Hyperglycemia (polyuria, polydipsia, weakness)<br>• Acidosis (air hunger, nausea, vomiting, abdominal pain, Kussmaul's respiration, acetone-odoured breath)<br>• Precipitating conditions (insulin omission, new diagnosis of diabetes, infection, MI, thyrotoxicosis, drugs) | • Onset is insidious → preceded by weakness, polyuria, polydipsia<br>• History of decreased fluid intake<br>• History of ingesting large amounts of glucose containing fluids<br>• Dehydration (orthostatic changes)<br>• ↓ LOC → lethargy, confusion, comatose due to high serum osmolality<br>• Kussmaul's respiration is absent unless the underlying precipitant has also caused a metabolic acidosis |
| **Serum** | • ↑ BG (typically 11-55 mmol/L, ↓ $Na^+$ (2º to hyperglycemia → for every ↑ in BG by 10 mmol/L there is a ↓ in $Na^+$ by 3 mmol/L)<br>• Normal or ↑ $K^+$, ↓ $HCO_3^-$, ↑ BUN, ↑ Cr, ketonemia, ↓ $PO_4^{3-}$<br>• ↑ osmolality<br>• corrected sodium = current sodium + [0.3 x (current glucose -5)] | • ↑ BG (typically 44.4-133.2 mmol/L)<br>• In mild dehydration, may have hyponatremia (spurious 2º to hyperglycemia → for every ↑ in BG by 10 mmol/L there is a ↓ in $Na^+$ by 3 mmol/L)<br>– if dehydration progresses, may get hypernatremia<br>• Ketosis usually absent or mild if starvation occurs<br>• ↑ osmolality |
| **ABG** | • Anion Gap Metabolic acidosis with possible 2º respiratory alkalosis<br>• If severe vomiting/dehydration there may also be a metabolic alkalosis | • Metabolic acidosis absent unless underlying precipitant leads to acidosis (e.g. lactic acidosis in MI) |
| **Urine** | • +ve for glucose and ketones | • -ve for ketones unless there is starvation ketosis<br>• Glycosuria |
| **Treatment** | • ABCs are first priority<br>• Monitor degree of ketoacidosis with AG, not BG or serum ketone level<br>• **NOTE: Anion gap is the most important endpoint used to monitor the resolution of the metabolic acidosis**<br>• Rehydration<br>– 500 mL/h x4 h, then 250 mL/h x4 h NS if mild-moderate deficit, 1-2 L/h NS if severe deficit (shock)<br>– Switch to 0.45% NaCl once euvolemic (continue NS if corrected [$Na^+$] is low or rate of fall of plasma osmolality ≥3 mosm/kg/h)<br>– once BG reaches 14.0 mmol/L add D5W or D10W to maintain BG of 12-14 mmol/L<br>• Insulin therapy<br>– critical to resolve acidosis, not hyperglycemia<br>– do not use with hypokalemia (see below), until serum $K^+$ is corrected to >3.3 mmol/L<br>– use only regular insulin (R)<br>– maintain on 0.1 U/kg/h insulin R infusion<br>– check serum glucose hourly<br>• $K^+$ replacement<br>– with insulin administration, hypokalemia may develop<br>– if serum $K^+$<3.3 mmol/L, give 40 mEq/L $K^+$ replacement and hold insulin until [$K^+$] ≥3.3mmol/L<br>– when $K^+$ 3.3-5.0 mmol/L add KCl 10-40 mEq/L to keep $K^+$ in the range of 3.5-5 mEq/L<br>• $HCO_3^-$<br>– if pH <7.0 or if hypotension, arrhythmia, or coma is present give $HCO_3^-$ 1 ampoule (50 mmol) in 200 mL D5W (or sterile water if available) over 1 h, repeated q1-2h until pH ≥7.0<br>– do not give if pH >7.1 (risk of metabolic alkalosis)<br>– can give in case of life-threatening hyperkalemia | • Same resuscitation and emergency measures as DKA<br>• Rehydration<br>– IV fluids: 1 L/h NS initially<br>– evaluate corrected serum $Na^+$<br>– if corrected serum $Na^+$ high or normal, switch to 0.45% NaCl (4-14 mL/kg/h)<br>– if corrected serum $Na^+$ low, maintain NS (4-14 mL/kg/h)<br>– when serum BG reaches 13.9 mmol/L (250 mg/dL) switch to D5W<br>• $K^+$ replacement<br>– less severe $K^+$ depletion compared to DKA<br>– if serum $K^+$ <3.3 mmol/L, give 40 mEq/L $K^+$ replacement and hold insulin until [$K^+$] ≥3.3mmol/L<br>– when $K^+$ 3.3-5.0 mmol/L add KCL 10-40 mEq/L to keep K+ in the range of 3.5-5 mEq/L<br>– if serum $K^+$ ≥5.5 mmol/L, check $K^+$ every 2 h<br>• Search for precipitating event<br>• Insulin therapy<br>– Achieved by monitoring plasma osmolality, adding glucose to infusions once BG reaches 14 mmol/L, using correct concentration of saline<br>– Switch to 0.45% NaCl once euvolemic as urinary loss of electrolytes in osmotic diuresis are usually hypotonic<br>– Increase saline concentration if falling too rapidly |
| **Prognosis** | • <1-3.3% mortality in developed countries<br>• Serious morbidity from sepsis, hypokalemia, respiratory complications, thromboembolic complications, and cerebral edema (the latter in children) | • Mortality rates between 12-17%, but studies looking at this included mixed DKA/HHS state |

# Macrovascular Complications

- increased risk of CAD, ischemic stroke, and peripheral arterial disease secondary to accelerated atherosclerosis
- CAD (see Cardiology and Cardiac Surgery, C25)
  - risk of MI is 3-5x higher in those with DM compared to age-matched controls
  - CAD is the leading cause of death in T2DM
  - most patients with DM are considered "high risk" under the risk stratification for CAD (see *Dyslipidemias*, E2)
- ischemic stroke (see Neurology, N50)
  - risk of stroke in those with DM is approximately 2-3x higher for men and 2-5x higher for women
  - level of glycemia is both a risk factor for stroke and a predictor of a poorer outcome in patients who suffer a stroke
  - HbA1c level is a significant and independent predictor of the risk of stroke
- peripheral arterial disease (see Vascular Surgery, VS2)
  - manifested by intermittent claudication in lower extremities, intestinal angina, foot ulceration
  - risk of foot gangrene is 30x higher in those with DM compared to age-matched controls
  - risk of lower extremity amputation is 15x higher in those with DM
- treatment
  - tight blood pressure control (<130/80 mmHg); especially for stroke prevention
  - tight glycemic control in early DM without established CVD (refer to ACCORD, VADT, ADVANCE, DCCT, EDIC, UKPDS extension studies)
  - tight low density lipoprotein (LDL) cholesterol control (LDL ≤2.0 mmol/L)
  - ACEI or angiotensin receptor blocker in high-risk patients
  - smoking cessation
  - for adults with CVD who do not meet glycemic targets, recommended to add anti-hyperglycemic agent with demonstrated cardiovascular benefit (empagliflozin or liraglutide) to reduce the risk of major cardiovascular events

# Microvascular Complications

## DIABETIC RETINOPATHY (see Ophthalmology, OP33 for a more detailed description)

### Epidemiology
- diabetic retinopathy is the most common cause of incident blindness in people of working age
- among individuals with T1DM, limb amputation and vision loss due to diabetic retinopathy are independent predictors of early death

### Clinical Features
- macular edema: diffuse or focal vascular leakage at the macula
- non-proliferative (microaneurysms, intraretinal hemorrhage, vascular tortuosity, vascular malformation) and proliferative (abnormal vessel growth)
- retinal capillary closure

### Treatment and Prevention
- tight glycemic control (delays onset, decreases progression), tight lipid control, manage HTN, smoking cessation
- ophthalmological treatments available (see Ophthalmology, OP33 for more details)
- annual follow-up visits with an optometrist or ophthalmologist examination through dilated pupils whether symptomatic or not (immediate referral after diagnosis of T2DM; 5 yr after diagnosis of T1DM for those ≥15 yr)
- interval for follow-up should be tailored to severity of retinopathy

## DIABETIC NEPHROPATHY (see Nephrology, NP31 for a more detailed description)

### Epidemiology
- DM-induced renal failure is the most common cause of renal failure in North America
- 20-40% of persons with T1DM (after 5-10 yr) and 4-20% with T2DM have progressive nephropathy

### Screening
- serum creatinine for eGFR, random urine albumin to creatine ratio (ACR)
- ACR is used as albuminuria is considered the earliest clinical sign of diabetic nephropathy (microalbuminuria); diagnosis requires persistent elevated urinary albumin (2 out of 3 urinary samples required over 3 mo)
- 24 h urine collection for protein/albumin is the gold standard but is difficult to perform, inconvenient, and often incorrect; random urine albumin is insufficient as albumin levels vary with urine concentration
- begin screening annually at diagnosis for all T2DM, and >5 yr after diagnosis of T1DM for postpubertal patients

**Laboratory Testing: Ketones**
The nitroprusside test for ketones identifies acetone and acetoacetate but does NOT detect β-hydroxybutyrate (BHB), the ketone most frequently in excess. This has two clinical consequences:
- Be wary of a patient with a clinical picture of DKA but negative serum or urinary ketones. These could be false negatives because of the presence of BHB
- As DKA is treated, BHB is converted to acetone and acetoacetate. Serum or urinary ketones may therefore rise, falsely suggesting that the patient is worsening when in fact they are improving

**Empagliflozin, Cardiovascular Outcomes, and Mortality in T2DM**
NEJM 2015;373:2117-2128
**Purpose**: To examine whether empagliflozin (an SGLT2 inhibitor) has any effect on cardiovascular risk in patients with T2DM.
**Study**: Multi-centre RCT comparing empagliflozin to placebo control; 7020 patients (test N=4687, placebo N=2333), median observation 3.1 yr.
**Outcome**: Death from cardiovascular causes, nonfatal MI, or nonfatal stroke.
**Results**: Both groups concurrently received the standard treatment for T2 DM. The empagliflozin group had significantly lower rates of death from cardiovascular causes than control (3.7%, vs. 5.9%; 38% decreased relative risk). The test group also had lower all-cause mortality (5.7% and 8.3%, respectively; 32% decreased relative risk).
**Conclusion**: Adding empagliflozin to standard treatment for T2DM reduced death from macrovascular complications and all-cause mortality when compared to placebo.

**Liraglutide and Cardiovascular Outcomes in T2DM**
NEJM 2016; 375:311-322
**Purpose**: To investigate whether liraglutide (a GLP-1 analogue) has any effect on cardiovascular risk in patients with T2DM when added to standard care.
**Study**: Multi-centre, double-blind RCT comparing liraglutide to placebo control; 9340 patients (test N=4668, placebo N=4672), median observation 3.8 yr.
**Outcome**: Death from cardiovascular causes, nonfatal MI, or nonfatal stroke.
**Results**: Both groups concurrently received the standard treatment for T2 DM. The liraglutide group had significantly lower rates of death from cardiovascular causes than control (4.7%, vs. 6%; p=0.007). The test group also had lower all-cause mortality (8.2% and 9.6%; p=0.02). Rates of nonfatal MI, nonfatal stroke, and hospitalization for HF were not significantly lower in the liraglutide group.
**Conclusion**: Adding liraglutide to standard treatment for patients with T2DM reduced death from cardiovascular cause and all-cause mortality when compared to placebo.

### Treatment and Prevention
- appropriate glycemic control
- appropriate blood pressure control (<130/80 mmHg)
- use either ACEI or ARB to delay progression of CKD (often used first line for their CVD protection)
- limit use of nephrotoxic drugs and dyes

## DIABETIC NEUROPATHY

### Epidemiology
- approximately 50% of patients within 10 yr of onset of T1DM and T2DM

### Pathophysiology
- can have peripheral sensory neuropathy, motor neuropathy, or autonomic neuropathy
- mechanism poorly understood
- acute cranial nerve palsies and diabetic amyotrophy are thought to be due to ischemic infarction of peripheral nerve
- the more common motor and sensory neuropathies are thought to be related to metabolic, vascular, and perhaps hormonal factors

### Screening
- 128 Hz tuning fork or 10 g monofilament
- begin screening annually at diagnosis for all T2DM, and >5 yr after diagnosis of T1DM for post-pubertal patients

### Clinical Features

**Table 13. Clinical Feature of Diabetic Neuropathies**

| Peripheral Sensory Neuropathy | Motor Neuropathy | Autonomic Neuropathy |
|---|---|---|
| Paresthesias (tingling, itching), neuropathic pain, radicular pain, numbness, decreased tactile sensation<br>Bilateral and symmetric with decreased perception of vibration and pain/temperature; especially true in the lower extremities but may also be present in the hands<br>Decreased ankle reflex<br>Distal-predominant – longest nerves affected first<br>Classic stocking-glove distribution<br>May result in neuropathic ulceration of foot | Less common than sensory neuropathy and occur later in the disease process<br>Delayed motor nerve conduction and muscle weakness/atrophy<br>May involve one nerve trunk (mononeuropathy) or more (mononeuritis multiplex)<br>Some of the motor neuropathies spontaneously resolve after 6-8 wk<br>Reversible CN palsies: III (ptosis/ophthalmoplegia, pupil sparing), VI (inability to laterally deviate eye), and VII (Bell's palsy)<br>Diabetic amyotrophy i.e. Bruns-Garland Syndrome: refers to pain, weakness, and wasting of hip flexors or extensors | Postural hypotension, tachycardia, decreased cardiovascular response to valsalva maneuver<br>Gastroparesis and alternating diarrhea and constipation<br>Urinary retention and erectile dysfunction |

### Treatment and Management
- tight glycemic control
- for neuropathic pain syndromes: tricyclic antidepressants (e.g. amitriptyline), pregabalin, duloxetine, anti-epileptics (e.g. carbamazepine, gabapentin), and capsaicin
- foot care education
- Jobst® fitted stocking and tilting of head of bed may decrease symptoms of orthostatic hypotension
- treat gastroparesis with domperidone and/or metoclopramide (dopamine antagonists), erythromycin (stimulates motilin receptors)
- medical, mechanical, and surgical treatment for erectile dysfunction (see Urology, U33)

# Other Complications

### Dermatologic
- diabetic dermopathy: atrophic brown spots commonly in pretibial region known as "tibia spots", secondary to increased glycosylation of tissue proteins or vasculopathy
- eruptive xanthomas secondary to increased triglycerides
- necrobiosis lipoidica diabeticorum: rare complication characterized by thinning skin over the shins allowing visualization of subcutaneous vessels

### Bone and Joint Disease
- juvenile cheiroarthropathy: chronic stiffness of hand caused by contracture of skin over joints secondary to glycosylated collagen and other connective tissue proteins
- Dupuytren's contracture
- increased fracture risk in both T1DM and T2DM due to increased bone demineralization
- adhesive capsulitis ("frozen shoulder")

**Effect of a Multifactorial Intervention on Mortality in T2DM: The Steno-2 Study**
NEJM 2008;358:580-591
**Study**: Single centre RCT.
**Patients**: People (n=160) with T2DM and persistent microalbuminuria.
**Intervention**: Random assignment to receive either conventional multifactorial treatment or intensified, target-driven therapy involving a combination of medications and focused behaviour modification. Targets included an HbA1c level of <6.5%, a fasting serum total cholesterol level of <4.5 mmol/L, a fasting serum triglyceride level of <1.7 mmol/L, a sBP of <130 mmHg, and a dBP of <80 mmHg. Patients were treated with blockers of the renin–angiotensin system because of their microalbuminuria, regardless of blood pressure, and received low-dose Aspirin® as primary prevention.
**Outcomes**: The primary end point was the time to death from any cause. Other endpoints examined were death from CV causes and various CV events along with diabetic neuropathy, nephropathy, and retinopathy.
**Results**: Twenty-four patients in the intensive-therapy group died, as compared with 40 in the conventional-therapy group (hazard ratio, 0.54; 95% confidence interval [CI] 0.32-0.89; p=0.02). Intensive therapy was associated with a lower risk of death from CV causes (hazard ratio, 0.43; 95% CI 0.19-0.94; p=0.04) and of CV events (hazard ratio, 0.41; 95% CI 0.25-0.67; p<0.001). One patient in the intensive-therapy group had progression to end-stage renal disease, as compared with six patients in the conventional-therapy group (p=0.04). Fewer patients in the intensive-therapy group required retinal photocoagulation (relative risk, 0.45; 95% CI 0.23-0.86; p=0.02).
**Conclusions**: In at-risk patients with T2DM, intensive intervention with multiple drug combinations and behaviour modification had sustained beneficial effects with respect to vascular complications and on rates of death from any cause and from CV causes.

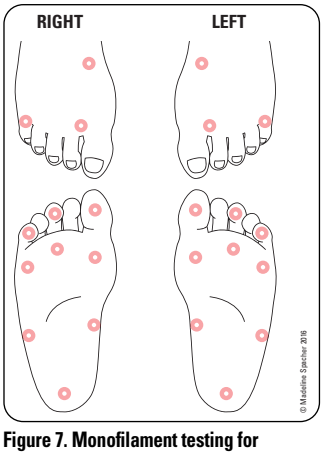


**Figure 7. Monofilament testing for diabetic neuropathy**

**Effects of Treatments for Symptoms of Painful Diabetic Neuropathy: Systematic Review**
BMJ 2007;335:87
**Purpose**: To evaluate the effects of treatments for the symptoms of painful diabetic neuropathy.
**Study Selection**: RCTs comparing topically applied and orally administered drugs with a placebo in adults with painful diabetic neuropathy.
**Results**: 25 included reports compared anticonvulsants (n=1270), antidepressants (94), opioids (329), ion channel blockers (173), NMDA antagonist (14), duloxetine (805), capsaicin (277), and isosorbide dinitrate spray (22) with placebo. The odds ratios in terms of 50% pain relief were 5.33 (95% CI 1.77-16.02) for traditional anticonvulsants, 3.25 (95% CI 2.27-4.66) for newer generation anticonvulsants, and 22.24 (95% CI 5.83-84.75) for tricylic antidepressants. The odds ratios in terms of withdrawals related to adverse events were 1.51 (95% CI 0.33-6.96) for traditional anticonvulsants, 2.98 (95% CI 1.75-5.07) for newer generation anticonvulsants, and 2.32 (95% CI 0.59-9.69) for tricyclic antidepressants.
**Conclusion**: Anticonvulsants and antidepressants are still the most commonly used options to manage diabetic neuropathy. Tricyclic antidepressants and traditional anticonvulsants are better for short-term pain relief than newer anticonvulsants. Evidence of the long-term effects of antidepressants and anticonvulsants is lacking. Further studies are needed on opioids, NMDA antagonists, and ion channel blockers.

### Cataracts
- subcapsular and senile cataracts secondary to glycosylated lens protein or increased sorbitol causing osmotic change and fibrosis

### Infections
- see Infectious Diseases, ID13

## Hypoglycemia

### Etiology and Pathophysiology
- hypoglycemia occurs most frequently in people with DM receiving insulin or certain antihyperglycemic therapies (insulin secretagogues)
- in people without DM, care must be taken to distinguish hypoglycemia that occurs in critically ill or medicated patients from hypoglycemia that presents in individuals who are seemingly well
  - each invokes separate differential diagnoses
  - the timing of hypoglycemia may also provide a clue to the diagnosis (e.g. individuals with an insulinoma typically have fasting hypoglycemia whereas those with noninsulinoma pancreatogenous hypoglycemia experience predominantly postprandial hypoglycemia)

**Table 14. Causes of Hypoglycemia**

| Insulin-Dependent Causes | Insulin-Independent Causes |
|---|---|
| Exogenous insulin<br>Sulfonylurea or meglitinide<br>Pentamidine (possibly due to β-cell destruction resulting in insulin release)<br>Autoimmune hypoglycemia (autoantibodies to insulin or insulin receptor)<br>Insulinoma<br>Non-insulinoma pancreatogenous hypoglycemia<br>Post-gastric bypass hypoglycemia | Hepatic failure<br>Renal failure<br>Inanition<br>Hormone deficiency (cortisol, glucagon and epinephrine in insulin-deficient DM)<br>Non-islet cell tumours (typically the result of mesenchymal tumour overproduction of IGF-II)<br>Inborn error of carbohydrate metabolism, glycogen storage disease, gluconeogenic enzyme<br>Alcohol<br>Drugs (e.g. quinine, indomethacin, gatifloxacin, lithium, ACE inhibitors, β-adrenergic receptor blockers) |

### Clinical Features
- Whipple's triad – suggest a patient's symptoms are from hypoglycemia
  1. serum glucose <4.0 mmol/L
  2. neuroglycopenic symptoms (below)
  3. rapid relief provided by administration of glucose
- autonomic symptoms (typically occur first; caused by autonomic nervous system activity)
  - palpitations, sweating, anxiety, tremor, tachycardia, hunger
- neuroglycopenic symptoms (caused by brain glucose deprivation)
  - dizziness, headache, clouding of vision, mental dullness, fatigue, confusion, seizures, coma

### Investigations
- depend on a thorough history, physical exam, and available biochemical investigations as these may provide clues to the etiology of hypoglycemia
  - for example, if suspecting insulin and insulin secretagogues in patients with diabetes, assess for cortisol deficiency. In a patient with weight loss, hyperpigmentation, and hyperkalemia, consider the possibility of IGF-2 mediated hypoglycemia. In an individual with a gastrointestinal stromal tumour (GIST), think about renal/hepatic failure in the setting of critical illness
- when the cause of hypoglycemia is not evident, screen for oral hypoglycemic agents and measure plasma glucose, serum ketones, insulin, pro-insulin, C-peptide, and insulin antibodies during a spontaneous hypoglycemic episode or a supervised fast of up to 72 h. If hypoglycemia occurs only in the postprandial state, evaluate the patient first with a mixed meal test

### Treatment
- for tumoural hypoglycemia, definitive treatment requires resection of the tumour. If that is not possible certain medications can be helpful such as diazoxide for patients with insulinoma
  - for noninsulinoma pancreatogenous hypoglycemia and post-bariatric bypass hypoglycemia, dietary changes including reducing the amount of carbohydrate intake and small frequent meals may be helpful. For patients who do not respond to nutritional modification or have severe symptoms acarbose can be utilized
- see Emergency Medicine, ER35
- treatment of hypoglycemic episode in the unconscious patient or patient NPO
  - D50W 50 mL (1 ampule) IV in 1-3 min or 1 mg glucagon SC or IM (if no IV access is available)
  - may need ongoing glucose infusion once BG >5 mmol/L

**Other Players in Glucose Homeostasis**
These hormones act to increase blood glucose levels
- Glucagon
- Epinephrine
- Cortisol
- Growth hormone

**C-Peptide**
A short peptide released into the circulation when proinsulin is cleaved to insulin

**Use C-peptide Levels to Distinguish between Exogenous and Endogenous Source of Hyperinsulinemia**
Increased = endogenous
Decreased or normal = exogenous

**Treatment of Acute Hypoglycemic Episode (Blood Glucose <4.0 mmol/L) in the Awake Patient (e.g. able to self-treat)**

1) Eat 15 g of carbohydrates (CHO) (e.g. 3 packets sugar dissolved in water; 3/4 cup of juice)
↓
2) Wait 15 min
↓
3) Retest Blood Glucose (BG)
↓
4) Repeat steps 1-3 until BG >5 mmol/L
↓
5) Eat next scheduled meal. If next meal is >1 h away, eat snack including 15 g of CHO and protein

**Hypoglycemia Unawareness (T1DM >>> T2DM)**
- Patient remains asymptomatic until severely hypoglycemic levels are reached
- **Causes**:
  - Decreased glucagon/epinephrine response
  - History of repeated hypoglycemia or low HbA1c
  - Autonomic neuropathy
- Not safe for patient to drive
- Suggest that patient obtain a Medic-Alert bracelet if at risk for hypoglycemia, especially with hypoglycemia unawareness

**5 to Drive**
BG must be >5 mmol/L to drive

# Metabolic Syndrome

- postulated syndrome related to insulin resistance associated with hyperglycemia, hyperinsulinemia, HTN, central obesity, and dyslipidemia
- obesity aggravates extent of insulin resistance
- complications include DM, atherosclerosis, CAD, MI, and stroke
- women with PCOS are at increased risk for developing insulin resistance, hyperlipidemia, and metabolic syndrome
- not to be confused with syndrome X related to angina pectoris with normal coronary arteries (Prinzmetal angina)

# Obesity

- see Family Medicine, FM7

# Pituitary Gland

## Pituitary Hormones

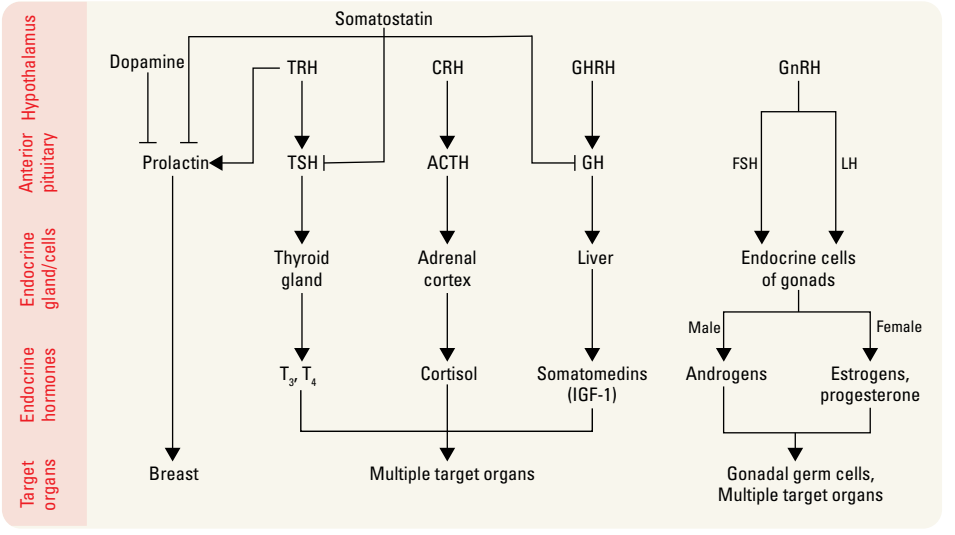

**Figure 8. Hypothalamic-pituitary hormonal axes**
CRH = corticotropin-releasing hormone; GHRH = growth hormone-releasing hormone; GnRH = gonadotropin-releasing hormone; PRH = prolactin-releasing hormone; TRH = thyrotropin-releasing hormone

### Hypothalamic Control of Pituitary

- trophic and inhibitory factors control the release of pituitary hormones
- most hormones are primarily under trophic stimulation except prolactin, which is primarily under inhibitory control by dopamine. GH and TSH are stimulated by GHRH and TRH respectively; less important for control is their inhibition by somatostatin
- transection of the pituitary stalk (i.e. dissociation of hypothalamus and pituitary) leads to pituitary hypersecretion of prolactin and hyposecretion of all remaining hormones

### Anterior Pituitary Hormones

- follicle stimulating hormone (FSH), luteinizing hormone (LH), adrenocorticotropic hormone (ACTH), thyroid stimulating hormone (TSH), prolactin, growth hormone (GH)

### Posterior Pituitary (Hypothalamic) Hormones

- antidiuretic hormone (ADH) and oxytocin
- peptides synthesized in the supraoptic and paraventricular nuclei of the hypothalamus
- although ADH and oxytocin are produced in the hypothalamus, these hormones are stored, and released from the posterior pituitary

**Features of Metabolic Syndrome (≥3 measures to make a Dx)**

| Measure | Men | Women |
|---|---|---|
| Abdominal Obesity (Elevated Waist Circumference | | |
| Canada, USA | ≥102 cm (40 inches) | ≥88 cm (35 inches) |
| Europid, Middle Eastern, Sub-Saharan Africa, Mediterranean | ≥94 cm (37 inches) | ≥80 cm (31.5 inches) |
| Asian, Japanese, South & Central America | ≥90 cm (35 inches) | ≥80 cm (31.5 inches) |
| Triglyceride Level | ≥1.7 mmol/L (150 mg/dL) | |
| HDL-C Level | <1.0 mmol/L (<40 mg/dL) | <1.3 mmol/L (<50 mg/dL) |
| Blood Pressure | ≥130/85 mmHg | |
| Fasting Glucose Level | ≥5.6 mmol/L (>100 mg/dL) | |

Drug treatment for any elevated marker is an alternate indicator

**Anterior Pituitary Hormones**
**"FLAT PiG"**
**F**SH
**L**H
**A**CTH
**T**SH

**P**rolactin
**G**H

**Table 15. The Physiology and Action of Pituitary Hormones**

| Hormone | Function | Physiology | Inhibitory Stimulus | Secretory Stimulus |
|---|---|---|---|---|
| **LH/FSH** | Stimulate gonads via cAMP<br>Ovary:<br>LH: production of androgens (thecal cells) which are converted to estrogens (granulosa cells); induces luteinization in follicles<br>FSH: growth of granulosa cells in ovarian follicle; controls estrogen production<br>Testes:<br>LH: production of testosterone (Leydig cells)<br>FSH: production of spermatozoa (Sertoli cells) | Polypeptide<br>Glycoproteins (similar α subunit as TSH and hCG)<br>Secreted in pulsatile fashion | Estrogen<br>Progesterone<br>Testosterone<br>Inhibin<br>Continuous (i.e. non-pulsatile) GnRH infusion | Pulsatile GnRH (low frequency pulsation = FSH release, high frequency pulsation = LH release) |
| **ACTH** | Stimulates growth of adrenal cortex and secretion of its hormones | Polypeptide<br>Pulsatile and diurnal variation (highest in AM, lowest at midnight) | Dexamethasone, cortisol, and other glucocorticoids | CRH<br>Metyrapone<br>Insulin-induced hypoglycemia<br>Vasopressin<br>Fever, pain, stress |
| **TSH** | Stimulates growth of thyroid and secretion of $T_3$ and $T_4$ via cAMP | Glycoprotein<br>Note: hCG can act like TSH and react with TSH receptor | Thyroid hormones ($T_3$, $T_4$) and analogues, dopamine, somatostatin, cytokines, high dose glucocorticoids | TRH<br>AVP<br>α adrenergic agonist |
| **Prolactin** | Promotes milk production<br>Inhibits GnRH secretion | Polypeptide<br>Episodic secretion | Dopamine (only pituitary hormone under tonic inhibition of secretion) | Sleep<br>Stress, hypoglycemia<br>Pregnancy, breastfeeding<br>Mid-menstrual cycle<br>Sexual activity<br>TRH<br>Drugs: antipsychotics, tricyclic antidepressants, metoclopramide, domperidone, verapamil, methyldopa, opioids, high dose estrogen |
| **GH** | Needed for linear growth<br>Stimulates secretion of IGF-1, a potent growth and differentiation factor | Polypeptide<br>Acts indirectly through IGF-1 (somato-medin-C) synthesized in the liver<br>Only anterior pituitary hormone that also acts directly on peripheral target cells<br>Serum GH undetectable for most of the day and suppressed after meals high in glucose<br>Sustained rise during sleep | Glucose challenge<br>Glucocorticoids<br>Somatostatin<br>Dopamine D2 receptor agonists<br>IGF-1 (long-loop) | GHRH<br>Insulin-induced hypoglycemia<br>Ghrelin<br>Exercise<br>REM sleep<br>Arginine, clonidine, propranolol, L-dopa<br>Sex hormones |
| **ADH** | Acts at renal collecting ducts on V2 receptors to cause insertion of aquaporin channels and increases water reabsorption thereby concentrating urine | Octapeptide<br>Secreted by posterior pituitary<br>Osmoreceptors in hypothalamus detect serum osmolality<br>Contracted plasma volume detected by baroreceptors is a more potent stimulus than ↑ osmolality | ↓ serum osmolality | Hypovolemia or ↓ effective circulatory volume<br>↑ serum osmolality<br>Stress, pain, fever, paraneoplastic<br>Lung or brain pathology |
| **Oxytocin** | Causes uterine contraction<br>Breast milk secretion | Nonapeptide<br>Secreted by posterior pituitary | EtOH | Suckling<br>Distention of female genital tract during labour via stretch receptors |

# Growth Hormone

## GH DEFICIENCY

- cause of short stature in children (see Pediatrics, P28)
- adults exhibit increased fat and decreased lean body mass, decreased bone mineral density, and fatigue
- diagnosis made with low serum IGF-1 levels in individuals with pituitary or hypothalamic disease or by failure to increase GH with a provocative test (see above under GH secretory stimulus)
- Tx: GH replacement if adult patient with childhood onset GH deficiency, and some patients with adult onset GH deficiency

### GH EXCESS

#### Etiology
- GH secreting pituitary adenoma, neuroendocrine tumours secreting ectopic GH or GHRH (very rare)

#### Pathophysiology
- normally GH is a catabolic hormone that acts to increase blood glucose levels
- in GH excess states, secretion remains pulsatile but there is loss of hypoglycemic stimulation, glucose suppression, and the nocturnal surge
- proliferation of bone, cartilage, soft tissues, organomegaly
- insulin resistance and impaired glucose tolerance (IGT)

#### Clinical Features
- in children (before epiphyseal fusion) leads to gigantism
- in adults (after epiphyseal fusion) leads to acromegaly
- dermatologic (thickening of skin, increased sebum production, sweating, acne, sebaceous cysts), musculoskeletal (enlargement of hands and feet, coarsening of facial features, thickening of calvarium, prognathism, carpal tunnel syndrome, osteoarthritis), cardiac/metabolic (HTN, DM, acanthosis nigricans, cardiomyopathy), sleep apnea, sexual (low libido)

#### Investigations
- first line test: serum IGF-1 (expected to be elevated)
- glucose suppression test is the most specific test (75 g of glucose PO suppresses GH levels in healthy individuals but not in patients with acromegaly)
- CT, MRI, or skull x-rays may show cortical thickening, enlargement of the frontal sinuses, and enlargement and erosion of the sella turcica
- MRI of the sella turcica is needed to look for a tumour

#### Treatment
- surgery, octreotide (somatostatin analogue), dopamine agonist (cabergoline), GH receptor antagonist (pegvisomant), radiation

**Risks Associated with GH Excess**
- Cardiac disease (e.g. CAD, cardiomegaly, cardiomyopathy) in 1/3 of patients, with a doubling of risk of death from cardiac disease
- HTN in 1/3 of patients
- Risk of cancer (particularly GI) increased 2-fold to 3-fold

## Prolactin

### HYPERPROLACTINEMIA

#### Etiology
- prolactinoma: most common pituitary adenoma (prolactin-secreting tumours may be induced by estrogens and grow during pregnancy)
- pituitary masses with pituitary stalk compression causing reduced dopamine inhibition of prolactin release
- primary hypothyroidism (increased TRH)
- decreased clearance due to chronic renal failure or severe liver disease (prolactin is metabolized by both the kidney and liver)
- medications with anti-dopaminergic properties are a common cause of high prolactin levels: antipsychotics (common), antidepressants, antihypertensives (verapamil/methyldopa), anti-migraine agents (triptans/ergotamines), bowel motility agents (metoclopramide/domperidone), H2-blockers (ranitidine)
- macroprolactinemia (high molecular weight prolactin also known as big-big prolactin) that has no action

#### Clinical Features
- galactorrhea (secretion of breast milk in women and, in rare cases, men), infertility, hypogonadism, amenorrhea, oligomenorrhea, erectile dysfunction

#### Investigations
- serum PRL, TSH, liver enzyme tests, creatinine
- macroprolactin level in patients with hyperprolactinemia but no symptoms of prolactin excess
- MRI of the sella turcica when a secondary cause is not identified or when prolactin levels suggest that there may be underlying tumoural hyperprolactinemia

#### Treatment
- first line: long-acting dopamine agonist: bromocriptine, cabergoline, or quinagolide
- surgery ± radiation (rare)
- prolactin-secreting tumours are often slow-growing; treatment may not be necessary in the setting of small tumours associated with hyperprolactinemia that does not result in hypogonadism or bothersome galactorrhea
- if medication-induced, consider stopping medication if possible
- in certain cases if microprolactinoma and not planning on becoming pregnant, may consider OCP

**Approach to Nipple Discharge**
- Differentiate between galactorrhea (fat droplets present) versus breast discharge (usually unilateral, may be bloody or serous)
- If galactorrhea, determine if physiologic (e.g. pregnancy, lactation, stress) versus pathologic
- If abnormal breast discharge, must rule out a breast malignancy

## Thyroid Stimulating Hormone

- see *Thyroid*, E21

# Adrenocorticotropic Hormone

- see *Adrenal Cortex*, E30

# Luteinizing Hormone and Follicle Stimulating Hormone

## HYPOGONADOTROPIC HYPOGONADISM

- hypogonadism due to impaired release of FSH and LH

### Etiology

- primary/congenital: Kallmann syndrome, CHARGE syndrome, GnRH insensitivity
- secondary: CNS or pituitary tumours, pituitary apoplexy, brain/pituitary radiation, drugs (GnRH agonists/antagonists, glucocorticoids, narcotics, chemotherapy, drugs causing hyperprolactinemia), functional deficiency due to another cause (hyperprolactinemia, chronic systemic illnesses, eating disorders, hypothyroidism, DM, Cushing's disease), systemic diseases (hemochromatosis, sarcoidosis, histiocytosis)

### Clinical Features

- hypogonadism, amenorrhea, erectile dysfunction (see Urology, U32), loss of body hair, fine skin, testicular atrophy, and failure of pubertal development

### Treatment

- combined FSH/LH hormone therapy, human chorionic gonadotropin (hCG), rFSH, or pulsatile GnRH analogue if fertility desired
- symptomatic treatment with estrogen/testosterone

## HYPERGONADOTROPIC HYPOGONADISM

- hypogonadism due to impaired response of the gonads to FSH and LH

### Etiology

- congenital:
  - chromosomal abnormalities (Turner's syndrome, Klinefelter syndrome, XX gonadal dysgenesis)
  - enzyme defects (17α-hydroxylase deficiency, 17,20-lyase deficiency)
  - gonadotropin resistance (Leydig cell hypoplasia, FSH insensitivty, pseudohypoparathyroidism type 1A)
- acquired:
  - gonadal toxins (chemotherapy, radiation)
  - drugs (glucocorticoids, antiandrogens, opioids, alcohol)
  - infections (STIs, mumps)
  - gonadal failure in adults (androgen decline and testicular failure in men, premature ovarian failure and menopause in women)

### Clinical Features

- amenorrhea, erectile dysfunction (see Urology, U33), loss of body hair, fine skin, testicular atrophy, failure of pubertal development, low libido, and infertility

### Treatment

- hormone replacement therapy consisting of androgen (for males) and estrogen (for females) administration

# Antidiuretic Hormone

## DIABETES INSIPIDUS

### Definition

- disorder of ineffective ADH (decreased production or peripheral resistance) resulting in passage of large volumes of dilute urine

### Etiology and Pathophysiology

- central DI: insufficient ADH due to pituitary surgery, tumours, idiopathic/autoimmune, stalk lesion, hydrocephalus, histiocytosis X, trauma, familial central DI
- nephrogenic DI: collecting tubules in kidneys resistant to ADH due to drugs (e.g. lithium), hypercalcemia, hypokalemia, chronic renal disease, hereditary nephrogenic DI
- psychogenic polydipsia and osmotic diuresis must be ruled out

**Diagnosing Subtypes of DI with DDAVP Response**
**C**oncentrated urine = **C**entral
**N**o effect = **N**ephrogenic

### Clinical Features

- passage of large volumes of dilute urine, polydipsia, and dehydration; hypernatremia can develop with inadequate water consumption or secondary to an impaired thirst mechanism

### Diagnostic Criteria

- fluid deprivation will differentiate true DI (high urine output persists, urine osmolality < plasma osmolality) from psychogenic DI (psychogenic polydipsia)
- response to exogenous ADH (DDAVP) will distinguish central from nephrogenic DI

### Treatment
- central DI: first line = desmopressin; second line = chlorpropamide, thiazides, NSAIDs and carbamazepine
- nephrogenic DI: solute restriction, thiazide diuretics

## SYNDROME OF INAPPROPRIATE ADH SECRETION

### Diagnostic Criteria
- 1) hyponatremia (serum $Na^+$ <135 mEq/L) with 2) plasma hypo-osmolality (<275 mOsm/kg), 3) urine $Na^+$ concentration >40 mEq/L, 4) urine osmolality >100 mOsm/kg), 5) euvolemia (no edema) and 6) absence of adrenal, renal, or thyroid insufficiency

### Etiology and Pathophysiology
- stress (pain, nausea, post-surgical)
- malignancy (lung, pancreas, lymphoma)
- CNS disease (inflammatory, hemorrhage, tumour, Guillain-Barré syndrome)
- respiratory disease (tuberculosis, pneumonia, empyema)
- drugs (SSRIs, vincristine, chlorpropamide, cyclophosphamide, carbamazepine, nicotine, morphine, DDAVP, oxytocin)

### Clinical Features
- symptoms of hyponatremia: headaches, nausea, vomiting, muscle cramps, tremors, cerebral edema if severe (confusion, mood swings, hallucinations, seizures, coma)

### Treatment
- goal is to increase serum sodium
- treat underlying cause, fluid restriction (800-1000 mL/d), vasopressin receptor antagonists (e.g. tolvaptan, conivaptan), demeclocycline (antibiotic with anti-ADH properties, rarely-used), and furosemide

**SIADH vs. Cerebral Salt Wasting (CSW)**
CSW can occur in cases of subarachnoid hemorrhage. $Na^+$ is excreted by malfunctioning renal tubules, mimicking findings of SIADH; hallmark is hypovolemia

# Pituitary Pathology

## PITUITARY ADENOMA (see Neurosurgery, NS14)

### Clinical Features
- local mass effects
  - visual field defects (bitemporal hemianopsia due to compression of the optic chiasm), diplopia (due to oculomotor nerve palsies is rare), headaches; increased ICP is rare
- hypofunction
  - hypopituitarism
- hyperfunction
  - PRL (galactorrhea), GH (acromegaly in adults, gigantism in children), ACTH (Cushing's disease = Cushing's syndrome caused by a pituitary tumour)
  - tumours secreting LH, FSH, and TSH are rare

### Investigations
- radiological evaluation (MRI is imaging procedure of choice)
- formal visual field testing for tumours compressing the optic chiasm
- hypothalamic-pituitary hormonal function

**Important Deficiencies to Recognize are:**
- Adrenal insufficiency
- Hypothyroidism

Concurrent adrenal insufficiency and hypothyroidism should be treated with glucocorticoids first and then with thyroid hormone to avoid adrenal crisis

**The Pituitary Hormones**
Order they are usually lost with compression by a mass:
"**G**o **L**ook **F**or **T**he **A**denoma **P**lease"
**G**H, **L**H, **F**SH, **T**SH, **A**CTH, **P**RL + posterior pituitary hormones: ADH and oxytocin

## HYPOPITUITARISM

### Etiology (The Eight I's)
- **I**nvasive
  - pituitary tumours, craniopharyngioma, cysts (Rathke's cleft, arachnoid, or dermoid), metastases
- **I**nfarction/hemorrhage
  - Sheehan's syndrome (pituitary infarction due to excessive post-partum blood loss and hypovolemic shock)
  - pituitary apoplexy (acute hemorrhage/infarction of a pituitary tumour; presents with sudden loss of pituitary hormones, severe headache, and altered level of consciousness; can be fatal if not recognized and treated early)
- **I**nfiltrative/inflammatory
  - sarcoidosis, hemochromatosis, histiocytosis
- **I**nfectious
  - syphilis, tuberculosis, fungal (histoplasmosis), parasitic (toxoplasmosis)
- **I**njury
  - severe head trauma
- **I**mmunologic
  - autoimmune destruction
- **I**atrogenic
  - following surgery or radiation
- **I**diopathic
  - familial forms, congenital midline defects

### Clinical Features
- symptoms depend on which hormone is deficient:
  - ACTH: fatigue, weight loss, hypoglycemia, anemia, hyponatremia, failure to thrive and delayed puberty in children
  - GH: short stature in children, adults exhibit increased fat and decreased lean body mass, decreased BMD, fatigue
  - TSH: tiredness, cold intolerance, constipation, weight gain
  - LH and FSH: oligo- or amenorrhea, infertility, decreased facial/body hair and muscle mass in men, erectile dysfunction, delayed puberty
  - Prolactin: inability to breastfeed
  - ADH: symptoms of diabetes insipidus (extreme thirst, polydipsia, hypernatremia)
  - Oxytocin: usually asymptomatic – only needed during labour and breastfeeding

### Investigations
- triple bolus test
  - stimulates release of all anterior pituitary hormones in normal individuals
  - rapid sequence of IV infusion of insulin, GnRH, and TRH
  - insulin (usual dose 0.1 unit/kg of human regular insulin) → hypoglycemia → increased GH and ACTH/cortisol
  - GnRH (100 μg IV push) → increased LH and FSH
  - TRH (200 μg IV push over 120 s) → increased TSH and PRL (no longer available in Canada)
  - GnRH and TRH stimulation tests are very limited in their utility; the insulin tolerance test is the only truly useful test in the triple bolus assessment

# Thyroid

## Thyroid Hormones

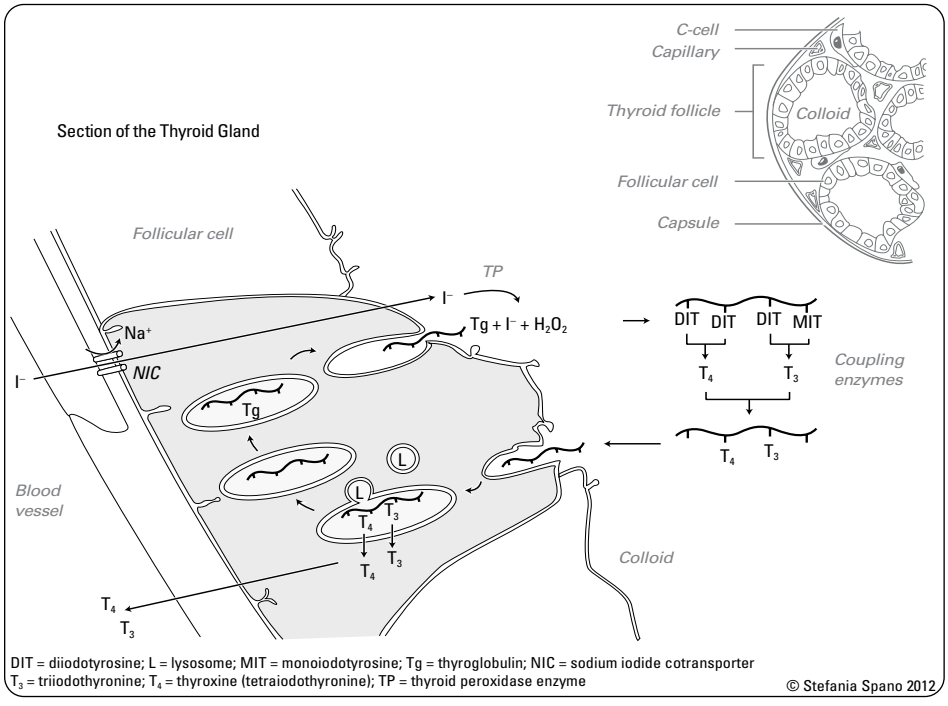

**Figure 9. Thyroid hormone synthesis**

### Synthetic Function of Thyroid Gland
- the synthesis of thyroid hormones $T_4$ (thyroxine) and $T_3$ (triiodothyronine) by the thyroid gland involves trapping and oxidation of iodide, iodination of thyroglobulin, proteolysis of thyroglobulin, and release of $T_3$ and $T_4$
  - more than 90% of thyroid hormone secreted by the thyroid is $T_4$
- free $T_4$ (0.02%) and free $T_3$ (0.3%) represent the hormonally active fraction of thyroid hormones
  - the remaining fraction is bound to thyroxine binding globulin (TBG), albumin and transthyretin, and is biologically inactive
- $T_3$ is more biologically active (approximately 4x as potent as $T_4$), but $T_3$ is present in the blood in smaller quantities and has a shorter half-life compared to $T_4$
- 85% of $T_4$ is converted to $T_3$ or reverse $T_3$ ($RT_3$) in the periphery by deiodinase enzymes
- $RT_3$ is metabolically inactive but produced in times of stress to decrease metabolic activity

**Extra-Thyroidal Factors Impacting Thyroid Hormone Homeostasis: A Review**
JRM 2015;4(1):40-49
- Most peripheral thyroid metabolism occurs in the liver and the kidneys, thus severe liver disease and CKD can significantly alter $T_3$:$T_4$ ratio.
- Alcohol dependence results in hypothalamic-pituitary-thyroid axis dysfunction demonstrated by decreased TSH, $T_4$, and $T_3$ levels.
- Smoking is associated with lower TSH levels in a dose-dependent manner: with heavy smoking (8-12 cigarettes/d) having more TSH suppression than light smokers (<4 cigarettes/d).
- Heavy metal exposure including lead, mercury, and cadamium has been shown to alter thyroid hormone function and peripheral metabolism.

**Patterns of Hormone Levels**

| | TSH | $T_3$, $T_4$ |
|---|---|---|
| 1° Hyper | ↓ | ↑ |
| 2° Hyper | ↑ | ↑ |
| 1° Hypo | ↑ | ↓ |
| 2° Hypo | ↓ | ↓ |

- most of the plasma T3 pool is derived from the peripheral conversion of $T_4$
- calcitonin, a peptide hormone, is also produced in the thyroid, by the parafollicular cells or C cells
  - calcitonin functions by inhibiting osteoclast activity and increasing renal calcium excretion

### Role of Thyroid Hormones

- thyroid hormones act primarily through modifying gene transcription by binding to nuclear receptors
- action of these hormones is diffuse, affecting nearly every organ system
- thyroid hormones have different tissue-specific effects determined by the expression of the types of thyroid receptor isoform and the local production of $T_3$
- they increase the basal metabolic rate including: increased $Na^+/K^+$ ATPase activity, increased $O_2$ consumption, increased respiration, heat generation, and increased cardiovascular activity
- when present at higher than normal levels it potentiates the actions of GH, catecholamines (epinephrine, norepinephrine), glucagon and cortisol, resulting in increased gluconeogenesis, ketogenesis and proteolysis, mimicking what happens in starvation
- it increases sensitivity to catecholamines, by up-regulating their receptors, but does not alter their blood concentrations
- thyroid hormone is required for normal growth in the fetus and child, including the central nervous system, via stimulation of GH release, in synergism with cortisol

### Regulation of Thyroid Function

- extrathyroid
  - stimulation of thyroid by TSH, epinephrine, prostaglandins (cAMP stimulators $T_3$ negatively feeds back on anterior pituitary to inhibit TSH and on hypothalamus to inhibit TRH
- $T_3$ intrathyroid (autoregulation)
  - synthesis (Wolff-Chaikoff effect, Jod-Basedow effect)
  - there is varying thyroid sensitivity to TSH in response to iodide availability
  - increased ratio of $T_3$ to $T_4$ in iodide deficiency
  - increased activity of peripheral 5' deiodinase in hypothyroidism increases $T_3$ production despite low $T_4$ levels

## Tests of Thyroid Function and Structure

### TSH

- third generation TSH is the best test for assessing thyroid function
- hyperthyroidism
  - primary: TSH is low because of negative feedback from increased levels of circulating $T_3$ and $T_4$
  - secondary: increased TSH results in increased $T_3$ and $T_4$
- hypothyroidism
  - primary: increased TSH (most sensitive test) because of less negative feedback from $T_3$ and $T_4$
  - secondary: TSH is low or normal with variable response to TRH depending on the site of the lesion (pituitary or hypothalamic)

### Free $T_3$ and Free $T_4$

- standard assessment of thyroid function measures TSH and, if necessary, free $T_4$. Free $T_3$ should only be measured in the small subset of patients with hyperthyroidism and suspected $T_3$ toxicosis. TSH would be suppressed, free $T_4$ normal, and free $T_3$ elevated

### Thyroid Autoantibodies

- thyroglobulin antibodies (TgAb), anti-thyroid peroxidase antibodies (TPOAb), and TSH receptor antibodies (TRAb) of the blocking variety are increased in Hashimoto's disease; normal variant in 10-20% of individuals
- TRAb of the stimulating variety are also referred to as thyroid stimulating immunoglobulins (TSI) and cause Graves' disease. However, both TRAb receptor blocking and stimulating antibodies are seen in patients with Graves' disease

### Plasma Thyroglobulin

- used to monitor for residual thyroid tissue post-thyroidectomy, e.g. tumour marker for thyroid cancer recurrence
- detectable or elevated levels may suggest persistent, recurrent, or metastatic disease

### Serum Calcitonin

- not routinely done to investigate thyroid nodules
- ordered if suspicion of medullary thyroid carcinoma e.g. in patients with a thyroid nodule and suspected or confirmed MEN IIa or IIb syndromes or those who have a pathogenic mutation in RET
- used to monitor for residual or recurrent medullary thyroid cancer

**Thyroid Assessment**

- Serum thyroid hormones (TSH, $T_3$, $T_4$)
- Antibodies (TRAb, TgAb and TPOAb)
- Thyroglobulin (to monitor thyroid cancer)
- Thyroid ultrasound
- Nuclear uptake and scan (for hyperthyroidism)
- Biopsy (FNA)

**Does this Patient have a Goitre?**
**From The Rational Clinical Examination**
JAMA 2009; https://jamaevidence.mhmedical.com/content.aspx?bookid=845&sectionid=61357508

**Study**: Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of a goitre.

**Results**: Clinical diagnosis was based on degree of lateral prominence, visibility, and palpability of the thyroid gland. No evidence exists to support the superiority of any one method.

The combined results of 4 studies detail the predictive utility of assessing grades of thyroid gland weight:

| Weight | Reference | LR+ | 95% CI |
|---|---|---|---|
| 0-20 g | normal | 0.15 | (0.10-0.21) |
| 20-40 g | 1-2x | 1.9 | (1.1-3.0) |
| >40 g | >2x | 25.0 | (2.6-175) |

Alternatively, defining a goitre as mass larger than the distal phalanx of the thumb has been shown to have an LR+ of 3.0 (95% CI 2.5-3.5) and LR- of 0.30 (95% CI 0.24-0.37) in children, and an LR+ of 4.7 (95% CI 3.6-6.0) and LR- of 0.08 (95% CI 0.02-0.27) for the presence of a goitre.

**Conclusions**: Use of weight of thyroid tissue is an appropriate method of diagnosing a goitre, while comparing the size of thyroid mass to the distal phalanx of the thumb may be a useful alternative.

### Thyroid Imaging/Scans

- normal gland size 15-20 g (estimated by palpation)
- thyroid U/S
  - to measure size of gland, characterize thyroid nodules, facilitate fine needle aspirate biopsy (FNAB)
  - ultrasonography is the first line tool for identification of thyroid nodules that require FNAB; exception is hyperthyroid patients with thyroid nodules where use of a radioisotope thyroid scan and RAIU (see below) permits identification of hyperfunctioning nodules which generally do not need to be biopsied
- radioisotope thyroid scan (Technetium-99) only if 1) one or more thyroid nodule(s) and 2) patient is hyperthyroid to determine whether nodules are hot (functioning → excess thyroid hormone production) or cold (non-functioning)
- hot nodule → very low chance malignancy; treat hyperthyroidism
- cold nodule →further workup required (U/S, then FNAB if concerning sonographic features)
- radioactive iodine uptake (RAIU)
  - test of function: order if patient is thyrotoxic
  - RAIU measures the turnover of iodine by thyroid gland *in vivo*
  - if ↑ uptake (e.g. incorporated), gland is overactive (hyperthyroid)
  - if ↓ uptake (e.g. not incorporated), gland is leaking thyroid hormone (e.g. thyroiditis), exogenous thyroid hormone use, or excess iodine intake (e.g. amiodarone or contrast dye, which has high iodine content)
- see Figure 9, *Thyroid Hormone Synthesis*, E21 for further information regarding the utility of these scans

### Thyroid Biopsy

- fine needle aspiration (FNA) for cytology
  - differentiates between benign and malignant disease
  - best done under U/S guidance
  - accuracy decreased if nodule is greater than 50% cystic, or if nodule located posteriorly in the gland

**Table 16. Summary of Diagnostic Testing in Hyperthyroidism and Hypothyroidism**

| | Hyperthyroidism | Hypothyroidism |
|---|---|---|
| **TSH** | Decreased in 1° hyperthyroidism<br>Increased in 2° hyperthyroidism | Increased in 1° hypothyroidism<br>Decreased in 2° hypothyroidism |
| **Free $T_4$** | Increased in 1° hyperthyroidism<br>Increased in 2° hyperthyroidism | Decreased in 1° hypothyroidism<br>Decreased in 2° hypothyroidism |
| **Antibodies** | Graves': TRAb (thyroid receptor antibody) | Hashimoto's: antithyroid peroxidase, thyroglobulin (TPOAb, TgAb) |
| **RAIU** | Increased uptake<br>Graves'<br>Toxic multinodular goitre<br>Toxic adenoma<br>Decreased uptake<br>Subacute thyroiditis<br>Recent iodine load<br>Exogenous thyroid hormone | |
| **Radioisotope Thyroid Scan** | Graves': homogenous diffuse uptake<br>Multinodular goitre: heterogeneous uptake<br>Toxic adenoma: single intense area of uptake with suppression elsewhere | |

**Drugs Affecting Thyroid Function**

Thyroid 2010;20(7):763-770

- Lithium plays an inhibitory role in thyroid hormone release, resulting in clinical hypothyroidism and goitre.
- **Amiodarone-Induced Hypothyroidism** (AIH): Amiodarone, a class III anti-arrhythmic drug, contains 2 atoms of iodine per molecule and is structurally similar to thyroid hormones, and may exert antagonistic effects on TSH receptors. It is also shown to inhibit type I deiodinases resulting in low $T_3$ and high $T_4$ levels. Amiodarone-induced hypothyroidism occurs in 5-15% of patients on amiodarone. AIH can also occur in people without pre-existing thyroid dysfunction.
- **Amiodarone-Induced thyrotoxicosis** (AIT): occurs in 2-12% of patients on amiodarone. This may be due to either an increased iodine load in patients with previously autonomous thyroid (Graves' disease, toxic multinodular goitre), or amiodarone-induced destructive thyroiditis.

**Signs and Symptoms of HYPERthyroidism**

**T**remor
**H**eart rate up
**Y**awning (fatigued)
**R**estlessness
**O**ligomenorrhea/amenorrhea
**I**ntolerance to heat
**D**iarrhea
**I**rritability
**S**weating
**M**uscle wasting/weight loss

**Common Etiologies**

| Thyrotoxicosis | Hypothyroidism |
|---|---|
| Graves' Disease | Hashimoto's |
| Toxic Nodular Goitre | Congenital |
| Toxic Nodule | Iatrogenic (thionamides, radioactive iodine, or surgery) |
| Thyroiditis | Hypothyroid phase of thyroiditis |

# Thyrotoxicosis

### Definition

- clinical, physiological, and biochemical findings in response to elevated thyroid hormone

### Epidemiology

- 1% of general population have hyperthyroidism
- F:M = 5:1

## Etiology and Pathophysiology

### Table 17. Differential Diagnosis of Thyrotoxicosis

| Disorder | TSH | Free $T_4$/$T_3$ | Thyroid Antibodies | RAIU | Other |
|---|---|---|---|---|---|
| **HYPERTHYROIDISM** | | | | | |
| **Graves' Disease** | Decreased | Increased | TRAb | Increased | Homogenous uptake on scan |
| **Toxic Nodular Goitre** | Decreased | Increased | None | Increased | Heterogeneous uptake on scan |
| **Toxic Nodule** | Decreased | Increased | None | Increased | Intense uptake in hot nodule on scan with no uptake in the rest of the gland |
| **THYROIDITIS** | | | | | |
| **Subacute, Silent, Postpartum** | Decreased | Increased | Up to 50% of cases (TSI, TPO, Tg) | Decreased (increases once entering hypothyroid phase, when TSH rises) | In classical subacute painful thyroiditis, ESR increased |
| **EXTRATHYROIDAL SOURCES OF THYROID HORMONE** | | | | | |
| **Endogenous** (struma ovariae, ovarian teratoma, metastatic follicular carcinoma) | Decreased | Increased | None | Decreased | |
| **Exogenous** (drugs) | Decreased | Increased ($T_4$ would be decreased if taking $T_3$) | None | Decreased | |
| **EXCESSIVE THYROID STIMULATION** | | | | | |
| **Pituitary Thyrotropinoma** | Increased | Increased | None | Increased | |
| **Pituitary Thyroid Hormone Receptor Resistance** | Increased | Increased | None | Increased | |
| **Increased hCG** (e.g. pregnancy) | Decreased | Increased | None | Increased<br>Test is contraindicated in pregnancy | |

## Clinical Features

### Table 18. Clinical Features of Thyrotoxicosis

| General | Fatigue, heat intolerance, irritability, fine tremor |
|---|---|
| **CVS** | Tachycardia, atrial fibrillation, palpitations<br>Elderly patients may have only cardiovascular symptoms, commonly new onset atrial fibrillation |
| **GI** | Weight loss with increased appetite, thirst, increased frequency of bowel movements (hyperdefecation) |
| **Neurology** | Proximal muscle weakness, hypokalemic periodic paralysis (more common in Asians) |
| **GU** | Oligomenorrhea, amenorrhea, decreased fertility |
| **Dermatology** | Fine hair, skin moist and warm, vitiligo, soft nails with onycholysis (Plummer's nails), palmar erythema, pruritis<br>Graves' disease: clubbing (acropachy), pretibial myxedema (rare) |
| **MSK** | Decreased bone mass, proximal muscle weakness |
| **Hematology** | Graves' disease: leukopenia, lymphocytosis, splenomegaly, lymphadenopathy (occasionally) |
| **Eye** | Graves' disease: lid lag, retraction, proptosis, diplopia, decreased acuity, puffiness, conjuctival injection<br>NOTE: Lid lag is a reflection of a hyperadrenergic state and can be present in any form of thyrotoxicosis |

## Treatment

- β-blockers for control of adrenergic symptoms
- antithyroidals (thionamides): propylthiouracil (PTU) or methimazole (MMI); MMI recommended (except in first trimester pregnancy); block thyroid hormone production
  - antithyroidals to prepare patients with endogenous hyperthyroidism for surgery, for patients with Graves' disease, and for patients with toxic nodules who do not wish to have definitive treatment with radioactive iodine or surgery
- radioactive iodine thyroid ablation for Graves' disease and toxic nodules/adenoma
- surgery in the form of hemi, subtotal, or complete thyroidectomy for toxic nodules
- surgery in the form of total or near total thyroidectomy for Graves' disease

# Graves' Disease

## Definition
- an autoimmune disorder characterized by autoantibodies that stimulate the TSH receptor leading to hyperthyroidism

## Epidemiology
- most common cause of hyperthyroidism
- occurs at any age with peak in 3rd and 4th decade
- F:M = 7:1, 1.5-2% of U.S. women
- familial predisposition: 15% of patients have a close family member with Graves' disease and 50% have family members with positive circulating antibodies
- association with HLA-B8 and DR3
- may be associated with other autoimmune disorders (e.g. pernicious anemia, Hashimoto's disease)

## Etiology and Pathophysiology
- autoimmune disorder due to breakdown in thyroid tolerance likely due to a combination of factors including autoreactive B lymphocytes and an imbalance favouring a Th2 vs Th1 immune response
- B lymphocytes produce thyroid-stimulating immunoglobulin (TSI) that binds and stimulates the TSH receptor and stimulates the thyroid gland
- immune response can be triggered by postpartum state, iodine excess, viral or bacterial infections, glucocorticoid withdrawal
- ophthalmopathy (thyroid associated orbitopathy) is a result of increased connective and extraocular muscle tissue volume due to inflammation and accumulation of glycosaminoglycans, stimulated by TSI, that increase osmotic pressure within the orbit; this leads to fluid accumulation and forward displacement of the eyeball
- dermopathy (pretibial or localized myxedema) may be related to cutaneous glycosaminoglycan deposition

## Clinical Features
- signs and symptoms of thyrotoxicosis
- diffuse goitre ± thyroid bruit secondary to increased blood flow through the gland
- ophthalmopathy: proptosis, diplopia, conjunctival injection, corneal abrasions, periorbital puffiness, lid lag, decreased visual acuity (plus signs of hyperthyroidism: lid retraction, characteristic stare)
- dermopathy (rare): pretibial myxedema: thickening of dermis that manifests as non-pitting edema
- acropachy: clubbing and thickening of distal phalanges

## Investigations
- low TSH
- increased free $T_4$ (and/or increased $T_3$)
- positive for TRAb (sensitivity and specificity of third-generation TRAb tests that are available currently is over 98 percent allowing their use for determining the etiology of hyperthyroidism)
- increased radioactive iodine (I-131) uptake
- homogeneous uptake on thyroid scan

## Treatment
- treatment for Graves' disease includes thionamides, radiodine (RAI), or surgery. These treatment options are not mutually exclusive. Patients who start with medical management, may eventually require a definitive treatment with RAI or surgery
- thionamides (antithyroid medications): propylthiouracil (PTU) or methimazole (MMI)
  - PTU and MMI inhibit thyroid hormone synthesis by inhibiting peroxidase-catalyzed reactions, thereby inhibiting organification of iodide, blocking the coupling of iodotyrosines
  - PTU also inhibits peripheral deiodination of $T_4$ to $T_3$
  - treat for approximately 12-18 mo aiming for a normal TSH and TRAb prior to consideration of treatment discontinuation
  - small goitre, mild hyperthyroidism, and low TRAb titres are good predictors for long-term remission with medical therapy
  - remission (normal thyroid indices one year after discontinuation of PTU or MMI) rates range between 20-30% following 12-18 mo of antithyroid medication
  - major side effects: hepatotoxicity (cholestasis, hepatitis), agranulocytosis, vasculitis
  - minor side effects: minor rash, pruritus
  - MMI preferred vs. PTU due to longer duration of action (once daily dosing for most), more rapid resolution of hyperthyroidism , and lower incidence of side effects
  - in pregnancy: use PTU during first 16 weeks of pregnancy and MMI after. MMI is contraindicated in the first trimester due to risk of aplasia cutis; MMI is preferred in the second and third trimester due to the potential risk of hepatotoxicity with PTU in the second and third trimesters
- symptomatic treatment with β-blockers
- thyroid ablation with radioactive I-131 if PTU or MMI trial does not produce disease remission or patient prefers definitive treatment with RAI
  - high incidence of hypothyroidism after I-131 requiring lifelong thyroid hormone replacement
  - contraindicated in pregnancy
  - may worsen ophthalmopathy
- total or near total thyroidectomy (indicated for large goitres, suspicious nodule for cancer, or if patient is intolerant to thionamides and refusing RAI ablation)
  - risks: hypoparathyroidism and vocal cord palsy

**Graves' Ophthalmopathy**

**NO SPECS** (in order of changes usually)
**N**o signs
**O**nly signs: lid lag, lid retraction
**S**oft tissue: periorbital puffiness, conjuctival injection, chemosis
**P**roptosis/exophthalmos
**E**xtraocular (diplopia)
**C**orneal abrasions (since unable to close eyes)
**S**ight loss

**Other Medications Used in the Treatment of Graves'**

**Glucocorticoids** have been useful in the treatment of severe Graves' hyperthyroidism and thyroid storm, by inhibiting the conversion of peripheral $T_4$ to $T_3$

**Lithium** is also used to treat Graves' hyperthyroidism. It acts by blocking thyroid hormone release, but its toxicity has limited its use in practice

**Caution with Thionamides**
These drugs are effective in controlling hyperthyroidism and induce permanent remission in 20-30% of patients with Graves' disease. They inhibit thyroid hormone synthesis. They are most often employed to achieve a euthyroid state before definitive treatment. Adverse effects include teratogenicity, agranulocytosis, hepatotoxicity, and ANCA-positive vasculitis

- ophthalmopathy/orbitopathy
  - smoking cessation is important
  - prevent drying of eyes and ulceration of cornea by using artificial tears during the day and lubricants at night
  - high dose prednisone or IV methylprednisolone in severe cases
  - high dose glucocorticoids preferably IV as well as potential orbital decompression surgery for sight threatening orbitopathy
  - orbital radiation, surgical decompression

### Prognosis
- course involves remission and exacerbation unless gland is destroyed by radioactive iodine or surgery
- total and subtotal thyroidectomy are rapid cures with low risk of recurrence (2% and 10%, respectively); risks include permanent hypothyroid and potential of damage to laryngeal nerve
- radioactive iodine is less invasive than surgery, but also results in permanent hypothyroid and requires precautions in contacts several days after treatment
- medical therapy with thionamides is not invasive, but has high recurrence rate at ~50%
- lifetime follow-up needed

## Subacute Thyroiditis (Thyrotoxic Phase)

- there are two main types: painful (DeQuervain's) and painless (silent)

**Table 19. Subacute Thyroiditis Painful versus Painless**

| | Painful Thyroiditis (DeQuervain's, granulomatous) | Painless Thyroiditis (Silent, autoimmune) |
|---|---|---|
| **Pathophysiology** | Presumed to be caused by viral infection or postviral inflammatory process<br>Strongly associated with HLA-D35<br>Thyroid inflammation damages thyroid folllicles, resulting in releasse of large amounts of T4 and T3 until stores are exhausted<br>State of hypothyroidism often persists until thyroid can generate sufficient thyroid hormones. | Considered variant of Hashimoto's thyroiditis<br>Associated with HLA-DR3<br>Postpartum subtype occurs following pregnancy<br>Also caused by inflammatory damage leading to unregulated release of T4 and 4 into circulation |
| **Clinical Features** | Painful swelling of the thyroid (may radiate to jaw and ears), transient vocal cord paresis, malaisse, fatigue, myalgia, fever<br>Often preceded by URTI<br>Painful condition lasts for a week to few months<br>Signs of hyperthyroidism during hyperthyroid phase (palpitations, tachycardia, stare) | thyroid enlargement without discomfort<br>5-20% of patients have sequence of hyperthyroidism, hypothyroidism and recovery<br>Signs of hyperthyroidism during hyperthyroid phase (palpitations, tachycardia, stare)<br>Affects women more than men |
| **Laboratory Investigations** | Initial elevated $T_4$ and $T_3$<br>Near absent RAIU<br>ESR and CRP often elevated | Initial elevated $T_4$ and $T_3$<br>Near absent RAIU |
| **Treatment** | NSAID/prednisone for pain<br>β-adrenergic blockage is usually effective in reversing most of the hypermetabolic and cardiac symptoms<br>If symptomatically hypothyoid, may treat short-term with thyroxine | β-adrenergic blockage is usually effective in reversing most of the hypermetabolic and cardiac symptoms<br>If symptomatically hypothyoid, may treat short-term with thyroxine |
| **Prognosis** | Complete spontaneous recovery to normal thyroid function in 90% of patients<br>10% of patients may become hypothyroid and require permanent replacement | 20-30% of patients may become hypothyroid and require permanent replacement<br>At risk of recurrent episodes of thyroiditis |

## Toxic Adenoma/Toxic Multinodular Goitre

### Etiology and Pathophysiology
- autonomous thyroid hormone production from a functioning adenoma that is hypersecreting $T_3$ and $T_4$
- may be singular (toxic adenoma) or multiple (toxic multinodular goitre [Plummer's disease])

### Clinical Features
- multinodular goitre
- tachycardia, heart failure, arrhythmia, weight loss, nervousness, weakness, tremor, and sweats
- seen most frequently in elderly people as opposed to Graves' disease which is more common in younger individuals

### Investigations
- low TSH, high $T_3$ and $T_4$
- thyroid scan with increased RAIU in nodule(s) and suppression of the remainder of the gland

### Treatment
- use high dose radioactive iodine (I-131) to ablate hyperfunctioning nodules
- β-blockers often necessary for symptomatic treatment prior to definitive therapy
- surgical excision may also be used as 1st line treatment

- initiate therapy with PTU or MMI to attain euthyroid state in individuals who do not wish to have definitive treatment of their disease, in preparation for thyroidectomy, and prior to RAI in patients at risk for complications due to exacerbation of hyperthyroidism following RAI such as the elderly with cardiovascular disease

# Thyrotoxic Crisis/Thyroid Storm

### Definition
- medical emergency – acute exacerbation of all of the symptoms of thyrotoxicosis presenting in a life-threatening state secondary to uncontrolled hyperthyroidism!
- rare, but serious with mortality rate between 10-30%

### Etiology and Pathophysiology
- often precipitated by infection, trauma, or surgery in a hyperthyroid patient

### Differential Diagnosis
- sepsis, pheochromocytoma, malignant hyperthermia, drug overdose, neuroleptic malignant syndrome

### Clinical Features
- hyperthyroidism
- extreme hyperthermia (≥40°C), tachycardia, vomiting, diarrhea, hepatic failure with jaundice, atrial fibrillation, congestive heart failure
- central nervous system manifestations including agitation, delirium, psychosis, lethargy, seizures, coma

### Laboratory Investigations
- increased free $T_3$ and $T_4$, undetectable TSH
- ± anemia, leukocytosis, hyperglycemia, hypercalcemia, elevated LFTs

### General Measures
- fluids, electrolytes, and vasopressor agents should be used as indicated
- a cooling blanket and acetaminophen can be used to treat the pyrexia
- propranolol or other β-blockers that additionally decrease peripheral conversion of $T_4 \rightarrow T_3$ can be used, but should be used with caution in patients with decompensated heart failure as it may worsen condition

### Specific Measures
- PTU is the anti-thyroid drug of choice and is used in high doses (200 mg q4h)
- give iodide, which acutely inhibits the release of thyroid hormone, 1 h after the first dose of PTU is given
  - Sodium iodide 1 g IV drip over 12 h q12h
    OR
  - Lugol's solution 10 drops q8h
    OR
  - Potassium iodide (SSKI) 5 drops q6h
- hydrocortisone 100 mg IV q8h or dexamethasone 2-4 mg IV q6h for the first 24-48 h; inhibits peripheral conversion of $T_4 \rightarrow T_3$

# Hypothyroidism

### Definition
- clinical syndrome caused by cellular responses to insufficient thyroid hormone production

### Epidemiology
- 2-3% of general population
- F:M = 10:1
- 10-20% of women >50 have subclinical hypothyroidism (normal $T_4$, TSH mildly elevated)
- iodine deficiency most common cause worldwide, but not in North America

### Etiology and Pathophysiology
- primary hypothyroidism (90%)
  - inadequate thyroid hormone production secondary to intrinsic thyroid defect
  - iatrogenic: post-ablative (I-131 or surgical thyroidectomy)
  - autoimmune: Hashimoto's thyroiditis
  - hypothyroid phase of subacute thyroiditis
  - drugs: goitrogens (iodine), PTU, MMI, lithium
  - infiltrative disease (progressive systemic sclerosis, amyloid)
  - iodine deficiency
  - congenital (1/4000 births)
  - neoplasia

**Factors Affecting Gastrointestinal Absorption of Levothyroxine: A Review**
Clin Ther 2017;39(2):378-403
- GI disorders such as celiac disease, atrophic gastritis, lactose intolerance, *H. pylori* infection may impede levothyroxine absorption.
- Drugs decreasing stomach acidity have been shown to significantly reduce exogenous thyroid hormone absorption from the GI tract. These include: proton-pump inhibitors, H2 receptor antagonists, calcium carbonate, sucralfate and aluminum hydroxide.
- Iron citrate is shown to reduce intestinal absorption of levothyroxine.
- Food, especially soybeans and coffee, have been shown to reduce absorption of levothyroxine significantly.
- Roughly 80% of levothyroxine is absorbed within 3 h after administration of the drug. Thus, patients should be educated to take levothyroxine on empty stomach at least one hour prior to eating breakfast.

- secondary hypothyroidism: pituitary hypothyroidism
  - insufficiency of pituitary TSH
- tertiary hypothyroidism: hypothalamic hypothyroidism
  - decreased TRH from hypothalamus (rare)
- peripheral tissue resistance to thyroid hormone (Refetoff syndrome)

**Table 20. Interpretation of Serum TSH and Free T4 in Hypothyroidism**

| | Serum TSH | Free $T_4$ |
|---|---|---|
| **Overt Primary Hypothyroidism** | Increased | Decreased |
| **Subclinical Primary Hypothyroidism** | Increased | Normal |
| **Secondary Hypothyroidism** | Decreased or not appropriately elevated | Decreased |

### Clinical Features

**Table 21. Clinical Features of Hypothyroidism**

| | |
|---|---|
| **General** | Fatigue, cold intolerance, slowing of mental and physical performance, hoarseness, macroglossia |
| **CVS** | Pericardial effusion, bradycardia, hypotension, worsening CHF + angina, hypercholesterolemia, hyperhomocysteinemia, myxedema heart |
| **Respiratory** | Decreased exercise capacity, hypoventilation secondary to weak muscles, decreased pulmonary responses to hypoxia, sleep apnea due to macroglossia |
| **GI** | Weight gain despite poor appetite, constipation |
| **Neurology** | Paresthesia, slow speech, muscle cramps, delay in relaxation phase of deep tendon reflexes ("hung reflexes"), carpal tunnel syndrome, asymptomatic increase in CK, seizures |
| **GU** | Menorrhagia, amenorrhea, impotence |
| **Dermatology** | Puffiness of face, periorbital edema, cool and pale, dry and rough skin, hair dry and coarse, eyebrows thinned (lateral 1/3), discolouration (carotenemia) |
| **Hematology** | Anemia: 10% pernicious due to presence of anti-parietal cell antibodies with Hashimoto's thyroiditis |

### Treatment
- L-thyroxine (dose range: 0.05-0.2 mg PO OD ~1.6 µg/kg/d)
- elderly patients and those with CAD: start at 0.025 mg daily and increase gradually every 6 wk (start low, go slow)
- after initiating L-thyroxine, TSH needs to be evaluated in 6 wk; dose is adjusted until TSH returns to normal reference range
- once maintenance dose achieved, follow-up TSH with patient annually
- secondary/tertiary hypothyroidism
  monitor via measurement of free $T_4$ (TSH is unreliable in this setting)

### CONGENITAL HYPOTHYROIDISM
- see Pediatrics, P29

## Hashimoto's Thyroiditis

### Definition
- most common form of primary hypothyroidism in North America
- chronic autoimmune thyroiditis characterized by both cellular and humoral factors in the destruction of thyroid tissue
- two major forms: goitrous and atrophic; both forms share same pathophysiology but differ in the extent of lymphocytic infiltration, fibrosis, and thyroid follicular cell hyperplasia
- goitrous variant usually presents with a small, rubbery goitre and euthyroidism, then hypothyroidism becomes evident
  - associated with fibrosis
- atrophic variant patients are hypothyroid from the start associated with thyroid lymphoma

### Etiology and Pathophysiology
- defect in clone of T-suppressors leads to cell-mediated destruction of thyroid follicles
- B lymphocytes produce antibodies against thyroid components including thyroglobulin, thyroid peroxidase, TSH receptor, $Na^+/I^-$ symporter

### Risk Factors
- F:M = 7:1
- genetic susceptibility: increased frequency in patients with Down's syndrome, Turner's syndrome, certain HLA alleles, cytotoxic T-lymphocyte-associated protein 4 (CTLA-4)
- family Hx or personal Hx of other autoimmune diseases
- cigarette smoking
- high iodine intake

### Investigations
- high TSH, low $T_4$ (not necessary to measure $T_3$ as it will be low as well)
- presence of anti-thyroid peroxidase (TPOAb) and thyroglobulin antibodies (TgAb) in serum

### Treatment
- if hypothyroid, replace with L-thyroxine (analog of $T_4$)

**Thyroid Hormone Replacement for Subclinical Hypothyroidism**
Cochrane DB Syst Rev 2007;3:CD003419
**Purpose:** To assess the effects of thyroid hormone replacement for subclinical hypothyroidism.
**Study Selection:** RCTs comparing thyroid hormone replacement with placebo in adults with subclinical hypothyroidism. Minimum duration of follow-up was 1 mo.
**Results:** No trial assessed (cardiovascular) mortality or morbidity. Seven studies evaluated symptoms, mood, and quality of life with no statistically significant improvement. One study showed a statistically significant improvement in cognitive function. Six studies assessed serum lipids; there was a trend for reduction in some parameters following levothyroxine replacement. Some echocardiographic parameters improved after levothyroxine replacement therapy, like myocardial relaxation. Only four studies reported adverse events with no statistically significant differences between groups.
**Conclusions:** In current RCTs, levothyroxine replacement therapy for subclinical hypothyroidism did not result in improved survival or decreased cardiovascular morbidity. Data on health-related quality of life and symptoms did not demonstrate significant differences between intervention groups. Some evidence indicates that levothyroxine replacement improves some parameters of lipid profiles and left ventricular function.

**Signs and Symptoms of Hypothyroidism**

**HIS FIRM CAP**
**H**ypoventilation
**I**ntolerance to cold
**S**low HR
**F**atigue
**I**mpotence
**R**enal impairment
**M**enorrhagia/amenorrhea
**C**onstipation
**A**nemia
**P**aresthesia

# Myxedema Coma

### Definition
- medical emergency – severe hypothyroidism complicated by trauma, sepsis, cold exposure, MI, inadvertent administration of hypnotics or narcotics, and other stressful events
- rare; high level of mortality (up to 40%, despite therapy)

### Clinical Features
- hallmark symptoms of decreased mental status and hypothermia
- hyponatremia, hypotension, hypoglycemia, bradycardia, hypoventilation, and generalized non-pitting edema often present

### Investigations
- decreased $T_4$, increased TSH, decreased glucose
- check ACTH and cortisol for evidence of adrenal insufficiency

### Treatment
- aggressive and immediate treatment required
- ABCs: ICU admission
- corticosteroids (for risk of concomitant adrenal insufficiency): hydrocortisone 100 mg q8h
- L-thyroxine 0.2-0.5 mg IV loading dose, then 0.1 mg IV OD until oral therapy tolerated; also consider $T_3$ therapy
- supportive measures: mechanical ventilation, vasopressor drugs, passive rewarming, IV dextrose, fluids if necessary (risk of overload)
- monitor for arrhythmia

# Sick Euthyroid Syndrome

### Definition
- changes in the regulation of the hypothalamic-pituitary-thyroid axis and thyroid hormone metabolism and transport amongst patients with severe illness, trauma, surgery, or starvation
- not due to intrinsic thyroid,pituitary, or hypothalamic disease
- initially low free $T_3$ may be followed by low TSH and if severe illness low free $T_4$
- with recovery of illness, TSH may become transiently high

### Pathophysiology
- abnormalities include alterations in:
  - peripheral transport and metabolism of thyroid hormone
  - regulation of TSH secretion
- may be protective during illness by reducing tissue catabolism

### Labs
- initially decreased free $T_3$ followed by decreased TSH and finally decreased free $T_4$

### Treatment
- treat the underlying disease; thyroid hormone replacement has not shown to be beneficial
- thyroid function tests normalize once patient is well (initially with a transient increase in TSH)

# Non-Toxic Goitre

### Definition
- generalized enlargement of the thyroid gland in a euthyroid individual that does not result from inflammatory or neoplastic processes

### Pathophysiology
- the appearance of a goitre is more likely to present during adolescence, pregnancy, and lactation due to increased thyroid hormone requirements
  - early stages: goitre is usually diffuse
  - later stages: multinodular non-toxic goitre with nodule, cyst formation and areas of ischemia, hemorrhage, and fibrosis

### Etiology
- iodine deficiency or excess
- rogens: brassica vegetables (e.g. turnip, cassava)
- drugs: iodine, lithium, para-aminosalicylic acid
- any disorder of hormone synthesis with compensatory growth
- peripheral resistance to thyroid hormone

### Treatment
- remove goitrogens
- radioiodine therapy (need very high doses given low iodine uptake, used as last resort)
- suppression with L-thyroxine (rarely done)
- surgery may be necessary for severe compressive symptoms; however, these patients are often asymptomatic

### Complications
- compression of neck structures causing stridor, dysphagia, pain, and hoarseness of voice
- multinodular goitre may become autonomous leading to toxic multinodular goitre and hyperthyroidism

## Thyroid Nodules

### Definition
- discrete lesion that and be distinguished sonographicallyfrom the rest of the thyroid parenchyma
- nodules found incidentally on ultrasound suggests a prevalence of 19-67%

### Etiology
- benign tumours (e.g. follicular adenoma)
- thyroid malignancy
- hyperplastic area in a multinodular goitre
- cyst: true thyroid cyst, area of cystic degeneration in a multinodular goitre

### Investigations

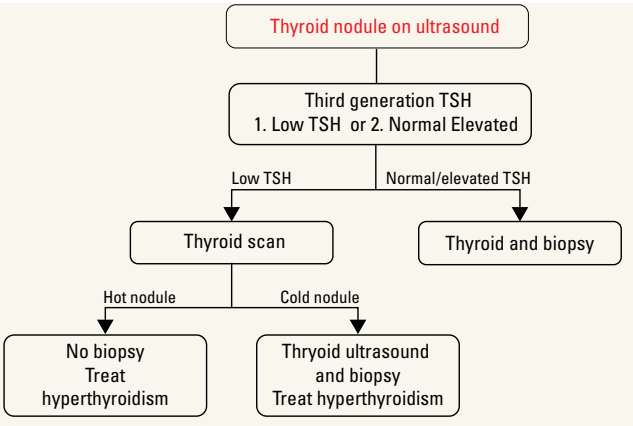

**Figure 10. Approach to the evaluation of a thyroid nodule**
Adapted from Dr. J Goguen, University of Toronto, MMMD 2013

## Thyroid Malignancies

- see Otolaryngology, OT37

# Adrenal Cortex

## Adrenocorticotropic Hormone

- a polypeptide (cleaved from prohormone POMC), secreted in a pulsatile fashion from the anterior pituitary with diurnal variability (peak: 0200-0400 h; trough: 1800-2400 h)
- secretion regulated by corticotropin-releasing hormone (CRH) and arginine vasopressin (AVP)
- stimulates growth of adrenal cortex and release of glucocorticoids, androgens and, to a very limited extent, mineralocorticoids
- ACTH can directly bind to MSH receptors on melanocytes, enhancing melanogenesis

## Adrenocortical Hormones

### Aldosterone
- a mineralocorticoid which regulates extracellular fluid (ECF) volume through $Na^+$ (and $Cl^-$) retention and $K^+$ (and $H^+$) excretion (stimulates distal tubule $Na^+/K^+$ ATPase)
- regulated by the renin-angiotensin-aldosterone system and by hyperkalemia
- negative feedback to juxtaglomerular apparatus (JGA) by long loop (aldosterone ↑ volume expansion) and short loop (angiotensin II ↑ peripheral vasoconstriction)

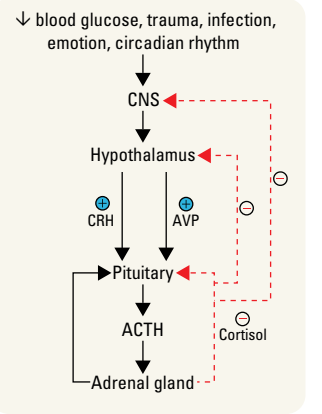

**Figure 11. Regulation of CRH-ACTH-adrenal gland axis**

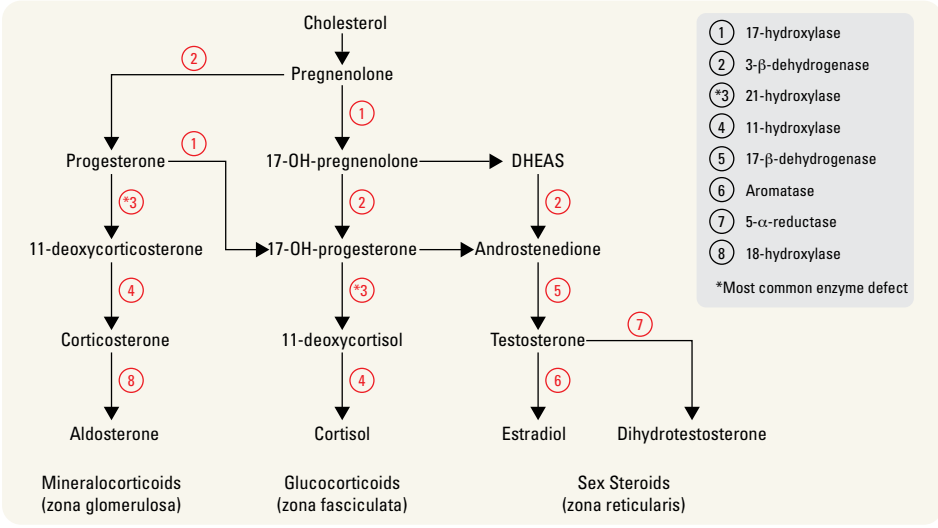

**Figure 12. Pathways of major steroid synthesis in the adrenal gland and their enzymes**

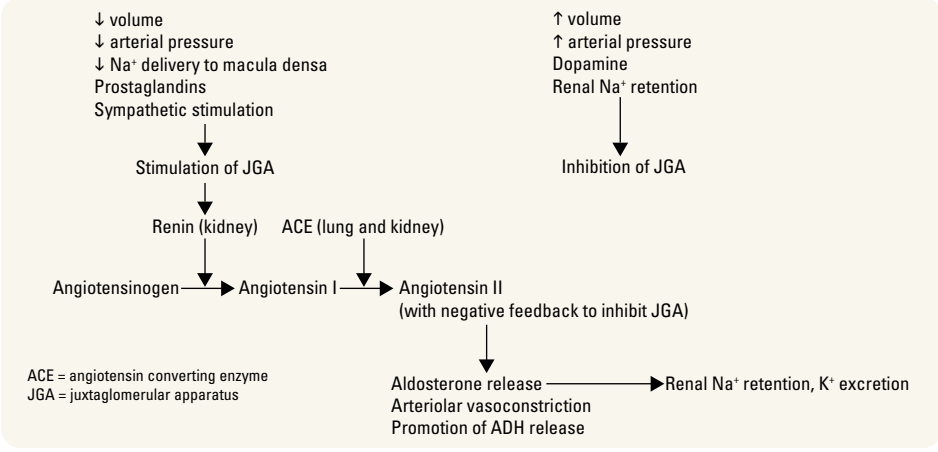

**Figure 13. Renin-angiotensin-aldosterone axis (see Nephrology, NP4)**

**Layers of the Adrenal Cortex**

**OUTSIDE**

**Zona Glomerulosa** produces **mineralocorticoids (aldosterone)**

**Zona Fasciculata** produces **glucocorticoids (cortisol)**

**Zona Reticularis** produces **androgens (DHEA, androstenedione)**

**INSIDE**

## Cortisol

- a glucocorticoid, regulated by the HPA axis
- involved in the regulation of metabolism
- supports blood pressure and vasomotor tone
- also involved in behavioural regulation and immunosuppression

**Table 22. Physiological Effects of Glucocorticoids**

| Stimulatory Effects | Inhibitory Effects |
|---|---|
| Stimulate hepatic glucose production (gluconeogenesis) | Inhibit bone formation; stimulate bone resorption |
| Increase insulin resistance in peripheral tissues | Inhibit fibroblasts, causing collagen and connective tissue loss |
| Increase protein catabolism | Suppress inflammation; impair cell-mediated immunity |
| Stimulate leukocytosis and lymphopenia | Inhibit growth hormone axis* |
| Increase cardiac output, vascular tone, $Na^+$ retention | Inhibit reproductive axis* |
| Increase PTH release, urine calcium excretion | Inhibit vitamin D3 and inhibit calcium uptake |

*Typically only occurs with cortisol excess

## Androgens

- sex steroids regulated by ACTH; primarily responsible for adrenarche (growth of axillary and pubic hair)
- principal adrenal androgens are: dihydroepiandrosterone (DHEA), androstenedione, and 11-hydroxyandrostenedione
- proportion of total androgens (adrenal to gonadal) increases in old age

# Adrenocortical Functional Workup

### STIMULATION TEST
- purpose: diagnosis of hormone deficiencies
- method: measure target hormone after stimulation with tropic (pituitary) hormone

### Tests of Glucocorticoid Reserve
- Cosyntropin (ACTH analogue) Stimulation Test
  - administer 250 µg cosyntropin IV/IM, and measure plasma cortisol levels before and 30 and 60 min after administration
  - physiologic response: stimulated plasma cortisol of >1500 nmol/L (>18 µg/L) at 30 or 60 min
  - inappropriate response: inability to stimulate increased plasma cortisol
- insulin tolerance test is the gold standard test used to diagnose adrenal insufficiency (see *Pituitary Gland*, E16)

### SUPPRESSION TESTS
- purpose: diagnosis of hormone hypersecretion
- method: measure target hormone after suppression of its tropic (pituitary) hormone

### 1. Tests of Pituitary-Adrenal Suppressibility
- Dexamethasone (DXM) Suppression Test
  - principle: DXM suppresses pituitary ACTH, plasma cortisol should be lowered if HPA axis is normal
  - *Screening Test*: Overnight DXM Suppression Test
    - oral administration of 1 mg DXM at midnight, then measure plasma cortisol levels the following day at 8 AM
    - physiologic response: plasma cortisol <50 nmol (<1.8 µg/dL)
    - inappropriate response: failure to suppress plasma cortisol
    - false positive results due to obesity, depression, alcoholism, medications inducing the metabolism of dexamethasone
  - *Confirmatory Test*: other testing is used to confirm the diagnosis, such as:
    - 24 h urine free cortisol (shows overproduction of cortisol)
    - midnight salivary cortisol (if available), shows lack of diurnal variation
      - inappropriate response: remains high (normally will be low at midnight)

### 2. Tests of Mineralocorticoid Suppressibility
- multiple medications interfere with the interpretation of screening and confirmatory tests for primary aldosteronism and these may need to be held prior to testing
- positive screen test for primary aldosteronism is elevated aldosterone:renin ratio in the presence of a low renin and high aldosteroneand an andosterone ≥416 pmol/L
- confirmation of primary aldosteronism requires lack of aldosterone suppression: with expansion of extracellular fluid volume (ECFV), plasma aldosterone should be lowered
- ECFV Expansion with Normal Saline (NS)
  - IV infusion of 500 mL/h of NS for 4 h, then measure plasma aldosterone levels
  - plasma aldosterone >277 pmol/L is consistent with primary hyperaldosteronsim, <140 pmol/L is normal
  - inappropriate response: failure to suppress plasma aldosterone

# Mineralocorticoid Excess Syndromes

### Definition
- primary aldosteronism (PA): excess aldosterone production (intra-adrenal cause) (previously called hyperaldosteronism)
- secondary aldosteronism (SA): aldosterone production in response to excess RAAS (extra-adrenal cause)

### Etiology
- primary hyperaldosteronism
  - aldosterone-producing adrenal adenoma (Conn's syndrome)
  - bilateral or idiopathic adrenal hyperplasia
  - glucocorticoid-remediable aldosteronism
  - aldosterone-producing adrenocortical carcinoma
  - unilateral adrenal hyperplasia
  - ectopic aldosterone-producing tumours
  - familial hyperaldosteronism (FH) types I-IV
- secondary hyperaldosteronism

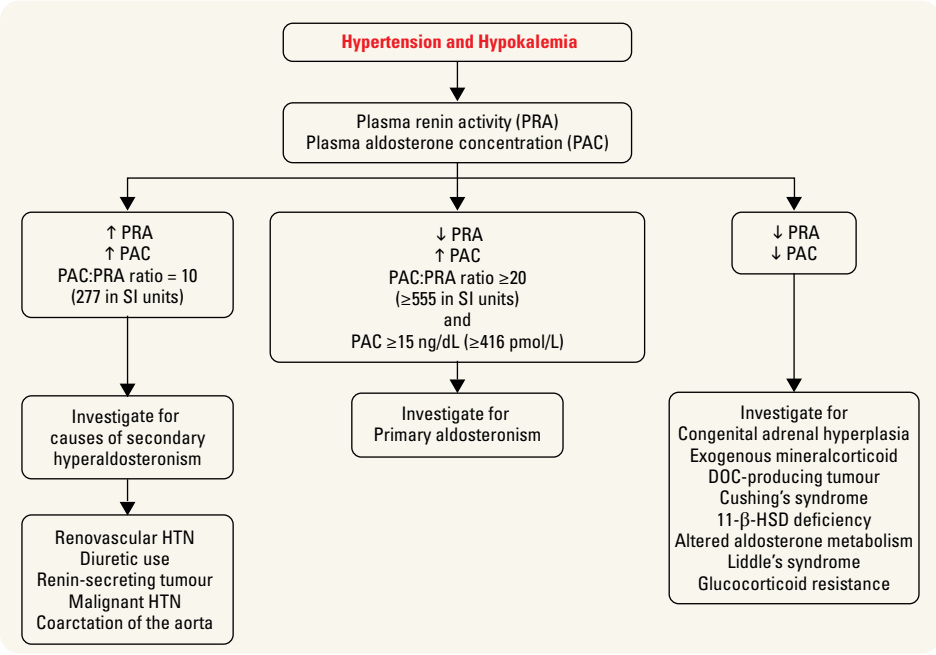

**Figure 14. Approach to mineralocorticoid excess syndromes**

## Clinical Features

- HTN
- hypokalemia (± mild hypernatremia), metabolic alkalosis
- normal $K^+$, hyponatremia in SH (low effective circulating volume leads to ADH release)
- increased cardiovascular risk: LV hypertrophy, atrial fibrillation, stroke, and MI
- elevated risk of metabolic syndrome and T2DM
- fatigue, weakness, paresthesia, headache; severe cases present with tetany, intermittent paralysis (only if $K^+$ <2.5 mEq/L)

## Diagnosis

- investigate plasma aldosterone:renin ratio in patients with HTN and hypokalemia, drug resistant HTN, HTN and a first degree relative with primary aldosteronism, HTN and a family history of stoke in a first degree relative 40 yr, HTN and adrenal incidentaloma
- confirmatory testing for PA: aldosterone suppression test (demonstrate inappropriate aldosterone secretion with ECF volume expansion), adrenal vein sampling may be required to determine whether there is lateralization of aldosterone excess
- imaging: CT adrenal glands

**Table 23. Diagnostic Tests in Hyperaldosteronism**

| Test | Primary Hyperaldosteronism | Secondary Hyperaldosteronism |
|---|---|---|
| **Plasma aldosterone to renin ratio (PAC/PRA)** | Elevated (↑ aldo, ↓ renin) | Normal (↑ aldo, ↑ renin) |
| **Salt loading test (confirmatory test)** | ↑ urine aldosterone | Not performed |
| **A) Oral test** | ↑ plasma aldosterone | |
| **B) IV saline test** | plasma aldosterone concentration >277 pmol/L (140-277 indeterminant range) | |

## Treatment

- inhibit action of aldosterone: spironolactone, eplerenone, triamterene, amiloride (act on sodium channels)
- surgical excision of adrenal adenoma
- secondary hyperaldosteronism: treat underlying cause

# Cushing's Syndrome

### Definition
- results from chronic glucocorticoid excess (endogenous or exogenous sources)

### Etiology
- ACTH-dependent (85%) – bilateral adrenal hyperplasia and cortisol hypersecretion due to:
  - ACTH-secreting pituitary adenoma (Cushing's disease; 80% of ACTH-dependent)
  - ectopic ACTH-secreting tumour (e.g. small cell lung carcinoma, bronchial, carcinoid, pancreatic islet cell, pheochromocytoma, or medullary thyroid tumours)
- ACTH-independent (15%)
  - primary adrenocortical tumours: adenoma and carcinoma (uncommon)
  - bilateral adrenal nodular hyperplasia
- iatrogenic CS is probably more common than endogenous cortisol excess but is not frequently reported, it is of course ACTH-independent

### Clinical Features
- symptoms: weakness, insomnia, mood disorders, impaired cognition, easy bruising, oligo-/amenorrhea, hirsutism, and acne (ACTH dependent)
- signs: central obesity, round face ("moon face"), supraclavicular and dorsal fat pads, facial plethora, proximal muscle wasting, purple abdominal striae, skin atrophy, acanthosis nigricans, HTN, hyperglycemia, osteoporosis, pathologic fractures, hyperpigmentation, hyperandrogenism (if ACTH-dependent)

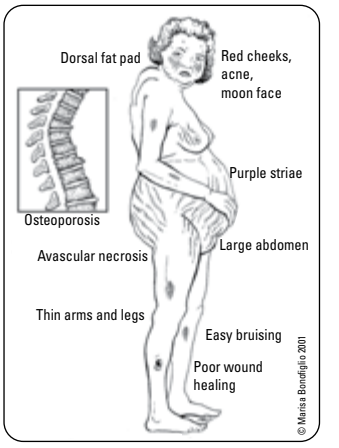

**Figure 15. Clinical features of Cushing's syndrome**

### Diagnosis
- complete a drug history to exclude exogenous sources for Cushing's syndrome
- perform one of: 1) 24 h urine free cortisol (x2 samples), 2) low dose dexamethasone suppression test, or 3) late night salivary cortisol
- consider reasons for a false positive (e.g. pregnancy, depression, alcoholism, morbid obesity, poorly controlled DM)
- confirm with one of the remaining tests

### Treatment
- adrenal
  - adenoma: unilateral adrenalectomy (curative) with glucocorticoid supplementation post-operatively, tapering slowly until HPA axis has recovered
  - carcinoma: adrenalectomy in patients with disease localized to the adrenal, adjunctive mitotane for individuals with high risk for current disease. Mitotane ± chemotherapy for patients with metastatic disease
  - medical treatment: ketoconazole to reduce cortisol, mitotane can be used – typically reserved for patients with malignant disease
- pituitary
  - transsphenoidal resection, with glucocorticoid supplementation post-operatively
  - if surgery delayed, contraindicated, or unsuccessful, consider medical management e.g. adrenal enzyme inhibitors (such as ketoconazole, metyrapone, and etomidate), glucocorticoid receptor antagonist (such as mifepristone)
- ectopic ACTH tumour (paraneoplastic syndrome): usually bronchogenic cancer (poor prognosis) surgical resection, if possible; chemotherapy/radiation for primary tumour
  - medical treatment with mitotane or ketoconazole to reduce cortisol synthesis. Often required when surgery is delayed, contraindicated, or unsuccessful

# Congenital Adrenal Hyperplasia

- see Pediatrics, P31

# Hyperandrogenism

## Definition
- state of having excessive secretion of androgens (DHEA, DHEA-sulfate, testosterone)

## Etiology and Pathophysiology

**Table 24. Etiology of Hyperandrogenism**

| | |
|---|---|
| **Medications Androgen-Mediated** | Anabolic steroids, ACTH, androgens, progestational agents |
| **Ovarian** | PCOS<br>Ovarian hyperthecosis<br>Theca cell tumours<br>Pregnancy: placental sulfatase/aromatase deficiency |
| **Adrenal** | Congenital adrenal hyperplasia (CAH, late-onset CAH)<br>Tumours (adenoma, carcinoma) |
| **Pituitary** | Cushing's disease – high ACTH<br>Hyperprolactinemia |

## Clinical Features

### Females
- hirsutism
  - male pattern growth of androgen-dependent terminal body hair in women: back, chest, upper abdomen, face, linea alba
  - Ferriman-Gallwey scoring system is used to quantify severity of hirsutism (score of >8 is abnormal for white/black women, >9 abnormal for Mediterranean/Hispanic/Middle-Eastern women, >2 for Asian women)
- virilization
  - frontal balding, clitoromegaly, increased muscle mass, deepening of the voice
- amenorrhea, ↓ breast size, infertility

**Conditions that do Not Represent True Hirsutism**
- Androgen-independent hair (e.g. lanugo hair)
- Drug-induced hypertrichosis (e.g. phenytoin, diazoxide, cyclosporine, minoxidil)
- Topical steroid use

### Males
- minimal effects on hair, muscle mass, etc.
- inhibition of gonadotropin secretion may cause reduction in: testicular size, testicular testosterone production, and spermatogenesis

## Investigations
- testosterone, DHEA-S as a measure of adrenal androgen production
- LH/FSH (commonly in PCOS >2.5)
- 17-OH progesterone, elevated in CAH due to 21-OH deficiency; check on day 3 of menstrual cycle with a progesterone level
- for virilization: CT/MRI of adrenals and ovaries (identify tumours)
- if PCOS, check blood glucose, lipids

## Treatment
- discontinue causative medications
- antiandrogens, e.g. spironolactone
- oral contraceptives (increase sex hormone binding globulin, which binds androgens>estrogens; reduces ovarian production of androgens)
- surgical resection of tumour
- glucocorticoid ± mineralocorticoid if CAH confirmed
- treat specific causative disorders, e.g. tumours, Cushing's, etc.
- cosmetic therapy (laser, electrolysis)

# Adrenocortical Insufficiency

## Definition

- state of inadequate cortisol and/or aldosterone production by the adrenal glands

## Etiology

### PRIMARY (ADDISON'S DISEASE)

**Table 25. Etiology of Primary Adrenocortical Insufficiency**

| | |
|---|---|
| **Autoimmune (70-90%)** | Isolated adrenal insufficiency<br>Polyglandular autoimmune syndromes types I and II<br>Antibodies often directed against adrenal enzymes and 3 cortical zones |
| **Infections** | Tuberculosis (7-20%) (most common in developing world)<br>Fungal: histoplasmosis, paracoccidioidomycosis<br>HIV, CMV<br>Syphilis<br>African trypanosomiasis |
| **Infiltrative** | Metastatic cancer (lung>stomach>esophagus>colon>breast); lymphoma<br>Sarcoidosis, amyloidosis, hemochromatosis |
| **Vascular** | Bilateral adrenal hemorrhage (risk increased by heparin and warfarin)<br>Sepsis (meningococcal, *Pseudomonas*)<br>Coagulopathy in adults or Waterhouse-Friderichsen syndrome in children<br>Thrombosis, embolism, adrenal infarction |
| **Drugs** | Inhibit cortisol: ketoconazole, etomidate, megestrol acetate<br>Increase cortisol metabolism: rifampin, phenytoin, barbiturates |
| **Others** | Adrenoleukodystrophy and adrenomyeloneuropathy<br>Congenital adrenal hypoplasia (impaired steroidogenesis)<br>Familial glucocorticoid deficiency or resistance<br>Defective cholesterol metabolism |

### SECONDARY ADRENOCORTICAL INSUFFICIENCY

- inadequate pituitary ACTH secretion
- multiple etiologies (see *Hypopituitarism*, E20), including withdrawal of exogenous steroids

## Clinical Features

**Table 26. Clinical Features of Primary and Secondary Adrenal Insufficiency (AI)**

| | Primary AI (Addison's or Acute AI) | Secondary AI |
|---|---|---|
| **Skin and Mucosa** | Dark (palmar crease, extensor surface) | Pale |
| **Potassium** | High | Normal |
| **Sodium** | Normal or Low | Normal or Low |
| **Metabolic Acidosis** | Present | Absent |
| **Associated Diseases** | Primary hypothyroidism, T1DM, vitiligo | Central hypogonadism or hypothyroidism, growth hormone deficiency, DI |
| **Associated Symptoms** | Weakness, fatigue, weight loss, hypotension, salt craving, postural dizziness, myalgia, arthralgia<br>GI: N/V, abdominal pain, diarrhea | Weakness, fatigue, weight loss, hypotension, postural dizziness, myalgia, arthralgia, headaches, visual abnormalities |
| **Diagnostic Test** | Cosyntropin Stimulation Test<br>High morning plasma ACTH<br>High renin | Insulin tolerance test<br>Cosyntropin Stimulation Test<br>Low or inappropriately low morning plasma ACTH |

Adapted from: Salvatori R. JAMA 2005;294:2481-2488

## Treatment

- acute adrenal crisis – can be life-threatening
  - IV NS 1L within the first hour followed by continuous IV NS guided by patient requirements; add D5W if hypoglycemic
  - hydrocortisone 100 mg IV stat followed by 50 mg IV q6h
  - identify and correct precipitating factors
- maintenance
  - hydrocortisone 15-25 mg total daily dose, in 2-3 divided doses, highest dose in the AM
  - Florinef™ (fludrocortisone, synthetic mineralocorticoid) 0.05-0.2 mg PO daily if mineralocorticoid deficient, increase dose of steroids 2-3 fold for a few days during moderate-severe illness (e.g. with vomiting, fever)
  - major stress (e.g. surgery, trauma) requires 150-300 mg hydrocortisone IV daily divided into 3 doses
  - medical alert bracelet and instructions for emergency hydrocortisone/dexamethasone IM/SC injection

# Adrenal Medulla

## Catecholamine Metabolism

- catecholamines are synthesized from tyrosine in postganglionic sympathetic nerves (norepinephrine) and chromaffin cells of adrenal medulla (epinephrine)
- broken down into metanephrines and other metabolites (VMA, HVA) and excreted in urine

**ABC of Adrenaline**

**A**drenaline activates
**β**-receptors, increasing
**C**yclic AMP

## Pheochromocytoma/Paraganglioma

### Definition

- paragangliomas are rare neuroendocrine tumours that arise from the extra-adrenal autonomic paraganglia (small organs comprised of neuroendocrine cells that secrete catecholamines)
- pheochromocytomas are catecholamine-secreting tumours derived from chromaffin cells of the adrenal gland

### Epidemiology

- most commonly a single tumour of adrenal medulla
- rare cause of HTN (<0.2% of all hypertensives)

### Etiology and Pathophysiology

- pheochromocytomas and paragangliomas are the most inherited among neuroendocrine tumours
- 30-40% cases are linked to germline mutations, including mutations in the RET, VHL, SDHx, NF1, and SDHAF2 genes
- pheochromocytomas and paragangliomas are divided into clusters: Cluster 1 - Pseudohypoxia subtype (FH, VHL/EPAS1-related), Cluster 2- Kinase signaling group (HRAS), Cluster 3 - WNT signaling group (CSDE1, UBTF-MAML3 fusion)
- most cases sporadic, 40% patients have the disease as part of a familial disorder and in these patients, the tumours are more likely to be bilateral adrenal pheochromocytoma/paragangliomas
- hereditary forms present earlier than sporadic cases
- several familial disorders are associated with adrenal pheochromocytoma, all have autosomal dominant inheritance, e.g. multiple endocrine neoplasia type 2 (MEN2) - 50% frequency, von Hippel-Lindau (VHL) syndrome - 10-20% frequency, and less commonly, neurofibromatosis type 1 (NF1) - 0.1-5.7%
- tumours, via unknown mechanism, able to synthesize and release excessive catecholamines

### Clinical Features

- 50% suffer from paroxysmal HTN; the rest have sustained HTN
- classic triad (not found in most patients): episodic "pounding" headache, palpitations/tachycardia, diaphoresis
- other symptoms: tremor, anxiety, chest or abdominal pain, nausea and vomiting, visual blurring, weight loss, polyuria, polydipsia
- other signs: orthostatic hypotension, papilledema, hyperglycemia, dilated cardiomyopathy
- symptoms may be triggered by stress, exertion, anesthesia, abdominal pressure, certain foods (especially tyramine containing foods – such as aged/strong cheese and cured meats)

### Investigations

- urine catecholamines
  - increased catecholamine metabolites (metanephrines) and free catecholamines
  - plasma metanephrines if available (most sensitive)
    - cut-off values will depend on assay used
- CT abdomen
  - if negative, whole body CT and meta-iodo-benzoguanidine (MIBG) scintigraphy, Octreoscan, or MRI

### Treatment

- surgical removal of tumour (curative) with careful pre- and post-operative ICU monitoring
- adequate pre-operative preparation
  - α-blockade for BP control: doxazosin or phenoxybenzamine (these are the most frequently used alpha blockers) (10-21 d pre-operative), IV phentolamine (perioperative, if required)
  - β-blockade for HR control once α blocked for a few days
  - metyrosine (catecholamine synthesis inhibitor) + alpha blocker
  - volume restoration with vigorous salt-loading and fluids
- rescreen urine 1-3 mo post-operatively
- all patients are currently offered genetic testing - probability of germline disease increases with young age, multifocal disease, in the setting of paraganglioma

# Disorders of Multiple Endocrine Glands

## Multiple Endocrine Neoplasia

- neoplastic syndromes involving multiple endocrine glands
- tumours of neuroectodermal origin
- autosomal dominant inheritance with variable penetrance
- genetic screening for RET proto-oncogene on chromosome 10 has long-term benefit in MEN 2
  - early cure and prevention of medullary thyroid cancer

**MEN I – Wermer's Syndrome Affects the 3 Ps**

**P**ituitary
**P**arathyroid
**P**ancreas

**Table 27. MEN Classification**

| Type | Tissues Involved | Clinical Manifestations |
|---|---|---|
| **MEN 1** (chromosome 11) | | |
| **Men 1 (Wermer's Syndrome)**<br><br>**3 Ps (Pituitary, parathyroid and pancreas)** | Pituitary (30-40%)<br>Anterior pituitary adenoma | Headache, visual field defects, often non-secreting but may secrete PRL (most common pituitary functional tumour in MEN 1 leading to galactorrhea, erectile dysfunction, decreased libido, amenorrhea), GH (acromegaly). GH+PRL |
| | Parathyroid (≥95%)<br>Primary hyperparathyroidism from hyperplasia | Nephrolithiasis, bone abnormalities, MSK complaints, symptoms of hypercalcemia |
| | Entero-pancreatic endocrine (30-80%)<br>Pancreatic islet cell tumours<br>Gastrinoma<br>Insulinomas<br>Vasoactive intestinal peptide (VIP)-omas<br>Glucagonoma<br>Carcinoid syndrome | Epigastric pain (peptic ulcers and esophagitis)<br>Hypoglycemia<br>Secretory diarrhea<br><br>Rash (necrolytic migratory erythema), anorexia, anemia, diarrhea, glossitis<br>Flushing, diarrhea, bronchospasm |
| | Adrenal tumours (~40%) | |
| **MEN 2** (chromosome 10) | | |
| 1. Men 2a (Sipple's Syndrome) | Thyroid (>90%)<br>Medullary thyroid cancer (MTC) | Physical signs are variable and often subtle<br><br>Neck mass or thyroid nodule; non-tender, anterior lymph nodes |
| | Adrenal medulla (40-50%)<br>Pheochromocytoma (40-50%) | HTN, palpitations, headache, sweating |
| | Parathyroid (10-20%)<br>1° parathyroid hyperplasia | Symptoms of hypercalcemia |
| | Skin<br>Cutaneous lichen amyloidosis | Scaly skin rash |
| 2. Familial Medullary Thyroid Ca (a variant of 2a) | Thyroid<br>MTC (≥95%) | MTC without other clinical manifestations of MEN 2a or 2b |
| 3. 2b | Thyroid<br>MTC | MTC: most common component, more aggressive and earlier onset than MEN 2a<br>HTN, palpitations, headache, sweating |
| | Adrenal medulla<br>Pheochromocytoma (≥50%) | Chronic constipation; megacolon |
| | Neurons<br>Mucosal neuroma, intestinal ganglioneuromas (100%) | Marfanoid habitus (no aortic abnormalities) |
| | MSK | |

### Investigations

- MEN 1
  - laboratory
    - offer genetic testing to patients with a clinical diagnosis of MEN 1
      - if a mutation is identified, screen family members who are at risk
    - gastrinoma: elevated serum gastrin level (>200 ng/mL) after IV injection of secretin
    - insulinoma: hypoglycemia with insulin and C-peptide levels that are inappropriately high for the level of glucose
    - glucagonoma: elevated glucagon levels
    - pituitary tumours: assess GH, IGF-1, and prolactin levels (for over-production), TSH, free $T_4$, 8 AM cortisol, LH, FSH, bioavailable testosterone or estradiol (for underproduction due to mass effect of tumour)
    - hyperparathyroidism: serum $Ca^{2+}$ and albumin, PTH levels; bone density scan (DEXA)
  - imaging
    - MRI for pituitary tumours, CT or MRI for gastrinoma, CT, MRI, or endoscopic ultrasound for insulinoma

- MEN 2
  - laboratory
    - genetic screening for RET mutations in all index patients
      - if a mutation is identified, screen family members who are at risk
    - calcitonin levels (MTC); urine catecholamines and metanephrines (pheochromocytoma); serum $Ca^{2+}$, and PTH levels (hyperparathyroidism)
    - pentagastrin ± calcium stimulation test if calcitonin level is within reference range
    - FNA for thyroid nodules cytology
  - imaging
    - CT or MRI of adrenal glands to localize pheochromocytoma
    - Metastatic disease generally picked up with cross-sectional imaging

### Treatment

- MEN 1
  - medical
    - proton pump inhibitor (PPI) for acid hypersecretion in gastrinoma
    - cabergoline or other dopamine agonists to suppress prolactin secretion
    - somatostatin analogue for control of symptoms of some of the GI neuroendocrine tumours such as glucagonoma
  - surgery for hyperparathyroidism, insulinoma, glucagonoma, functioning pituitary tumours (except for prolactinomas where dopamine agonists are used, or nonfunctioning pituitary tumours associated with mass effect)
    - trans-sphenoidal approach is generally preferred for pituitary tumours
- MEN 2
  - surgery for MEN 2a associated manifestations may require pre-operative medical therapy
  - prostaglandin inhibitors to alleviate diarrhea associated with thyroid cancer
  - α-blocker for at least 10-21 d for pheochromocytoma pre-operatively
    - hydration, IV bisphosphonates or denosumab for severe hypercalcemia

# Calcium Homeostasis

- normal total serum $Ca^{2+}$: 2.2-2.6 mmol/L
- ionic/free $Ca^{2+}$ levels: 1.15-1.31 mmol/L
- serum $Ca^{2+}$ is 40% protein bound (mostly albumin), 50% ionized, and 10% complexed with $PO_4^{3-}$ and citrate
- regulated mainly by two factors: parathyroid hormone (PTH) and vitamin D, whose actions are on three main organs: GI tract, bone, and kidney

**Primary Hyperparathyroidism**
Increased PTH secretion commonly due to parathyroid adenoma, lithium therapy; less often due to parathyroid carcinoma or parathyroid hyperplasia

**Secondary Hyperparathyroidism**
Partial resistance to PTH action leads to parathyroid gland hyperplasia and increased PTH secretion, often in patients with renal failure and osteomalacia (due to low or low normal serum calcium levels)

**Tertiary Hyperparathyroidism**
Irreversible clonal outgrowth of parathyroid glands, usually in long-standing inadequately treated chronic renal failure on dialysis

**Table 28. Major Regulators in Calcium Homeostasis**

| Major Regulators | Source | Regulation | Net Effect |
|---|---|---|---|
| **PTH** | Parathyroid glands | Stimulated by low serum $Ca^{2+}$ and high serum $PO_4^{3-}$<br>Inhibited by high serum $Ca^{2+}$, high calcitriol, FGF23, and chronic low serum $Mg^{2}$ | ↑ $Ca^{2+}$<br>↑ Cacitriol<br>↓ $PO_4^{3-}$ |
| **Calcitriol ($1,25-(OH)_2D_3$)** | Dietary intake of cholecalciferol (D3) or ergocalciferol (D2)<br>OR<br>Synthesized from cholesterol: UV light on skin makes cholecalciferol (D3). Liver then coverts it to calcidiol ($25-(OH)D_3$) and kidneys convert it to calcitriol | Stimulated by:<br>Low serum $PO_4^{3}$<br>High PTH<br><br>Inhibited by:<br>High serum $PO_4^{3}$<br>Low PTH<br>Calcitriol (negative feedback)<br>FGF23 | ↑ $Ca^{2+}$<br>↑ $PO_4^{3-}$ |
| **Calcitonin** | Thyroid C cells | Stimulated by:<br>Pentagastrin (GI hormone) and high serum $Ca^{2+}$; inhibited by low serum $Ca^{2+}$ | ↓ $Ca^{2+}$ (in pharmacologic doses)<br>↓ $PO_4^{3-}$ |
| **$Mg^{2+}$** | Major intracellular divalent cation | See Nephrology, Serum Magnesium, NP15 | Cofactor for PTH secretion |
| **$PO_4^{3-}$** | Intracellular anion found in all tissues | See Nephrology, Serum Phosphate, NP14 | ↓ $Ca^{2+}$ |

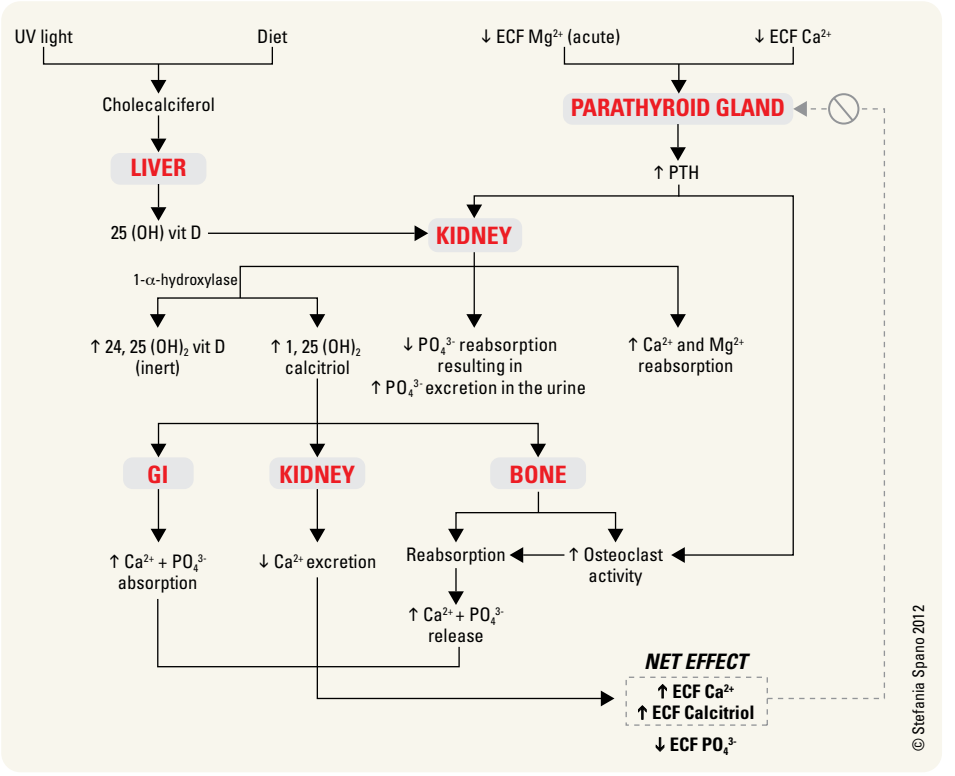

**Figure 16. Parathyroid hormone (PTH) regulation**

**Primary Hyperparathyroidism** is the most common cause of hypercalcemia in healthy outpatients. Most commonly related to a solitary adenoma or less commonly multiple gland hyperplasia. Surgical excision acts as definitive treatment and is recommended for patients who are symptomatic. For mild asymptomatic disease, medical surveillance may be appropriate with annual serum calcium, creatinine, and bone mineral density (BMD)

**For asymptomatic patients, surgery is recommended for those who meet ≥1 of the following criteria:**

- Serum calcium concentration more than 0.25 mmol/L (1.0 mg/dL) above the upper limit of normal
- Creatinine clearance <60 mL/min
- BMD T-score <-2.5 at hip, spine, or distal radius, and/or previous fragility fracture
- Age <50 yr

**Total $Ca^{2+}$ does not reflect ionized $Ca^{2+}$ in the following circumstances:**

- abnormal albumin levels
- critical illness
- chronic hepatic failure/renal failure

In circumstances where the albumin is low, you should perform an ionized calcium assessment.

If ionized calcium is not available, total calcium can be corrected for albumin using this approximation:
Corrected $Ca^{2+}$ (mmol/L) = measured $Ca^{2+}$ + 0.02 (40 – albumin)

- for every decrease in albumin by 10, increase in $Ca^{2+}$ by 0.2

# Hypercalcemia

## Definition

- total corrected serum $Ca^{2+}$ >2.6 mmol/L OR ionized $Ca^{2+}$ >1.35 mmol/L

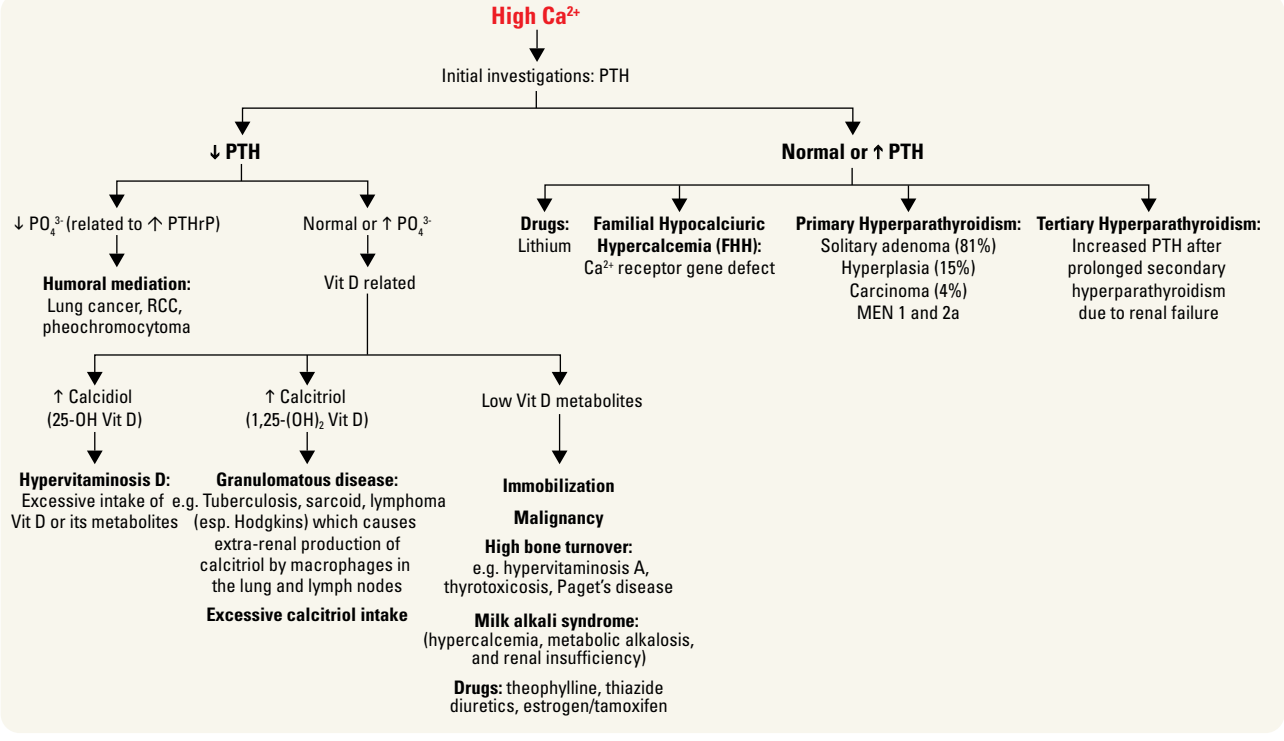

**Figure 17. Differential diagnosis of hypercalcemia**

## Approach to Hypercalcemia

1. Is the patient hypercalcemic?
2. Is the PTH high/normal or low?
3. If PTH is low, is phosphate high/normal or low?
4. If phosphate is high/normal, is the level of vitamin D metabolites high or low?

## Clinical Features

- symptoms depend on the absolute $Ca^{2+}$ value and the rate of its rise (may be asymptomatic)

### Table 29. Symptoms of Hypercalcemia

| Cardiovascular | GI | Renal | Rheumatological | MSK | Psychiatric | Neurologic |
|---|---|---|---|---|---|---|
| HTN<br>Arrhythmia<br>Short QT<br>Deposition of $Ca^{2+}$ on valves, coronary arteries, myocardial fibres | Constipation<br>Anorexia<br>Nausea<br>Vomiting **(groans)**<br>PUD<br>pancreatitis | Polyuria (Nephrogenic DI)<br>Polydipsia<br>**Nephrolithiasis (stones)**<br>Renal failure (irreversible)<br>Dehydration | Gout<br>Pseudogout<br>Chondrocalcinosis | Weakness<br>Bone pain **(bones)** | >3 mmol/L (12 mg/dL)<br>Increased alertness<br>Anxiety<br>Depression<br>Cognitive dysfunction<br>Organic brain syndromes<br>>4 mmol/L (16 mg/dL)<br>**Psychosis (moans)** | Hypotonia<br>Hyporeflexia<br>Myopathy<br>Paresis |

** **Hypercalcemic crisis (usually >4 mmol/L or 16 mg/dL):** primary symptoms include oliguria/anuria and mental status changes including somnolence and eventually coma → this is a medical emergency and should be treated immediately!

## Treatment

- treatment depends on the $Ca^{2+}$ level and the symptoms
- treat the underlying cause of the hypercalcemia
- treat acute, symptomatic hypercalcemia aggressively
- mild asymptomatic hypercalcemia: monitor, avoid: thiazide, volume depletion, high $Ca^{2+}$ diet, lithium, bed rest

### Table 30. Treatment of Acute Hypercalcemia/Hypercalcemic Crisis

| | |
|---|---|
| **Increase Urinary $Ca^{2+}$ Excretion** | FLUID, FLUID, FLUID!<br>Isotonic saline (4-5 L) over 24 h ± loop diuretic (e.g. furosemide) but only if hypervolemic (urine output >200mL/h)<br>Calcitonin:<br>4 IU/kg IM/SC q12h<br>8 IU/kg IM/SC q6h<br>Only works for 48 h, can develop tachyphylaxis<br>Rapid onset within 4-6 h<br>Before prescribing Calcitonin, remember to ask about fish allergies |
| **Diminish Bone Resorption** | Bisphosphonates (treatment of choice)<br>Inhibits osteoclastic bone resorption, preventing calcium release from bone<br>Effects on calcium levels are typically seen at 24-48 h after administration<br>Calcitonin often given in conjunction with bisphosphonate, given rapid onset of effect<br>Indicated in malignancy-related hypercalcemia (IV pamidronate or zoledronic acid used) |
| **Decrease GI $Ca^{2+}$ Absorption** | Corticosteroids can be used in hypercalcemia mediated by 1,25 Vitamin D. Corticosteroids are potent inhibitors of 1a-hydroxylase and therefore, decrease calcitriol production by activated mononuclear cells (e.g. in lymphoma, granuloma)<br>Effects will be seen in 2-5 d |
| **Dialysis** | Treatment of last resort<br>Indication: severe malignancy-associated hypercalcemia and renal insufficiency or heart failure |

# Hypocalcemia

## Definition

- total corrected serum $Ca^{2+}$ <2.2 mmol/L

### Table 31. Clinical Features of Hypocalcemia

| Acute Hypocalcemia | Chronic Hypocalcemia |
|---|---|
| Paresthesia<br>Laryngospasm (with stridor)<br>Hyperreflexia<br>Tetany<br>Chvostek's sign (tap CN VII)<br>Trousseau's sign (carpal spasm)<br>ECG changes<br>Delirium<br>Psychiatric Sx: emotional instability, anxiety, and depression<br><br>Note: Tetany is a hallmark of hypocalcemia – can be mild or severe<br><br>Mild: perioral numbness, paresthesia of hands and feet, muscle spasm<br>Severe: carpopaedal spasm, laryngospasm, focal/generalized seizures | CNS: lethargy, seizures, psychosis, basal ganglia calcification, Parkinson's, dystonia, hemiballismus, papilledema, pseudotumour cerebri<br>CVS: prolonged QT interval → Torsades de pointes (ventricular tachycardia)<br>GI: steatorrhea<br>ENDO: impaired insulin release<br>SKIN: dry, scaling, alopecia, brittle and transversely fissured nails, candidiasis, abnormal dentition<br>OCULAR: cataracts<br>MSK: generalized muscle weakness and wasting |

The symptoms and signs of hypercalcemia include:
**"Bones, stones, groans, and psychiatric overtones"**

The most common cause of **hypercalcemia in hospital** is **malignancy-associated hypercalcemia**
- Usually occurs in the later stages of disease
- Most commonly seen in lung, renal, breast, ovarian, and squamous tumours, as well as lymphoma and multiple myeloma

Mechanisms:
- Secretion of parathyroid hormone-related protein (PTHrP) which mimics PTH action by preventing renal calcium excretion and activating osteoclast-induced bone resorption
- Cytokines in multiple myeloma
- Calcitriol production by lymphoma
- Osteolytic bone metastases direct effect
- Excess PTH in parathyroid cancer

Before prescribing Calcitonin, remember to ask about fish allergies

**Differential Diagnosis of Hypercalcemia**
- Primary hyperparathyroidism
- Malignancy: hematologic, humoral, skeletal metastases (>90% from 1 or 2)
- Renal disease: tertiary hyperparathyroidism
- Drugs: calcium carbonate, milk alkali syndrome, thiazide, lithium, theophylline, vitamin A/D intoxication
- Familial hypocalciuric hypercalcemia
- Granulomatous disease: sarcoidosis, tuberculosis, Hodgkin's lymphoma
- Thyroid disease: thyrotoxicosis
- Adrenal disease: adrenal insufficiency, pheochromocytoma
- Immobilization

**Signs and Symptoms of Acute Hypocalcemia**
- **Paresthesias**: perioral, hands, and feet
- **Chvostek's sign**: percussion of the facial nerve just anterior to the external auditory meatus elicits ipsilateral spasm of the orbicularis oculi or orbicularis oris muscles
- **Trousseau's sign**: inflation of a blood pressure cuff above systolic pressure for 3 min elicits carpal spasm and paresthesia

Hypomagnesmia can impair PTH secretion and action

**Watch Out for:**
- Volume depletion via diuresis
- Arrhythmias

## Approach to Hypocalcemia

1. Is the patient hypocalcemic?
2. Is the PTH high or low?
3. If PTH is high, is phosphate low or normal?
4. Is the $Mg^{2+}$ level low?

## Approach to Treatment

- correct underlying disorder
- treat concurrent hypomagnesemia
- mild and symptomatic (ionized $Ca^{2+}$ >0.8 mmol/L)
  - calcium supplementation - 1500-2000 mg of elemental calcium/d
  - calcitriol 0.25 µg/d (especially in renal failure or hypoparathyroidism)
- note: this dose is typically higher in hypoparathyroidism
- acute or symptomatic hypocalcemia (ionized $Ca^{2+}$ <0.7 mmol/L)
  - immediate treatment required
  - IV calcium gluconate 1-2 g over 10-20 min followed by slow infusion
  - if underlying cause is hypoparathyroidism, the goal is to raise $Ca^{2+}$ to low normal range (2.0-2.1 mmol/L) to prevent symptoms but allow maximum stimulation of PTH secretion
- if PTH recovery not expected, requires long-term therapy with calcitriol and calcium
- start oral calcium and calcitriol concurrently with IV calcium infusion
- do not correct hypocalcemia if asymptomatic and suspected to be transient

**Acute Management of Hypercalcemia/ Hypercalcemic Crisis**

- Volume expansion (e.g. NS IV 300-500 cc/h): initial therapy
- Calcitonin: transient, partial response
- Bisphosphonate: treatment of choice, adjust dose if CrCl <30 ml/min
- Corticosteroid: most useful in vitamin D toxicity, granulomatous disease, some malignancies
- Saline diuresis + loop diuretic (for volume overload): temporary measure

**Differential Diagnosis of Tetany**

- Hypocalcemia
- Metabolic alkalosis (with hyperventilation)
- Hypokalemia
- Hypomagnesemia

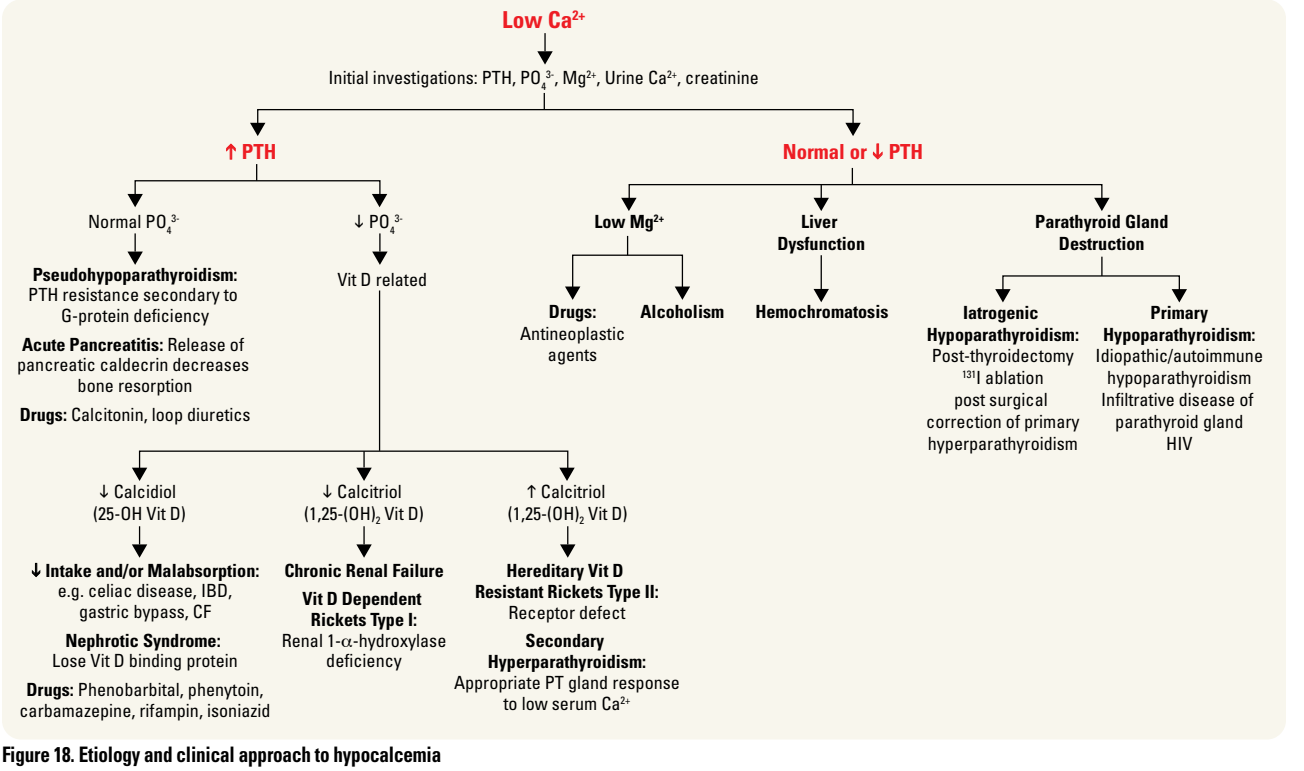

**Figure 18. Etiology and clinical approach to hypocalcemia**

Transient hypoparathyroidism (resulting in hypocalcemia) common after subtotal thyroidectomy (permanent in <3% of surgeries)

# Metabolic Bone Disease

- see 2010 Clinical Practice Guidelines for the Diagnosis and Management of Osteoporosis for details

## Osteoporosis

### Definition

- a condition characterized by decreased bone mass and microarchitectural deterioration with a consequent increase in bone fragility and susceptibility to fracture
- BMD is measured at hip and lumbar spine, BMD T-score ≤-2.5 is indicative of osteoporosis
- osteopenia (low bone mass): BMD with T-score between –1.0 and –2.5

### ETIOLOGY AND PATHOPHYSIOLOGY

### Secondary Osteoporosis

- gastrointestinal diseases
  - gastrectomy
  - malabsorption (e.g. celiac disease)
  - chronic liver disease
- bone marrow disorders
  - multiple myeloma
  - lymphoma
  - leukemia
- endocrinopathies
  - Cushing's syndrome
  - hyperparathyroidism
  - hyperthyroidism
  - premature menopause
  - DM
  - hypogonadism
- malignancy
  - secondary to chemotherapy
  - myeloma
- drugs
  - corticosteroid therapy
  - phenytoin
  - chronic heparin therapy
  - androgen deprivation therapy
  - aromatase inhibitors
  - rheumatologic disorders
    - rheumatoid arthritis
    - SLE
    - ankylosing spondylitis
  - renal disease
  - poor nutrition
  - immobilization
- COPD (due to disease, tobacco, and glucocorticoid use)

### Clinical Features

- commonly asymptomatic
- height loss due to collapsed vertebrae
- fractures: most commonly in hip, vertebrae, humerus, and wrist
  - fragility fractures: fracture with fall from standing height or less
  - Dowager's hump: collapse fracture of vertebral bodies in mid-dorsal region
  - x-ray: vertebral compression fractures (described as wedge fractures, require a minimum of 20% height loss), "codfishing" sign (weakening of subchondral plates and expansion of intervertebral discs)
- pain, especially backache, associated with fractures

### Approach to Osteoporosis

1. assess risk factors for osteoporosis on history and physical
2. decide if patient requires BMD testing with dual-energy x-ray absorptiometry (DEXA): men and women ≥65 yr (or younger if presence of risk factors, see Table 33, E44)
3. initial investigations
   - all patients with osteoporosis: calcium corrected for albumin, CBC, creatinine, ALP, TSH
   - also consider serum and urine protein electrophoresis if vertebral fractures, celiac workup, and 24 h urinary $Ca^{2+}$ excretion to rule out additional secondary causes
   - 25-OH-Vitamin D level should only be measured after 3-4 mo of adequate supplementation and should not be repeated if an optimal level ≥75 nmol/L is achieved
   - lateral thoracic and lumbar x-ray if clinical evidence of vertebral fracture (or in individuals at moderate risk of fracture to help decide if they require medical therapy)
4. assess 10-yr fracture risk by combining BMD result and risk factors
   1) WHO Fracture Risk Assessment Tool (FRAX)
   2) Canadian Association of Radiologists and Osteoporosis Canada Risk Assessment Tool (CAROC)
      - approach to management guided by 10-yr risk stratification into low, medium, high risk
5. for all patients being assessed for osteoporosis, encourage appropriate lifestyle changes (see Table 34, E44)

**Corticosteroid Therapy is a Common Cause of Secondary Osteoporosis**
Individuals receiving ≥7.5 mg of prednisone daily for over 3 mo should be assessed for bone-sparing therapy
Mechanism: increased resorption + decreased formation + increased urinary calcium loss + decreased intestinal calcium absorption + decreased sex steroid production

**Calcium Plus Vitamin D Supplementation and Risk of Fractures. Osteoporosis**
Int 2015;27:367-376
**Purpose**: To review trials of Vitamin D and Calcium therapy for reducing fracture risk in osteoporosis.
**Study**: Systematic review searching 2011-2015, inclusive, identified 8 RCTs totalling 30,970 participants. RCTs reviewed included healthy adults and ambulatory older adults with medical conditions (excluding cancer). Vitamin D and Calcium combination therapy was compared to placebo.
**Results**: Analysis of RCT data revealed that calcium plus vitamin D supplementation produced a statistically significant reduction in risk of total fractures (0.85; CI:0.73-0.98) and in hip fractures (0.70; CI:0.56-0.87). Subgroup analysis was significant for community dwelling or institutionalized patients.
**Conclusions**: Systematic analysis suggests that Vitamin D and calcium therapy significantly decreases fracture risk. This study did not specifically look at individuals with osteoporosis. However, it still supports that Vitamin D and calcium should continue to be used as preventative treatment for individuals at increased risk of fractures.

**Clinical Signs of Fractures or Osteoporosis**
- Height loss >3 cm (Sn 92%)
- Weight <51 kg
- Kyphosis (Sp 92%)
- Tooth count <20 (Sp 92%)
- Grip strength
- Armspan-height difference >5 cm (Sp 76%)
- Wall-occiput distance >0 cm (Sp 87%)
- Rib-pelvis distance ≤2 finger breadth (Sn 88%)

### Table 32. Indications for BMD Testing

| Older Adults (age ≥50 yr) | Younger Adults (age <50 yr) |
|---|---|
| All women and men age ≥65 yr<br>Menopausal women, and men aged 50-64 yr with clinical risk factors for fracture:<br>Fragility fracture after age 40<br>Prolonged glucocorticoid use<br>Other high-risk medication use (aromatase inhibitors, androgen deprivation therapy)<br>Parental hip fracture<br>Vertebral fracture or osteopenia identified on x-ray<br>Current smoking<br>High alcohol intake<br>Low body weight (<60 kg) or major weight loss (>10% of weight at age 25 yr)<br>Rheumatoid arthritis<br>Other disorders strongly associated with osteoporosis: primary hyperparathyroidism, T1DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. inflammatory bowel disease) | Fragility fracture<br>Prolonged use of glucocorticoids<br>Use of other high-risk medications (aromatase inhibitors, androgen deprivation therapy, anticonvulsants)<br>Hypogonadism or premature menopause<br>Malabsorption syndrome<br>Primary hyperparathyroidism<br>Other disorders strongly associated with rapid bone loss and/or fracture |

### Table 33. Osteoporosis Risk Stratification

| | |
|---|---|
| **Low Risk** | |
| 10 yr fracture risk <10% | Unlikely to benefit from pharmacotherapy; encourage lifestyle changes<br>Reassess risk in 5 yr |
| **Medium Risk** | |
| 10 yr fracture risk 10-20% | Discuss patient preference for management and consider additional risk factors<br>Factors that warrant consideration for pharmacological therapy:<br>Additional vertebral fracture(s) identified on vertebral fracture assessment (VFA) or lateral spine x-ray<br>Previous wrist fracture in individuals ≥65 or with T-score ≤–2.5<br>Lumbar spine T-score much lower than femoral neck T-score<br>Rapid bone loss<br>Men receiving androgen-deprivation therapy for prostate cancer<br>Women receiving aromatase-inhibitor therapy for breast cancer<br>Long-term or repeated systemic glucocorticoid use (oral or parenteral) that does not meet the conventional criteria for recent prolonged systemic glucocorticoid use<br>Recurrent falls (defined as falling 2 or more times in the past 12 mo)<br>Other disorders strongly associated with osteoporosis<br><br>Repeat BMD and reassess risk every 1-3 yr initially |
| **High Risk** | |
| 10 yr fracture risk >20%; OR<br>Prior fragility fracture of hip or spine; OR<br>More than one fragility fracture | Start pharmacotherapy |

**Aledronate (10 mg/d)**

| | |
|---|---|
| 1° Prevention – Vertebral (Gold) | 45% RRR, 2% ARR |
| 1° Prevention – Hip | Not significant |
| 1° Prevention – Wrist | Not significant |
| 2° Prevention – Vertebral (Gold) | 45% RRR, 6% ARR |
| 2° Prevention – Hip (Gold) | 53% RRR, 1% ARR |
| 2° Prevention – Wrist (Gold) | 50% RRR, 2% ARR |

**Etidronate (400 mg/d)**

| | |
|---|---|
| 1° Prevention – Vertebral | Not significant |
| 1° Prevention – Hip | Not significant |
| 1° Prevention – Wrist | Not significant |
| 2° Prevention – Vertebral (Silver) | 47% RRR, 5% ARR |
| 2° Prevention – Hip | No benefit |
| 2° Prevention – Wrist | No benefit |

**Risedronate (5 mg/d)**

| | |
|---|---|
| 1° Prevention – Vertebral | Not significant |
| 1° Prevention – Hip | Not significant |
| 1° Prevention – Wrist | Not significant |
| 2° Prevention – Vertebral (Gold) | 39% RRR, 5% ARR |
| 2° Prevention – Hip (Silver) | 26% RRR, 1% ARR |
| 2° Prevention – Wrist | Not significant |

## Treatment of Osteoporosis

### Table 34. Treatment of Osteoporosis in Women and Men

| | |
|---|---|
| **Treatment for Both Men and Women** | |
| **Lifestyle** | Diet: Elemental calcium 1000-1200 mg/d; Vit D 1000 IU/d<br>Exercise: 3x30 min weight-bearing exercises, balance exercise, and aerobic exercise/wk<br>Cessation of smoking, reduce caffeine intake<br>Stop/avoid osteoporosis-inducing medications |
| **Drug Therapy** | |
| **Bisphosphonate**: inhibitors of osteoclast binding | 1st line in prevention of hip, nonvertebral, and vertebral # (Grade A): alendronate (PO), risedronate (PO), zoledronic acid (IV) |
| **RANKL Inhibitors** | Denosumab: 1st line in prevention of hip, nonvertebral, vertebral # (Grade A)<br>*Denosumab should not be abruptly stopped/administration delayed. Increased risk of vertebral fractures due to increased bone turnover on discontinuation |
| **Parathyroid Hormone (teriparatide)** | 18-24 mo duration, followed by long-term anti-resorptive therapy with bisphosphonate or RANKL inhibitor, followed by long-term anti-resorptive therapy with bisphosphonate or RANKL inhibitor |
| **Treatment Specific to Post-Menopausal Women** | |
| **SERM (selective estrogen-receptor modulator):** agonistic effect on bone but antagonistic effect on uterus and breast | Raloxifene: 1st line in prevention of vertebral # (Grade A)<br>+ve: prevents osteoporotic # (Grade A to B evidence), improves lipid profile, decreased breast cancer risk<br>-ve: increased risk of DVT/PE, stroke mortality, hot flashes, leg cramps |
| HRT: combined estrogen + progesterone (see Gynecology, GY34) | 1st line in prevention of hip, nonvertebral, and vertebral # (Grade A)<br>For most women, risks > benefits<br>Combined estrogen/progestin prevents hip, vertebral, total #<br>Increased risks of breast cancer, cardiovascular events, and DVT/PE |

**Factors Necessary for Mineralization**

- Quantitatively and qualitatively normal osteoid formation
- Normal concentration of calcium and phosphate in ECF
- Adequate bioactivity of ALP
- Normal pH at site of calcification
- Absence of inhibitors of calcification

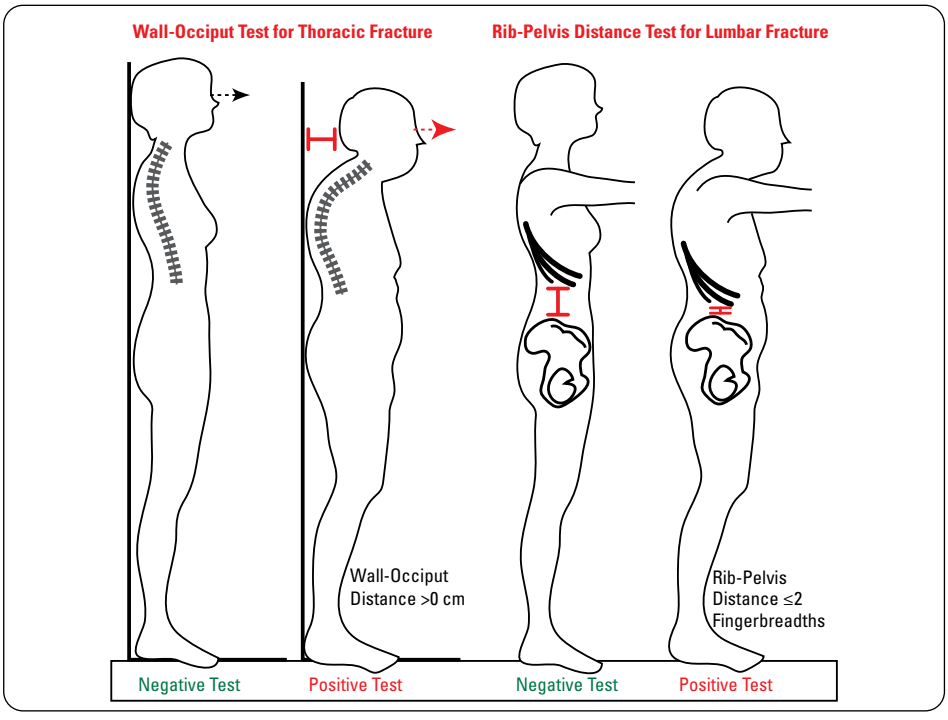

**Figure 19. Physical examination test**

# Osteomalacia and Rickets

- osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue prior to epiphyseal closure: rickets (in childhood), osteomalacia (in adulthood)

## Etiology and Pathophysiology

### Vitamin D Deficiency

- deficient uptake or absorption
  - nutritional deficiency
  - malabsorption: post-gastrectomy, small bowel disease (e.g. Celiac sprue), pancreatic insufficiency
- defective 25-hydroxylation
  - liver disease
  - anticonvulsant therapy (phenytoin, carbamazepine, phenobarbital)
- loss of vitamin D binding protein
  - nephrotic syndrome
- defective 1-α-25 hydroxylation
  - hypoparathyroidism
- renal failure
- pathophysiology: leads to secondary hyperparathyroidism and hypophosphatemia

### Mineralization Defect

- abnormal matrix
  - osteogenesis imperfecta
- enzyme deficiency
  - hypophosphatasia (inadequate ALP bioactivity)
- presence of calcification inhibitors
  - aluminum, high dose fluoride, anticonvulsants

**Table 35. Clinical Features of Rickets and Osteomalacia**

| Rickets | Osteomalacia |
|---|---|
| Skeletal pain and deformities, bow legged | Not as dramatic |
| Fracture susceptibility | Diffuse skeletal pain |
| Weakness and hypotonia | Bone tenderness |
| Disturbed growth | Fractures |
| Ricketic rosary (prominent costochondral junctions) | Gait disturbances (waddling) |
| Harrison's groove (indentation of lower ribs) | Proximal muscle weakness |
| Hypocalcemia | Hypotonia |

### Investigations

**Table 36. Laboratory Findings in Osteomalacia and Rickets**

| Disorder | Serum Phosphate | Serum Calcium | Serum ALP | Other Features |
|---|---|---|---|---|
| **Vitamin D deficiency** | Decreased | Decreased to normal | Increased | Decreased calcitriol |
| **Hypophosphatemia** | Decreased | Normal | Decreased to normal | |
| **Proximal RTA** | Decreased | Normal | Normal | Associated with hyperchloremic metabolic acidosis |
| **Conditions associated with abnormal matrix formation** | Normal | Normal | Normal | |

- radiologic findings
  - pseudofractures, fissures, narrow radiolucent lines – thought to be healed stress fractures or the result of erosion by arterial pulsation
  - loss of distinctness of vertebral body trabeculae; concavity of the vertebral bodies
  - changes due to secondary hyperparathyroidism: subperiosteal resorption of the phalanges, bone cysts, resorption of the distal ends of long bones
  - others: bowing of tibia, coxa profundus hip deformity
- bone biopsy: usually not necessary but considered the gold standard for diagnosis

### Treatment
- definitive treatment depends on the underlying cause
- vitamin D supplementation
- $PO_4^{3-}$ supplements if low serum $PO_4^{3-}$, $Ca^{2+}$ supplements for isolated calcium deficiency
- bicarbonate if chronic metabolic acidosis

**KDIGO 2017 Clinical Practice Guideline for the Evaluation and Management of Chronic Kidney Disease**
Kidney Inter Suppl 2017;7(1):1-60

**Recommendations for Metabolic Bone Disease in CKD**

**Screening**
- In CKD patients with evidence of CKD-MBD and/or risk factors for osteoporosis, perform BMD testing to assess fracture risk if results will impact treatment decisions
- In patients with CKD-BMD, it is reasonable to perform a bone biopsy if knowledge of the type of renal osteodystrophy will impact treatment decisions

**Management**
- Treatment of CKD-MBD should be based on serial assessments of $PO_4^{3-}$, $Ca^{2+}$ and PTH levels, considered together
- Suggest lowering elevated $PO_4^{3-}$ levels towards the normal range
- Avoid hyperglycemia in adult patients and maintain serum $Ca^{+}$ in age-appropriate normal range in children

## Renal Osteodystrophy

- changes to mineral metabolism and bone structure secondary to chronic kidney disease
- represents a mixture of four types of bone disease:
  - osteomalacia: low bone turnover combined with increased unmineralized bone (osteoid)
  - adynamic bone disease: low bone turnover due to excessive suppression of parathyroid gland
  - osteitis fibrosa cystica: increased bone turnover due to secondary hyperparathyroidism
  - mixed uremic osteodystrophy: both high and low bone turnover, characterized by marrow fibrosis and increased osteoids
- metastatic calcification secondary to hyperphosphatemia may occur

### Pathophysiology
- metabolic bone disease secondary to chronic renal failure
- combination of hyperphosphatemia (inhibits 1,25(OH)2-Vit D synthesis) and loss of renal mass (reduced 1-α-hydroxylase)

### Clinical Features
- soft tissue calcifications, necrotic skin lesions if vessels involved
- osteodystrophy, generalized bone pain and fractures
- pruritus
- neuromuscular irritability and tetany may occur (with low serum calcium)
- radiologic features of osteitis fibrosa cystica, osteomalacia, osteosclerosis, osteoporosis

### Investigations
- serum $Ca^{2+}$ corrected for albumin, $PO_4^{3-}$, PTH, ALP, ± imaging (x-ray, BMD), ± bone biopsy

### Treatment
- prevention
- maintenance of normal serum $Ca^{2+}$ and $PO_4^{3-}$ by restricting $PO_4^{3-}$ intake to 1 g OD
- $Ca^{2+}$ supplements; $PO_4^{3-}$ binding agents (calcium carbonate, aluminum hydroxide)
- vitamin D with close monitoring to avoid hypercalcemia and metastatic calcification

## Paget's Disease of Bone

### Definition
- a metabolic disease characterized by excessive bone destruction and repair

### Epidemiology
- 3% of the population, 10% of population >80 yr old
- consider Paget's disease of bone in older adults with ↑ ALP but normal GGT

### Etiology and Pathophysiology
- postulated to be related to a slowly progressing viral infection of osteoclasts, possibly paramyxovirus
- strong familial incidence
- initiated by increased osteoclastic activity leading to increased bone resorption; osteoblastic activity increases in response to produce new bone that is structurally abnormal and fragile

### Differential Diagnosis
- osteogenic sarcoma
- multiple myeloma
- fibrous dysplasia
- osteitis fibrosa cystica
- metastases

### Clinical Features
- usually asymptomatic (routine x-ray finding or elevated serum ALP)
- 3 characteristic findings: osteolytic lesions, cortical thickening, pseudofractures (small fissures which develop in the convex surface of long bone)
- most commonly affects: skull, thoracolumbar spine, pelvis, and long bones of lower extremities
- severe bone pain (e.g. pelvis, femur, tibia)
- skeletal deformities: bowed tibias, kyphosis, frequent fractures
- increased risk of osteosarcoma and giant cell tumours

### Investigations
- laboratory
  - high serum ALP, normal or high $Ca^{2+}$, normal $PO_4^{3-}$
  - elevated c-telopeptide (CTX) (bone resorption marker, breakdown product of collagen in the blood)
- imaging
  - confirmation on x-ray required for diagnosis
    - denser bone with cortical thickening
    - characteristic findings: osteolytic lesions, cortical thickening & pseudofractures
    - Paget disease-related signs include: Tam o'Shanter sign (appearance of advanced Paget disease of the skull – overall enlargement of cranium, skull falling over the facial bones), blade of grass sign (lucent leading edge in a long bone seen in lytic phase of Paget's), osteoporosis circumscripta (radiolucent regions of the skull), jigsaw pattern bone or mosaic pattern bone (thickened, disorganized trabeculae lead to areas of sclerosis), picture frame vertebra (cortex of vertebral body is thickened), cotton wool appearance of bone (results from thickened, disorganized trabeculae that lead to areas of sclerosis), banana fracture (horizontal pathological fracture seen in bones deformed by Paget's), looser zones (wide, transverse lucencies traversing through a bone), ivory vertebra sign (diffuse and homogenous increase in opacity of a vertebral body)
    - Burned-out Paget's disease: when the disease has been there for a long time
  - bone scan to evaluate the extent of disease and identify asymptomatic sites

### Complications
- local
  - fractures; osteoarthritis
  - cranial nerve compression and palsies (e.g. deafness), spinal cord compression
  - osteosarcoma/sarcomatous change in 1-3%
    - indicated by marked bone pain, new lytic lesions and suddenly increased ALP
- systemic
  - hypercalcemia and nephrolithiasis
  - high output CHF due to increased vascularity

### Treatment
- goals: decrease pain, decrease rate of remodelling
- weight-bearing exercise
- adequate calcium and vitamin D intake to prevent development of secondary hyperparathyroidism
- treat medically if symptomatic or asymptomatic with ALP >3x normal or planned surgery
  - bisphosphonates, e.g. zoledronic acid 5 mg IV per yr (preferred) OR alendronate 40 mg PO OD x 6 mo OR risedronate 30 mg PO OD x 3 mo
  - calcitonin 50-100 U/d SC if unable to tolerate bisphosphonate
- surgery for fractures, deformity, degenerative changes

# Male Reproductive Endocrinology

## Androgen Regulation

- testosterone (from Leydig cells) primarily involved in negative feedback on LH and GnRH, whereas inhibin (from Sertoli cells) suppresses FSH secretion

## Tests of Testicular Function

- testicular size (lower limit = 4 cm x 2.5 cm in adult). Can use orchidometer to measure testicular volume (12-25 ml = adult size)
- LH, FSH, total, bioavailable, and/or free testosterone
- semen analysis
  - semen volume, sperm concentration, morphology, and motility are the most commonly used parameters
- testicular biopsy
  - indicated with normal FSH and azoospermia/oligospermia

## Hypogonadism and Infertility

- see Urology, U36
- deficiency in gametogenesis or testosterone production

### Etiology

- causes include primary (testicular failure), secondary (hypothalamic-pituitary failure), and idiopathic

### Diagnosis of Testosterone Deficiency Syndrome (i.e. adult onset primary hypogonadism)

- requires clinical manifestations of testosterone deficiency (see sidebar) AND documented testosterone levels below the laboratory reference range (confirmed on x2 separate analyses, test needs to be done at 8-9 AM when testosterone is usually at its peak)
- rule out secondary causes

**Table 37. Classification and Features of Hypogonadism**

| | Hypergonadotropic Hypogonadism (Primary Hypogonadism) | Hypogonadotropic Hypogonadism (Secondary Hypogonadism) |
|---|---|---|
| **Definition** | Primary testicular failure<br>↑ LH and FSH<br>↓ testosterone and sperm count | Hypothalamic-pituitary axis failure<br>↓ LH + FSH (LH sometimes inappropriately normal)<br>↓ testosterone and sperm count |
| **Etiology** | Congenital<br>Chromosomal defects (Klinefelter's, Noonan)<br>Cryptorchidism<br>Disorders of sexual development (DSD)<br>Bilateral anorchia (vanishing testicle syndrome)<br>Myotonic dystrophy<br>Mutation of FSH or LH receptor gene<br>Disorders of androgen synthesis<br>Germ cell defects<br>Sertoli cell only syndrome<br>Leydig cell aplasia/failure<br>Infection/Inflammation<br>Orchitis – tuberculosis, lymphoma, mumps, leprosy<br>Genital tract infection<br>Physical factors<br>Trauma, heat, irradiation, testicular torsion, varicocele<br>Drugs<br>Marijuana, alcohol, chemotherapy, ketoconazole, glucocorticoid, spironolactone | Congenital<br>Kallman's syndrome<br>Prader-Willi syndrome<br>Abnormal subunit of LH or FSH<br>Infection<br>Tuberculosis, meningitis<br>Endocrine<br>Adrenal androgen excess<br>Cushing's syndrome<br>Hypo or hyperthyroidism<br>Hypothalamic-pituitary disease (tumour, hyperprolactinemia, hypopituitarism)<br>Drugs<br>Alcohol, marijuana, spironolactone, ketoconazole, GnRH agonists, androgen/estrogen/progestin use, chronic narcotic use<br>Chronic illness<br>Cirrhosis, chronic renal failure, AIDS<br>Sarcoidosis, Langerhan's cell histiocytosis, hemochromatosis<br>Critical illness<br>Surgery, MI, head trauma<br>Obesity<br>Idiopathic |
| **Diagnosis** | **Testicular size and consistency (soft/firm)**<br>Sperm count<br>LH, FSH, total, and/or bioavailable testosterone<br>hCG stimulation (mainly used in pediatrics)<br>Karyotype | **Testicular size and consistency (soft/firm)**<br>Sperm count<br>LH, FSH, total, and/or bioavailable testosterone<br>Prolactin levels (and pituitary panel - T4/8AM cortisol)<br>Fe, Transferrin<br>MRI of hypothalamic-pituitary region |

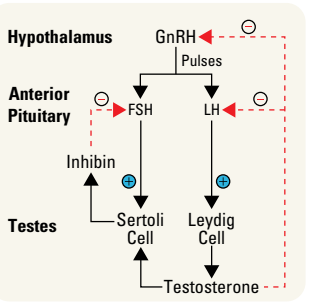

**Figure 20. Hypothalamo-pituitary-gonadal axis**

**Two Distinct Features of Primary Hypogonadism**

- The decrease in sperm count is affected to a greater extent than the decrease in serum testosterone level
- Likely to be associated with gynecomastia

**Two Features of Secondary Hypogonadism**

- Associated with an equivalent decrease in sperm count and serum testosterone
- Less likely to be associated with gynecomastia

### Treatment
- goal: testosterone replacement (improve libido, muscle mass, strength, body hair growth, bone mass)
  - IM injection, transdermal testosterone patch/gel, oral
  - side effects: acne, fluid retention, erythrocytosis, sleep apnea, benign prostatic hypertrophy, uncertain effects on cardiac events/mortality in older men
  - contraindicated in men with prostate or breast cancer, a palpable prostate nodule, PSA>4 ng/mL, elevated hematocrit, untreated severe OSA, severe LUTS, uncontrolled CHF, MI or stroke in last 6 mo, or thrombophilia
  - not suggested in men >65, in men with T2DM with low testosterone concentrations, or in men planning fertility in the near term
  - testosterone therapy only to treat symptoms of hypogonadism, often results in decreased spermatogenesis by further suppression of hypothalamic-pituitary-gonad axis
- goal: fertility
  - treat underlying cause
  - GnRH agonist if hypothalamic dysfunction with intact pituitary, administered SC in pulsatile fashion using an external pump
  - hCG ± recombinant follicular stimulating hormone (rFSH) in cases of either hypothalamic or pituitary lesions
  - dopamine agonist (e.g. bromocriptine, cabergoline) if prolactinoma
  - testicular sperm extraction (TESE) or microscopic sperm extraction (MICROTESE) – only if testicular tissues are not functioning

### Other Causes of Male Infertility
- hereditary disorders: Kartagener syndrome (primary ciliary dyskinesia), cystic fibrosis (absence of the vas deferens)
- anatomy: hypospadias, retrograde ejaculation
- obstruction: vasal occlusion, vasal aplasia, vasectomy, seminal vesicle disease
- sexual dysfunction: erectile dysfunction, premature ejaculation, infrequent coitus
- surgery: TURP, radical prostatectomy, orchiectomy

## DEFECTS IN ANDROGEN ACTION

### Etiology
- complete androgen insensitivity (CAIS)
- partial androgen insensitivity (PAIS)
- 5-α-reductase deficiency
- mixed gonadal dysgenesis
- defects in testosterone synthesis
- infertile male syndrome
- undervirilized fertile male syndrome

### Clinical Features
- depends on age of onset

**Table 38. Effects of Testosterone Deficiency**

| | |
|---|---|
| **First Trimester *in utero*** | Incomplete virilization of external genitalia (ambiguous genitalia)<br>Incomplete development of Wolffian ducts to form male internal genitalia (male pseudohermaphrodism) |
| **Third Trimester *in utero*** | Micropenis<br>Cryptorchidism (failure of normal testicular descent) |
| **Prepuberty** | Incomplete pubertal maturation (high pitch voice, sparse pubic + axillary hair, absence of facial hair)<br>Eunuchoidal body habitus (greater growth of extremity long bones relative to axial bones)<br>Poor muscle development, reduced peak bone mass |
| **Postpuberty** | Decrease in energy, mood, and libido<br>Fine wrinkles in corners of mouth and eyes<br>Decrease in pubic/axillary hair, hematocrit, muscle mass, strength, and BMD |

Adapted from: UpToDate, 2010; *Cecil's Essentials of Medicine*

### Treatment
- gender assignment in the newborn
- hormone replacement or supplementation
- psychological support
- gonadectomy for cryptorchidism (due to increased risk for testicular cancer)
- reduction mammoplasty for gynecomastia

# Erectile Dysfunction

- see Urology, U33

**Approach to Male Infertility**

**Infertility**: failure of a couple to conceive after 12 mo of regular intercourse without use of contraception in women <35 yr of age; after 6 mo of regular intercourse without use of contraception in women ≥35 yr

**History**
- Partner status re: infertility
- Length of time for attempt to conceive
- Prior successes with other partners
- Ejaculation problems
- Frequency of intercourse
- Prev Surg, Med Hx, STI Hx
- Hx orchitis? Cryptorchidism?
- Hx toxic exposure?
- Medications
- Alcohol and illicit drug use
- Heat exposure: bath, sauna, whirlpool
- Smoking

**P/E**
- General (height, weight, gynecomastia, masculine)
- Testicular size and consistency
- Varicocele?
- Pituitary disease?
- Thyroid disease?

**Investigations**

Should be considered for couples unable to conceive after 12 mo of unprotected and frequent intercourse. Consider earlier evaluation if suggestive medical Hx and physical, and in women ≥35 yr of age
- Semen analysis x 2 (sperm count, morphology, motility)
- Scrotal/testicular U/S (look for varicocele)
- Blood work: LH, FSH, testosterone, prolactin, thyroid function tests, DNA fragmentation of sperm, karyotype, Y chromosome deletion
- Test female partner (see Gynecology, GY22)

**Treatment**
- No specific therapy for majority of cases
- Treat specific causes
- Consider: intrauterine insemination, IVF, therapeutic donor insemination, testicular aspiration of sperm, adoption

**Pubertal Gyencomastia**
- This benign condition peaks between 13-14 years of age and spontaneously regresses in 90% of cases within 2 yr
- Waiting is often the best approach

**Causes of Gynecomastia**

**DOC TECH**
**D**rugs
**O**ther
**C**ongenital
**T**umour
**E**ndocrine
**CH**ronic disease

# Gynecomastia

## Definition
- true gynecomastia refers to benign proliferation of the glandular component of the male breast, resulting in the formation of a concentric, rubbery, firm mass extending from the nipple(s)
- pseudogynecomastia or lipomastia refers to enlargement of soft adipose tissue, especially seen in obese individuals

**Drugs Causing Gynecomastia: DISCKO**
**D**igoxin
**I-**Isoniazid
**S**pironolactone
**C**imetidine **K**etoconazole
**O**estrogen/anti-testosterone

## Etiology

### Physiologic
- puberty
- elderly
- neonatal (maternal hormone)

### Pathologic
- physiologic gynecomastia – trimodal distribution in neonatal, pubertal and older males
- drugs – spironolactone, cimetidine, ketoconazole, recombinant human GH, hCG, estrogens, antiandrogens, GnRH agonists, 5-alpha reductase inhibitors
- hormone therapy for prostate cancer
- starvation and refeeding
- male hypogonadism
- cirrhosis
- treatment of HIV infection – due to fat tissue as part of lipodystrophy
- herbal products – plant-derived oils as lavender and tea tree oil
- idiopathic
- testicular neoplasms
- CKD
- other rare causes: feminizing adrenal tumours, disorders of sex development, ectopic hCG, familial prepubertal gynecomastia
- hyperthyroidism

**Occurrence of Gynecomastia**

| 3 Peaks | % Affected |
|---|---|
| Infancy | 60-90 |
| Puberty | 4-69 |
| Ages 50-80 | 24-65 |

## Pathophysiology
- hormonal imbalance due to:
  - increased estrogen activity
    - increased production, or increased availability of estrogen precursors for peripheral conversion to estrogen
  - decreased androgen activity
    - decreased androgen production, binding of androgen to sex hormone binding globulin (SHBG), or androgen receptor blockage

## History
- recent change in breast characteristics
- pain
- trauma to testicles
- mumps
- alcohol and/or drug use
- FHx
- sexual dysfunction

## Physical Exam
- signs of feminization
- breast
  - rule out red flags suggesting breast cancer: unilateral, eccentric, hard or fixed mass, skin dimpling or retraction, and nipple discharge or crusting
  - gynecomastia occurs concentrically around nipple, is not fixed to underlying tissue
- genito-urinary exam
- stigmata of liver or thyroid disease

## Investigations
- laboratory: serum TSH, PRL, LH, FSH, testosterone, estradiol, LFTs, creatinine, hCG (if hCG is elevated, need to locate the primary tumour); however not all investigations are required for every case of gynecomastia
- CXR and CT of chest/abdomen/pelvis (to locate neoplasm)
- testicular U/S (if primary hypogonadism suspected or mass on physical examination)
- MRI of hypothalamic-pituitary region if secondary hypogonadism or pituitary adenoma suspected

## Treatment
- initial observation for most men with gynecomastia (after stopping offending medications and treating underlying cause)
- medical
  - correct the underlying disorder, discontinue responsible drug
  - androgens for hypogonadism
  - anti-estrogens: tamoxifen has most evidence for benefit
- surgical
  - longstanding (>12 mo, fibrotic), discomfort, or causing psychological distress

# Female Reproductive Endocrinology

- see Gynecology, GY22

# Paraneoplastic Syndrome

- clinical syndromes involving non-metastatic systemic effects that accompany malignant disease
- triggered by antibodies against neoplasm cross-reacting with normal tissue or by production of a physiologically active substance by the neoplasm
- commonly present with cancers of lung, breast, ovaries, or lymphatic system

**Table 39. Clinical Feature**

| Syndrome Class | Symptoms/Syndrome | Associated Malignancies | Mechanism |
|---|---|---|---|
| **Endocrine** | Cushing's syndrome | Small-cell lung cancer<br>Pancreatic carcinoma<br>Neural tumours<br>Thymoma | Ectopic ACTH and ACTH-mimicking substance secretion |
| | SIADH | Small-cell lung cancer<br>CNS malignancies | Antidiuretic hormone secretion |
| | Hypercalcemia | Lung cancer<br>Breast carcinoma<br>Renal cell carcinoma<br>Multiple myeloma<br>Ovarian carcinoma | PTH-related protein, TGF-α, TNF secretion |
| | Hypoglycemia | Hepatocellular carcinoma<br>Fibrosarcoma | Insulin or insulin-like substance secretion |
| | Carcinoid | Pancreatic carcinoma<br>Gastric carcinoma | Serotonin, bradykinin secretion |
| **Neurologic** | Lambert-Eaton myasthenic syndrome (LEMS)<br>Muscle weakness in limbs | Small-cell lung cancer | Ab interferes with ACh release |
| | Myasthenia gravis<br>Fluctuating muscle weakness and fatiguability | Thymoma | Ab interferes with ACh release |
| | Paraneoplastic limbic encephalitis<br>Depression, seizures, short-term memory loss | Small-cell lung cancer | Unknown |
| **Renal** | Hypokalemic nephropathy | Small-cell lung cancer | Ectopic ACTH and ACTH-like substance secretion |
| | Nephrotic syndrome | Lymphoma<br>Melanomas | Immunocomplex sedimentation in nephrons |
| **GI** | Watery diarrhea | Medullary thyroid carcinomas | Prostaglandin secretion |
| **Hematologic** | Erythrocytosis | Renal cell carcinoma<br>Hepatocellular carcinoma | EPO production |
| **Rheumatologic** | SLE | Lymphomas<br>Lung cancer<br>Breast carcinoma<br>Gonadal carcinoma | Anti-nuclear Ab production |
| | Scleroderma | Breast carcinoma<br>Lung cancer<br>Uterine cancer | Anti-nuclear Ab production |

## Investigations

- CBC, electrolytes, creatinine, LFTs, ALP, ESR, CRP, serum/urine electrophoresis
- serum autoantibodies, lumbar puncture
- imaging: skeletal survey, CT, MRI, PET scan
- ± endoscopy

## Treatment

- treat underlying tumour: surgery, radiation, chemotherapy
- treat immune-mediated disorder: IVIG, steroids, immunosuppressive drugs, plasmapheresis (reserved for patients with identifiable antibodies in serum)

# Diabetes Medications

| Drug Class | Mechanism of Action | Generic Drug Name | Canada Name | US Name (if different) | Dosing | Indications | Contraindications | Side Effects | Comments |
|---|---|---|---|---|---|---|---|---|---|
| Biguanide | Sensitizes peripheral tissues to insulin → increases glucose uptake<br>Decreases hepatic glucose production by simulation of hepatic AMP-activated protein kinase (AMPK) | metformin | Glucophage®<br>Glumetza® | | 500 mg OD titrated to 2000 mg/d maximum | Useful in obese T2DM<br>Improves both fasting and postprandial hyperglycemia<br>Also ↓ TG | ABSOLUTE:<br>Moderate to severe liver dysfunction<br>Moderate renal dysfunction GFR <30 mL/min<br>Cardiac dysfunction | GI upset (abdo discomfort, bloating, diarrhea)<br>Lactic acidosis<br>Anorexia | ↓ HbA1c 1.0-1.5%<br>Weight neutral<br>Negligible risk of hypoglycemia as monotherapy |
| Insulin Secretagogue | Stimulates insulin release from β cells by causing $K^+$ channel closure → depolarization → $Ca^{2+}$ mediated insulin release<br>Use in nonobese T2DM | sulfonylureas:<br>glyburide | Diabeta®<br>Euglucon® | Micronase®<br>Glynase PreTab® | 2.5-5.0 mg/d titrated to >5 mg bid<br>Max: 20 mg/d | | ABSOLUTE:<br>Moderate to severe liver dysfunction<br>RELATIVE (glyburide and glimepiride):<br>Adjust dose in mild to moderate kidney dysfunction and avoid in severe kidney dysfunction<br>Avoid glyburide in the elderly<br>INTERACTIONS:<br>Do not combine with a non-sulfonylurea insulin secretagogue or preprandial insulin | Hypoglycemia<br>Weight gain | ↓ HbA1c 0.8%<br>Glicalazide lowest incidence of hypoglycemia |
| | | gliclazide | Diamicron®<br>Diamicron® MR | | 40-160 mg bid<br>30-120 mg OD | | | | |
| | | glimepiride | Amaryl® | | 1-8 mg OD | | | | |
| | | non-sulfonylureas:<br>repaglinide | GlucoNorm® | | 0.5-4 mg tid | Short $t_{1/2}$ of 1 h causes brief but rapid ↑ in insulin, therefore effective for postprandial control | ABSOLUTE:<br>Severe liver dysfunction<br>INTERACTIONS:<br>Do not combine with a sulfonylurea or preprandial insulin | Hypoglycemia (less than sulfonylurea)<br>Weight gain | ↓ HbA1c 0.7% for repaglinide and 0.5-1.0% for nateglinide<br>Costly<br>Must be dosed with meals |
| | | nateglinide | Starlix® | | 60-120 mg tid | | | | |
| Insulin Sensitizers (thiazolidinedione) | Sensitizes peripheral tissues to insulin → increases glucose uptake<br>Decreases FFA release from adipose<br>Binds to nuclear receptor PPAR-γ | rosiglitazone | Avandia® | | 2-8 mg OD | Rosiglitazone – indicated only in patients with T2DM for whom all other oral antidiabetic agents, in monotherapy or in combination, do not result in adequate glycemic control or are inappropriate due to contraindications or intolerance | ABSOLUTE: NYHA > class II CHF<br>INTERACTIONS: Do not combine with insulin | Peripheral edema<br>CHF<br>Anemia<br>Fluid retention and CHF<br>Increased risk of cardiac events with rosiglitazone (requires written informed consent when prescribing)<br>Increased risk of bladder cancer with pioglitazone<br>Fractures | ↓ HbA1c 0.8%<br>Delayed maximum efficacy (6-12 wk)<br>NOTE: This class of medication is rarely used anymore due to side effects and concerns about CV mortality |
| | | pioglitazone | Actos® | | 15-45 mg OD | | | | |
| α-Glucosidase Inhibitor | ↓ carbohydrate GI absorption by inhibiting brush border α-glucosidase | acarbose | Glucobay® | | 25 mg OD titrated to 100 mg tid | ↓ postprandial hyperglycemia | ABSOLUTE:<br>Inflammatory bowel disease<br>Severe liver dysfunction | Flatulence<br>Abdominal cramps<br>Diarrhea | ↓ HbA1c 0.6%<br>Not recommended as initial therapy in patients with HbA1c>8.5% |
| Dipeptidyl Peptidase-IV (DPP-IV) Inhibitor | Inhibits degradation of endogenous antihyperglycemic incretin hormones<br>Incretin hormones stimulate insulin secretion, inhibit glucagon release, and delay gastric emtyping | sitagliptan | Januvia® | | 100 mg OD | | ABSOLUTE (sitagliptin):<br>T1DM<br>DKA | Nasopharyngitis<br>URTI<br>Headache<br>Pancreatitis | ↓ HbA1c 0.7%<br>Weight neutral<br>Expensive<br>Negligible risk of hypoglycemia as monotherapy |
| | | saxagliptin | Onglyza™ | | 2.5-5 mg OD | | | | |
| | | linagliptin | Trajenta® | | 5 mg OD | | RELATIVE (sitagliptin and saxagliptin):<br>Use with dose reduction in kidney dysfunction | Stevens Johnson syndrome | |
| Glucagon-Like Peptide (GLP)-1 Analogue | Binds to GLP-1 receptor to promote insulin release<br>Insulinotropic effect suppressed as plasma glucose <4 mmol/L<br>Slows gastric emptying, suppresses inappropriately elevated glucagon levels<br>Causes β-cell regeneration and differentiation *in vitro* | exenatide | | BByetta® | 5-10 μg SC bid 1 h before meals | | ABSOLUTE:<br>T1DM<br>DKA<br>Acute pancreatitis Hx<br>RELATIVE:<br>Gastroparesis<br>ESRD<br>Personal or family history of medually thyroid cancer (MTC) | N/V, diarrhea<br>Dizziness, headache<br>Muscle weakness<br>Anti-exenatide antibodies<br>Pancreatitis | ↓ HbA1c 1.0%<br>Weight loss<br>Negligible risk of hypoglycemia as monotherapy |
| | | liraglutide | | Victoza® | 0.6-1.8 mg OD SC | | | | |
| | | semaglutide | | Ozempic® | | | | | |
| | | dulaglutide | | Trulicity® | | | | | |

# Diabetes Medications (continued)

| Drug Class | Mechanism of Action | Generic Drug Name | Canada Name | US Name (if different) | Dosing | Indications | Contraindications | Side Effects | Comments |
|---|---|---|---|---|---|---|---|---|---|
| Sodium-glucose linked transporter 2 (SGLT2) Inhibitor | Enhances urinary glucose excretion by inhibiting glucose reabsorption in the proximal renal tubule | canagliflozin | Invokana® | | 100 mg OD before first meal of the day | | ABSOLUTE:<br>Severe renal impairment<br>ESRD<br>Patients on dialysis | UTI, genital infections<br>Hypotension caution with concomitant loop diuretic use<br>Caution with renal dysfunction<br>Hyperlipidemia (raises LDL and HDL)<br>Dapagliflozin not to be used in patients with active or history of bladder cancer<br>Rare diabetic ketoacidosis (may occur with no hyperglycemia) | ↓ HbA1c 0.7-1.0%<br><br>Negligible risk of hypoglycemia as monotherapy<br><br>Cause weight loss |
| | | dapagliflozin | Forxiga® | | 5 mg OD in the morning with or without food | | | | |
| | | empagliflozin | Jardiance® | | 10 mg OD in the morning with or without food | | | | |

# Dyslipidemia Medications

| Drug Class | Mechanism of Action | Generic Drug Name | Canada Name | US Name (if different) | Dosing | Indications | Contraindications | Side Effects |
|---|---|---|---|---|---|---|---|---|
| HMG-CoA Reductase Inhibitor (statins) | Inhibits cholesterol biosynthesis, ↓ LDL synthesis, ↑ LDL clearance, modest ↑ HDL, limited ↓ VLDL | atorvastatin<br>fluvastatin<br>lovastatin<br>pravastatin<br>rosuvastatin<br>simvastatin | Lipitor®<br>Lescol®<br>Mevacor®<br>Pravachol®<br>Crestor®<br>Zocor® | | 10-80 mg/d<br>20-80 mg/d<br>20-80 mg/d<br>10-40 mg/d<br>5-40 mg/d<br>10-80 mg/d | 1st line monotherapy<br>Used for ↑ LDL, ↑ TG | Active liver disease | ↑ liver enzymes<br>Myositis (↑ risk if combined with fibrates)<br>Rhabdomyolysis |
| Fibrates | Activate PPAR α, upregulate lipoprotein lipase + apo A1, ↓ VLDL, ↓ TG, modest ↓ LDL, modest ↑HDL | bezafibrate<br>fenofibrate<br>gemfibrozil | Bezalip®<br>Lipidil®<br>Lopid® | | 400 mg/d<br>48-200 mg/d<br>600-1200 mg/d | Used for ↑ TG, hyperchylomicronemia | Hepatic disease<br>Renal disease | GI upset<br>Skin rashes<br>↑ risk of gallstone formation<br>↑ risk of rhabdomyolysis when combined with statins |
| Niacin | Inhibits secretion of hepatic VLDL via lipoprotein lipase (LPL) pathway → decreased VLDL and LDL; decreased clearance of HDL | nicotinic acid | Niaspan®<br>generic niacin | Niacor® | 0.5-2 g/d | Used for severe hypertriglyceridemia not controlled by fibrate | Hypersensitivity<br>Hepatic dysfunction<br>Active PUD<br>Hyperuricemia<br>Severe hypotension | Generalized flushing<br>Abnormal liver enzymes<br>Pruritus<br>IGT<br>Watch glucose control with overt DM |
| Bile Acid Sequestrants | Resins that bind bile acids in intestinal lumen and prevent absorption thereby<br>↓ LDL | cholestyramine | Questran® | | 2-24 g/d | Used for ↑ LDL<br>Use as adjunct with statins or fibrates | Complete biliary obstruction<br>TG >3.5 mmol/L | Constipation, nausea<br>Flatulence<br>Bloating<br>Rise in TG<br>Binds other medications |
| | | colestipol | Colestid® | | 5-30 g/d | | | |
| Cholesterol Absorption Inhibitors | Inhibits cholesterol absorption at the small intestine brush border | ezetimibe | Ezetrol® | Zetia® | 10 mg/d | Used for ↑ LDL | Hypersensitivity<br>Hepatic dysfunction (when used with statin)<br>Do not combine with fibrates or bile acid resins | Fatigue<br>Pharyngitis<br>Sinusitis<br>Abdominal pain<br>Diarrhea<br>Arthralgia |
| Anti-PCSK9 | Inhibits degradation of the LDL receptor by PCSK9 enzyme<br>LDL clearance | evolocumab | Repatha® | | 140 mg q2w or 420 mg qmon | Add-on to maximally tolerated statin therapy in heterozygous FH (evolocumab, alirocumab) and homozygous FH (evolocumab)<br>Consider in patients with atherosclerotic CVD and LDL-C not at target despite maximally tolerated statin ± ezetimibe | Hypersensitivity<br>No studies regarding use in severe hepatic or renal impairment | Nasopharyngitis, URTI, influenza<br>Sinusitis<br>Back pain<br>Myalgia<br>Arthralgia<br>Nausea |
| | | alirocumab | Praluent® | | 75 mg q2w or 300 mg qmo | | | |

# Thyroid Medications

| Drug Class | Mechanism of Action | Generic Drug Name | Canada Name | US Name (if different) | Dosing | Indications | Contraindications | Side Effects |
|---|---|---|---|---|---|---|---|---|
| Antithyroid Agent (thionamides) | Decreases thyroid hormone production by inhibiting iodine and peroxidase from interacting with thyroglobulin to form $T_4$ and $T_3$<br>PTU also interferes with conversion of $T_4$ to $T_3$ | propylthiouracil (PTU) | Propyl-Thyracil® | | Start 100 mg PO tid, then adjust accordingly<br>Thyroid storm: start 150-300 PO qid, then adjust accordingly | Hyperthyroidism, thyroid storm | Hypersensitivity<br>PTU recommended in 1st trimester, MMI during 2nd and 3rd trimester<br>Lactation: safe with PTU <300 mg/d and MMI <20-30 mg/d | N/V<br>Rash<br>Drug-induced hepatitis<br>Agranulocytosis<br>Hepatitis with PTU<br>Cholestasis with MMI |
| | | methimazole (MMI) | Tapazole® | | Start 5-20 mg PO OD, then adjust accordingly<br>Up to 60 mg OD may be required | | | |
| Thyroid Hormone | Synthetic form of thyroxine ($T_4$) | levothyroxine<br>l-thyroxine | Synthroid®<br>Eltroxin® | Levoxyl® | 0.05-2.0 mg/d, usually 1.6x weight (kg) is dose in micrograms<br>In elderly patients start at 0.025 mg/d | Hypothyroidism<br>Post thyroidectomy | Recent MI, thyrotoxicosis | If wrong dosing: symptoms of hypothyroidism or hyperthyroidism<br>Skin rash from dye in pill |
| Antithyroid Agent Radiopharmaceutical | Radioactive isotope of iodine that is incorporated into the thyroid gland irradiating the area and destroying local glandular tissue | sodium iodide I-131 | Iodotope® | | Dose corrected for 24 h radioactive iodine uptake<br>Hyperthyroidism 4-12 mCi<br>Thyroid Ca 50-150 mCi | Hyperthyroidism<br>Thyroid malignancy | Hypersensitivity<br>Concurrent antithyroid medication<br>Pregnancy, lactation | N/V<br>Bone marrow suppression<br>Sialadenitis<br>Thyroiditis |

# Metabolic Bone Disease Medications

| Drug Class | Mechanism of Action | Generic Drug Name | Canada Name | US Name (if different) | Dosing | Indications | Contraindications | Side Effects |
|---|---|---|---|---|---|---|---|---|
| Bisphosphonates | Inhibits osteoclast-mediated bone resorption | alendronate | Fosamax® | | Osteoporosis:<br>5-10 mg OD<br>70 mg once weekly<br>Paget's<br>40 mg OD for 6 mo | Prevention of postmenopausal osteoporosis<br>Treatment of osteoporosis<br>Glucocorticoid-induced osteoporosis<br>Paget's disease | Esophageal stricture or achalasia (oral)<br>Unable to stand or sit upright for >30 min (oral)<br>Hypersensitivity<br>Hypocalcemia<br>Renal insufficiency (CrCl <35 mL/min)<br>History or atypical femoral fracture or osteonecrosis of the jaw | GI<br>MSK pain<br>Headache<br>Osteonecrosis of the jaw<br>Atypical femoral fracture |
| | | risedronate | Actonel® | | Osteoporosis:<br>5 mg OD<br>35 mg once weekly<br>150 mg once monthly<br>Paget's:<br>30 mg OD for 2 mo | Treatment and prevention of postmenopausal osteoporosis<br>Treatment and prevention of glucocorticoid-induced osteoporosis<br>Paget's disease | | |
| | | pamidronate | Aredia® | | Hypercalcemia of malignancy<br>60-90 mg IV over 2-24 h<br>Wait at least 7 d before considering retreatment | Hypercalcemia of malignancy<br>Paget's disease<br>Osteolytic bone metastases of breast cancer<br>Osteolytic lesions of multiple myeloma | | |
| | | zoledronate | Zometa®<br>Aclasta® | | 5 mg IV once yearly<br>5 mg IV | Treatment of osteoporosis<br>Hypercalcemia of malignancy<br>Treatment and prevention of skeletal complications related to cancer | | |
| Selective Estrogen Receptor Modulators | Decreases resorption of bone through binding to estrogen receptors | raloxifene | Evista® | | 60 mg OD | Treatment and prevention of postmenopausal osteoporosis (2nd line) | Lactation<br>Pregnancy<br>Active or past history of DVT, PE, or retinal vein thrombosis | Hot flashes<br>Leg cramps<br>Increased risk of fatal stroke, venous thromboembolism |

# Metabolic Bone Disease Medications (continued)

| Drug Class | Mechanism of Action | Generic Drug Name | Canada Name | US Name (if different) | Dosing | Indications | Contraindications | Side Effects |
|---|---|---|---|---|---|---|---|---|
| Calcitonin | Inhibits osteoclast-mediated bone resorption | calcitonin | Miacalcin® | | One spray (200 IU) per d, alternating nostrils | Treatment for postmenopausal osteoporosis (greater than 5 yr postmenopause) | Clinical allergy to salmon-calcitonin | Rhinitis<br>Epistaxis<br>Sinusitis<br>Nasal dryness |
| Anti-RANKL Monoclonal Ab | Inhibits RANKL (osteoclast differentiating factor) → inhibits osteoclast formation and decreases bone resorption | denosumab | Prolia™ | Xgeva™ | 60 mg SC q6mo | Treatment for postmenopausal women at high risk of fracture<br>Prevent skeletal-related events in patients with bone metastasis from solid tumours<br>Also approved for glucocorticoid-induced osteoporosis, and for men | Hypocalcemia<br>Vitamin D insufficiency | Fatigue/headache/GI injection site reaction<br>Hypocalcemia<br>Atypical femoral fracture<br>Osteonecrosis of the Jaw |
| PTH | Stimulates new bone formation by preferential stimulation of osteoblastic activity over osteoclastic activity | teriparatide | Forteo® | | 20 µg SC OD x 18-24 mo | Treatment for postmenopausal women with osteoporosis who are at high risk for fracture<br>Treatment for men with primary or hypogonadal osteoporosis who are at high risk for fracture<br>Also approved for Glucocorticoid-induced osteoporosis | Paget's disease<br>Prior external beam or implant radiation therapy involving the skeleton<br>Bone metastases<br>Metabolic bone diseases other than osteoporosis | Orthostatic hypotension<br>Hypercalcemia<br>Dizziness<br>Leg cramps |
| Calcium | Inhibits PTH secretion | | | | 1200 mg/d (including diet)<br>Divided in 3 doses | Osteopenia<br>Osteoporosis<br>Prevention of metabolic bone disease | Caution with renal stones | Vomiting<br>Constipation<br>Dry mouth |
| Vitamin D | Regulation of calcium and phosphate homeostasis | cholecalciferol (vitamin D3) | | | 800 -2000 IU/d (higher doses required in Insufficiency or deficiency) | Osteopenia<br>Osteoporosis<br>Prevention of metabolic bone disease | Caution in patients on digoxin (risk of hypercalcemia which may precipitate arrhythmia) | Hypercalcemia<br>Headache<br>Nausea and vomiting<br>Constipation |
| | | ergocalciferol (vitamin D2) | Drisdol®<br>Erdol® | | 50,000 IU/wk | Osteoporosis in patients with liver dysfunction, refractory rickets, hypoparathyroidism | Hypercalcemia<br>Malabsorption syndrome<br>Decreased renal function | |
| | | calcitriol ($1,25(OH)_2$-D) | Rocaltrol® | | Start 0.25 µg/d<br>Titrate up by 0.25 µg/d at 4-8 wk intervals to 0.5-1 µg/d | Hypocalcemia and osteodystrophy in patients with chronic renal failure on dialysis<br>Hypoparathyroidism | Hypercalcemia<br>Vitamin D toxicity | |
| | | | Calcijex® | | Start 0.25 µg/d<br>Titrate up by 0.25 µg/d at 2-4 wk intervals to 0.5-2 µg/d | | | |

# Adrenal Medications

| Drug Class | Mineralocorticoid Activity | Generic Drug Name | Potency Relative to Cortisol) | Equivalent Dose (mg) | Duration of Action ($t_{1/2}$ in h) | Dosing | Comments |
|---|---|---|---|---|---|---|---|
| Hydrocortisone | Yes | cortef<br>solu-Cortef | 1.0 | 20 | 8 | Adrenal Crisis: 50-100 mg IV bolus, then 50-100 mg q8h (continuous infusion x 24-48 h)<br>PO once stable (50 mg q8h x 48 h, then taper over 14 d)<br>Chronic AI: 15-20 mg PO OD (2/3 AM, 1/3 PM) | In high doses, mineralocorticoid side effects may emerge (salt + water retention, ECF volume expansion, HTN, low $K^+$ metabolic alkalosis) |
| Cortisone Acetate | Yes | cortisone acetate | 0.8 | 25 | oral = 8<br>IM = 18+ | Adrenal Crisis: 75-300 mg/d PO/IM divided q12-24h<br>Chronic AI: 25 mg/d | Pro-drug which is converted to active form as hydrocortisone<br>High doses can result in mineralocorticoid side effects (see above) |
| **Mineralocorticoid** | | | | | | | |
| Fludrocortisone | 100% | — | — | | | Chronic: 0.1 mg daily | Replaces aldosterone in primary adrenal insufficiency |
| Prednisone | No | prednisone | 4 | 5 | 16-36 | Adrenal Crisis: 15-60 mg/d PO qd or divided bid/qid<br>Chronic AI: 5 mg daily | Pro-drug which is converted to active form as prednisolone |
| Dexamethasone | No | dexamethasone | 30 | 0.7 | 36-54 | Adrenal Crisis: 4 mg IV; repeat q2-6h if necessary | Used for undiagnosed adrenal insufficiency (does not interfere with measurement of serum cortisol levels) |

# Landmark Endocrinology Trials

| Trial | Reference | Results |
|---|---|---|
| **DIABETES** | | |
| ACCORD | NEJM 2008;358:2560-72 | Compared with standard therapy the use of intensive therapy to target normal HbA1c levels (<6%) for 3.5 yr increased mortality and did not significantly reduce major cardiovascular events |
| ADVANCE | NEJM 2008;358:2545-59 | Intensive glucose control that lowered the HbA1c value to 6.5% and reduced the incidence of nephropathy but did not significantly reduce major macrovascular events, death from cardiovascular events, or death from any cause; hypoglycemia was more common in the intensive control group |
| BARI-2D | NEJM 2009;360:2503-15 | In patients with both T2DM and CAD, no significant difference was found in the rates of death and major cardiovascular events in patients undergoing prompt revascularization and those undergoing medical therapy or between strategies of insulin sensitization and insulin |
| DCCT | NEJM 1993;329:977-86 | Intensive blood glucose control delayed the onset and reduced the progression of microvascular complications (retinopathy, nephropathy, and neuropathy) in T1DM |
| EDIC | NEJM 2005;353:2644-53 | Compared with conventional therapy, intensive DM therapy early on without macrovascular disease (goal HbA1c <6.05%) has long-term beneficial effects on the risk of cardiovascular disease in patients with T1DM |
| Look AHEAD | NEJM 2013;369:145-54 | Moderate weight loss (<7% BW) and increased exercise are not associated with reduction in CVD and its complications among overweight or obese patients with T2DM |
| NAVIGATOR | NEJM 2010;362:1463-90 | In patients with impaired glucose tolerance, nateglinide did not reduce progression to DM or risk of cardiovascular events while valsartan only reduced progression to DM |
| PREDIMED | NEJM 2013;368:1279-90 | A Mediterranean diet with extra-virgin olive oil or nuts reduces rates of MI, CVA, or CV death in those at high risk for CV disease (outcome was driven by reduction in rates of CVA) |
| Steno-2 | NEJM 2008;358:580-91 | In at-risk patients with T2DM, intensive intervention with multiple drug combinations and behaviour modification had sustained significant beneficial effects with respect to vascular complications and mortality; multifactorial intervention is critical in the management of T2DM |
| UKPDS | Lancet 1998;352:837-53 | Intensive blood glucose control reduces microvascular but not macrovascular complications in T2DM |
| UKPDS Extension | NEJM 2008;359:1577-89 | Continued risk reduction in microvascular risk and emergent risk reductions for MI and death from any cause 10 yr post UKPDS trial follow-up in T2DM |
| VADT | NEJM 2009;360:1-11 | In patients with longstanding poorly controlled T2DM, intensive glucose control had no significant effect on the rates of major cardiovascular events, death, or microvascular complications; adverse events, predominantly hypoglycemia, were more common in the intensive control group |
| **LIPIDS** | | |
| 4S | Lancet 1994;344:1383-89 | In patients with angina or previous MI and high total cholesterol, simvastatin reduced: all-cause mortality, fatal and nonfatal coronary events, and need for coronary artery bypass surgery or angioplasty |
| FIELD | Lancet 2005;366:1849-61 | In patients with T2DM not previously on statin therapy, fenofibrate did not significantly reduce the risk of the primary outcome of coronary events; it did reduce non-fatal MI and revascularizations |
| HPS | Lancet 2002;360:7-22 | In high-risk patients with various cholesterol values, simvastatin reduced all-cause mortality, coronary deaths, and major vascular events |
| Jupiter | NEJM 2008;359:2195-207 | Rosuvastatin significantly reduced the incidence of major cardiovascular events in patients with elevated high-sensitivity CRP levels and no hyperlipidemia |
| TNT | NEJM 2005;352:1425-35 | Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d |

| WSIB | Workplace Safety and Insurance Board |

# Four Principles of Family Medicine

**College of Family Physicians of Canada**

**1. The family physician is a skilled clinician**
- diagnoses and manages diseases common to the population served
- recognizes importance of early diagnosis of serious life-threatening illnesses

**2. Family medicine is a community-based discipline**
- provides information and access to community services
- responds/adapts to changing needs and circumstances of the community

**3. The family physician is a resource to a defined practice population**
- serves as a health resource
- advocates for public policy to promote health

**4. The patient-physician relationship is central to the role of the family physician**
- commits to the person, not just the disease
- promotes continuity of patient care

# Periodic Health Examination

- Canadian Task Force on Preventive Health Care established in 1976 to develop and disseminate clinical practice guidelines for primary and preventive care
- recommendations are based on systematic analysis of scientific evidence
- periodic preventive health visits are recommended instead of annual physical examinations

**Adult Periodic Health Exam**
Male and female evidence-based preventive care checklist forms are available online at http://www.cfpc.ca, most recently updated in 2015

## Purpose of the Periodic Health Examination

- primary prevention: identify risk factors for common diseases; counsel patients to promote healthy behaviour
- secondary prevention: pre-symptomatic detection of disease to allow early treatment and to prevent disease progression

## Classification of Recommendations (GRADE, 2011)

**Strength of Recommendation**
- **strong**: confidence that desirable effects outweigh undesirable effects (strong recommendation for an intervention) or that the undesirable effects outweigh desirable effects (strong recommendation against an intervention)
  - implies that most individuals will be best served by the recommended course of action

- **conditional**: desirable effects probably outweigh the undesirable effects (conditional recommendation for an intervention) or undesirable effects probably outweigh the desirable effects (conditional recommendation against an intervention)
  - implies that most people would want the recommended course of action but that many would not
  - different choices will be appropriate for different individuals, patients require support in reaching a management decision consistent with his/her values and preferences

### Quality of Evidence

- high: high level of confidence that true effect lies close to the estimate of the effect
- moderate: true effect likely to be close to the estimate of the effect, but there is a possibility that it is substantially different
- low or very low: true effect may be substantially different from the estimate of the effect

**Table 1. Periodic Health Exam**

| | General Population | Special Population |
|---|---|---|
| **Discussion** | Dental hygiene (community fluoridation, brushing, flossing) (A)<br>Noise control and hearing protection (A)<br>Screen for poverty<br>Smokers: counsel on smoking cessation, provide:<br>Nicotine replacement therapy (A)<br>Referral to smoking cessation program (B)<br>Dietary advice on leafy green vegetables and fruits (B)<br>Seat belt use (B)<br>Injury prevention (bicycle helmets, smoke detectors) (B)<br>Moderate physical activity (B)<br>Avoid sun exposure and wear protective clothing (B)<br>Problem drinking screening and counselling (B)<br>Counselling to protect against STIs (B)<br>Nutritional counselling, dietary advice on fat, and cholesterol (B)<br>Dietary advice on calcium and vitamin D requirements (B) | **Pediatrics:** Home visits for high risk families (A), Inquiry into developmental milestones (B)<br><br>**Adolescents**: Counsel on sexual activity and contraceptive methods (B), Counsel to prevent smoking initiation and substance use (B)<br><br>**Perimenopausal Women (>50):** Assess for risk factors for: osteoporosis and fracture (A), Counsel on osteoporosis, Counsel on risks/benefits of hormone replacement therapy (B)<br><br>**Adults >65**: Follow-up on caregiver concern of cognitive impairment (A), Multidisciplinary post-fall assessment (A) |
| **Physical** | Blood pressure measurement, using techniques described in CHEP guidelines (strong recommendation; moderate quality evidence)<br>BMI measurement in obese adults (B) | **Pediatrics:** Repeated examinations of hips, eyes, and hearing (especially in first year of life) (A), Serial height, weight, and head circumference (B), Visual acuity testing after age 2 (B)<br><br>**Adults >65:** Visual acuity (Snellen sight chart) (B), Hearing impairment (inquiry, whispered voice test, audioscope) (B)<br><br>**First-Degree Relative with Melanoma:** Full body skin exam (B) |
| **Tests** | See recommendations below for age and gender specific screening for diabetes, dyslipidemia, hypertension, and cancer screening (colon, prostate, cervical, lung, and breast) | **Pediatrics:** Routine hemoglobin for high risk infants (B), Blood lead screening of high risk infants (B)<br><br>**TB High Risk Groups**: Mantoux skin testing (A)<br><br>**STI High Risk Groups**: Voluntary HIV antibody screening (A), Gonorrhea screening (A), Chlamydia screening in women (B), Syphillis screening (A)<br><br>**Syphilis Risk Group**: VDRL test (A) |
| **Therapy** | Folic acid supplementation to women of child-bearing age (A)<br>Pharmacologic treatment of HTN (Refer to CHEP Guidelines) (A)<br>Varicella vaccine for children age 1-12 and susceptible adolescents/adults (A)<br>Rubella vaccine for all non-pregnant women of child-bearing age unless there is proof of immunity via immunization records or serology (B)<br>Tetanus vaccine: routine booster q10yr if had 1° series (A)<br>Pertussis vaccine: adults <65 should receive one booster given as Tdap– Adacel® or Boostrix® (A)<br>Herpes zoster vaccine for adults ≥60 | **Pediatrics:** Routine immunizations (A), Hepatitis B, HPV, and Meningococcal immunizations are offered in schools in most Canadian provinces<br><br>**Influenza High Risk Groups**: Outreach strategies for vaccination (A), Annual immunization (B), now recommended for all<br><br>**TB High Risk Groups** INH prophylaxis for household contacts or skin test converters (B), INH prophylaxis for high risk sub-groups (B)<br><br>**Immunocompromised/Age≥65/COPD/Asthma/CHF/Asplenia/Liver Disease/Renal Failure/DM:**<br>Pneumococcal vaccine (Pneumovax®) (A) |

Classification of recommendation in brackets: A - High quality of evidence; B – Moderate quality of evidence. See www.canadiantaskforce.ca – for up-to-date guidelines Reference: Canadian Task Force on Preventive Health Care, 2014

**Choosing Wisely Canada**
http://www.choosingwiselycanada.org/
A campaign to help clinicians and patients engage in conversations about unnecessary tests and treatments and make smart and effective choices to ensure high quality care

**Folic Acid Supplementation in Pregnancy (Joint SOGC-Motherisk Clinical Guideline May 2015)**

- To prevent neural tube defects in all women capable of becoming pregnant
- Low risk women (no personal health risks, planned pregnancy): diet of folate-rich foods and a daily oral multivitamin supplement containing 0.4-1.0 mg folic acid for at least 2-3 mo before conception, throughout pregnancy, and 4 to 6 wk postpartum or as long as breast-feeding continues
- High risk women (health risks including epilepsy, insulin-dependent diabetes, BMI >35, family history of NTD, high risk ethnic group): diet of folate-rich foods and daily supplementation with multivitamins with 5 mg folic acid at least 3 mo prior to conception until 12 wk post conception
- From wk 12 post-conception until postpartum period (4-6 wk or as long as breastfeeding continues): 0.4-1.0 mg of folic acid supplementation is sufficient
- Women with additional lifestyle issues (poor compliance with medications, no consistent birth control, taking possible teratogenic substances): higher folic acid dose of 5 mg and counselling about prevention of birth defects

# Breast Cancer Screening Guidelines

### 2018 Canadian Task Force on Preventive Health Care

- average-risk women: women age 40-74 with no personal history of breast cancer, history of breast cancer in 1st degree relatives, known mutations of the *BRCA1/BRCA2* genes or previous exposures of the chest wall to radiation

### Mammography
- age 40-49: recommend not screening with mammography (conditional recommendation, low-certainty evidence)
- age 50-74: recommend routine screening q2-3yr (conditional recommendation, very low-certainty evidence)
- age 75+: screen if benefits outweigh harm, must take overall health into account

### Magnetic Resonance Imaging and Ultrasound
- recommend not using MRI, tomosynthesis or ultrasound to screen for breast cancer in women not at increased risk (strong recommendation, no evidence)

### Clinical Breast Examination
- recommend not performing CBE to screen for breast cancer (conditional recommendation, no evidence)

## Breast Self-Examination

- recommend against routine breast self-examination to screen for breast cancer (conditional recommendation, low-certainty evidence)
- for more information on benign breast lesions and breast cancer, see General Surgery, GS60

## Lung Cancer Screening Guidelines

### 2016 Canadian Task Force on Preventive Health Care
- apply to adults aged 18 and older who are not suspected of having lung cancer
- recommend low dose CT scan for annual screening in adults aged 55-74 with at least a 30 pack-yr smoking history who currently smoke or quit less than 15 yr ago, up to three consecutive times
- chest x-ray is not recommended to screen for lung cancer, with or without sputum cytology

## Colorectal Cancer Screening Guidelines

### 2016 Canadian Task Force on Preventive Health Care
- apply to average risk individuals (asymptomatic, no family history of UC, polyps, or CRC)
- average risk testing should begin at age 50, but assessment for risk factors should begin earlier to identify high-risk individuals 50-59 (conditional recommendation, moderate quality evidence), 60-74 (strong recommendation, moderate quality evidence)
- recommend screening with FOBT (either high sensitivity FOBT or FIT) q2yr OR flexible sigmoidoscopy q10yr
- colonoscopy not recommended as a screening test
- screening is not recommended after age 75, but it may be assessed on an individual basis for ages 76-85
- for more information on colorectal neoplasms, see General Surgery, GS38

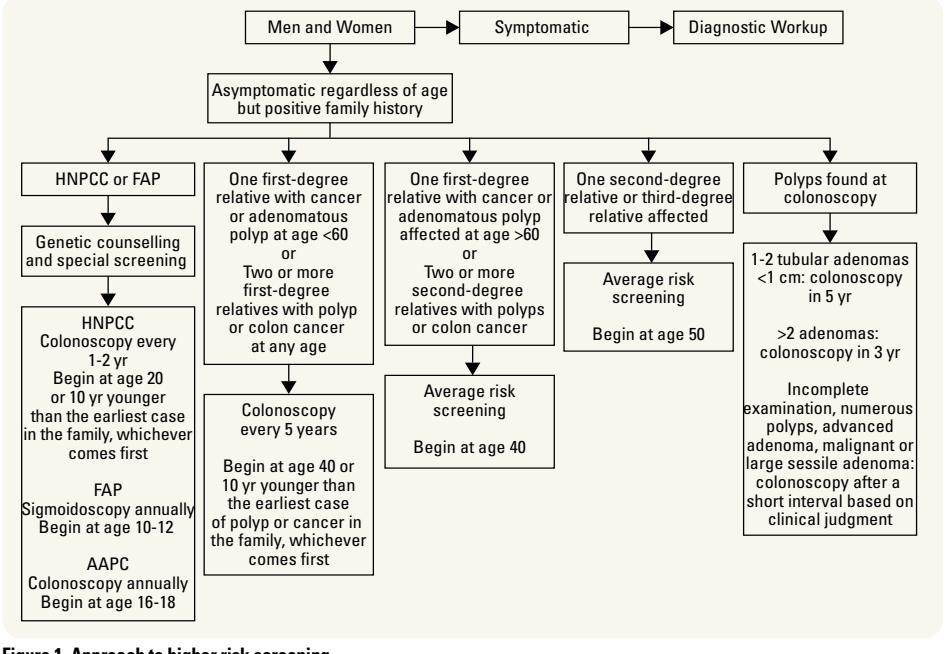

**Figure 1. Approach to higher risk screening**
AAPC = attenuated adenomatous polyposis; FAP = familial adenomatous polyposis; HNPCC = hereditary nonpolyposis colorectal cancer; 1st degree relatives: parents, siblings, children; 2nd degree relatives: grandparents, aunts, uncles; 3rd degree relatives: great grandparents or cousins. Figure printed with permission from Can J Gastroenterol 2004;18:93-99. Also see: Colorectal Screening for Cancer Prevention in Asymptomatic Patients, March 2013. Available from http://www.bcguidelines.ca/pdf/colorectal_screening.pdf

# Cervical Cancer Screening Guidelines

- either conventional Papanicolaou (Pap) smear or liquid based cytology testing
- endocervical and exocervical cell sampling (aim is to sample the transitional zone)
- best identifies squamous cell abnormalities, less reliable for glandular abnormalities
  - false positives 5-10%, false negatives 10-40% (for single test)
  - false negative rate 50% for existing cervical cancer
- cervical cancer screening guidelines differ by provincial jurisdiction (see The Society of Obstetricians and Gynaecologists of Canada guidelines)

### 2013 Canadian Task Force for Preventive Care Guidelines

- recommend screening all women age ≥25 q3yr who are or have ever been sexually active (includes intercourse or digital/oral activity with partner of either sex); age 25-29 (conditional recommendation; moderate quality evidence), age 30-69 (strong recommendation; high quality evidence)
- can reccomdend discontinuing screening in women age ≥70: if 3 normal tests in a row and no abnormal tests in last 10 yr, (conditional recommendation; low quality evidence)
- **Ontario guidelines**
  - screen all women age ≥21 who are or have ever been sexually active
  - if cytology is normal, can screen every 3 yr
  - women age ≥70: if 3 successive negative Pap tests in last 10 yr, can discontinue screening
  - women who are not sexually active by age 21 should delay cervical cancer screening until sexually active
- pregnant women and women who have sex with women should follow the routine cervical screening regimen
- women who have had a hysterectomy
  - total: discontinue screening if hysterectomy was for benign disease and no history of cervical dysplasia or HPV infection, continue to swab vaginal vault if history of uterine malignancy/dysplasia
  - subtotal: continue screening according to guidelines
- exceptions to guidelines
  - immunocompromised (transplant, steroids, diethylstilbestrol exposure, HIV)
  - previously unscreened patients
- for more information on cervical cancer (see Gynecology, GY43)

**Prostate Cancer Mortality at 11 Years of Follow-Up**
NEJM 2012;366:981-990
**Purpose**: To evaluate the effect of prostate-specific antigen (PSA) testing on prostate cancer mortality.
**Methods**: Update of European Randomized Study of Screening for Prostate Cancer with two additional years of follow-up. Men between the ages of 50 and 74 yr were eligible, and eight European countries were involved. Men were randomly assigned to screening or control. Primary outcome was prostate cancer-related mortality.
**Results**: 162,388 men were involved, and a median follow-up of 11 yr was completed. Relative reduction in the risk of prostate cancer-related deaths was 21% in favour of the screening group (rate ratio (RR) 0.79, 95% CI 0.68-0.91, p=0.001), and absolute reduction was 0.10 deaths/1000 person-years (1.07 deaths/1000 randomized men). 1055 men would need to be invited for screening to prevent one death from prostate cancer with 11 yr follow-up. No significant between-group difference in all-cause mortality was noted.
**Conclusion**: PSA-based screening significantly reduced prostate cancer-related mortality but did not affect all-cause mortality.

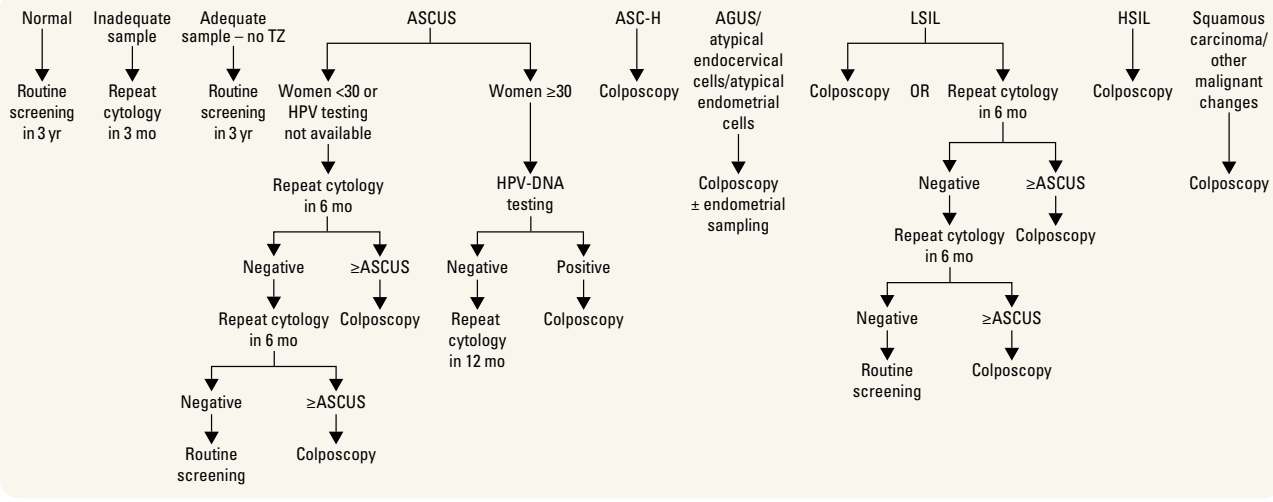

**Figure 2. Decision making chart for cervical cancer screening (not applicable to adolescents)**
AGUS = atypical glandular cells of unknown significance; ASCUS = abnormal squamous cells of unknown significance; ASC-H = abnormal squamous cells cannot rule out HSIL; HSIL = high grade squamous intraepithelial lesion; LSIL = low grade squamous intraepithelial lesion; TZ = transitional zone
Adapted from: Ontario Cervical Screening Cytology Guidelines, May 2012

# Prostate Cancer Screening Guidelines

### 2014 Canadian Task Force for Preventative Care Guidelines

- recommend NOT using prostate apecific antigen for prostate cancer screening in any age group (age <55: strong recommendation; low quality evidence, age 55-69: conditional recommendation; moderate quality evidence, age >70: strong recommendation; low quality evidence

# Health Promotion and Counselling

- health promotion is the most effective preventive strategy
- there are several effective ways to promote healthy behavioural change, such as discussions appropriate to a patient's present stage of change
- for more information, see www.motivationalinterviewing.org

## Motivational Strategies for Behavioural Change

**Table 2. Motivational Strategies for Behavioural Change**

| Patient's Stage of Change | Physician's Aim | Physician's Plan |
|---|---|---|
| **Pre-Contemplation** | Encourage patient to consider the possibility of change<br>Assess readiness for change<br>Increase patient's awareness of the problem and its risks | Raise issue in a sensitive manner<br>Offer (not impose) a neutral exchange of information to avoid resistance |
| **Contemplation** | Understand patient's ambivalence and encourage change<br>Build confidence and gain commitment to change | Offer opportunity to discuss pros and cons of change using reflective listening |
| **Preparation** | Explore options and choose course most appropriate to patient<br>Identify high-risk situations and develop strategies to prevent relapse<br>Continue to strengthen confidence and commitment | Offer realistic options for change and opportunity to discuss inevitable difficulties |
| **Action** | Help patients design rewards for success<br>Develop strategies to prevent relapse<br>Support and reinforce convictions towards long-term change | Offer positive reinforcement and explore ways of coping with obstacles<br>Encourage self-rewards to positively reinforce change |
| **Maintenance** | Help patient maintain motivation<br>Review identified high-risk situations and strategies for preventing relapse | Discuss progress and signs of impending relapse |
| **Relapse** | Help patient view relapse as a learning experience<br>Provide support appropriate to present level of readiness post-relapse | Offer a non-judgmental discussion about circumstances surrounding relapse and how to avoid relapse in the future<br>Reassess patient's readiness to change |

Adapted from: Hunt P. Motivating Change. *Nurs Stand* 2001;16:45-52, 54-55

## Nutrition

### General Population

- Canada's Food Guide is appropriate for individuals age ≥2
- counsel on variety, portion size, and plate layout
- vitamins and minerals: see "Functions and Food Sources of Some Common Vitamins" and "Functions and Food Sources of Some Common Minerals" - available from https://www.dietitians.ca/
- Guideline 1: Nutritious foods are the foundation for healthy eating, vegetables, fruits, whole grains, and proteins should be consumed regularly, consume plant based more often. Foods with mostly unsaturated fat should be replaced with those that contain mostly saturated fat. Water should be beverage of choice
- Guideline 2: Processed or prepared foods and beverages that contribute to excess sodium, free sugars, or saturated fat undermine healthy eating, should not be consumed regularly
- Guideline 3: Food skills are needed to navigate the complex food environment and support healthy eating. Cooking and food preparation using nutritious foods should be promoted. Food labels should be promoted as a tool to make informed choices

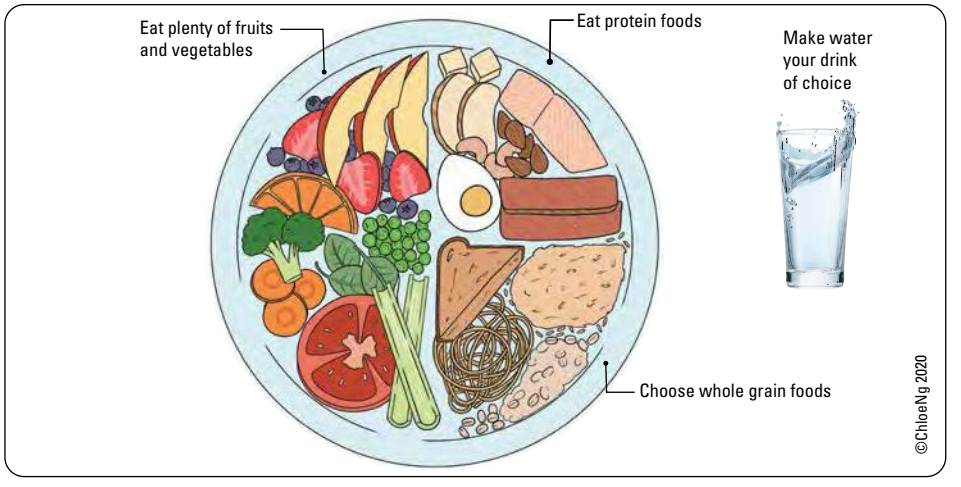

**Figure 3. Canada's Food Guide 2019 - plate layout**
Source: © All Rights Reserved. Canada's Food Guide. Health Canada, 2019. Adapted and reproduced with permission from the Minister of Health, 2019.

**Canadian Cancer Society (CCS) Recommendations for Vitamin D Use**
- Based on CCS research on Vitamin D and the prevention of colorectal, breast, and prostate cancer
- In consultation with their healthcare provider, the Society recommends that:
  - Adults living in Canada should consider taking Vitamin D supplementation of 1000 international units (IU) a day during the fall and winter
  - Adults at higher risk of having lower Vitamin D levels should consider taking Vitamin D supplementation of 1000 IU/d all year round. This includes people: who are older, with dark skin, who do not go outside often, and who wear clothing that covers most of their skin
  - Babies who are exclusively breast-fed: 400 IU/d

**Energy Content of Food**
- Carbohydrates 4 kcal/g
- Protein 4 kcal/g
- Fat 9 kcal/g
- Ethanol 7 kcal/g

**Calculating Total Daily Energy Expenditure (TDEE)**
- Roughly 35 kcal/kg/d
- Varies by age, weight, sex, and activity level
- Average 2000-2100 kcal/d for women, 2700-2900 kcal/d for men

**Handy Serving Size Comparisons**
- 3 oz meat, fish, poultry → palm of hand
- 1 cup dairy (milk/yogurt) → size of fist
- Bread/grains → one slice, palm of hand
- ½ cup rice/pasta → one hand cupped
- 1 cup of fruit/vegetables → two cupped hands
- 1 oz cheese → full length of thumb
- 1 tsp oil/butter → tip of thumb
- Nuts/chips/snacks → palm covered

## Cardiovascular Disease Prevention

### Table 3. Dietary Guidelines for Reducing Risk of Cardiovascular Disease

| | Recommendations | Effects |
|---|---|---|
| **Fat, Carbohydrates, Protein** | Overall fat intake: 26-27% of total energy<br>Saturated fat: 5-6% of total energy<br>Trans fat: reduce intake, replace with MUFA or PUFA<br>Carbohydrates: 55-59% of total energy<br>Protein: 15-18% of total energy | Lower LDL |
| **Omega-3 Fatty Acid Rich Foods** | ≥2 servings/wk of fish (especially oily fish like salmon) | Decreased sudden death, death from CAD<br>Lower TG |
| **Salt** | ≤2400 mg/d | Lower BP<br>Combining decreased sodium intake with the DASH diet (see below) achieves even greater BP-lowering effects |
| **Alcohol** | ≤3 drinks/d for men, max 15/wk<br>≤2 drinks/d for women, max 10/wk | Decreased risk of hypertriglyceridemia, HTN, osteoporosis, certain cancers |
| **Dietary Approaches** | DASH diet (Dietary Approaches to Stop Hypertension), recommended by the American Heart Association (AHA)<br><br>Diet: high in vegetables/fruits, low-fat dairy, whole grains, poultry, fish, and nuts;<br>Low in sweets, sugar-sweetened beverages, red meats<br>Macronutrients: low in saturated/total fat and cholesterol; high in potassium, magnesium, calcium, protein, and fibre<br><br>Mediterranean diet (fruits, vegetables, whole grains, legumes, nuts, olive oil, and herbs) | Lower BP, lower LDL |

MUFA = monounsaturated fatty acids; PUFA = polyunsaturated fatty acids
Eckel RH, et al. 2013 AHA/ACC Guideline on Lifestyle Management to Reduce Cardiovascular Risk: A Report of the American College of Cardiology/American Heart Association Task Force on Practice Guidelines. Circulation 2013
Dietary approaches to stop hypertension (DASH), available from: http://www.nhlbi.nih.gov/health/public/heart/hbp/dash/dash_brief.pdf
Lichtenstein AH, et al. Diet and lifestyle recommendations revision 2006: a scientific statement from the American Heart Association Nutrition Committee. Circulation 2006;114:82-96

**Osteoporosis Canada Recommendations for Calcium and Vitamin D Daily Requirements**
- Vitamin D: 800-1000 IU for individuals <50 yr, 800-2000 IU for individuals ≥50 yr
- Calcium: 1000 mg daily from all sources for individuals 19-50 yr and pregnant/lactating women; 1200 mg daily for individuals >50 yr (recommended to obtain calcium from nutrition whenever possible vs. supplementation)

# Obesity

## 2015 Canadian Task force on Preventive Health Care Recommendations

- body mass index (BMI) = weight (kg)/height (m)$^2$ = weight (lbs)/height (in)$^2$ x 703; poor predictor of obesity
- waist circumference (WC) = flexible tape placed on horizontal plane at iliac crest; normal depends on ethnic background
- increased WC for BMI 25-35 increases the risk of cardiovascular disease and type 2 diabetes

**Effectiveness of Behavioural and Pharmacologic Treatment for Overweight and Obesity in Adults**
CMAJ Open 2014;2:E306-17
**Purpose**: To evaluate the effectiveness of behavioural and pharmacological treatments for overweight and obese adults.
**Methods**: Review of RCTs of primary-care-relevant behavioural (diet, exercise, lifestyle) and pharmacological (orlistat, metformin) treatments with or without behavioural interventions in overweight or obese adults with 12 mo follow-up from baseline for weight outcomes or harms. Secondary health outcomes (total cholesterol, LDL, fasting blood glucose, incidence of type 2 DM, systolic and diastolic BP) were also studied.
**Results**: 68 RCTs were included, and showed that intervention participants had greater weight loss (-3.02 kg, 95% CI -3.52 to -2.52), waist circumference reduction (-2.78, -3.34 to -2.22) and body mass index reduction (-1.11, -1.39 to -0.84). Relative risk for weight loss of 5% or greater body weight was 1.77 (1.58 to 1.99, NNT 5, 95% CI 4-7). Incidence of type 2 DM was lower among pre-diabetic intervention participants.
**Conclusion**: Behavioural and pharmacological treatments for overweight and obese adults may lead to clinically important reductions in weight and type 2 DM incidence in pre-diabetics.

### Table 4. Classification of Weight by BMI, Waist Circumference, and Associated Disease Risks in Adults

| | | | Disease Risk* Relative to Normal Weight and Waist Circumference | |
|---|---|---|---|---|
| | **BMI (kg/m$^2$)** | **Obesity Class** | **Men ≤102 cm (40 in) Women ≤88 cm (35 in)** | **Men >102 cm (40 in) Women >88 cm (35 in)** |
| **Underweight** | <18.5 | | | |
| **Normal** | 18.5-24.9 | | | |
| **Overweight** | 25.0-29.9 | | Increased | High |
| **Obesity Class I** | 30.0-34.9 | I | High | Very High |
| **Obesity Class II** | 35.0-39.9 | II | Very High | Very High |
| **Obesity Class III** (Extreme Obesity) | 40.0 + | III | Extremely High | Extremely High |

* Disease risk for type 2 diabetes, hypertension, and CVD
From: Classification of Overweight and Obesity by BMI, Waist Circumference, and Associated Disease Risks, National Institute of Health, National Heart Lung and Blood Institute, Obesity Education Initiative, http://www.nhlbi.nih.gov/health/public/heart/obesity/lose_wt/bmi_dis.htm

**Adverse Medical Consequences of Obesity**
- Type 2 DM
- CAD
- Stroke
- HTN
- Gallbladder disease
- Non-alcoholic steatohepatitis
- Pregnancy complications
- Dyslipidemia
- Osteoarthritis
- Sleep apnea
- Certain cancers
  - CHF
- Low back pain
- Increased total mortality

## Epidemiology

- 20.2% of Canadians aged 18 and older (excluding pregnant women) were obese in 2014 (StatsCan, 2014)
- obesity remains higher in Aboriginal populations compared with non-Aboriginal populations with 25.7% of Aboriginal adults (excluding First Nations on-reserve) estimated to be obese (CCHS 2007/2008)
- close to a third of 5-17yr were identified as overweight or obese (2009 to 2011 CHMS)
- overweight and obesity rates in children are directly proportional to screen time (see *Exercise*, FM10)

**Low BMI Associations**
- Osteoporosis
- Eating disorders
- Under-nutrition
- Pregnancy complications

## Screening Recommendations

- CANRISK or FINRISC scores can be used to assess the risk for type 2 DM in overweight and obese patients
- recommends measuring height and weight and then calculating BMI at appropriate primary care visits

## Management

### Behavioural/ Lifestyle

- weight loss of >5% is clinically significant for reducing many cardiovascular risk factors (e.g. elevated blood pressure, glucose, and lipids)
- efficacious behavioural interventions: >12 mo duration, include diet, exercise, lifestyle components, and group and individual sessions
- structured behavioural and lifestyle interventions should be offered or arranged for overweight individuals BMI >25
- strong recommendation for those with increased risk of Type 2 DM
- BMI >35 and risk factors or BMI >40 are candidates for bariatric surgery failing behavioural modification

## Pharmacologic

- recommends against pharmacologic intervention to manage patients who are overweight and obese, although some patients may prefer medications and be good candidates for pharmacologic treatment
- high benefit of behavioural modification alone, NNH (number needed to harm) 10 (mostly GI side effects) for pharmacotherapy

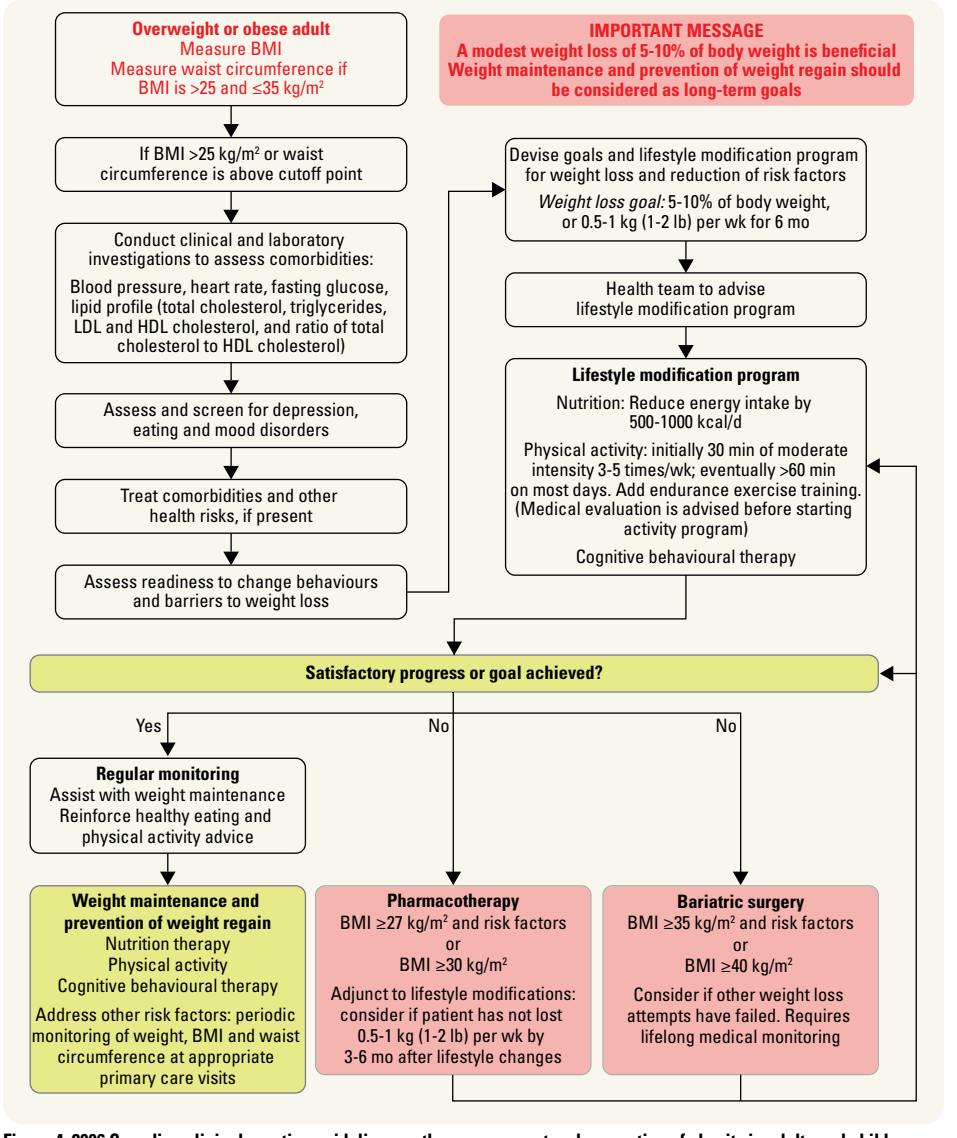

**Figure 4. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children**
Adapted from: CMAJ 2007;176:S1-S13

**Pharmacotherapy for Obesity**

- Orlistat: gastrointestinal lipase inhibitor, reduces fat absorption by 30% by inhibition of pancreatic lipase
- Orlistat is associated with several adverse effects and not approved for clinical use longer than 2 yr
- Orlistat should be avoided in people with inflammatory or chronic bowel disease

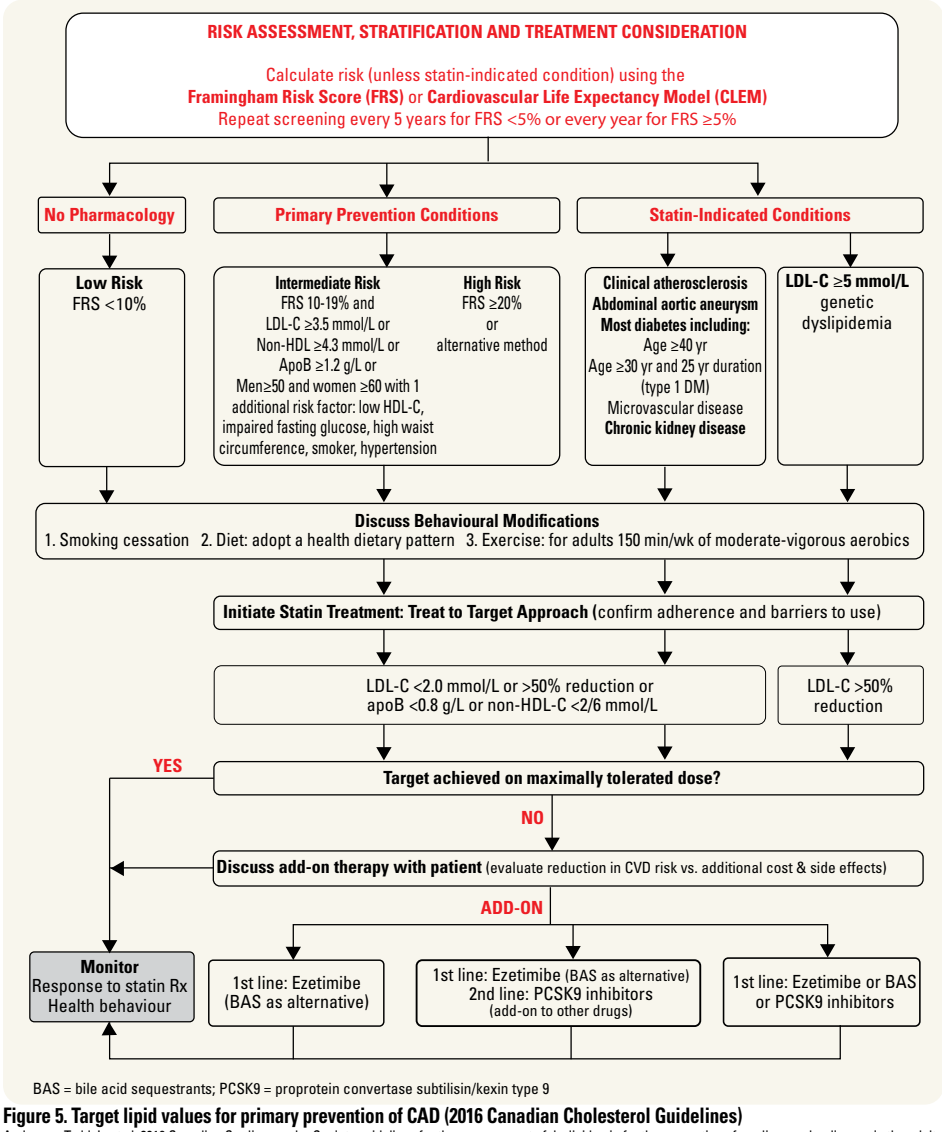
**Effects of Popular Diets without Specific Calorie Targets on Weight Loss Outcomes: Systematic Review of Findings from Clinical Trials - 2017**

**Purpose**: To assess the short term (≤6 mo) and long term (≥6 mo) weight loss outcomes for current popular diets.

**Methods**: A systematic review was conducted. All diets in the 2016 U.S. News & World Report Rankings were examined. From the potential 38 diets, eligible studies included trials with a sample size greater than 15, interventional clinical trials, intervention periods longer than 12 wk, BMI ≥25 mg/m², participants age ≥18 and objective measures of pre- and post-intervention.

**Results**: Sixteen articles were included in the review which included the Atkin, DASH, Glycemic-Index, Mediterranean, Ornish, Paleolithic, and Zone diets. The Atkins diet showed the most significant reduction in weight loss both in the short-term and long-term.

**Conclusion**: Other diets had limited evidence in producing clinically significant short-term and long-term weight loss. Future studies are needed to evaluate the efficacy of each diet.



**Hyperlipidemia Signs**

- Atheromata: plaques in blood vessel walls
- Xanthelasmata: a sharply demarcated yellowish deposit of cholesterol underneath the skin, usually on or around the eyelid
- Tendinous xanthoma: lipid deposit in tendon (especially Achilles)
- Eruptive xanthoma: hypertriglyceridemia induced reddish yellow, pruritic, and painful papular or nodular rash
- Lipemia retinalis: thin atheromata seen in the retinal blood vessels
- Corneal arcus (arcus senilis): lipid deposit in cornea

# Dyslipidemia

- see Endocrinology, E3
- **definition**: abnormal elevation of plasma cholesterol or triglyceride levels

## Assessment

BAS = bile acid sequestrants; PCSK9 = proprotein convertase subtilisin/kexin type 9

**Figure 5. Target lipid values for primary prevention of CAD (2016 Canadian Cholesterol Guidelines)**
Anderson, Todd J., et al. 2016 Canadian Cardiovascular Society guidelines for the management of dyslipidemia for the prevention of cardiovascular disease in the adult. Canadian Journal of Cardiology 32.11 (2016): 1263-1282

- measure fasting serum TC, LDL-C, HDL-C, and TG
- screen with full fasting lipid profile q1-3yr in males and females >40 yr or who are menopausal, or at any age for adults with additional dyslipidemia risk factors (see sidebar)
- screen for secondary causes: hypothyroidism, chronic kidney disease, DM, nephrotic syndrome, liver disease
- risk category
  - estimate using the Framingham Risk Score (FRS) for assessing 10 yr risk of developing CAD
    - FRS is calculated based on gender, age, HDL-C, total cholesterol, sBP, smoking, DM
    - family history of CVD <55 male relative or <65 in female relative doubles FRS
    - to be completed for men and women age 40-75 q3-5yr
    - cardiovascular age calculated as patient's age ± the difference between his or her estimated remaining life expectancy
- used to increase adherence to therapy and reaffirm positive effect of following therapy
  - treatment decisions focus on LDL-C level and/or FRS risk; the alternate primary targets are apolipoprotein B (apo B) and non-HDL-C
  - if moderate risk and LDL-C <3.5, treatment decision thresholds shifted to apo B >1.2 g/L or non-HDL-C >4.3 mmol/L
  - other targets include: TC:HDL-C ratio, apo B:apo AI ratio, hs-CRP (used more for risk stratification of CAD), non-HDL-C, and serum TG levels

To calculate Framingham Risk Score, go to https://www.framinghamheartstudy.org/fhs-risk-functions/cardiovascular-disease-10-year-risk/

**Risk Factors for Screening for Dyslipidemia**
- First Nations or South Asian ancestry
- Current cigarette smoking
- Diabetes
- Arterial Hypertension
- Family history of premature CVD
- Family history of hyperlipidemia
- Erectile dysfunction
- Chronic kidney disease
- Inflammatory disease (lupus, rheumatoid arthritis, psoriatic arthritis, IBD)
- HIV infection
- Chronic obstructive pulmonary disease
- Clinical evidence of atherosclerosis or abdominal aneurysm
- Clinical manifestation of hyperlipidemia
- Obesity (BMI>27)

**Non-fasting Lipids vs. Fasting Lipids**
Non-fasting (TC and non-HDL cholesterol) can be used for Framingham Risk Assessment and hold same prognostic value as fasting lipids
In fasted vs. non-fasted samples, non-HDL and TC varies by 2%, LDL-C by 10% and TG by 20%
Recently, non-fasting LDL-C has the same prognostic value as fasting LDL-C
Ontario Association of Medical Laboratories Guidelines for Lipid Testing in Adults (2013): https://oaml.com/wp-content/uploads/2016/05/OAMLGuidelineforAdultLipidTestingFinal2013.pdf

LDL cannot be calculated when TG ≥4.5 mmol/L

**Safety of Statins: An Update**
Therapeutic Advances in Drug Safety 2012;3:133-144
Trials have shown that statin therapy slightly increases the incidence of diabetes; however, the absolute risk is small. Relative to the reduction in coronary events, the clinical significance is not great enough to recommend against their use.

Use with caution when prescribing combined statin and fibrate therapy as there has been concern regarding the safety of certain combinations (potential increased risk of myopathy and rhabdomyolysis)

### Management

- intensity and type of treatment is guided by "risk category" assigned (see Figure 5)

1. Health behaviours (can decrease LDL-C by up to 10%)
   - smoking cessation: probably the most important for preventing CAD
   - dietary modification: reduce saturated fat, red meat, refined sugar, alcohol; consume nuts, fruits/vegetables, poultry, fish
   - physical activity: at least 150 min of moderate to vigorous intensity aerobic exercise per wk, in bouts of 10 min or more to reduce CVD risk (see Table 5)
   - employ consistent lifestyle modifications for at least 3 mo before considering drug therapy; high risk patients should start treatment immediately with concurrent health behaviour interventions
2. Pharmacologic therapy (can decrease LDL-C by up to 40%)
   - for a comparison of dyslipidemia medications, see Endocrinology, E3
   - 1st line monotherapy: statins (HMG-CoA reductase inhibitors)
     - risks: myopathy and hepatotoxicity
     - if severe side effects: ezetimibe (cholesterol absorption inhibitor) can be used for 19% reduction in LDL-C
     - post-acute coronary syndrome, cholesterol absorption inhibitors (e.g. ezetimibe) in addition to simvastatin reduced mortality, attained lipid targets <1.8, and improved outcomes in high risk individuals

- lower evidence for other agents: bile acid sequestrants, nicotinic acid, fibrates, psyllium
  - monitoring
- ALT, CK, creatinine at baseline then 6 wk later for signs of transaminitis or myositis; tolerate rise in CK up to 10 times upper limit of normal vs. 2-3 times if symptomatic, or serum creatinine rise of ≤25%
- no routine repeated measures of ALT and CK necessary in asymptomatic patients using statin therapy
- if adequate response is achieved, evaluate fasting lipids q6-12mo

**Clinical Definition of Metabolic Syndrome**

- Central obesity
  Men – waist circumference ≥94 cm
  Women – waist circumference ≥80 cm
- Plus any TWO of the following four factors

| Risk Factor | Defining Level |
|---|---|
| TG level | ≥1.7 mmol/L (150 mg/dL) |
| HDL-C level: | |
| Men | <1.0 mmol/L (40 mg/dL) |
| Women | <1.3 mmol/L (50 mg/dL) |
| Blood pressure | ≥130/85 mmHg |
| Fasting glucose level | ≥5.6 mmol/L (100 mg/dL) |

### Isolated Hypertriglyceridemia

- does not increase cardiovascular risk
- normal HDL-C and TC, elevated TG
- mild ≥2.2 mmol/L (≥200 mg/dL); marked ≥5.6 mmol/L (≥500 mg/dL)
- principal therapy is lifestyle modification
  - weight loss, exercise, avoidance of smoking and alcohol, effective blood glucose control in diabetics, increased omega-3 fatty acid intake
  - severe hypertriglyceridemia (typically >10 mmol/L) is associated with an increased risk of acute pancreatitis
- drug therapy (lowers risk for pancreatitis, not CAD)
  - nicotinic acid
  - fibrates

## Exercise

**Table 5. Canadian 24-Hour Movement Guidelines (2017 CSEP Guidelines)**

| Age Category | Physical Activity Guidelines | Example Activities | Sleep/Sit Guidelines |
|---|---|---|---|
| **Infant (<1)** | Active several times daily<br>Tummy time for at least 30 min/d | Interactive floor-based play including tummy time, reaching for toys, crawling | **Sleep**: 14-17 h/d of good quality sleep including naps<br>**Sit**: not restrained (i.e. in a stroller) for more than 1 h, screen time not recommended, engaging in reading/storytelling while sedentary |
| **Toddler (1-2)** | Accumulate 180 min of physical activity at any intensity spread throughout the day including energetic play | Moving around the home<br>Climbing stairs<br>Exploring environment<br>Brisk walking, running, dancing | **Sleep**: 11-14 h/d of good quality sleep including naps<br>**Sit**: not restrained (i.e. in a stroller) for more than 1 h, screen time not recommended, engaging in reading/storytelling while sedentary |
| **Preschool (2-4)** | Accumulate >180 min in a variety of activities at any intensity, including at least 60 min of energetic play throughout the day | Moving around the home<br>Climbing stairs<br>Exploring environment<br>Brisk walking, running, dancing | **Sleep**: 10-13 h/d of good quality sleep which may include a nap<br>**Sit**: not restrained (i.e. in a stroller) for more than 1 h, screen time no more than 1 h (less is better), reading/storytelling while sedentary |
| **Children (5-11) and Youth (12-17)** | Moderate to vigorous aerobic and muscle/bone strengthening exercises 60 min/d 3x/wk<br>Light physical activity for several hours per day | Moderate: bike riding, playground<br>Vigorous: running, swimming | **Sleep**: 9-11 h/d (5-13 yr), 8-10 h/d (16-17 yr)<br>**Sit**: no more than 2 h/d of recreational screen time, limit sitting for extended periods |
| **Adults (18-64)** | Accumulate 150 min of moderate to vigorous intensity aerobic physical activity per wk, in bouts of 10 min or more<br>It is beneficial to add muscle and bone strengthening activities using major muscle groups, at least 2 d/wk | Moderate: brisk walking, bike riding<br>Vigorous: jogging, cross country skiing | No specific guidelines |
| **Older Adults (≥65)** | Same as Adults above | Same as Adults above<br>Those with poor mobility should perform physical activities to enhance balance and prevent falls | No specific guidelines |

**Statin-Related Adverse Events: A Meta-Analysis**
Clin Ther 2006;28:26-35
**Purpose**: To synthesize adverse event (AE) data with statin use based on RCT data.
**Methods**: Meta-analysis of RCTs focused on adverse effects of statins. Eligible patients were those taking statin monotherapy for primary or secondary prevention of CVD, compared to placebo. AEs including elevated liver enzymes or myopathy (myalgias, elevated CK, rhabdomyolysis) were the main outcomes.
**Results**: Statin therapy increased the risk of any AE by 39% (OR 1.4; 95% CI 1.09-1.80; p=0.008) compared with placebo. Treating 1000 patients with a statin would cause 5 AE. Serious events (CK >10 times the upper limit of normal or rhabdomyolysis) are infrequent (NNH 3400) and rhabdomyolysis, although serious, is rare (NNH 7428).
**Conclusion**: Statin therapy was associated with greater odds of AEs compared with placebo but with substantial clinical benefit. Similar rates of serious AEs were observed between statin and placebo.

### Epidemiology
- 25% of the population exercises regularly, 50% occasionally, 25% are sedentary

### Management
- assess current level of fitness, motivation, and access to exercise
- encourage warm up and cool down periods to allow transition between rest and activity and to avoid injuries
- exercise with caution for patients with CAD, DM (risk of hypoglycemia), exercise-induced asthma
- patients with known CAD should have cardiac assessment prior to commencing exercise
- benefits of exercise
  - reduces risk of premature death, heart disease, stroke, HTN, certain types of cancer, type 2 DM, osteoporosis, and overweight/obesity
  - leads to improved fitness, strength, and mental health (morale and self-esteem)

## Smoking Cessation

### Epidemiology
- smoking is the single most preventable cause of premature illness and death
- 70% of smokers see a physician each year
- 2012 Canadian Tobacco Use Monitoring Survey (CTUMS) on population age ≥15
  - 16% are current smokers (lowest since 1965)
  - highest prevalence in age group 20-24 (20%)
  - 11% of youth age 15-19 smoke (decreased from 25% in 2000): more males smoke than females; number of cigarettes consumed per day also decreasing

### Management
- general approach
  - identify tobacco users; elicit smoking habits, previous quit attempts, and results
  - 2012 CAN-ADAPTT Guidelines
    - tobacco use status should be updated for all patients regularly
    - health care providers should clearly advise patients to quit
    - health care providers should also monitor the patient's mental health status/other addictions while quitting smoking
- medication dosage should be monitored and adjusted as necessary
  - every smoker should be offered treatment
- combining counselling and smoking cessation medication is more effective than either alone
  - educate patient to watch for withdrawal symptoms
- low mood, insomnia, irritability, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite
  - ≥4 counselling sessions >10 min each with 6-12 mo follow-up yields better results
  - 14% abstinent with counselling vs. 10% without counselling
  - approach depends on patient's stage of change (see *Motivational Strategies for Behavioural Change*, FM6)
- willing to quit
  - provision of social support, community resources (self-help, group, helpline, web-based strategies)
  - pregnant patients: counselling is recommended as first line treatment
    - nicotine replacement therapy (NRT) should be made available to pregnant women who are unable to quit using non-pharmacologic methods
    - intermittent NRT use (lozenges, gum) is preferred over continuous dosing of the patch
    - no strong evidence that either major positive or negative outcomes were associated with gestational use of bupropion or varenicline; consider using only if benefits outweigh risks and consult Motherisk Helpline
- pharmacologic therapy
  1. Nicotine Replacement Therapy
     - 19.7% abstinent at 12 mo with NRT vs. 11.5% for placebo
     - no difference in achieving abstinence for different forms of NRT
     - reduces cravings and withdrawal symptoms without other harmful substances that are contained in cigarettes
     - use with caution: immediately post-MI, worsening angina, arrhythmia
     - advise no smoking while using NRT
  2. Antidepressants (mechanism of action appears to be independent of antidepressant effect)
     - bupropion SR (Zyban®)
     - 21% abstinent at 12 mo vs. 8% for placebo
     - similar effectiveness of NRT vs. bupropion
  3. Varenicline (Champix®)
     - partial nicotinic receptor agonist (to reduce cravings) and partial competitive nicotinic receptor antagonist (to reduce the response to smoked nicotine)
     - more effective than bupropion (23% abstinent from 9-52 wk with varenicline vs. 16% with bupropion vs. 9% with placebo)
     - significant side effects may lower patient compliance

**Antidepressants for Smoking Cessation**
Cochrane Database Syst Rev 2014;1:CD000031
**Purpose**: To assess the efficacy and safety of antidepressants for long-term smoking cessation.
**Methods**: Meta-analysis of RCTs comparing antidepressant medications to placebo or alternative medications for smoking cessation. Studies comparing different doses, use of pharmacotherapy for relapse prevention or re-initiation of smoking cessation, or those targeting reduction in cigarette consumption by smokers, were also considered eligible. Eligible studies were required to have a minimum of 6 mo follow-up.
**Results**: 90 trials were included. Antidepressants found to significantly increase long-term cessation included bupropion alone (risk ratio (RR) 1.62, 95% CI 1.49-1.76) and nortriptyline alone (RR 2.03, 1.48-2.78), which appeared equally effective to each other and to nicotine replacement therapy (NRT). No significant additional long-term benefit was found with adding bupropion (RR 1.19, 0.94-1.51) or nortriptyline (RR 1.21, 0.94-1.55) to NRT. Significantly lower quit rates (RR 0.68, 0.56-0.83) and increased adverse events close to statistical significance (1.30, 1.00-1.69) were found with buproprion compared to varenicline. No evidence showed significant effectiveness for selective serotonin reuptake inhibitors alone (RR 0.93, 0.71-1.22) or in addition to NRT (RR 0.70-0.64-1.82), or with monoamine oxidase inhibitors alone (RR 1.29, 0.93-1.79), venlafaxine (RR 1.22, 0.64-2.32), St. John's wort/hypericum (RR 0.81, 0.26-2.53) or SAMe dietary supplement (RR 0.70, 0.24-2.07).
**Conclusion**: The antidepressants bupropion and nortriptyline can aid smoking cessation and have a similar efficacy to NRT. Bupropion is less effective than varenicline. Neither SSRIs (e.g. fluoxetine) nor MAOIs aid smoking cessation.

**The 5 A's for Patients Willing to Quit**
**A**sk if the patient smokes
**A**dvise patients to quit
**A**ssess willingness to quit
**A**ssist in quit attempt
**A**rrange follow-up

**The 2-3 Pattern of Smoking Cessation**
- Onset of withdrawal is 2-3 h after last cigarette
- Peak withdrawal is at 2-3 d
- Expect improvement of withdrawal symptoms at 2-3 wk
- Resolution of withdrawal at 2-3 mo
- Highest relapse rate within 2-3 mo

**Assist Patient in Developing Quit Plan**

**STAR**
**S**et quit date
**T**ell family and friends (for support)
**A**nticipate challenges (e.g. withdrawal)
**R**emove tobacco-related products (e.g. ashtrays/lighters)

**Physician Advice for Smoking Cessation**
Cochrane Database Syst Rev 2013;5:CD000165
**Purpose**: To assess the effectiveness of physician advice in promoting smoking cessation, compare minimal physician interventions with more intensive interventions, assess the effectiveness of various aids in smoking cessation, and determine the effect of anti-smoking advice on mortality.
**Methods**: Systematic review of RCTs of smoking cessation advice from a health care provider. Abstinence was assessed at least 6 mo after advice was provided.
**Results**: 42 trials with over 31,000 smokers were identified. Most common setting for advice delivery was primary care. A significant increase in quitting rates was noted with advice versus no advice (relative risk (RR) 1.66, 95% CI 1.42-1.94), which was further increased where the intervention was considered more intensive (RR 1.84, 1.60-2.13; n.s.). Intensive advice showed a small advantage to minimal advice when directly compared (RR 1.37, 1.20-1.56). A small benefit with follow-up visits was also found. No statistically significant difference in mortality at 20 yr follow-up was noted.
**Conclusion**: Simple advice can increase cessation rates by 1-3%. More intensive advice and providing follow-up support may further increase quit rates.

**Table 6. Types of Nicotine Replacement Therapy**

| Type | Dosage | Comment | Side Effects |
|---|---|---|---|
| **Nicotine Gum (OTC)** | 2 mg if <25 cig/d<br>4 mg if >25 cig/d<br>1 piece q1-2h for 1-3 mo<br>(max 24 pieces/d) | Chew until "peppery" taste then "park" between gum and cheek to facilitate absorption<br>Continue to chew-park intermittently for 30 min | Mouth soreness<br>Hiccups<br>Dyspepsia<br>Jaw ache<br>Most are transient |
| **Nicotine Patch (OTC)** | Use for 8 wk<br>21 mg/d x 4 wk<br>14 mg/d x 2 wk<br>7 mg/d x 2 wk | Start with lower dose if <10 cig/d<br>Change patch q24h and alternate sides | Skin irritation<br>Insomnia<br>Palpitations<br>Anxiety |
| **Nicotine Inhaler (OTC)** | 6-16 cartridges/d<br>up to 12 wk | Nicotine inhaled through mouth, absorbed in mouth and throat not in lungs | Local irritation<br>Coughing |
| **Nicotine Nasal Spray (Rx)** | | Newer form of NRT | Local irritation<br>Coughing |

**Table 7. Pharmacologic Treatments for Smoking Cessation**

| Drug | Mechanism | Dosage | Prescribing* | Contraindications |
|---|---|---|---|---|
| **Bupropion** | Inhibits re-uptake of dopamine and/or norepinephrine<br>Side effects: insomnia, dry mouth | 1. 150 mg qAM x 3 d<br>2. Then 150 mg bid x 7-12 wk<br>3. For maintenance consider 150 mg bid for up to 6 mo | 1. Decide on a quit date<br>2. Continue to smoke for first 1-2 wk of treatment and then completely stop (therapeutic levels reached in 1 wk) | Seizure disorder<br>Eating disorder<br>MAOI use in past 14 d<br>Simultaneous use of bupropion (Wellbutrin®) for depression |
| **Varenicline** | Partial nicotinic receptor agonist, and partial nicotinic receptor competitive antagonist<br>Side effects: nausea, vomiting, constipation, headache, dream disorder, insomnia, increased risk of psychosis, depression, suicidal ideation | 1. 0.5 mg qAM x 3 d<br>2. Then 0.5 mg bid x 4 d<br>3. Continue 1 mg bid x 12 wk ± additional 12 wk as maintenance | 1. Decide on a quit date<br>2. Continue to smoke for first wk of treatment and then completely stop | Caution with pre-existing psychiatric condition |

*Bupropion and verenicline may be used in combination with nicotine replacement therapy

**Nicotine Replacement Therapy for Smoking Cessation**
Cochrane Database Syst Rev 2012;11:CD000146
**Purpose**: To determine the effect of nicotine replacement therapy (NRT) versus placebo and other pharmacotherapies for smoking cessation, and to determine whether abstinence rates are influenced by NRT form, single-therapy or combination therapy, dosage, timing of use, additional advice and support offered, or clinical setting of recruitment and treatment.
**Results**: 150 trials were identified. All forms of NRT relative to placebo was associated with a significant increase in abstinence (risk ratio (RR) 1.60, 95% CI 1.53-1.68). A similar increase was seen by NRT form for the nicotine gum (RR 1.49, 1.40-1.60), nicotine patch (RR 1.64, 1.52-1.78), oral tablets/lozenges (RR 1.95, 1.61-2.36), nicotine inhaler (RR 1.90, 1.36-2.67) and nicotine nasal spray (RR 2.02, 1.49-2.73). Effects were independent of duration of therapy, intensity of additional support or setting in which NRT was offered. Some evidence suggested combining a nicotine patch with rapid NRT delivery was more effective than a single type of NRT (RR 1.34, 1.18-1.51), though not statistically significant. No evidence of a significant difference in efficacy relative to buproprion was found (RR 1.01, 0.87-1.18), and combination therapy with the two was more effective than buproprion alone (RR 1.24, 1.06-1.45). While side-effects were noted, no evidence suggested increased risk of heart attacks with NRT.
**Conclusions**: All commercially available forms of NRT (gum, transdermal patch, nasal spray, inhaler, and sublingual tablets/lozenges) are effective as part of a strategy to promote smoking cessation. They increase the rate of quitting by 50-70% regardless of setting and independent on the level of additional support provided to the smoker. Compared to a single form of NRT, combining a nicotine patch with a rapid delivery form of NRT may be more effective.

- unwilling to quit
  - motivational intervention (5 Rs)
    1. **R**elevance to patient
       - relevant to patient's disease status or risk, family or social situation (e.g. having children in the home), health concerns, age, gender
    2. **R**isks of smoking
       - short-term: SOB, asthma exacerbation, impotence, infertility, pregnancy complications, heartburn, URTI
       - long-term: MI, stroke, COPD, lung CA, other cancers
       - environmental: higher risk in spouse/children for lung CA, SIDS, asthma, respiratory infections
    3. **R**ewards: benefits
       - improved health, save money, food tastes better, good example to children
    4. **R**oadblocks: obstacles
       - fear of withdrawal, weight gain, failure, lack of support
    5. **R**epetition
       - reassure unsuccessful patients that most people try many times before successfully quitting (average number of attempts before success is 7)
- recent quitter
  - highest relapse rate within 3 mo of quitting
    - minimal practice: congratulate on success, encourage ongoing abstinence, review benefits and problems
    - prescriptive interventions: address problem of weight gain, negative mood, withdrawal, lack of support

# Alcohol Use

- see Psychiatry, PS26

## Definition

- alcohol use disorder diagnostic categories occur along a continuum

## Epidemiology

- 10-15% of patients in family practice are problem drinkers
- 20-50% of hospital admissions, 10% of premature deaths, 30% of suicides, and 50% of fatal traffic accidents in Canada are alcohol-related
- more likely to miss diagnosis in women, elderly, and patients with high socioeconomic status

**Standard Drink Equivalents**
One standard drink = 14 g of pure alcohol
- Beer (5% alcohol) = 12 oz
- Wine (12-17% alcohol) = 5 oz
- Fortified wine = 3 oz
- Hard liquor (40%) = 1.5 oz

### Assessment
- screen for alcohol dependence with CAGE questionnaire
  - if CAGE positive, explore with further questions for alcohol abuse/dependence
- assess drinking profile
  - setting, time, place, occasion, with whom
  - impact on: family, work, social
  - quantity-frequency history
    - how many drinks per day?
    - how many days per week?
    - maximum number of drinks on any one day in the past month?
- if identified positive for alcohol problem
  - screen for other drug use
  - identify medical/psychiatric complications
  - ask about drinking and driving
  - ask about past recovery attempts and current readiness for change

**CAGE Questionnaire**
Have you ever felt you needed to **C**ut down on your drinking?
Have people **A**nnoyed you by criticizing your drinking?
Have you ever felt **G**uilty about drinking?
Have you ever felt you needed a drink first thing in the morning (**E**ye-opener) to steady your nerves or to get rid of a hangover?
Two "yes" responses is considered positive

### Investigations
- GGT and MCV for baseline and follow-up monitoring
- AST, ALT (usually AST:ALT approaches 2:1 in an alcoholic)
- CBC (anemia, thrombocytopenia), INR (decreased clotting factor production by liver)

### Management
- intervention should be consistent with patient's motivation for change
- individualized counselling and regular follow-up is crucial
- 10% of patients in alcohol withdrawal will have seizures or delirium tremens
- Alcoholics Anonymous/12-step program
  - outpatient/day programs for those with chronic, resistant problems
  - family treatment (Al-Anon, Alateen, screen for spouse/child abuse)
- in-patient program if:
  - dangerous or highly unstable home environment
  - severe medical/psychiatric problem
  - addiction to drug that may require in-patient detoxification
  - refractory to other treatment programs
- pharmacologic
  - diazepam for withdrawal
  - disulfiram (Antabuse®): impairs metabolism of alcohol by blocking conversion of acetaldehyde to acetic acid, leading to flushing, headache, N/V, hypotension if alcohol is ingested (available in U.S., but no longer available in Canada)
  - naltrexone: competitive opioid antagonist that reduces cravings and pleasurable effects of drinking
- may trigger withdrawal in opioid-dependent patients
  - acamprosate: glutamate receptor modulator that also reduces craving
- see Psychiatry, PS26

**Figure 6. Continuum of alcohol use**

### Prognosis
- relapse is common and should not be viewed as failure
- monitor regularly for signs of relapse
- 25-30% of abusers exhibit spontaneous improvement over 1 yr
- 60-70% of individuals with jobs and families have an improved quality of life 1 yr post-treatment

**Some Adverse Medical Consequences of Problem Drinking**
- GI: gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral/esophageal cancer
- Cardiac: HTN, alcoholic cardiomyopathy
- Neurologic: Wernicke-Korsakoff syndrome, peripheral neuropathy
- Hematologic: anemia, coagulopathies
- Other: trauma, insomnia, family violence, anxiety/depression, social/family dysfunction, sexual dysfunction, fetal damage

# Common Presenting Problems

## Abdominal Pain

- see Gastroenterology, G4, General Surgery, GS4, and Emergency Medicine, ER59

### Epidemiology
- 20% of individuals have experienced abdominal pain within the last 6-12 mo
- 90% resolve in 2-3 wk
- only 10% are referred to specialists, of those <10% admitted to hospital

### Etiology
- most common diagnosis in family medicine at 28% is "nonspecific abdominal pain," which has no identifiable cause and is usually self-limited
- GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticular disease, biliary tract disease)
- urinary tract disorders (e.g. UTI, renal calculi)
- gynecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
- cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
- other: DKA, porphyria, hypercalcemia, medications (e.g. NSAIDs), alcohol, toxic ingestion, foreign body, psychogenic

If pain precedes nausea/vomiting, cause of abdominal pain is more likely to be surgical

### Pathophysiology
- type of pain
  - somatic pain: sharp, localized pain
  - visceral pain: dull, generalized pain
- location of pain
  - epigastric (foregut): distal esophagus, stomach, proximal duodenum, biliary tree, pancreas, liver
    - RUQ: biliary, hepatic, colonic, pulmonary, renal
    - LUQ: cardiac, gastric, pancreatic, renal, vascular
  - periumbilical (midgut): distal duodenum to proximal 2/3 of transverse colon
  - hypogastric (hindgut): distal 1/3 of transverse colon to rectosigmoid region
    - RLQ: colonic, appendix, gynecologic, renal
    - LLQ: colonic, gynecologic, renal
  - any location: aneurysm, dissection, ischemia, zoster, muscle strain, hernia, bowel obstruction, peritonitis, porphyria, DKA

**Abdominal Pain Red Flags**
- Severe pain
- Signs of shock
- Peritoneal signs
- Abdominal distention
- Pain out of proportion to clinical findings
- New onset pain, change in pain, or altered bowel habits in elderly
- Weight loss
- Blood per rectum/melena
- Anemia
- Supraclavicular nodes
- Family history of serious bowel disease

### Investigations
- guided by findings on history and physical
- possible blood work: CBC, electrolytes, BUN, Cr, amylase, lipase, AST, ALT, ALP, bilirubin, glucose, INR/PTT, toxicology screen, β-hCG
- imaging
  - CXR (for free air under the diaphragm) in setting of perforation in surgical abdomen
  - abdominal x-ray, KUB (consider: gas pattern, free air, kidney stones, constipation)
  - ultrasound (renal stones, gallbladder disease, gynecological problems, liver disease, pancreatitis, diverticular disease, appendicitis)
  - CT scan (AAA, appendicitis), non-contrast helical CT-Scan (first choice for renal stones)
- other tests
  - urinalysis
  - endoscopy (for peptic ulcers, gastritis, tumours, etc.)
  - *H. pylori* testing (urea breath test, serology, biopsy)

In patients >50, keep a high index of suspicion for AAA – its presentation may mimic renal colic or diverticulitis

## Allergic Rhinitis

- see Otolaryngology, OT23

### Definition
- inflammation of the nasal mucosa that is triggered by an allergic reaction
- classification
  - seasonal
    - symptoms during a specific time of the year
    - common allergens: trees, grass and weed pollens, airborne moulds
  - perennial
    - symptoms throughout the year with variation in severity
    - common allergens: dust mites, animal dander, moulds
- persistent allergic rhinitis may lead to chronic rhinosinusitis

**Differential Diagnosis**
- Acute viral infection
- Vasomotor rhinitis
- Deviated septum
- Nasal polyps
- Acute/chronic sinusitis
- Drug-induced rhinitis

**Rhinitis Medicamentosa**
Rebound nasal congestion. Occurs with prolonged use (>5-7 d) of vasoconstrictive intranasal medications. Patient may become dependent, requiring more frequent dosing to achieve the same decongestant effect

### Epidemiology
- affects approximately 40% of children and 20-30% of adults
- prevalence has increased in developed countries, particularly in the past two decades
- associated with asthma, eczema, sinusitis, and otitis media

### Etiology
- increased IgE levels to certain allergens → excessive degranulation of mast cells → release of inflammatory mediators (e.g. histamine) and cytokines → local inflammatory reaction

### Assessment
- identify allergens
- take an environmental/occupational history
- ask about related conditions (e.g. atopic dermatitis, asthma, sinusitis, and family history)

### Management
- conservative
  - minimize exposure to allergens
    - most important aspect of management, often sufficient (may take months)
  - maintain hygiene, saline nasal rinses
- pharmacologic agents
  - oral antihistamines – first line therapy for mild symptoms
    - e.g. cetirizine (Reactine®), fexofenadine (Allegra®), loratadine (Claritin®)
  - intranasal corticosteroids for moderate/severe or persistent symptoms (>1 mo of consistent use to see results)
  - intranasal decongestants (use must be limited to <5 d to avoid rhinitis medicamentosa)

- allergy skin testing
  - for patients with chronic rhinitis whose symptoms are not controlled by conservative and pharmacological therapy
  - may identify allergens to include in immunotherapy treatment
- immunotherapy (allergy shots)
  - reserved for severe cases unresponsive to pharmacologic agents
  - consists of periodic (usually weekly) subcutaneous injections of custom prepared solutions of one or more antigens to which the patient is allergic

# Amenorrhea

- see Gynecology, GY7

# Anxiety

- see Psychiatry, PS20

## Epidemiology

- 25-30% of patients in primary care settings have psychiatric disorders
- many are undiagnosed or untreated; hence the need for good screening
- high rate of coexistence of anxiety disorders and depression

## Screening

- screening tools such as the Generalized Anxiety Disorder 7-item (GAD-7) tool
- screening questions
  - Do you tend to be an anxious or nervous person?
  - Have you felt unusually worried about things recently?
  - Has this worrying affected your life? How?

## Assessment

- associated symptoms
- risk factors: past history of anxiety, stressful life event, trauma, social isolation, female, comorbid psychiatric diagnosis (e.g. depression), family history of anxiety or depression
- assess substance abuse, suicidal ideation/self-harm
- to differentiate anxiety disorders, consider symptoms and their duration
- use the GAD-7 tool to assess and monitor levels of anxiety

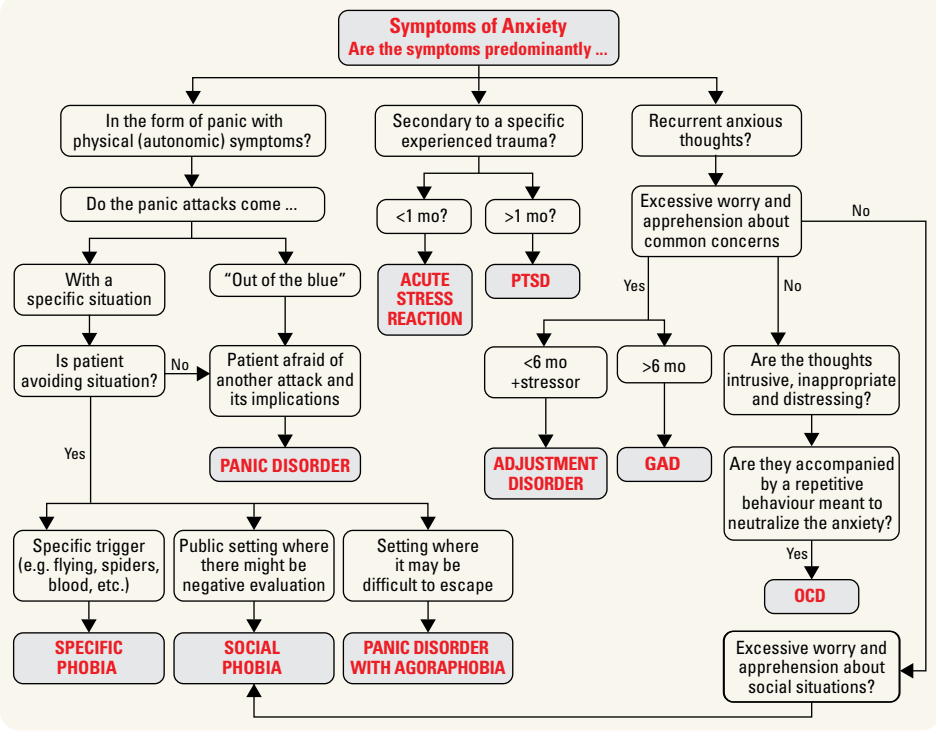


**Figure 7. Differentiating anxiety disorders**
Adapted from: Evans M, Bradwejn J, Dunn L. Anxiety Review Panel. Guidelines for the treatment of anxiety disorders in primary care. Toronto: Queen's Printer of Ontario, 2000.41

**Symptoms of GAD**

**AND I C REST**
**A**nxious, nervous, or worried
**N**o control over the worry
**D**uration >6 mo
**I**rritability
**C**oncentration impairment
**R**estlessness
**E**nergy decreased
**S**leep impairment
**T**ension in muscles
Can Fam Physician 2005;51:1340-42

**Differential Diagnosis of Anxiety Disorders**
- Panic disorder
- GAD
- Social Anxiety Disorder (previously Social Phobia)
- Agoraphobia
- Specific phobia
- Selective Mutism
- Separation Anxiety Disorder
- Other: GMC, AMC, mood disorder, psychotic disorder, OCD, PTSD

**Rule Out**
- Cardiac (post MI, arrhythmias)
- Endocrine (hyperthyroidism, diabetes, pheochromocytoma)
- Respiratory (asthma, COPD)
- Somatoform disorders
- Psychotic disorders
- Mood disorders (depression, bipolar)
- Personality disorder (OCPD)
- Drugs (amphetamines, thyroid preparations, caffeine, OTC for colds/decongestants, alcohol/benzodiazepine withdrawal)

### Management
- patient education: emphasize prevalence, good recovery rate of anxiety conditions
- lifestyle advice: exercise, decrease caffeine and alcohol intake
- psychological: CBT, including exposure therapy, relaxation techniques, and mindfulness strategies
- pharmacotherapy: see Psychiatry, PS43
- provide self-help materials, connect with community resources (e.g. support groups), and provide support to family and caregivers

## Asthma/COPD

- see Respirology, R7

### Definition
- asthma
  - chronic, reversible airway inflammation characterized by periodic attacks of wheezing, SOB, chest tightness, and coughing
  - airways are hyper-responsive to triggers/antigens leading to acute obstructive symptoms by bronchoconstriction, mucous plugs, and increased inflammation
  - cannot be diagnosed at first presentation; is called reactive airway disease until recurrent presentations
  - PFTs can be done starting at age 6 or when child is able to follow testing instructions
  - peak flow metres are useful in the office and at home for monitoring
- chronic obstructive pulmonary disease (COPD)
  - group of chronic, progressive, non-reversible lung diseases characterized by limited airflow with variable degrees of air sac enlargement and lung tissue destruction
  - emphysema and chronic bronchitis are the most common forms

**Table 8. Differentiating COPD from Asthma**

| | COPD | Asthma |
|---|---|---|
| **Age of Onset** | Usually in 6th decade | Any age (but 50% of cases are diagnosed in children age <10) |
| **Role of Smoking** | >10 pack yr | Not causal, known trigger |
| **Reversibility of Airflow Obstruction** | Airflow obstruction is chronic and persistent | Airflow obstruction is episodic and usually reversible with therapy |
| **Evolution** | Slow, progressive worsening (with periodic exacerbations) | Stable, episodic, <50% will outgrow |
| **History of Allergy** | Infrequent | >50% patients |
| **Precipitators** | Environmental irritants (air pollution), cigarette smoking, α-1 antitrypsin deficiency, viral infection, occupational exposure (firefighters, dusty jobs) | Environmental irritants (dust, pollen), animal fur, cold air, exercise, URTIs, cigarette smoke, use of β-blockers/ASA |
| **Symptoms/Signs** | Chronic cough, sputum, and/or dyspnea | Wheeze (hallmark symptom), dyspnea, chest tightness, prolonged expiration, cough which is worse in the cold, at night, and in the early AM |
| **Diffusion Capacity** | Decreased (more so in pure emphysema) | Normal (for pure asthma) |
| **Hypoxemia** | Chronic in advanced stages | Not usually present<br>Episodic with severe attacks |
| **Spirometry** | May have improvement with bronchodilators but not universally seen | Marked improvement with bronchodilators or steroids |
| **Chest X-Ray** | Often normal<br>Increased bronchial markings (chronic bronchitis) and chronic hyperinflation (emphysema) often co-exist, bullae | Often normal or episodic hyperinflation<br>Hyperinflation during asthma attack |
| **Management** | **Mild**<br>Step 1: SABA prn (salbutamol)<br>Step 2: SABA prn + LAAC (i.e. tiotropium) or + LABA (e.g. salmeterol)<br>**Moderate**<br>Step 3: SABA prn + LAAC + low-dose combined ICS/LABA; consider inhaled vs. oral steroids<br>**Severe**<br>Step 4: ± theophylline<br>Pneumococcal vaccination, annual influenza immunization | Ongoing patient education, and environmental control<br>SABA taken prn as rescue medication + maintenance meds<br>Maintenance medications<br>Step 1: Low-dose ICS<br>Step 2: Medium/high-dose ICS or low-dose ICS plus either LABA, LT modifier, or long-acting theophylline<br>Step 3: Medium/high-dose ICS + either LABA, LT modifier, or long-acting theophylline<br>Step 4: As above + immunotherapy ± oral glucocorticosteroids + pneumococcal vaccination, annual influenza immunization |

ICS = inhaled corticosteroids; LAAC = long-acting anticholinergic; LABA = long-acting β-agonist; LT modifier = leukotriene modifier; SABA = short-acting β-agonist

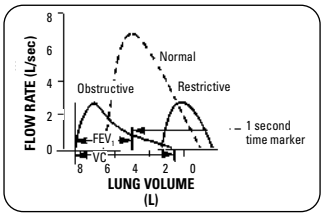

**Figure 8. Expiratory flow volume curves** (obstructive, normal, and restrictive disease)
See Respirology, R4 Adapted from: Weinberger SE. Principles of pulmonary medicine, 5th ed. With permission from Elsevier. ©2008

**Signs of Poorly Controlled Asthma**
- $\beta_2$-agonist use >4x/wk
- Asthma-related absence from work/school
- Exercise induced asthma
- Night-time symptoms >1x/wk

**What Colour is Your Inhaler?**

| Name | Body/Cap Colour |
|---|---|
| **$\beta_2$-Agonists** | |
| salbutamol – Ventolin® | light blue/navy |
| salmeterol – Serevent® | teal/light teal |
| terbutaline – Bricanyl® | blue/white |
| **ICS** | |
| fluticasone – Flovent® | orange/peach |
| budesonide – Pulmicort® | white/brown |
| **Combined Long-Acting $\beta_2$-Agonist + ICS** | |
| fluticasone/salmeterol – Advair® | purple discus |
| budesonide/formoterol – Symbicort® | red/white |
| ipratropium/albuterol – Combivent® | clear/orange |
| **Anticholinergics** | |
| ipratropium – Atrovent® | clear/green |
| tiotropium – Spiriva® | white/turquoise |

**More About Inhalers**
- Aerosols (puffers=MDI, MDI + spacer) MDIs should be used with spacers to:
  - Reduce side effects
  - Improve amount inhaled
  - Increase efficiency of use
- Dry Powder Inhalers (discus, turbuhaler, and diskhaler) require deep and fast breathing (may not be ideal for children)
- Nebulizers can be used to convert liquid medications into a fine mist: recommended for use if contraindications to MDIs

**Differential Diagnosis of Wheezing**
- Allergies, anaphylaxis
- Asthma, reactive airway disease
- GERD
- Infections (bronchitis, pneumonia)
- Obstructive Sleep Apnea
- COPD
- Less common: congestive heart disease, foreign body, malignancy, cystic fibrosis, vocal cord dysfunction

When prescribing salbutamol, watch out for signs of **hypokalemia**: lethargy, irritability, paresthesias, myalgias, weakness, palpitations, N/V, polyuria

# Benign Prostatic Hyperplasia

• see Urology, U7

## Definition
• hyperplasia of the stroma and epithelium in the periurethral transition zone

## History and Physical
• include current/past health, surgeries, trauma, current medications including OTC
• specific urinary symptoms
• physical exam must include DRE for size, symmetry, nodularity, and texture of prostate (prostate is symmetrically enlarged, smooth, and rubbery in BPH)

## Investigations
• urinalysis to exclude UTI and for microscopic hematuria (common sign)
• serum PSA: protein produced by prostatic tissue
  ▪ values
    ◆ <4.0 ng/mL: normal, but must take into account patient's age and velocity of PSA increase
    ◆ 4-10 ng/mL: consider measuring free/total PSA
    ◆ >10 ng/mL: high likelihood of prostate pathology
  ▪ PSA testing is inappropriate in men with a life expectancy less than 10 yr or patients with prostatitis, UTI
  ▪ increased PSA in a younger man is more often due to cancer than other causes
  ▪ abnormal DRE or PSA should trigger further assessment
  ▪ discuss test with men at increased risk of prostate cancer (FHx, African ancestry) or who are concerned about development of prostate cancer
  ▪ decision to test PSA in an asymptomatic man should involve discussion about the risks and possible benefits
• other tests
  ▪ Cr, BUN, post-void residual volume by ultrasound, urodynamic studies, renal ultrasound, patient voiding diary
• tests NOT recommended as part of routine initial evaluation include:
  ▪ cystoscopy, cytology, prostate ultrasound or biopsy, IVP, urodynamic studies

**Table 9. Symptoms and Complications of BPH**

| Obstructive Symptoms | Irritative Symptoms | Late Complications |
|---|---|---|
| Hesitancy (difficulty starting urine flow)<br>Diminution in size and force of urinary stream<br>Stream interruption (double voiding)<br>Urinary retention (bladder does not feel completely empty)<br>Post-void dribbling<br>Overflow incontinence<br>Nocturia | Urgency<br>Frequency<br>Nocturia<br>Urge incontinence<br>Dysuria | Hydronephrosis<br>Loss of renal concentrating ability<br>Systemic acidosis<br>Renal failure |

## Management
• referral to urologist if moderate/severe symptoms
• conservative: for patients with mild symptoms or moderate/severe symptoms considered by the patient to be non-bothersome
  ▪ fluid restriction (avoid alcohol and caffeine)
  ▪ avoidance/monitoring of certain medications (e.g. antihistamines, diuretics, antidepressants, decongestants)
  ▪ pelvic floor/Kegel exercises
  ▪ bladder retraining (scheduled voiding)
• pharmacological: for moderate/severe symptoms
  ▪ α-receptor antagonists (e.g. terazosin [Hytrin®], doxazosin [Cardura®], tamsulosin [Flomax®], alfuzosin [Xatral®])
    ◆ relax smooth muscle around the prostate and bladder neck
  ▪ 5-α reductase inhibitors (e.g. finasteride [Proscar®])
    ◆ only for patients with demonstrated prostatic enlargement due to BPH
    ◆ inhibit the enzyme responsible for conversion of testosterone to dihydrotestosterone (DHT) thus reducing growth of prostate
  ▪ phytotherapy (e.g. saw palmetto berry extract, Pygeum africanum)
    ◆ more studies are required before it can be recommended as standard therapy (currently considered safe)
• surgical
  ▪ TURP (transurethral resection of the prostate), TUIP (transurethral incision of the prostate, for prostate <30 g)
  ▪ absolute indications: failed medical therapy, intractable urinary retention, benign prostatic obstruction leading to renal insufficiency
  ▪ complications: impotence, incontinence, ejaculatory difficulties (retrograde ejaculation), decreased libido

**Self-Management Asthma and COPD Education and Written Action Plan**
• Education is a key component in management of asthma and COPD
• Guided self-management combining education, regular medical review, self-assessment, and written action plan have been shown to reduce hospitalizations, ER visits, and missed days at work or school.
• Sample action plans available online: http://www.respiratoryguidelines.ca

**Differential Diagnosis**
• Prostate cancer
• Urethral obstruction
• Bladder neck obstruction
• Neurogenic bladder
• Overactive bladder
• Cystitis
• Prostatitis

# Bronchitis (Acute)

## Definition
- acute infection of the tracheobronchial tree causing inflammation leading to bronchial edema and mucus formation

## Epidemiology
- 5th most common diagnosis in family medicine, and most common is URTI

## Etiology
- 80% viral: rhinovirus, coronavirus, adenovirus, influenza, parainfluenza, and respiratory syncytial virus (RSV)
- 20% bacterial: *M. pneumoniae, C. pneumoniae, S. pneumoniae*

## Investigations
- acute bronchitis is typically a clinical diagnosis
- sputum culture/Gram stain is not useful
- CXR if suspect pneumonia (cough >3 wk, abnormal vital signs, localized chest findings) or CHF
- PFT with methacholine challenge if suspect asthma

## Management
- primary prevention: frequent hand washing, smoking cessation, avoid irritant exposure
- symptomatic relief: rest, fluids (3-4 L/d when febrile), humidity, analgesics, and antitussives as required
- bronchodilators may offer improvement of symptoms (e.g. salbutamol)
- current literature does not support routine antibiotic treatment for the management of acute bronchitis because it is most likely to be caused by a viral infection
  - antibiotics may be useful if elderly, comorbidities, suspected pneumonia, or if the patient is toxic (see *Antimicrobial Quick Reference*, FM51)
  - antibiotics in children show no benefit

**Differential Diagnosis of Bronchitis**
- URTI
- Asthma
- Acute exacerbation of chronic bronchitis
- Sinusitis
- Pneumonia
- Bronchiolitis
- Pertussis
- Environmental/occupational exposures
- Post-nasal drip
- Others: GERD, CHF, cancer, aspiration syndromes, CF, foreign body

**How to Tell if Viral or Bacterial?**
Bacterial infections tend to give a higher fever, excessive amounts of purulent sputum production, and may be associated with concomitant COPD

# Chest Pain

- see Cardiology and Cardiac Surgery, C4 and Emergency Medicine, ER21

## Differential Diagnosis

**Table 10. Differential Diagnosis of Chest Pain**

| Diagnosis | Clinical Findings | LR+ | LR– |
|---|---|---|---|
| **Acute Myocardial Infarction** | Chest pain radiates to both arms | 7.1 | 0.67 |
| | Third heart sound on auscultation | 3.2 | 0.88 |
| | Hypotension | 3.1 | 0.96 |
| **Chest Wall Pain** | >2 of: localized muscle tension; stinging pain; pain reproducible by palpation; absence of cough | 3.0 | 0.47 |
| **Gastroesophageal Reflux Disease** | Burning retrosternal pain, acid regurgitation, sour or bitter taste in the mouth; 1 wk trial of high-dose proton pump inhibitor relieves symptoms | 3.1 | 0.30 |
| **Panic Disorder/Anxiety State** | Single question: In the past 4 wk, have you had an anxiety attack (suddenly feeling fear or panic)? | 4.2 | 0.09 |
| **Pericarditis** | Clinical triad of pleuritic chest pain (increases with inspiration or when reclining, and is lessened by leaning forward), pericardial friction rub, and electrocardiographic changes (diffuse ST segment elevation and PR interval depression without T wave inversion) | N/A | N/A |
| **Pneumonia** | Egophony | 8.6 | 0.96 |
| | Dullness to percussion | 4.3 | 0.79 |
| | Fever | 2.1 | 0.71 |
| | Clinical impression | 2.0 | 0.24 |
| **Heart Failure** | Pulmonary edema on chest radiography | 11.0 | 0.48 |
| | Clinical impression/judgment | 9.9 | 0.65 |
| | History of heart failure | 5.8 | 0.45 |
| | History of acute myocardial infarction | 3.1 | 0.69 |
| **Pulmonary Embolism** | High pretest probability based on Wells criteria | 6.8 | 1.8 |
| | Moderate pretest probability based on Wells criteria | 1.3 | 0.7 |
| | Low pretest probability based on Wells criteria | 0.1 | 7.6 |
| **Acute Thoracic Aortic Dissection** | Acute chest or back pain and a pulse differential in the upper extremities | 5.3 | N/A |

Adapted from: McConaghy J, Rupal S. Outpatient diagnosis of acute chest pain in adults. Am Fam Physician. 2013 Feb 1; 87(3): 177.182

**Risk Factors for CAD**

**Major**
- Smoking
- Diabetes
- HTN
- Hyperlipidemia
- Family history of early CAD in first degree relative (males <55 yr, females <65 yr)
- Untreated obstructive sleep apnea
- Chronic kidney disease

**Minor**
- Obesity
- Sedentary lifestyle
- Age

**Red Flags**
- Severe pain
- Pain for >20 min
- New onset pain at rest
- Severe SOB
- Loss of consciousness
- Hypotension
- Tachycardia
- Bradycardia
- Cyanosis

**Ruling Out Coronary Artery Disease in Primary Care**
CMAJ 2010;182(12):1295-1300
Components of the prediction rule used to determine the presence or absence of CAD in patients with chest pain in primary care:
- Age/sex (female ≥65, male ≥55): 1 pt
- Known clinical vascular disease (coronary artery disease, occlusive vascular disease, or cerebrovascular disease): 1 pt
- Pain worse during exercise: 1 pt
- Pain not reproducible by palpation: 1 pt
- Patient assumes pain is of cardiac origin: 1 pt

Positive result: 3-5 pts; negative result: ≤2 pts (sensitivity: 87.1%, specificity: 80%)

### Investigations
- ECG, CXR, and others if indicated (cardiac enzymes, d-dimers, liver function tests, etc.)
- refer to ED if suspect serious etiology (e.g. aortic dissection, MI)

### Management of Common Causes of Chest Pain
- angina/ischemic heart disease
  - nitroglycerin (NTG): wait 5 min between sprays and if no effect after 3 sprays, send to ED
- myocardial infarction
  - ASA (160-325 mg, chewed stat), clopidogrel (Plavix®), LMWH (enoxaparin), morphine, oxygen, NTG
  - ± reperfusion therapy with fibrinolytics (e.g. tissue plasminogen activator (tPA), reteplase (rPA), tenecteplase (TNK), or streptokinase (SK)) if within 12 h (ideally <30 min) or percutaneous intervention (cath lab) if <90 min
  - start β-blocker (e.g. metoprolol starting dose 25 mg PO q6h or bid, titrating to HR goal of 55-60 bpm)
- endocarditis: antibiotic choice is based on whether patient has a native or prosthetic heart valve as well as culture and sensitivity results
- GERD: antacids, H2-blockers, PPIs, patient education
- costochondritis: NSAIDs

**MI in Elderly Women**
Elderly women can often present with dizziness, back pain, lightheadedness, or weakness in the absence of chest pain

**MI in Diabetics**
May present with dyspnea, syncope, and fatigue in the absence of chest pain

# Common Cold (Acute Rhinitis)

- see Infectious Diseases, *Pneumonia and Influenza*, ID7

### Definition
- viral URTI with inflammation

### Epidemiology
- most common diagnosis in family medicine, peaks in winter months
- incidence: adults = 2-4/yr, children = 6-10/yr
- organisms
  - mainly rhinoviruses (30-35% of all colds)
  - others: coronavirus, adenovirus, RSV, influenza, parainfluenza, coxsackie virus
- incubation: 1-5 d
- transmission: person-person contact via secretions on skin/objects and by aerosol droplets

### Risk Factors
- psychological stress, excessive fatigue, allergic nasopharyngeal disorders, smoking, sick contacts

### Clinical Features
- symptoms
  - local: nasal congestion, clear to mucopurulent secretions, sneezing, sore throat, conjunctivitis, cough
  - general: malaise, headache, myalgias, mild fever
- signs
  - erythematous nasal/oropharyngeal mucosa, enlarged lymph nodes
  - normal chest exam
- complications
  - secondary bacterial infection: otitis media, sinusitis, bronchitis, pneumonia
  - asthma/COPD exacerbation

### Differential Diagnosis
- allergic rhinitis, pharyngitis, influenza, laryngitis, croup, sinusitis, bacterial infections

### Management
- patient education
  - symptoms peak at 1-3 d and usually subside within 1 wk
  - cough may persist for days to weeks after other symptoms disappear
  - no antibiotics indicated because of viral etiology
  - secondary bacterial infection can present within 3-10 d after onset of cold symptoms
- prevention
  - frequent hand washing, avoidance of hand to mucous membrane contact, use of surface disinfectant
  - yearly influenza vaccination
- symptomatic relief
  - rest, hydration, gargling warm salt water, steam, nasal irrigation (spray/pot)
  - analgesics and antipyretics: acetaminophen, ASA (not in children because risk of Reye's syndrome), ibuprofen
  - cough suppression: dextromethorphan or codeine if necessary (children <6 yr of age should not use any cough/cold medications)
  - decongestants, antihistamines
- patients with reactive airway disease will require increased use of bronchodilators and inhaled steroids

**Influenza vs. Colds: A Guide to Symptoms**

| Features | Flu | Cold |
|---|---|---|
| Onset of illness | Sudden | Slow |
| Fever | High fever | None |
| Exhaustion level | Severe | Mild |
| Cough | Dry severe or hacking | ± |
| Throat | Fine | Sore |
| Nose | Dry and clear | Runny |
| Head | Achy | Headache-free |
| Appetite | Decreased | Normal |
| Muscles | Achy | Fine |
| Chills | Yes | No |

**Echinacea for Preventing and Treating the Common Cold**
Cochrane DB Syst Rev 2014;2:CD000530
**Purpose**: To assess whether Echinacea preparations are effective and safe for the prevention and treatment of the common cold.
**Methods**: Meta-analysis of RCTs comparing mono-preparations of Echinacea with placebo. Primary efficacy outcome was number of individuals with at least one cold in prevention trials, and duration of colds in treatment trials. Primary safety and acceptability outcome was number of participants dropping out due to adverse events.
**Results**: 24 double-blind trials with 4631 participants were included. No prevention study comparisons comparing Echinacea and placebo found a statistically significant difference in terms of number of patients with at least one cold episode, though a relative risk reduction of 10% to 20% was identified. Of treatment trials reporting on duration of colds, only 1 study of 7 showed a significant effect favouring Echinacea over placebo. No significant differences were found between Echinacea and placebo groups in number of dropouts due to adverse events, though prevention trials showed a trend towards higher dropout numbers due to adverse events in treatment groups.
**Conclusions**: Echinacea products have not been shown to provide benefits for treating colds, although it is possible there is a weak benefit from some Echinacea products. Individual prophylaxis trials consistently show positive (if non-significant) trends, although potential effects are of questionable clinical relevance.

# Concussion/Mild Traumatic Brain Injury

- see Neurosurgery, NS31 and Emergency Medicine, ER8
- a useful tool for the assessment of individuals and athletes with concussion is the Sport Concussion Assessment Tool, 5th edition (SCAT5), Br J Sports Med 2017;0:1-8

# Contraception

- see Gynecology, GY15

### EMERGENCY CONTRACEPTION

- hormonal EC (Yuzpe® or Plan B®, usually 2 doses taken 12 h apart) or post-coital copper IUD insertion
- hormonal EC is effective if taken within 72 h of unprotected intercourse (reduces chance of pregnancy by 75-85%), most effective if taken within 24 h, does not affect an established pregnancy
- copper IUDs inserted within 5 d of unprotected intercourse are significantly more effective than hormonal EC (reduces chance of pregnancy by ~99%)
- pregnancy test should be performed if no menstrual bleeding within 21 d of either treatment
- advance provision of hormonal EC increases the use of EC without decreasing the use of regular contraception
- pharmacists across Canada can dispense Plan B® OTC

# Cough

### History and Physical

- duration (chronic - 8 wk), onset, frequency, quality (dry vs. productive), sputum characteristics, provoking/relieving factors, recent changes
- associated symptoms: fever, dyspnea, hemoptysis, wheezing, chest pain, orthopnea, PND, rhinitis, reflux, post-nasal drip
- constitutional symptoms: fever, chills, fatigue, night sweats
- risk factors: smoking, occupation, exposure, family history of lung CA or other CA, TB status, recent travel
- medications (e.g. ACEI, β-blockers), allergies
- PMH: lung (asthma, COPD, CF), heart (CHF, MI, arrhythmias), chronic illness, GI (reflux)
- vitals including $O_2$ saturation, respiratory exam, HEENT and precordial exam

### Investigations

- guided by findings on history and physical
  - consider throat swab, CXR, PFTs, upper GI series, sputum culture test for acid-fast bacilli (if TB is suspected)

**Differential Diagnosis**

**Common Causes**
- Upper airway cough syndrome (post-nasal drip)
- Asthma/COPD
- GERD
- Non-asthmatic eosinophilic bronchitis

**Other Causes**
- ACEI
- Aspiration
- Bronchiectasis
- Cystic fibrosis
- Chronic interstitial lung disease
- CHF
- Lung/laryngeal cancer
- Pertussis
- Psychogenic
- Restrictive lung disease
- TB, atypical mycobacterium, and other chronic lung infections

# Dementia (Major Neurocognitive Disorder)

- see Psychiatry, PS23

### Epidemiology

- 15% of Canadians ≥65 yr are living with dementia; risk for dementia doubles every 5 yr after age 65
- prevalence of depression in dementia is 20-60%; major depression decreases as dementia severity increases; vascular and mixed dementias have a higher prevalence of depression
- leading types of dementia: Alzheimer's (40-50%), Mixed (20-25%), Lewy-Body (5-15%), Vascular (5-10%), Frontotemporal (5-10%)

### Investigations

- history, physical exam, MMSE, MOCA (best screening test), Dementia Quick Screen (see sidebar)
- investigations are completed to exclude reversible causes of dementia and should be selected based on the clinical circumstances
- CBC, liver enzymes, TSH, renal function tests, serum electrolytes, serum calcium, serum glucose, vitamin $B_{12}$, folate, VDRL, HIV, head CT

### Management

- treat and prevent reversible causes
- provide orientation cues (e.g. calendars, clocks) and optimize vision and hearing
- family education, counselling, and support (respite programs, group homes)
- pharmacologic therapy: N-methyl-d-aspartate receptor antagonists and cholinesterase inhibitors slow rate of cognitive decline; low-dose neuroleptics and antidepressants can be used to treat behavioural and emotional symptoms
- 20% of patients develop clinical depression, most commonly seen in vascular dementia

**Dementia Quick Screen = Mini Cog + Animal Naming**
- 3 simple tests, takes about 2 min
- Use when suspect mild cognitive impairment or when patient is at high risk
- Mini Cog = 3 words recalled + clock drawing
  - Clock Drawing – including numbers and hands so time shows 10 min past 11 (normal = correct number/hand placing or only minor spacing problems)
  - 0 word recall = impairment
  - 1-2 words and clock drawing abnormal = impairment
  - 3 words recalled = normal
  - Naming animals in 1 min (normal = >15 in one min)
- Interpretation: If all 3 results within normal range, cognitive impairment unlikely
- Return for further evaluation if:
  - <15 animals named
  - 0-1 words recalled
  - Clock drawing abnormal

# Depression

• see Psychiatry, PS12

## Etiology
- often presents as non-specific complaints (e.g. sleep disturbance, chronic fatigue, pain)
- depression is a clinical diagnosis and tests are done in order to rule out other causes of symptoms
- 2/3 of patients may not receive appropriate treatment for their depression
- early diagnosis and treatment improve outcomes

## Screening Questions
- Canadian Task Force on Preventive Health Care (2013) recommends not routinely screening for depression
- if screening indicated, use the Patient Health Questionnaire (PHQ-2)
  - "Over the past 2 wk, how often have you been bothered by any of the following problems?":
    - little interest or pleasure in doing things
    - feeling down, depressed, or hopeless
- the PHQ-2 is scored out of 6, with a score of 3 or more considered positive
  - those who screen positive should be evaluated with the PHQ-9 to determine whether they meet criteria for depression
- PHQ-9 tool is useful to diagnose and monitor depression; use Geriatric Depression Scale (GDS) for the geriatric population

## Assessment
- risk factors: see Psychiatry, PS12
- personal or family history of depression
- medications and potential substance abuse problems
- high risk for suicide/homicide
  - fill out Form 1 (in Ontario): application by physician to hospitalize a patient against his/her will for psychiatric assessment (up to 72 h)
- functional impairment (e.g. work, relationships)
- at least 5 out of 9 criteria including at least one of anhedonia or depressed mood ≥2 wk for actual diagnosis to be met (see sidebar)
- validated depression rating scales: Beck's Depression Inventory, Zung's self-rating depression scale, Children's Depression Inventory, Geriatric Depression Scale, Personal Health Questionnaire Depression Scale (PHQ-9)
- routine medical workup (physical exam, CBC, TSH, ferritin, folate, $B_{12}$, electrolytes, urinalysis, glucose, etc.)

## Treatment
- goal: full remission of symptoms and return to baseline psychosocial function
- phases of treatment
  - acute phase (8-12 wk): relieve symptoms and improve quality of life
  - maintenance phase (6-12 mo after symptom resolution): prevent relapse/recurrence, must stress importance of continuing medication treatment for full duration to patients
- treatment options are pharmacotherapy, psychotherapy, or a combination of both
  - combination therapy is synergistic and most effective (refer to EBM in sidebar)
- treatment of youth (age 10-21)
  - for mild depression, a period of active support and monitoring before initiating treatment is recommended
  - fluoxetine is first line among SSRIs (most evidence)
    - monitor closely for adverse effects such as suicidal ideation and behaviour
  - psychotherapy
    - CBT or interpersonal therapy (IPT) alone can be used for mild depression
    - psychotherapy plus medication is recommended for moderate to severe depression
  - treatment should continue for at least 6 mo
    - ongoing management should include assessment in key domains (school, home, social setting)
    - reassessment and referral is recommended if there is no improvement after 6-8 wk of treatment
    - consider referral for adolescents with moderate/severe depression and coexisting psychosis and/or substance abuse

**Table 11. Common Medications**

| Class | Examples | Action | Side Effects | Notes |
|---|---|---|---|---|
| **SSRI** | paroxetine (Paxil®)<br>fluoxetine (Prozac®)<br>sertraline (Zoloft®)<br>citalopram (Celexa®)<br>fluvoxamine (Luvox®)<br>escitalopram (Cipralex®) | Block serotonin reuptake | Sexual dysfunction (impotence, decreased libido, delayed ejaculation, anorgasmia), headache, GI upset, weight loss, tremors, insomnia, fatigue, increase QT interval (baseline ECG is suggested) | First line therapy for youth is fluoxetine; paroxetine is not recommended for youth (controversial) |
| **SNRI** | venlafaxine (Effexor®)<br>duloxetine (Cymbalta®) | Block serotonin and norepinephrine reuptake | Insomnia, tremors, tachycardia, sweating | |
| **SDRI** | bupropion (Wellbutrin®) | Block dopamine and NE reuptake | Headache, insomnia, nightmares, seizures, less sexual dysfunction than SSRIs | Often chosen for lack of sexual side effects, can be used for augmentation of anti-depressant effects with other classes of medication |
| **TCA** | amitriptyline (Elavil®) | Block serotonin and NE reuptake | Sexual dysfunction, weight gain, tremors, tachycardia, sweating | Narrow therapeutic window, lethal in overdose |

**Must Ask About/Rule Out**
- Suicidal/homicidal ideation
- Psychosis
- Substance use/abuse/withdrawal
- Anxiety
- Bipolar/manic/hypomanic episodes
- Bereavement
- Intimate partner violence
- Post-partum depression
- Organic cause

**Differential Diagnosis**
- Other psychiatric disorders (e.g. anxiety, personality, bipolar, adjustment disorder, schizoaffective, seasonal affective disorder, substance abuse/withdrawal)
- Cancer (50% of patients with tumours, especially of brain, lung, and pancreas, develop symptoms of depression before the diagnosis of cancer is made)
- Chronic fatigue syndrome
- Early dementia
- Endocrine (e.g. hyper/hypothyroidism, DM, adrenal disorders)
- Infections (mononucleosis)
- Liver failure, renal failure
- Medication side effects (β-blockers, benzodiazepines, glucocorticoids, interferon)
- Menopause
- Neurological (Parkinson's, MS)
- Vitamin deficiency (pernicious anemia, pellagra)

**Criteria for Depression (≥5/9 with at least one of anhedonia or depressed mood for ≥2 wk)**

**M-SIGECAPS**
**M** Depressed **M**ood
**S** Increased/decreased **S**leep
**I** Decreased **I**nterest
**G** **G**uilt
**E** Decreased **E**nergy
**C** Decreased **C**oncentration
**A** Increased/decreased **A**ppetite and weight
**P** **P**sychomotor agitation/retardation
**S** **S**uicidal ideation

**Combined Pharmacotherapy and Psychological Treatment for Depression: A Systematic Review**
Arch Gen Psychiatry 2004;61:714-719
**Purpose**: To examine the relationship between adherence and efficacy of antidepressant medications plus psychological treatment versus medications alone in the management of depressive disorders.
**Methods**: Systematic review of RCTs comparing antidepressant medications alone versus combination therapy with psychological intervention included. Efficacy and adherence to therapy were the main outcomes.
**Results**: 16 trials with 1842 patients were included. Patients receiving combination therapy showed significantly greater improvements than those receiving medications alone (odds ratio (OR) 1.86, 95% CI 1.38-2.52); dropout and non-responder proportions did not differ in distribution between the two groups (OR 0.86, 0.60-1.24). A significant advantage with combination therapy was noted in studies with follow-up longer than 12 wk (OR 2.21, 1.22-4.03), accompanied by significant reduction in dropout and non-responder proportions.
**Conclusion**: Combination therapy with psychological treatment and medication is associated with greater improvement rates than medication alone, and may decrease dropout rates with longer therapies.

### Prognosis
- up to 40% resolve spontaneously within 6-12 mo
- risks of recurrence: 50% after 1 episode; 70% after 2 episodes; 90% after 3 episodes

# Diabetes Mellitus

- see Endocrinology, E7
- see 2013 Clinical Practice Guidelines from Canadian Diabetes Association (updated in 2016), available from: http://guidelines.diabetes.ca/fullguidelines
- see Diabetes Mellitus Patient Care Flow Sheet from Canadian Diabetes associated, available from: http://guidelines.diabetes.ca/organizingcare/patientcareflowsheet

### Definition
- metabolic disorder characterized by the presence of hyperglycemia due to defective insulin secretion, defective insulin action or both

### Classification and Diagnosis
- see Endocrinology, E7

### Epidemiology
- major health concern, affecting up to 10% of Canadians
- incidence of type 2 DM is rising due to increasing obesity, sedentary lifestyle, and age of the population
- leading cause of new-onset blindness and renal dysfunction
- Canadian adults with DM are twice as likely to die prematurely compared to persons without DM

### Risk Factors
- type 1 DM
  - personal or family history of autoimmune disease
- type 2 DM
  - first degree relative with DM
  - age ≥40 yr
  - obesity (especially abdominal), HTN, hyperlipidemia, CAD, vascular disease
  - prior gestational diabetes mellitus, macrosomic baby (>4 kg)
  - PCOS
  - history of IGT or IFG
  - presence of complications associated with DM
  - presence of associated diseases: PCOS, acanthosis nigricans, psychiatric disorders, HIV
  - medications: glucocorticoids, atypical antipsychotics, HAART
- both
  - member of a high risk population (e.g. Aboriginal, Hispanic, Asian, or African descent)

### Screening
- type 2 DM
  - FBG or HbA1c in everyone ≥40 q3yr, or at high risk using the CANRISK calculator
  - more frequent and/or earlier testing if presence of ≥1 risk factor (see above)
- gestational diabetes mellitus (see Obstetrics, OB26)
  - all pregnant women between 24-28 wk gestation

### Goals of Therapy
- see Endocrinology and side bar (SMART Goals)

**DM Related Symptoms**

**Hyperglycemia:** polyphagia, polydipsia, polyuria, weight change, blurry vision, yeast infections

**Diabetic Ketoacidosis (DKA):** fruity breath, anorexia, N/V, fatigue, abdominal pain, Kussmaul breathing, dehydration

**Hypoglycemia:** hunger, anxiety, tremors, palpitations, sweating, headache, fatigue, confusion, seizures, coma

**Long-Term Complications of DM**
- Microvascular: nephropathy, retinopathy, neuropathy
- Macrovascular: CAD, CVD, PVD

**Smart Goals**
**Diabetes Quick Reference Guide**

**A** A1C: Optimal Glycemic Control (Usually <7%)
**B** BP: Optimal Blood Pressure Control (≤130/80)
**C** Cholesterol: LDL-C <2 if treating
**D** Drugs: Consider ACEI/ARB, Statin, and ASA
**E** Exercise/Eating
**S** Smoking Cessation

## Assessment and Monitoring

### Table 12. Assessment and Monitoring

| | Initial Assessment | q2-4mo | Annually |
|---|---|---|---|
| **History** | Symptoms of hyperglycemia, ketoacidosis, hypoglycemia<br>Past medical history<br>Functional inquiry<br>Family history<br>Risk factors<br>Medications<br>Sexual function<br>Lifestyle | DM-directed history<br>Screen for awareness and frequency of hypoglycemia and DKA<br>Glucose monitoring<br>Use of insulin and oral agents<br>Smoking cessation | DM-directed history<br>Screen for awareness and frequency of hypoglycemia and DKA<br>Glucose monitoring<br>Use of insulin and oral agents<br>Sexual function<br>Lifestyle counselling<br>Screen for depression |
| **Physical Exam** | General: height, weight, BMI, BP, WC<br>Head and neck: fundoscopy, thyroid exam<br>Cardiovascular exam: signs of PVD, pulses, bruits<br>Abdominal exam (e.g. for organomegaly)<br>Hand/foot/skin exam<br>Neurological exam | Wt, BP, BMI, WC | Foot exam for sensation (using a 10 g monofilament), ulcers or infection<br>Remainder of exam as per PHE |
| **Investigations** | FBG, HbA1c, fasting lipids, Cr, microalbumin:creatinine ratio<br>Baseline ECG; repeat testing q2yr for those at high risk | HbA1c q3mo<br>FBG as needed | Fasting lipid profile<br>Annual random ACR and eGFR |
| **Management** | Nutritional and physical education<br>Consider referral to DM education program if available<br>Monitoring blood glucose: explain methods and frequency<br>Medication counselling: oral hypoglycemics and/or insulin, method of administration, dosage adjustments<br>Pneumococcal vaccination<br>Ophthalmology consult<br>type 1 DM within 5 yr<br>type 2 DM at diagnosis | Assess progress towards long-term complications<br>Adjust treatment plan if necessary | Calibrate home glucose monitor<br>Arrange retinopathy screening<br>Influenza vaccination annually |

**Calculate Total Insulin Required**
type 1 DM: 0.5-0.7 units/kg/d
type 2 DM: 0.3 units/kg/d

**Dietary Advice for Treatment of Type 2 DM in Adults**
Cochrane DB Syst Rev 2007;3:CD004097
**Purpose**: To assess the effects of type and frequency of different dietary advice strategies for adults with type 2 diabetes.
**Methods**: Systematic review of RCTs with follow-up of 6 mo or longer, where dietary advice was the main intervention.
**Results**: 36 RCTs with 1467 participants were included, all measuring weight and glycemic control measures, and some reporting mortality, blood pressure, serum cholesterol and triglycerides, maximal exercise capacity and compliance. No data was available for efficacy of dietary advice in terms of dietary changes. Adoption of regular exercise was found to promote HbA1c glycemic control in type 2 diabetic patients.
**Conclusion**: No high-quality data is available for the efficacy of dietary treatment of type 2 diabetes, though exercise has been shown to improve HbA1C at 6 and 12 mo follow-up in patients.

## Nonpharmacologic Management

- diet
  - can reduce HbA1c by 1-2%
  - moderate weight loss (5%) improves glycemic control and CVD risk factors
  - all diabetics should see a registered dietician for nutrition counselling
  - decrease combined saturated fats and trans-fatty acids to <10% of calories
  - avoid simple sugars, choose low glycemic-index foods, ensure regularity in timing and spacing of meals
- physical activity and exercise
  - at least 150 min of aerobic exercise plus 2 sessions of resistance training per wk is recommended
  - encourage 30-45 min of moderate exercise 4-7 d/wk
  - promote cardiovascular fitness: increases insulin sensitivity, lowers BP, and improves lipid profile
  - if using insulin, may require alterations of diet, insulin regimen, injection sites, and self-monitoring

## Self-Monitoring of Blood Glucose

- type 1 DM: 3 or more self-tests/d is associated with a 1% reduction in HbA1c
- type 2 DM: recommendations vary based on treatment regimen (e.g. insulin dependent requires more frequent monitoring – refer to 2013 Canadian Practice Guidelines)
- if FBG >14 mmol/L, perform ketone testing to rule out DKA
- if bedtime level is <7 mmol/L, have bedtime snack to reduce risk of nocturnal hypoglycemia

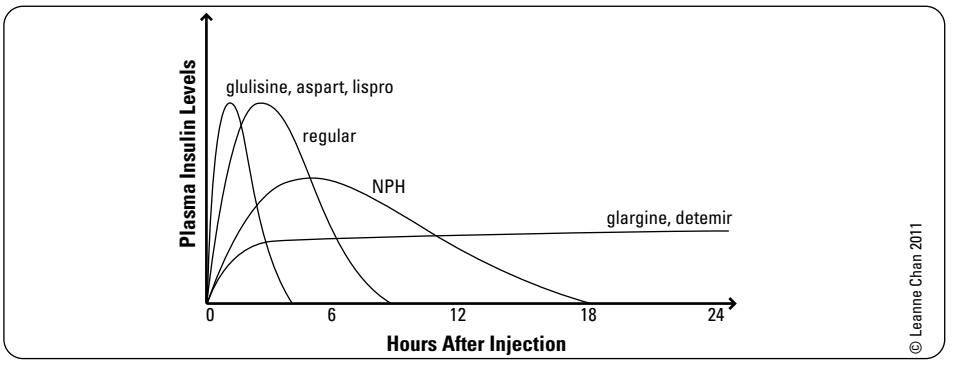

**Figure 9. Types of insulin preparation**

**At diagnosis of Type 2 DM**
Start lifestyle intervention (nutrition therapy and physical activity) ± Metformin

| A1C <8.5% | A1C ≥8.5% | Symptomatic hyperglycemia with metabolic decompensation |
|---|---|---|
| If not at glycemic target (2-3 mo) | Start **metformin immediately** Consider initial combination with another antihyperglycemic agent | Initiate **insulin ± metformin** |
| Start or increase **metformin** → | If not at glycemic targets | |

**Add another agent best suited to the individual by prioritizing patient characteristics:**

| PATIENT CHARACTERISTIC | CHOICE OF AGENT |
|---|---|
| **Priority:** Clinical cardiovascular disease | → SGLT2 inhibitor with demostrated CV outcome benefit |
| • Degree of hyperglycemia<br>• Risk of hypoglycemia<br>• Overweight or obesity<br>• Cardiovascular disease<br>• Comorbidities (renal, CHF, hepatic)<br>• Preferences and access to treatment | • Consider relative A1C lowering<br>• Rare hypoglycemia<br>• Weight loss or weight neutral<br>• Effect on cardiovascular outcome<br>• See therapeutic considerations, consider eGFR<br>• See cost column; consider access |

**Add another class of agent best suited to the individual** (classes listed in alphabetical order):

| Class | Relative A1C Lowering | Hypoglycemia | Weight | Effect in Cardiovascular Outcome Trial | Other Therapeutic Considerations | Cost |
|---|---|---|---|---|---|---|
| α-Glucosidase inhibitor (acarbose) | ↓ | Rare | Neutral to↓ | | Improved postprandial control, GI side-effects | $$ |
| Incretin agents: DPP-4 inhibitors | ↓↓ | Rare | Neutral to↓ | Neutral (alo, saxa, sita) | Caution with saxagliptin in heart failure | $$$ |
| GLP-1R agonists | ↓↓ to ↓↓↓ | Rare | ↓↓ | Neutral (lixi) | GI side effects | $$$$ |
| Insulin | ↓↓↓ | Yes | ↑↑ | Neutral (glar) | No dose ceiling, flexible regiments | $-$$$$ |
| Insulin secretagogue; Meglitinide | ↓↓ | Yes | ↑ | | Less hypoglycemia in context of missed meals, but usually requires TID to QID dosing | $$ |
| Sulfonylurea | ↓↓ | Yes | ↑ | | Gliclazide and glimepiride associated with less hypoglycemia than glyburide | $ |
| SGLT2 inhibitors | ↓↓ to ↓↓↓ | Rare | ↓↓ | Superior (empa in T2DM patients with clinical CVD) | Genital infections, UTI, hypotension, dose-related changes in LDL-C, caution with renal dysfunction and loop diuretics, dapagliflozin not to be used if bladder cancer, rare diabetic ketoacidosis (may occur with no hyperglycemia) | $$$ |
| Thiazolidinediones | ↓↓ | Rare | ↑↑ | Neutral | CHF, edema, fractures, rare bladder cancer (ploglitazone), cardiovascular controversy (rosiglitazone), 6-12 wk required for max effect | $$ |
| Weight loss agent (orlistat) | ↓ | None | ↓ | | GI side-effects | $$$ |

A1C = glycated hemoglobin; alo = alogliptin; CHF = congestive heart failure; DPP-4 = dipeptidyl peptidase 4; empa = empagliflozin; GI = gastrointestinal; glar = glargine; GLP-1 = glucagon-like peptide 1; lixi = lixisenatide; saxa = saxagliptin; sita = sitagliptin; TZD = thiazolidinedione

**If not at glycemic targets**

Add another agent from a different class; add or intensify insulin regimen

**Make timely adjustments to attain target A1C within 3-6 mo**

**Note:** Physicians should refer to the most recent edition of the *Compendium of Pharmaceuticals and Specialties* (Canadian Pharmacists Association, Ottawa, Ontario, Canada) for product monographs and for detailed prescribing information

**Figure 10. Management of hyperglycemia in type 2 diabetes**
With permission of: Canadian Diabetes Association Clinical Practice Guidelines Expert Committee. Pharmacologic Management of Type 2 Diabetes. Can J Diabetes 2013;37:S61-S68

### Hypoglycemic Agents (Type 2 DM)

- oral
  - biguanide: metformin (Glucophage®)
  - thiazolidinedione: troglitazone (Rezulin®), rosiglitazone (Avandia®)
  - α-glucosidase inhibitor: acarbose (Precose®)
  - nonsulfonylureas: nateglinide (Starlix®), repaglinide (Gluconorm®)
  - sulfonylureas: glyburide (DiaBeta®), glimepiride (Amaryl®), gliclazide (Diamicron®)
  - DPP-4 inhibitor: sitagliptin (Januvia®)
- injectable
  - GLP-1 analogue: liraglutide (Victoza®)

### Other Medications Used in DM

- ACEI or ARB in those with any of:
  - clinical macrovascular disease
  - age ≥55
  - age <55 and microvascular complications
- statin in those with any of:
  - clinical macrovascular disease
  - age ≥40
  - age <40 and any of the following:
    - diabetes duration >15 yr and age >30 yr
    - microvascular complications
    - other cardiovascular risk factors
- low dose ASA (81-325 mg)
  - for secondary prevention in people with established CVD (NOT to be used routinely for primary prevention)

**Rosiglitazone Revisited: An Updated VertiMeta-Analysis of Risk for Myocardial Infarction and Cardiovascular Mortality**
Arch Intern Med 2010;170:1191-1201
**Purpose**: To evaluate the effectiveness of rosiglitazone on myocardial infarctions (MIs) and mortality.
**Methods**: Systematic review of RCTs of rosiglitazone, lasting at least 24 wk in duration, and reporting cardiovascular (CV) adverse events. Main outcomes were MIs, CV-related mortality and all-cause mortality.
**Results**: Rosiglitazone significantly increased MI risk (odds ratio (OR) 1.28, 95% CI 1.02-1.63, p=0.04) but not CV mortality (OR 1.03, 0.78-1.36, p=0.86).
**Conclusion**: Rosiglitazone continues to demonstrate increased risk of MIs, though it is not associated with increased risk of CV or all-cause mortality.

# Dizziness

- see Otolaryngology, OT6

### Epidemiology

- 70% of affected patients see general practitioners initially; 4% are referred to specialists
- frequency is proportional to age; commonest complaint of ambulatory patients age >75

### Differential Diagnosis

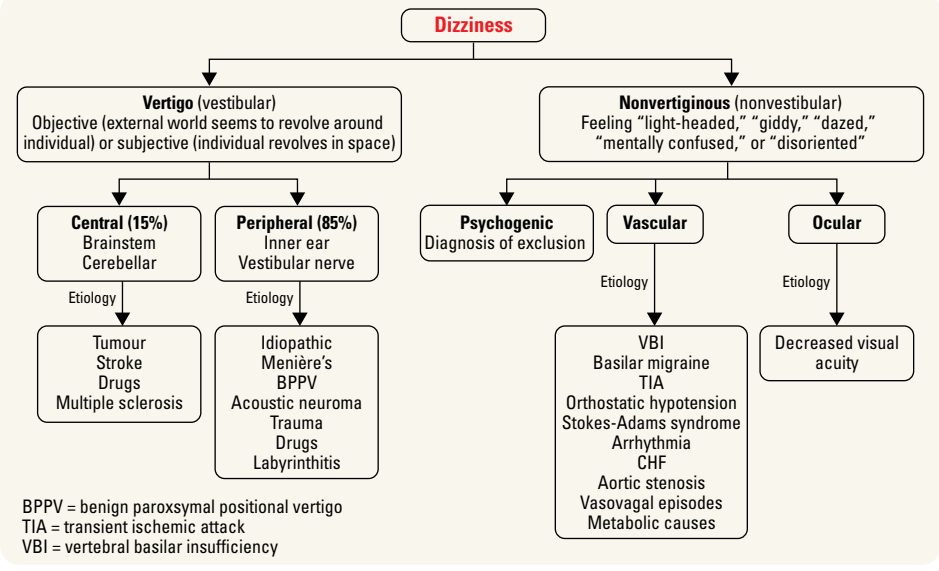

**Figure 11. Differential diagnosis of dizziness**

**Differential Diagnosis of Vertigo**

| | BPPV | Labyrinthitis | Menière's | Acoustic Neuroma |
|---|---|---|---|---|
| Onset | sudden | sudden | gradual | insidious |
| Duration | seconds | days | min-h | chronic |
| Hearing Loss | — | + | + | + |
| Tinnitus | — | + | + | + |
| Neuro Sx | — | — | — | + |

### History

- clarify type of dizziness: vertigo, pre-syncope, disequilibrium, light-headedness
- duration
- exacerbations
  - worse with head movement or eye closure (vestibular)
  - no change with head movement and eye closure (nonvestibular)
  - worse with exercise (cardiac/pulmonary causes)
- associated symptoms
  - neurologic (central)
    - transient diplopia, dysphagia, dysarthria, ataxia (TIA, VBI, migraine)
    - persistent headache, alterations in level of consciousness, sensory and/or motor deficits (CNS)

  - audiologic (peripheral)
    - hearing loss, tinnitus, otalgia, aural fullness
  - others
    - N/V (peripheral vestibular disorders)
    - SOB, palpitations (hyperventilation, cardiac problem)
- general medical history
  - HTN, DM, heart disease, fainting spells, seizures, cerebrovascular disease, migraines
  - ototoxic drugs: aminoglycosides (gentamicin, streptomycin, tobramycin), erythromycin, ASA, antimalarials
  - hypotension (secondary to diuresis): furosemide, caffeine, alcohol
  - depression/anxiety: can present with light-headedness

### Physical Exam/Investigations
- syncopal
  - cardiac (orthostatic changes in vitals), peripheral vascular, and neurologic exams
  - blood work, ECG, 24 h Holter, treadmill stress test, loop ECG, tilt table testing, carotid, vertebral doppler, and EEG
- vertiginous
  - ENT and neurologic exams
  - Dix-Hallpike, consider audiometry and MRI if indicated
- non-syncopal, non-vertiginous
  - assess gait, vision and test for neuropathy
  - cardiac and neurologic exams (cerebellar and cranial nerve function)
  - 3 min hyperventilation trial (patient is coached to hyperventilate until patient becomes dizzy to identify if symptoms are reproducible and confirm that hyperventilation is the etiology of the symptoms), ECG, EEG
  - Romberg test: test for disequilibrium (patient sways towards the side of vestibular dysfunction)

**Dix-Hallpike Test**
- Have the patient seated with legs extended and head at 45° rotation
- Rapidly shift patient to supine position with head fully supported in slight extension (for 45 s)
- Observe for rotatory nystagmus and ask about sensation of vertigo

### Treatment
- guided by history, physical exam, and investigations
- include education, lifestyle modification, physical maneuvers (e.g. Epley for BPPV), symptomatic management (e.g. antiemetics), pharmacotherapy, and surgery
- refer when significant central disease is suspected, when vertigo of peripheral origin is persistent (lasting >2-4 wk), or if atypical presentation

# Domestic Violence/Elder Abuse

## INTIMATE PARTNER VIOLENCE

### Definition
- includes physical, sexual, emotional, psychological, and financial abuse

### Epidemiology
- lifetime prevalence of intimate partner violence against women is between 25-30%
- similar prevalence of intimate partner violence against men, who may be less likely to report due to social stigma
- women who experience abuse have increased rates of injury, death, and health consequences including 50-70% increase in gynecological, central nervous system, and stress-related problems
- occurs in all socioeconomic, educational, and cultural groups with increased incidence in pregnancy, disabled women, bisexuality, and 18-24 age group
- 25-50% chance of child abuse or neglect in families where partner abuse occurs; children exposed to violence in the home are more likely to experience or perpetrate violence later in life (Cycle of Violence)
- physician recognition rates as low as 5%

### Presentation
- multiple visits with vague, ill-defined complaints such as: headaches, gastrointestinal symptoms, insomnia, chronic pain, hyperventilation
- may also present with injuries inconsistent with history

### Management
- screen ALL patients
  - always have a high index of suspicion
  - asking about abuse is the strongest predictor of disclosure
  - several screening tools (see sidebar) exist to identify victims of partner violence
  - make sure to determine the victim's level of immediate and long-term danger and ask if there are weapons in the house
- ensure patient safety
  - victim most at risk for homicide when attempting to leave home or following separation
  - safety planning includes ensuring that there is access to an exit in the home, establishing a safe place to go, and having emergency items prepared should the patient need to leave quickly (including money, clothes, keys, medications, and important documents)

**Screening Instruments for Domestic Violence**

**A) Woman Abuse Screening Tool (WAST)-SHORT**

1. In general how would you describe your relationship?
   a. A lot of tension
   b. Some tension
   c. No tension
2. Do you and your partner work out arguments with . . .?
   a. Great difficulty
   b. Some difficulty
   c. No difficulty

Endorsing either question 1 ("a lot of tension") or question 2 ("great difficulty") makes intimate partner violence exposure likely

**B) HITS**

How often does your partner:
1. Physically hurt you?
2. Insult you?
3. Threaten you with harm?
4. Scream or curse at you?

Each question on HITS to be answered on a 5 point scale ranging from 1 (= never) to 5 (= frequently)
A total score of 10 or greater is significant

- provide community resources
  - shelter or helpline number with legal advocacy and counselling services
  - involve social workers or domestic violence advocates
- appointment for follow-up to assess whether condition is better or worse
- reassure patient that she/he is not to blame and that the assault is a crime
  - goal is to convey the message that "As your doctor, I am concerned for your safety" and "Your partner has a problem that he/she needs help with" and "I want to help you"
  - reporting suspected or known child abuse is mandatory
  - spousal abuse is a criminal act, but not reportable without the woman's/man's permission
- DOCUMENT all evidence of abuse-related visits for medico-legal purposes

### ELDER ABUSE
- see Geriatric Medicine, GM10

# Dyspepsia

- see Gastroenterology, G10

### Definition and Clinical Features
- defined as epigastric pain or discomfort
- can be associated with fullness, belching, bloating, heartburn, food intolerance, N/V

### Epidemiology
- annual incidence 1-2%, prevalence 20-40%

### Etiology
- common: functional, PUD, GERD, gastritis
- others: cholelithiasis, irritable bowel syndrome, esophageal or gastric cancer, pancreatitis, pancreatic cancer, Zollinger-Ellison syndrome, and abdominal angina

### History
- symptoms may not be useful in finding cause
- associated with eating, anorexia, N/V, alcohol, NSAID use
- red flags: vomiting, bleeding/anemia, abdominal mass, dysphagia (VBAD)

### Investigations and Management
- for new onset dyspepsia:
- <60 yr without high risk features, test for *H. pylori* using the urea breath test or serology
- ≥60 yr should undergo upper endoscopy to rule out organic pathology
- lifestyle modifications: decrease caffeine and alcohol intake, avoid citrus food, smaller and more frequent meals, avoid supine position right after meals, smoking cessation
- pharmacologic treatment
  - gastric acid suppression: H2 blockers, PPIs; both are effective for PUD and GERD
  - TCAs or prokinetics: e.g. Metoclopramide; effective for functional dyspepsia
- *H. pylori* eradication
- do not keep patients on PPI without at least 1 trial off the medication per year (https://choosingwiselycanada.org/perspective/ppi-toolkit/)
- for non-responders, upper endoscopy should be considered; if endoscopy is negative, defined as functional dyspepsia

**Dyspepsia Red Flags**
- Weight Loss
- Dysphagia
- Persistent vomiting
- GI bleeding (hematemesis, hematochezia, melena)
- Onset age >50

***H. pylori* Eradication**
Take the following 10 d treatment
1) PPI 1 tablet 2x/d for 10 d and
2) Amoxicillin 1 g twice a day for 5 d (day 1-5)
Followed by
3) Clarithromycin 500 mg 2x/d (day 6-10) and
4) Metronidazole 500 mg 2x/d (day 6-10)

# Dyspnea

- see Respirology, R3 and Emergency Medicine, ER26

### Definition
- uncomfortable, abnormal awareness of breathing

### History and Physical Exam
- history
  - cough, sputum, hemoptysis, wheezing, chest pain, palpitations, dizziness, edema, SOB
  - constitutional symptoms
  - history of asthma, allergies, eczema, ASA/NSAID sensitivity, nasal polyps
  - smoking, recreational drugs, medications
  - occupational exposure, environmental exposure (e.g. pets, allergens, smoke)
  - travel and birth place
  - FHx of atopy
  - previous CXR or PFTs
- physical exam: vitals, respiratory, precordial, HEENT, signs of anemia/liver failure/heart failure

**Differential Diagnosis of Dyspnea**

**Pulmonary**
- COPD
- Asthma
- Restrictive lung disease
- Pneumothorax
- Congenital lung disease
- PE

**Cardiac**
- CHF
- CAD
- MI (recent or past)
- Cardiomyopathy
- Valve dysfunction
- Pericarditis
- Arrhythmia
- Hypertrophy

**Mixed/Other**
- Deconditioning
- Trauma
- Pain
- Neuromuscular
- Metabolic condition
- Functional: anxiety, panic attack, hyperventilation

### Investigations
- CXR, ECG
- PFTs, ABG acutely if indicated

### Management
- ABCs: send to ED if in severe respiratory distress
- depends on cause

# Dysuria

- see Urology, U10

### Definition
- the sensation of pain, burning, or discomfort on urination

### Epidemiology
- in adulthood, more common in women than men
- approximately 25% of women report one episode of acute dysuria per yr
- most common in women age 25-54 and in those who are sexually active
- in men, dysuria becomes more prevalent with increasing age

### Etiology
- infectious
  - most common cause
  - presents as cystitis, urethritis, pyelonephritis, vaginitis, cervicitis, epididymo-orchitis, or prostatitis
- non-infectious
  - hormonal conditions (hypoestrogenism), obstruction (BPH, urethral strictures), allergic reactions, radiation, drugs/chemicals, foreign bodies, trauma, neoplasm, kidney stones, inflammatory diseases, endometriosis, psychogenic

**Table 13. Etiology, Signs and Symptoms of Common Causes of Dysuria**

| Infection | Etiology | Signs and Symptoms |
|---|---|---|
| **UTI/Cystitis** | KEEPS bacteria (*Klebsiella, E. coli, Enterobacter, Proteus mirabilis, Pseudomonas, S. saprophyticus*) | Internal dysuria throughout micturition, frequency, urgency, incontinence, hematuria, nocturia, back pain, suprapubic discomfort, low grade fever (rare) |
| **Urethritis** | *C. trachomatis, N. gonorrhoeae, Trichomonas, Candida*, herpes | Initial dysuria, urethral/vaginal discharge, history of STI |
| **Vaginitis** | *Candida, Gardnerella, Trichomonas, C. trachomatis*, atrophic, herpes, lichen sclerosis | External dysuria/pain, vaginal discharge, irritation, dyspareunia, abnormal vaginal bleeding |
| **Prostatitis** | *E. coli, C. trachomatis, S. saprophyticus, Proteus mirabilis, Enterobacter, Klebsiella, Pseudomonas* | Dysuria, fever, chills, urgency, frequency, tender prostate, rectal pain |
| **Pyelonephritis** | *E. coli, S. saprophyticus, Proteus mirabilis, Enterobacter, Klebsiella, Pseudomonas* | Internal dysuria, fever, chills, flank pain radiating to groin, CVA tenderness, N/V |

### Investigations
- no investigations necessary when history and physical consistent with uncomplicated UTI – treat empirically (urinalysis can be performed when indicated by dipstick or microscopy)
- urinalysis/dipstick: positive for nitrites and leukocytes
- urine R&M: pyuria, bacteriuria, hematuria
- urine C&S
- CBC and differential if suspecting pyelonephritis
- if vaginal/urethral discharge present: wet mount, Gram stain, KOH test, vaginal pH, culture for yeast and trichomonas, endocervical/urethral swab or urine PCR for *N. gonorrhoeae* and *C. trachomatis*
- radiologic studies and other diagnostic tests if atypical presentation
- see Pediatrics, P60 for UTI

### Management
- UTI/cystitis
  - pregnant women with bacteriuria (2-7%) must be treated even if asymptomatic due to increased risk of pyelonephritis, preterm labour, low birth weight, and perinatal mortality; need to follow with monthly urine cultures and repeat if still infected
  - patients with recurrent UTIs (>3/yr) should be considered for prophylactic antibiotics
  - if complicated UTI, patients require longer courses of broader spectrum antibiotics
- urethritis
  - positive swab or PCR for chlamydia or gonorrhea must be reported to Public Health
  - all patients should return 4-7 d after completion of therapy for clinical evaluation

**UTI Clinical Decision Aid**
*Arch Intern Med* 2007;67:2201-2206
- Dysuria
- +Leukocytes
- +Nitrites

If 2 or more criteria met, then treat without culture, otherwise culture required prior to treatment

**Risk Factors for Complicated UTI**
- Male
- Pregnancy
- Recent urinary tract instrumentation
- Functional or anatomic abnormality of the urinary tract
- Chronic renal disease
- DM
- Immunosuppression
- Indwelling catheter

**Cranberries for Preventing Urinary Tract Infections**
Cochrane DB Syst Rev 2008;1:CD001321
**Study:** Meta-analysis of 10 RCTs (n=1049).
**Patients:** All populations.
**Intervention:** Cranberry juice vs. placebo, juice or water was evaluated in seven studies, and cranberry tablets vs. placebo in four studies.
**Main Outcome**: UTIs – symptomatic and asymptomatic.
**Results:** Cranberry products significantly reduced the incidence of UTIs at 12 mo (RR 0.65, 95% CI 0.46-0.90) compared with placebo/control.
**Conclusion:** There is some evidence that cranberry products may decrease the number of symptomatic UTIs over a 12 mo period, particularly for women with recurrent UTIs.

**Prevention of UTIs**
- Maintain good hydration (especially with cranberry juice) (recommendation level I)
- Wipe urethra from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse

# Epistaxis

- see Otolaryngology, OT26

# Erectile Dysfunction

- see Urology, U33

## Definition
- consistent or recurrent inability to attain and/or maintain penile erection sufficient for sexual performance of ≥3 mo duration

## Epidemiology
- ~20% of men age 40; ~50% of men age 70

## Etiology
- organic: vascular (90%) (arterial insufficiency, atherosclerosis), endocrine (low testosterone, DM), anatomic (structural abnormality, e.g. Peyronie's), neurologic (post-operative, DM), medications (clonidine, antihypertensives, psychotropics)
- psychogenic (10%)

**Table 14. Differentiation Between Organic and Psychogenic ED**

| Characteristic | Organic | Psychogenic |
|---|---|---|
| **Onset** | Gradual | Acute |
| **Circumstances** | Global | Situational |
| **Course** | Constant | Varying |
| **Non-Coital Erection** | Poor | Rigid |
| **Morning Erection** | Absent | Present |
| **Psychosexual Problem** | Secondary | Long history |
| **Partner Problem** | Secondary | At onset |
| **Anxiety and Fear** | Secondary | Primary |

Walsh PC, Campbell MF, Retik AB. Campbell's Urology, 8th ed. W.B. Saunders, 2002.Table 46-4

## History
- comprehensive sexual, medical, and psychosocial history
- time course
  - last satisfactory erection
  - gradual or sudden onset
  - attempts at sexual activity
- quantify
  - presence of morning or night time erections
  - stiffness (scale of 1-10)
  - ability to initiate and maintain an erection with sexual stimulation
  - erection stiffness during sex (scale of 1-10)
- qualify
  - partner or situation specific
  - loss of erection before penetration or climax
  - degree of concentration required to maintain an erection
  - percentage of sexual attempts satisfactory to patient and/or his partner
  - significant bends in penis or pain with erection
  - difficulty with specific positions
  - impact on quality of life and relationship

## Investigations
- hypothalamic-pituitary-gonadal axis evaluation: testosterone (free + total), prolactin, LH
- risk factor evaluation: fasting glucose, HbA1c, lipid profile
- others: TSH, CBC, urinalysis
- specialized testing
  - psychological and/or psychiatric consultation
  - in-depth psychosexual and relationship evaluation
  - nocturnal penile tumescence and rigidity (NPTR) assessment
  - vascular diagnostics (e.g. doppler studies, angiography)

**Differential Diagnosis of Erectile Dysfunction**

**PENIS**
**P**sychogenic
**E**ndocrine (type 2 DM, testosterone)
**N**eurogenic (type 2 DM, post-operative)
**I**nsufficiency of blood (atherosclerosis)
**S**ubstances

**The Effect of Lifestyle Modification and Cardiovascular Risk Factor Reduction on Erectile Dysfunction**
Arch Intern Med 2011;171:1797-1803
**Purpose**: To evaluate the effectiveness of lifestyle interventions and pharmacotherapy for cardiovascular (CV) risk factors on severity of erectile dysfunction (ED).
**Methods**: Meta-analysis of RCTs with a follow-up of a minimum of 6 wk, evaluating lifestyle intervention versus pharmacotherapy for CV risk factor reduction. Main outcome measure was weighted mean differences in the International Index of Erectile Dysfunction (IIEF-5) score.
**Results**: 6 RCTs with a total of 740 participants were included. Lifestyle modifications and pharmacotherapy for CV risk factor reduction were both associated with significant improvements in sexual function based on IIEF-5 scores (weighted mean difference (WMD) 2.66, 95% CI 1.86-3.47). Excluding statin trials, lifestyle modification interventions were associated with a statistically significant improvement in sexual function (WMD 2.40, 1.19-3.61).
**Conclusion**: Lifestyle modifications and pharmacotherapy for CV risk reduction are effective in improving male sexual function.

**Reasons for Referral to Urology**
- Significant penile anatomic disease
- Younger patient with a history of pelvic or perineal trauma
- Cases requiring vascular or neuro-surgical intervention
- Complicated endocrinopathies
- Complicated psychiatric or psychosocial problems
- Patient or physician desire for further evaluation

### Management

**Table 15. Management of Erectile Dysfunction**

| Nonpharmacologic | Pharmacologic | Surgical |
|---|---|---|
| Lifestyle changes (alcohol, smoking, exercise)<br>Relationship/sexual counselling<br>Vacuum devices | Oral agents<br>Suppository<br>Male urethral suppository for erection (MUSE)<br>Injections | Implants<br>Vascular repair<br>Realignment |

- pharmacologic treatment
  - phosphodiesterase type 5 inhibitors
  - α-adrenergic blockers (e.g. yohimbine)
  - serotonin antagonist and reuptake inhibitor (e.g. trazodone)
  - testosterone – currently only indicated in patients presenting with hypogonadism and testosterone deficiency (note: breast/prostate cancer are absolute contraindications)

**Table 16. Phosphodiesterase Type 5 Inhibitors**

| Examples | Dosing (1 dose/d) | Specifics | Side Effects | Contraindications |
|---|---|---|---|---|
| sildenafil (Viagra®) | 25-100 mg/dose | Take 0.5-4 h prior to intercourse<br>May last 24 h | Flushing, headache, indigestion | Not to be used in patients taking nitrates |
| tadalafil (Cialis®) | 5-20 mg/dose | Effects may last 36 h | As above | As above |
| vardenafil (Levitra®) | 2.5-20 mg/dose | Take 1 h prior to intercourse | As above | As above |

# Fatigue

### Definition
- can describe difficulty or inability to initiate activity, maintain activity, or difficulty with concentration/memory
- try to determine what the patient means e.g. excessive sleepiness, muscle weakness, decreased exercise tolerance, mood concerns

**Fatigue Red Flags**
- Fever
- Weight loss
- Night sweats
- Neurological deficits
- Ill-appearing

### Epidemiology
- 25% of office visits to family physicians
  - peaks in ages 20-40
  - F:M = 3-4:1
- 50% have associated psychological complaints/problems, especially if <6 mo duration

### Differential Diagnosis

**Table 17. Differential Diagnosis of Fatigue: PS VINDICATE**

| | | |
|---|---|---|
| **P** | **Psychogenic** | **Depression, life stresses**, anxiety disorder, chronic fatigue syndrome, fibromyalgia |
| | Physiologic | **Pregnancy, caregiving demands (young children, elderly)** |
| **S** | Sleep disturbance | **Obstructive sleep apnea, sleep disorder,** poor sleep hygiene, BPH, shift work, pain |
| | Sedentary | Unhealthy/sedentary lifestyle |
| **V** | Vascular | Stroke |
| **I** | **Infectious** | Viral (e.g. mononucleosis, hepatitis, HIV), bacterial (e.g. TB), fungal, parasitic |
| **N** | **Neoplastic** | Any malignancy |
| | Nutrition | **Anemia** ($Fe^{2+}$ deficiency, $B_{12}$ deficiency) |
| | Neurogenic | Myasthenia gravis, multiple sclerosis, Parkinson's disease |
| **D** | **Drugs** | β-blockers, antihistamines, anticholinergics, benzodiazepines, antiepileptics, antidepressants |
| **I** | Idiopathic | |
| **C** | Chronic illnesses | CHF, lung diseases (e.g. COPD, sarcoidosis), renal failure, chronic liver disease |
| **A** | Autoimmune | SLE, RA, mixed connective tissue disease, polymyalgia rheumatica |
| **T** | Toxin | **Substance abuse** (e.g. alcohol), heavy metal |
| **E** | Endocrine | **Hypothyroidism, DM**, Cushing's syndrome, adrenal insufficiency, pregnancy |

Common causes are in **bold**

### Investigations
- psychosocial causes are common, so usually minimal investigation is warranted
- physical causes of fatigue usually have associated symptoms/signs that can be elicited from a focused history and physical exam
- investigations are guided by history and physical exam and may include:
  - CBC and differential, electrolytes, BUN, Cr, ESR, glucose, TSH, ferritin, vitamin $B_{12}$, serum protein electrophoresis, Bence-Jones protein, albumin, AST, ALT, ALP, bilirubin, calcium, phosphate, ANA, β-hCG
  - urinalysis, CXR, ECG
  - additional tests: serologies (Lyme disease, hepatitis B and C screen, HIV, ANA) and Mantoux skin tests

### Treatment
- treat underlying cause
- if etiology cannot be identified (1/3 of patients)
  - reassurance and follow-up, especially with fatigue of psychogenic etiology
  - supportive counselling, behavioural, or group therapy
  - encourage patient to stay physically active to maximize function
  - review all medications, OTC, and herbal remedies for drug-drug interactions and side effects
  - prognosis: after 1 yr, 40% are no longer fatigued

## CHRONIC FATIGUE SYNDROME

### Definition (CDC 2006) – must meet both criteria
1. new or definite onset of unexplained, clinically evaluated, persistent or relapsing chronic fatigue, not relieved by rest, which results in occupational, educational, social, or personal dysfunction
2. concurrent presence of ≥4 of the following symptoms for a minimum of 6 mo
   - impairment of short-term memory or concentration, severe enough to cause significant decline in function
   - sore throat
   - tender cervical or axillary lymph nodes
   - muscle pain
   - multi-joint pain with no swelling or redness
   - new headache
   - unrefreshing sleep
   - post-exertion malaise lasting >24 h
- exclusion criteria: medical conditions that may explain the fatigue, certain psychiatric disorders (depression with psychotic or melancholic features, schizophrenia, eating disorders), substance abuse, severe obesity (BMI >45)

### Epidemiology
- F>M, Caucasians > other groups, majority in their 30s
- found in <5% of patients presenting with fatigue

### Etiology
- unknown, likely multifactorial
- may include infectious agents, immunological factors, neurohormonal factors, and/or nutritional deficiency

### Investigations
- no specific diagnostic laboratory tests

### Treatment
- promote sleep hygiene
- provide support and reassurance that most patients improve over time
- non-pharmacological
  - regular physical activity, optimal diet, psychotherapy (e.g. CBT), family therapy, support groups
- pharmacological
  - to relieve symptoms: e.g. antidepressants, anxiolytics, NSAIDs, antimicrobials, antiallergy therapy, antihypotensive therapy

**Exercise Therapy for Chronic Fatigue**
Cochrane DB Syst Rev 2017;4:CD003200
**Purpose**: To determine the effectiveness of exercise therapy for chronic fatigue syndrome (CFS).
**Methods**: Meta-analysis of RCTs involving adults with CFS as a primary diagnosis who were able to participate in exercise therapy. Studies compared exercise therapy to passive control, psychological therapies, adaptive pacing therapy or pharmacological therapy.
**Results**: 8 RCTs with 1518 participants were included. Exercise therapy lasted 12 to 26 wk in duration. Moderate-quality evidence showed exercise therapy was more effective in reducing fatigue relative to passive or no treatment, and was also associated with a positive effect on daily physical functioning, sleep and self-rated overall health. One study suggested exercise therapy was more effective than pacing strategies for fatigue reduction, though was no more effective than cognitive behavioural therapy (CBT). Exercise therapy was not found to worsen symptoms for CFS patients, and serious side-effects were rare across all intervention groups.
**Conclusion**: Exercise therapy may be beneficial to overall health and may decrease fatigue in CFS patients, and is not associated with worsening outcomes. Therapy may also have a positive impact on sleep, physical function, and self-perceived general health. In general, exercise therapy appears more effective than pacing strategies, and similar to CBT.

# Fever

- see Pediatrics, P49

### Definition
- oral temperature >37.2°C (AM), 37.7°C (PM)
- fever in children under 2 must be a rectal temperature for accuracy
- TM not accurate for measurement until child is >5 yr

**Table 18. Differential Diagnosis of Fever**

| Infection | Cancer | Medications | | Other |
|---|---|---|---|---|
| Bacterial | Leukemia | Allopurinol | Nifidepine | Irritable Bowel Syndrome |
| Viral | Lymphoma | Captopril | Phenytoin | Collagen Vascular Disease |
| TB | Other Malignancies | Cimetidine | Diuretics | DVT |
| | | Heparin | Barbiturates | |
| | | INH | Antihistamines | |
| | | Meperidine | | |

### History
- fever
  - peak temperature, thermometer, route, duration
  - time of day
  - response to antipyretics
- systemic symptoms
  - weight loss, fatigue, rash, arthralgia, night sweats
- symptoms of possible source
  - UTI/pyelonephritis: dysuria, foul-smelling urine, incontinence, frequency, hematuria, flank pain
  - pneumonia: cough, pleuritic chest pain
  - URTI: cough, coryza, ear pain
  - meningitis: headache, confusion, stiff neck, rash
  - osteomyelitis: bone pain
  - skin: purulent discharge
  - PID: discharge, dyspareunia, lower abdominal pain
  - gastroenteritis: abdominal pain, diarrhea, blood per rectum, vomit
  - medications
  - PE/DVT: swollen legs, pain in calf, SOB, pleuritic chest pain
  - history of cancer/family history of cancer
- infectious contacts
  - travel history, camping, daycare, contact with TB, foodborne, animals

### Possible Investigations
- CBC and differential, blood culture, urine culture, urinalysis
- stool O&P, Gram stain, culture
- CXR, Mantoux skin test, sputum culture
- lumbar puncture

### Management
- increase fluid intake
- general: sponge bath, light clothing
- acetaminophen/ibuprofen as needed
- treat underlying cause

## Headache

### Primary Headaches
- see Neurology, N44

### Secondary Headaches
- caused by underlying organic disease
- account for <10% of all headaches, may be life-threatening

### Etiology
- drug: drug withdrawal, medication overuse, drug side effect, and carbon monoxide
- infectious: meningitis, encephalitis, abscess
- vascular: aneurysm, stroke, subarachnoid hemorrhage, hypertension, and temporal arteritis
- endocrine: thyroid disease, pheochromocytoma
- neoplastic: tumour
- trauma: TMJ injury, c-spine injury, head injury, subdural hematoma, and subarachnoid hemorrhage
- other: serious ophthalmological and otolaryngological causes

### Investigations
- indicated only when red flags are present and may include:
  - CBC for suspected systemic or intracranial infection
  - ESR for suspected temporal arteritis
  - neuroimaging (CT or MRI) to rule out intracranial pathology
  - CSF analysis for suspected intracranial hemorrhage, infection

### Management
- based on underlying disorder
- analgesics may provide symptomatic relief

**Acupuncture for Migraine Prophylaxis**
Cochrane DB Syst Rev 2016:6:CD001218
**Purpose**: To investigate whether acupuncture is more effective than no prophylactic treatment, routine care only or sham acupuncture, and whether it is as effective as prophylactic pharmacological treatment, in terms of reducing headache frequency in adults with episodic migraine.
**Methods**: Meta-analysis of RCTs with a minimum of an 8 wk duration, comparing acupuncture intervention with a no-acupuncture control (no prophylaxis, routine care, sham, or pharmacological prophylaxis).
**Results**: 22 trials with 4985 participants were included. Acupuncture was associated with moderate headache frequency reduction compared to no acupuncture (standardized mean difference (SMD) -0.56, 95% CI -0.65 to -0.48), and a reduction of >50% in headache frequency for 41% and 17% of participants receiving acupuncture and no acupuncture, respectively (pooled risk ratio (RR) 2.40, 2.08 to 2.76; number needed to treat (NNT) 4, 3 to 6). Acupuncture showed a small but statistically significant reduction over sham both post-treatment (SMD -0.18, -0.28 to -0.08) and post-follow-up (SMD -0.19, -0.30 to -0.09), with 50%+ headache frequency reduction being achieved in 50% versus 41% of those receiving acupuncture and sham, respectively (pooled RR 1.23, 1.11 to 1.36; NNT 11, 7 to 20); these numbers were 53% and 42%, respectively, post-follow-up (pooled RR 1.25, 1.13 to 1.39; NNT 10, 6 to 18). Number of participants dropping out and reporting adverse effects did not differ significantly between acupuncture and sham groups. Compared to pharmacological prophylaxis, a significant reduction in migraine frequency was noted with drugs (SMD -0.25, -0.39 to -0.10), but the significance was not maintained at follow-up. After 6 mo, headache frequency was halved in 59% of patients receiving acupuncture and 54% receiving prophylactic drugs (pooled RR 1.11, 0.97 to 1.26). Those receiving acupuncture were less likely to drop out due to adverse effects or to report adverse events than those receiving drugs.
**Conclusion**: Adding acupuncture to symptomatic treatment of attacks reduces frequency of headaches. Acupuncture is more effective than sham, and is similarly effective to pharmacological interventions for migraine prophylaxis.

**Migraine Screen**

**POUND**
**P**ulsatile quality
**O**ver 4-72 h
**U**nilateral
**N**ausea and vomiting
**D**isabling intensity
if ≥4 present then a diagnosis is likely (+LR = 24)

**Headache Red Flags**

**SNOOP**
**S**ystemic symptoms of illness
- fever
- anticoagulation
- pregnancy
- cancer

**N**eurologic signs/symptoms
- impaired mental status
- neck stiffness
- seizures
- focal neurological deficits

**O**nset
- sudden and severe
- new headache after age 50

**O**ther associated conditions
- following head trauma
- awakens patient from sleep
- jaw claudication
- scalp tenderness
- worse with exercise, sexual activity or Valsalva

**P**rior headache history
- different pattern
- rapidly progressing in severity/frequency

# Hearing Impairment

- see Otolaryngology, OT7

### Definition
- hearing impairment: a raised hearing threshold measured as decibels of hearing loss relative to the normal population at specific frequencies
- hearing disability: hearing impairment that interferes with performing daily tasks

### Epidemiology
- prevalence increases with age (6% of 35-44 yr old, 43% of 65-84 yr old)
- 90% of age-related hearing loss (presbycusis) is sensorineural
- hearing loss detectable by audiology is present in greater than 1/3 of people >65 yr

### Classification
- conductive (external sound does not reach the middle ear)
- sensorineural involving the inner ear, cochlea, or auditory nerve
- mixed

### Assessment
- infants: universal newborn hearing screening program
- elderly
  - whispered-voice test
    - examiner stand 0.6 metres behind the patient, whispers a combination of 6 letters/numbers, and asks the patient to repeat the sequence; test 1 ear at a time while masking the non-test ear simultaneously
  - tuning fork test (to distinguish conductive from sensorineural hearing loss)
    - Rinne and Weber (not for general screening)
  - formal audiologic assessment
- pure tone, air, and bone conduction testing
- speech audiometry
- impedance audiometry

### Management
- counsel about noise control and hearing protection programs (Grade A evidence)
- perform investigations in patients with unexplained sensorineural hearing loss
  - blood sugar, CBC and differential, TSH, syphilis testing
  - consider a CT/MRI for patients with progressive asymmetric sensorineural hearing loss to exclude vestibular schwannoma (acoustic neuroma)
- refer patients who
  - exhibit hearing loss for a complete audiological examination
  - have an unknown etiology to an ENT specialist
  - experience sudden sensorineural hearing loss to an ENT specialist (urgent, requires oral steroid Tx)
- treatment: hearing amplification (e.g. hearing aids), assistive listening devices, and cochlear implants can dramatically improve quality of life

**Does This Patient Have Hearing Impairment?**
JAMA 2006;295:416-428
**Purpose**: To evaluate bedside clinical maneuvers used to evaluate the presence of hearing impairment.
**Methods**: Systematic review of original studies examining the accuracy or precision of screening questions and tests.
**Results**: 24 studies were included.
**Conclusions**: Elderly patients acknowledging a hearing impairment require audiometry, while those who indicate they do not have hearing impairment should be screened with a whispered-voice test. A normal whispered-voice test requires no further workup, and those unable to perceive the whisper require audiometry. Weber and Rinne tests are not suitable for general hearing impairment screening.

# Hypertension

Hypertension Guidelines are reviewed and updated annually, for up-to-date recommendations, please see http://guidelines.hypertension.ca/

### Epidemiology
- 22% of Canadian adults suffer from HTN (prevalence is 52% in the 60-70 age group)
- lifetime risk of developing hypertension is approximately 90%
- 64% of Canadians who have HTN are treated and controlled, while 17% are unaware that they have HTN
- 3rd leading risk factor associated with death
  - risk factor for CAD, CHF, cerebrovascular disease, renal failure, peripheral vascular disease

### Definitions
- HTN
  - BP ≥140/90 mmHg (OBPM) ≥135/85 (ABPM/AOBP)
- isolated systolic HTN
  - sBP ≥140 and dBP <90
  - associated with progressive reduction in vascular compliance
  - usually begins in 5th decade
- hypertensive urgency
  - sBP >210 or dBP >120 with minimal or no target-organ damage

Symptoms of HTN are usually NOT PRESENT (this is why it is called the "silent killer").
May have occipital headache upon awakening or organ-specific complaints if advanced disease

**Renovascular HTN Suspected if Patient Presenting with 2 or more of:**
- Sudden onset or worsening of HTN and age >55 or <30 yr
- Presence of abdominal bruit
- HTN resistant to 3 or more drugs
- Rise in Cr of 30% or more associated with use of an ACEI or ARB
- Other atherosclerotic vascular disease, particularly in patients who smoke or have dyslipidemia
- Recurrent pulmonary edema associated with hypertensive surges

- hypertensive emergency
  - severe HTN (dBP >120) + acute target-organ damage
  - accelerated HTN
    - significant recent increase in BP over previous hypertensive levels associated with evidence of vascular damage on fundoscopy, but without papilledema
  - malignant HTN
    - sufficient elevation in BP to cause papilledema and other manifestations of vascular damage (retinal hemorrhages, bulging discs, mental status changes, increasing creatinine)
- white coat HTN
  - high clinic BP with normal home BP and 24 h ambulatory BP, caused by anxiety in clinic
- masked HTN
  - normal clinic BP with high BP in home and/or ambulatory setting, often provoked by anxiety, job stress, exercise

## Etiology
- essential hypertension (90%, undetermined cause)
- secondary hypertension (10%, known cause)

## Predisposing Factors
- family history
- obesity (especially abdominal)
- alcohol consumption
- stress
- sedentary lifestyle
- smoking
- male
- age >30
- excessive salt intake/fatty diet
- African American ancestry
- dyslipidemia

**Table 19. Causes of Secondary HTN**

| | Common Cause | | |
|---|---|---|---|
| **Renal** | Renovascular HTN<br>Renal parenchymal disease, glomerulonephritis, pyelonephritis, polycystic kidney | | |
| **Endocrine** | 1° hyperaldosteronism<br>Pheochromocytoma<br>Cushing's syndrome<br>Hyperthyroidism/hyperparathyroidism<br>Hypercalcemia of any cause | | |
| **Vascular** | Coarctation of the aorta<br>Renal artery stenosis | | |
| **Drug-Induced** | Estrogens/OCP<br>MAOIs<br>Cocaine | Steroids<br>Lithium<br>Amphetamines | NSAIDs<br>Decongestants<br>Alcohol |

## Investigations
- for all patients with HTN:
  - electrolytes, Cr, fasting glucose and/or HbA1c, lipid profile, 12-lead ECG, urinalysis
  - self-measurement of BP at home is encouraged (recommended devices listed at www.hypertension.ca)
- for specific patient etiology:
  - DM or chronic kidney disease: urinary protein excretion
  - if suspected renovascular HTN: renal ultrasound, captopril renal scan (if GFR >60 mL/min), MRA/CTA (if normal renal function)
  - if suspected endocrine cause: plasma aldosterone, plasma renin (aldosterone-to-renin ratio)
- measured from morning samples taken from patients in sitting position after resting 15 min
- discontinue aldosterone antagonists, ARBs, β-blockers, and clonidine prior to testing
  - if suspected pheochromocytoma: 24 h urine for metanephrines and creatinine
- if suspected LV dysfunction: echocardiogram

## Diagnosis
- all Canadian adults should have BP assessed at all appropriate clinical visits, oscillometric preferred to manual

**Suspect Hyperaldosteronism when**
- HTN refractory to treatment with ≥3 drugs
- Spontaneous hypokalemia
- Profound diuretic-induced hypokalemia (<3.0 mmol/L)
- Incidental adrenal adenomas

**Hypertensive Emergencies**
- **Malignant HTN**
- **Cerebrovascular**
  Hypertensive encephalopathy
  Stroke
  Intracerebral hemorrhage
  SAH
- **Cardiac**
  Acute aortic dissection
  Acute refractory LV failure
  Myocardial infarction/ischemia
  Acute pulmonary edema
- **Renal failure**

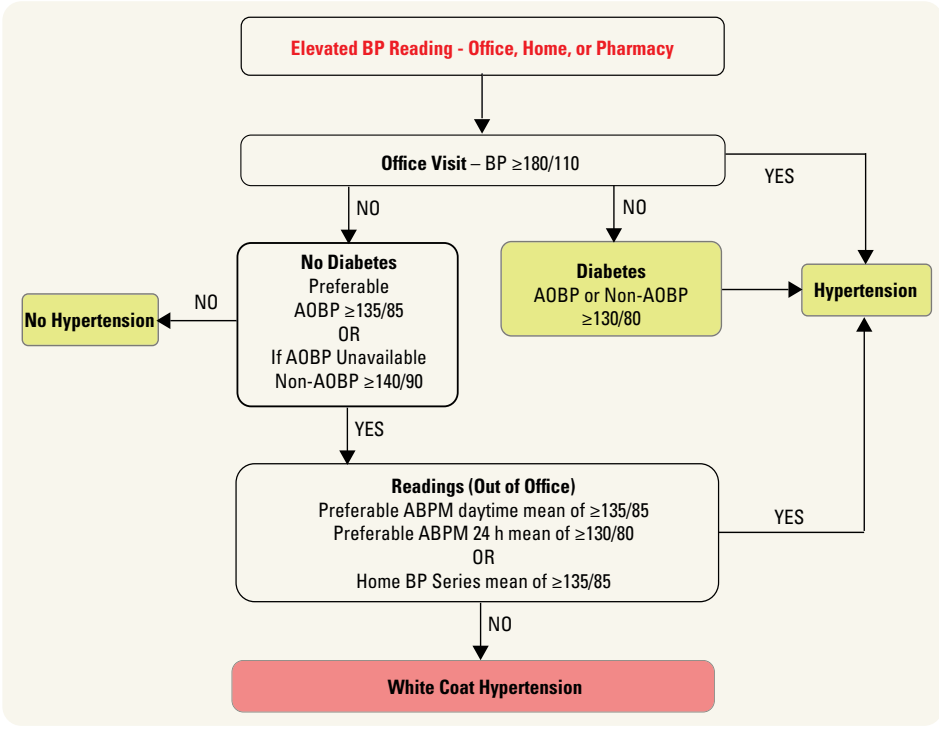

**Figure 12. Diagnostic algorithm for hypertension in adults**

## Treatment

- treat to target BP: <140/90 mmHg, <130/80 mmHg if DM
- optimum management of HTN requires assessment of overall cardiac risk
- adherence to lifestyle modification and pharmacotherapy should be assessed at each visit
- single pill combinations should be used as first line treatment (regardless of the extent of BP elevation)
- lifestyle modification (in all HTN patients – may be sufficient treatment in patients with stage 1 HTN (140-159/90-99))
  - diet
    - follow Canada's Guide to Healthy Eating (see *Nutrition*, FM9) and Dietary Approaches to Stop Hypertension (DASH)
    - limit daily sodium intake to 5 g or 87 mmol/d
    - potassium/magnesium/calcium supplementations are NOT recommended for HTN but an increase in dietary potassium may help
  - moderate intensity dynamic exercise: 30-60 min, 4-7x/wk; higher intensity exercise is not more effective
  - smoking cessation
  - low-risk alcohol consumption (see *Alcohol*, FM12)
  - work towards a healthy BMI (18.5-24.9 kg/m$^2$) and waist circumference (<102 cm for men, <88 cm for women)
  - individualized cognitive behavioural interventions for stress management
- pharmacological
  - indications for therapy (caution with elderly patients):
    - dBP ≥90 mmHg with target organ damage or independent cardiovascular risk factors
    - dBP ≥100 mmHg or sBP ≥160 mmHg without target organ damage or cardiovascular risk factors
    - sBP ≥140 with target organ damage
    - sBP >130 for high risk populations (Framingham Risk >20%, age >50)
  - first line antihypertensives (consider a single pill combination therapy)
  - combination therapy principles:
    - if there is an inadequate response to therapy, consider adding another first line antihypertensive
    - avoid combining a non-DHP CCB with a β-blocker or an ACEI with an ARB
    - monitor potassium and creatinine when administering an ACEI/ARB with a potassium sparing diuretic

**Impact of Health Behaviour on Blood Pressure**

| Intervention | Systolic BP (mmHg) | Diastolic BP (mmHg) |
|---|---|---|
| Diet and weight control | -6.0 | -4.8 |
| Reduced salt/ sodium intake | - 5.4 | - 2.8 |
| Reduced alcohol intake (heavy drinkers) | -3.4 | -3.4 |
| DASH diet | -11.4 | -5.5 |
| Physical activity | -3.1 | -1.8 |
| Relaxation therapies | -3.7 | -3.5 |

CHEP (Canadian Hypertension Education Program) Guidelines 2014. Available from: http://www.hypertension.ca/en/chep

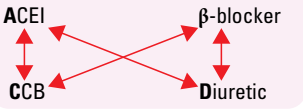
**β-blocker**
Not recommended as first line for patients of age ≥60

**ACEI**
Not recommended as monotherapy in people of African descent

## Table 20. Considerations in the Individualization of Pharmacological Therapy in Adults

| Condition or Risk Factor | Recommended Drugs | Alternative Drugs | Not Recommended/Notes |
|---|---|---|---|
| **Isolated Diastolic HTN with or without Systolic HTN** | Monotherapy or SPC. Recommended monotherapy choices include thiazide/thiazide-like diuretics (with longer-acting diuretics preferred), ß-blockers, ACEI, ARBs, or long-acting CCBs. Recommended SPC choices include combinations of an ACEI with CCB, ARB with CCB, or ACEI/ARB with a diuretic. (Consider ASA and statins in selected patients) | Combinations of first-line drugs | Not recommended for monotherapy: α-blockers, β-blocker in those ≥60 yr of age, ACEI in black people. Hypokalemia should be avoided in those prescribed diuretics. ACEI, ARBs and direct renin inhibitors are potential teratogens, and caution is required if prescribing to women with childbearing potential. Combination of an ACEI with an ARB is not recommended |
| **Isolated Systolic HTN without other compelling indications** | Thiazide diuretic, ARB, or long acting dihydropyridine CCB | Combinations of first-line drugs | Same as above |
| **CAD** | ACEI or ARB; β-blockers or CCB for patients with stable angina | When combination therapy for high risk patients, ACEI/DHP CCB is preferred | Avoid short-acting nifedipine. Combination of an ACEI with an ARB is specifically not recommended. Exercise caution when lowering sBP to target if dBP is ≤60 mmHg, especially in patients with LVH |
| **Recent MI** | β-blocker and ACEI (ARB if cannot tolerate ACEI) | Long-acting CCB if β-blocker contraindicated or not effective. | Non-dihydropyridine CCBs should not be used with concomitant heart failure |
| **Left Ventricular Hypertrophy** | ACEI, ARB, thiazide/thiazide-like diuretics, or long-acting CCB | Combination of additional agents | Hydralazine and minoxidil can increase LVH, thus not recommended |
| **Cerebrovascular Disease (stroke/TIA)** | ACEI and thiazide/thiazide-like diuretic combination | Combination of additional agents | Treatment of HTN should not be routinely undertaken in acute stroke unless extreme BP elevation. ACEI and ARB combination after a stroke is not recommended |
| **Heart Failure** | ACEI (ARB if ACEI intolerant) and β-blockers<br>Aldosterone antagonists (mineralocorticoid receptor antagonists) may be added for patients with a recent cardiovascular hospitalization, acute myocardial infarction, elevated BNP or NT-proBNP level, or NYHA Class II to IV symptoms | ARB in addition to ACEI<br>Hydralazine/isosorbide dinitrate combination if ARB or ACEI not tolerated/contraindicated<br><br>Thiazide/thiazide-like or loop diuretics are recommended as additive therapy. DHP CCB can also be used<br><br>A combined ARB/neprilysin inhibitor is recommended (in place of an ACEI or ARB) in symptomatic patients with hypertension and HFrEF on standard guideline-based therapies | Titrate doses of ACEI and ARBs to those used in clinical trials. Carefully monitor potassium and renal function if combining any of ACEI, ARB and/or aldosterone antagonist |
| **Dyslipidemias** | Does not affect initial treatment recommendations | Combination of additional agents | |
| **DM with Albuminuria (ACR >2.0 mg/mmol renal disease, CVD or additional CV risk factors)** | ACEI or ARB | Addition of a dihydropyridine CCB is preferred over a thiazide/ thiazide-like diuretic | A loop diuretic could be considered in hypertensive chronic kidney disease patients with extracellular fluid volume overload |
| **DM without Albuminuria (criteria listed above)** | ACEI, ARB, DHP CCB, or thiazide/ thiazide-like diuretics | Combination of first-line drugs<br>If combination with ACE inhibitor is being considered, a dihydropyridine CCB is preferable to a thiazide/ thiazidelike diuretic | Normal urine microalbumin to creatinine ratio <2.0 mg/mmol |
| **Non-Diabetic Chronic Kidney Disease with Proteinuria (urinary protein >500 mg/24 h or ACR >30 mg/mmol)** | ACEI (ARB if ACEI intolerant), if there is proteinuria<br>Diuretics as additive therapy | Combinations of additional agents | Patients on an ACEI or ARB should have careful monitoring of renal function and potassium. ACEI and ARB combinations are not recommended in patients without proteinuria |
| **Renovascular Disease** | Does not affect initial treatment recommendations<br>Atherosclerotic renal artery stenosis should be primarily managed medically, while revascularization should be considered for renal fibromuscular dysplasia | Combinations of additional agents | Caution in using ACEI or ARB if bilateral renal artery stenosis or unilateral disease with solitary kidney<br>Renal artery angioplasty and stenting could be considered for patients with renal artery stenosis and complicated, uncontrolled hypertension |

2020 Hypertension Highlights, Hypertension Canada. https://hypertension.ca/wp-content/uploads/2018/07/Hypertension-Guidelines-English-2018-Web.pdf



**Calcium Channel Blockers**

Dihydropyridine CCBs
- amlodipine
- nifedipine
- felodipine

Non-Dihydropyridine CCBs
- diltiazem
- verapamil

**How to Combine Antihypertensive Medications (in general)**

**Thiazides as First-Line Antihypertensive Therapy – ALLHAT**

JAMA 2002;288:2981-2997

**Purpose**: To evaluate whether calcium channel blocker or angiotensin-converting enzyme inhibitors lower incidence of coronary heart disease (CHD) or other cardiovascular disease (CVD) relative to treatment with a diuretic.

**Methods**: Randomized, double-blind, active-controlled clinical trial with mean follow-up of 4.9 yr. Participants with stage 1 or 2 hypertension (HTN) and at least 1 other CHD risk factor were included, and randomized to receive chlorthalidone (12.5-25 mg/d), amlodipine (2.5-10mg/d), or lisinopril (10-40 mg/d). Target BP was <140/90 mmHg, achieved by titrating the assigned study drug, and adding open-label agents when necessary. The primary outcome was combined fatal CHD or non-fatal MI. Secondary outcomes were all-cause mortality, stroke, combined CHD, and combined CVD.

**Results**: 33,357 participants (mean age 67 yr, 53% male, 47% white) were included. There were no significant differences in either the primary outcome or all-cause mortality between treatment groups. For amlodipine vs. chlorthalidone, secondary outcomes were similar except for a higher 6 yr rate of heart failure with amlodipine (10.2% vs. 7.7%; p<0.001). For lisinopril vs. chlorthalidone, lisinopril had higher 6 yr rates of combined CVD (33.3% vs. 30.9%; p<0.001), stroke (6.3% vs. 5.6%; p=0.02) and heart failure (8.7% vs. 7.7%; p<0.001).

**Conclusion**: Thiazide-type diuretics are superior to CCB and ACEI for preventing one or more major forms of CVD, with similar risks of death and non-fatal MI.

### Follow-Up
- assess and encourage adherence to pharmacological and non-pharmacological therapy at every visit
- lifestyle modification q3-6mo
- pharmacological
  - follow-up q1-2mo until BP under target for 2 consecutive visits. q3-6mo once at target BP
  - follow-up frequently for patients with symptomatic/severe HTN, antihypertensive drug intolerance, target organ damage
- referral is indicated for cases of refractory HTN, suspected secondary causes, or worsening renal failure
- hospitalization is indicated for malignant HTN

## Joint Pain

- see Rheumatology, RH3

### History
- number of joints involved: monoarticular, oligoarticular, polyarticular
- pattern of joints involved: symmetrical vs. asymmetrical, large vs. small joints, axial skeleton
- onset: acute vs. chronic (>6 wk)
- morning stiffness (duration) vs. worse at end of day with activity
- PMHx
  - trauma, infection, medications (steroids, diuretics)
  - comorbidities: DM, renal insufficiency (gout), psoriatic arthritis, myeloma, osteoporosis, and OA
  - FHx of arthritis, autoimmune disease
- ROS: constitutional symptoms (neoplasm, septic arthropathy), myalgia, skin/eye/nail/hand changes, and GI/GU changes

**Signs and Symptoms of Inflammatory Arthritis**

**WARM(S) Joints**
**W**orse with rest, better with activity
**A**wakening in the latter half of the night
**R**edness around joint
**M**orning stiffness (>30 min)
**S**oft tissue swelling, erythema

### Physical Exam
- vitals
- specific joint exams to affected areas
- systemic features (skin, nails, eyes, hands)

### Investigations (Guided by the History and Physical Exam)
- general: CBC and differential, electrolytes, Cr
- acute phase reactants: ESR, CRP
- complement (C3, C4)
- urinalysis to detect disease complications (proteinuria, active sediment)
- serology (ANA, anti-dsDNA, HLA-B27, anti-Jo-1, anti-Sm, anti-La, anti-Ro, RhF, and anti-CCP, etc.)
- synovial fluid analysis (cell count + differential, culture, Gram stain, microscopy)
- radiology (plain film, CT, MRI, U/S, bone densitometry, bone scan)

**Systemic Features**
- Fever (SLE, infection)
- Rash (SLE, psoriatic arthritis)
- Nail abnormalities (psoriatic, reactive arthritis)
- Uveitis (psoriatic, reactive arthritis, ankylosing spondylitis)
- Myalgias (fibromyalgia, myopathy)
- Weakness (polymyositis, neuropathy)
- GI symptoms (scleroderma, IBD)
- GU symptoms (reactive arthritis, gonococcemia)

### Treatment
- tailor therapy depending on the specific cause
- non-pharmacological: patient education, lifestyle modification, assisted devices, physiotherapy, occupational therapy
- pharmacological: analgesia (acetaminophen, NSAIDs), anti-inflammatory (DMARDs, steroids), antibiotics

## Low Back Pain

- see Orthopedic Surgery, OR26
- see CORE Back Tool: http://www.cfpc.ca/uploadedFiles/Resources/Resource_Items/Health_Professionals/CEP_CoreBackTool_2016.pdf

**Red Flags**
**B**owel or bladder dysfunction
**A**nesthesia (saddle)
**C**onstitutional symptoms/malignancy
**C**hronic disease
**P**aresthesias
**A**ge >50 and mild trauma
**I**V drug use/**I**nfection
**N**euromotor deficits

### Definition
- acute: <6 wk
- subacute: 6-12 wk
- chronic: >12 wk

### Epidemiology
- 5th most common reason for visiting a physician
- lifetime prevalence: 90%, and peak prevalence: age 45-60
- largest WSIB category and most common cause of chronic disability for individuals <45 yr old
- 90% resolve in 6 wk, <5% become chronic

## Etiology

- source of pain can be local, radicular, referred, or related to a psychiatric illness
- 98% are mechanical causes (worse with movement, better with rest)
  - soft tissue: sprain (ligament), strain (muscle)
  - spine: facet joint/disc degeneration, disc herniation, spinal stenosis (e.g. spondylosis), spondylolisthesis, compression fracture
  - other: pregnancy
- 2% are non-mechanical causes
  - surgical emergencies
    - cauda equina syndrome (areflexia, lower extremity weakness, saddle anesthesia, fecal incontinence, urinary retention)
- AAA (pulsatile abdominal mass)
  - medical conditions
- neoplastic: primary, metastatic, multiple myeloma
- infectious: osteomyelitis, TB
- metabolic: osteoporosis, osteomalacia, Paget's disease
- rheumatologic: ankylosing spondylitis, polymyalgia rheumatica
- referred pain: perforated ulcer, pancreatitis, pyelonephritis, ectopic pregnancy, herpes zoster

**Indications for Lumbar Spine X-Ray**

- No improvement after 6 wk
- Fever >38°C
- Unexplained weight loss
- Prolonged corticosteroid use
- Significant trauma
- Progressive neurological deficit
- Suspicion of ankylosing spondylitis
- History of cancer (rule out metastases)
- Alcohol/drug abuse (increased risk of osteomyelitis, trauma, fracture)

## Physical Exam

- inspection: curvature, posture, gait
- palpation: bony deformities/tenderness, paraspinal muscle bulk/tenderness, trigger points
  - percussion of spine to elicit pain due to fracture or infection
- range of motion and peripheral pulses
- neurologic exam for L4/L5/S1 helps determine level of spinal involvement (power, reflexes, sensation)
- special tests
  - straight leg raise (positive if pain at <70 degrees and aggravated by ankle dorsiflexion), positive test is indicative of sciatica
  - crossed straight leg raise (raising of uninvolved leg elicits pain in leg with sciatica), more specific than straight leg raise
  - femoral stretch test (patient prone, knee flexed, examiner extends hip) to diagnose L4 radiculopathy

## Investigations

- plain films not recommended in initial evaluation
- if infection/cancer suspected: CBC, ESR
- if neurologic deficits worsening or infection/cancer suspected: consider CT or MRI

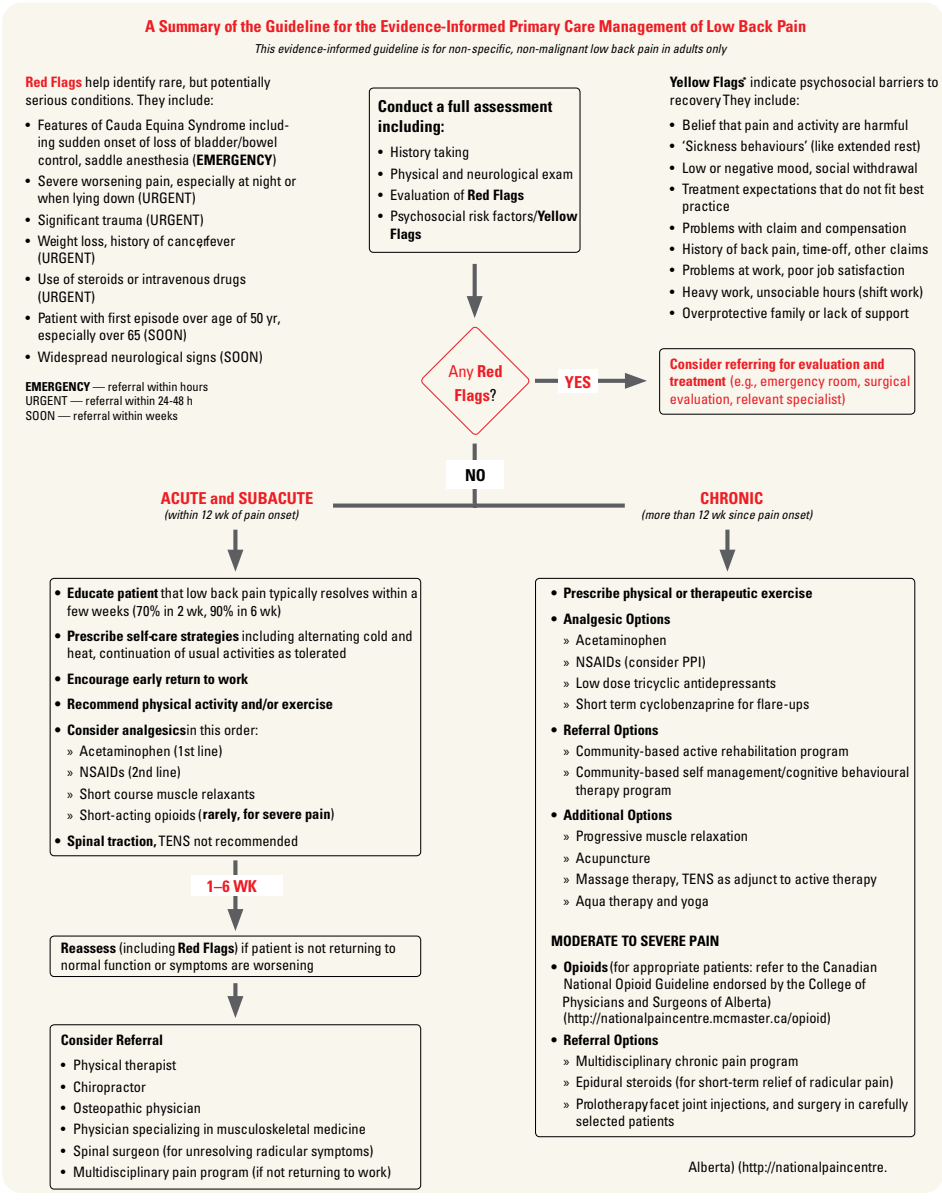


**Figure 13. Low back pain treatment**
Reprinted with permission from: Kendall NAS, et al. Guide to Assessing Psycho-Social Yellow Flags in Acute Low Back Pain. ACC & NZGG, Wellington, NZ. (2004 ed.); Toward Optimized Practice. Guideline for the evidence-informed primary care management of low back pain, 2nd ed. 2007. Available from: www.topalbertadoctors.org

**Massage for Low Back Pain**
Cochrane DB Syst Rev 2015;4:CD001929
**Purpose**: To evaluate the effect of massage therapy for non-specific low back pain.
**Methods**: Meta-analysis of randomized or quasi-randomized trials evaluating use of any massage modality (hands or mechanical device) as a treatment for non-specific low back pain.
**Results**: 13 RCTs were identified, comparing massage therapy to other active or sham treatments. Massage was superior for pain and function on both short and long-term follow-ups relative to sham treatment. It was similar to exercises, and superior to join mobilization, relaxation therapy, physical therapy, acupuncture and self-care education. Benefits lasted at least 1 yr post-treatment. Acupuncture massage was associated with better results than classic (Swedish) massage, and Thai massage produced similar results to the classic massage.
**Conclusions**: Massage may be beneficial for subacute and chronic non-specific low back pain, especially in combination with exercise and education; it is more effective than classic massage.

**Spinal Manipulative Therapy (SMT) for Acute Low-Back Pain**
Cochrane DB Syst Rev 2012;9:CD008880
**Purpose**: To evaluate spinal manipulative therapy (SMT) for acute low back pain.
**Methods**: Meta-analysis of RCTs examining effectiveness of SMT (hands-on therapy directed towards spine, including both manipulation and mobilization) in adults with acute low back pain (pain lasting <6 wk). Studies involving patients with predominantly low back pain but radiating into the buttocks and legs were also included. Primary outcomes were back pain, back-pain specific functional status and perceived recovery.
**Results**: 20 RCTs involving 2674 participants were included. Low to very low quality evidence suggested no difference in effect for SMT compared to inert interventions, sham SMT or as an adjunct to another intervention, for the primary outcomes. Side-lying and supine thrust SMT techniques demonstrated a short-term significant difference when compared to non-thrust SMT techniques for outcomes of pain, functional status and recovery.
**Conclusion**: SMT is not more effective than inert interventions, sham SMT or as an adjunct to another intervention for patients with acute low back pain, and does not appear any better than other recommended therapies either. Decision to refer patients for SMT should be based on costs, patient and provider preferences, and the relative safety of SMT relative to other treatment options.

## Table 21. Approach to Non-Traumatic Low Back Pain

| | **Back Dominant** (Pain greatest above gluteal fold) | | **Leg Dominant** (Pain greatest below gluteal fold) | |
|---|---|---|---|---|
| **History** | **Pattern 1**<br>Worse with flexion<br>Constant/intermittent | **Pattern 2**<br>Worse with extension<br>Never worse with flexion<br>Always intermittent | **Pattern 3**<br>Pain changes with back movement/position<br>Currently/previously constant | **Pattern 4**<br>Worse with activity<br>Improves with rest and posture change<br>Intermittent/short duration |
| **Physical Exam** | Normal neuro exam<br>Fast responder<br>Improves with extension<br>Slow responder<br>No change or worsens with extension | Normal neuro exam<br>± improves with flexion<br>Worse with extension | Leg pain can improve but not disappear<br>Positive straight leg raise ± conduction loss<br>Fast responder<br>Improves with specific back position<br>Slow responder<br>Not better with position changes | No irritative findings ± conduction loss |
| **Likely Pathology** | Disc pain | Facet joint pain | Compressed nerve pain: sciatica | Symptomatic spinal stenosis: neurogenic claudication |
| **Initial Management** | Scheduled extension<br>Lumbar roll<br>Night lumbar roll<br>Medication as required: acetaminophen + NSAIDs | Scheduled flexion<br>Limited extension<br>Night lumbar roll<br>Medication as required: acetaminophen + NSAIDs | Prone extension<br>Supine "Z" lie<br>Lumbar roll<br>Night lumbar roll<br>Medication as required: acetaminophen + NSAIDs, may consider if 1st line not sufficient | Abdominal exercises<br>Night lumbar roll<br>Sustained flexion<br>Pelvic tilt<br>Medication as required: acetaminophen + NSAIDs |

# Menopause/Hormone Replacement Therapy

• see Gynecology, GY33

### Epidemiology
- mean age of menopause = 51.4 yr

### Clinical Features
- associated with estrogen deprivation
- urogenital tract: atrophy, vaginal dryness/itching, urinary frequency/urgency/incontinence, bleeding
- vascular: vasomotor instability (e.g. hot flashes), increased risk of heart disease
- bones: bone loss, joint/muscle/back pain, fractures, loss of height
- brain: depression, irritability, mood swings, memory loss

### Management
- non-pharmacological management: encourage physical exercise, smoking cessation, and a balanced diet with adequate intake/supplementation of calcium (1200 mg/d) and vitamin D (1000 IU/d)
- pharmacological management:
  - hormone replacement therapy (HRT)
    - initiation of HRT requires a thorough discussion of short- and long-term benefits and risks
    - prescribe for moderate to severe symptoms for no longer than 5 yr; routine use is not recommended
    - regimens: cyclic or continuous estrogen-progestin, estrogen only (if no uterus, patch/gel/cream/ring/vaginal tablet)
    - advantages: decreases risk of osteoporotic fractures, colorectal cancer
    - disadvantages: increases risk of breast cancer, coronary heart disease, stroke, DVT, and PE
  - venlafaxine, SSRIs, or gabapentin to ease vasomotor instability

# Osteoarthritis

• see Rheumatology, RH5

### Epidemiology
- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone over the age of 65 shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

### Clinical Features
- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, peri-articular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

### Investigations
- no laboratory tests for the diagnosis of OA
- hallmark radiographic features: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes

### Management
- goals: relieve pain, preserve joint motion and function, prevent further injury
- conservative
  - patient education, weight loss, low-impact exercise (OT/PT), assistive devices (e.g. canes, orthotics)
- pharmacological
  - consider comorbidities such as PUD, HTN, IHD, hepatic disease, and renal disease
  - medications do not alter natural course of OA
  - 1st line: acetaminophen up to 4 g/d (OA is not an inflammatory disorder)
  - 2nd line: NSAIDs (COX-2 selective) in low doses for short durations
  - 3rd line: combination analgesics (e.g. acetaminophen and codeine)
  - other pharmacological adjuncts:
    - intra-articular corticosteroid or hyaluronic acid injections
    - topical NSAIDS (diclofenac)
    - capsaicin cream
    - oral glucosamine
- surgery
  - consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g. debridement, osteotomy, total joint arthroplasty)

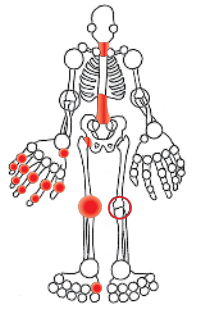

**Figure 14. Common sites of involvement in OA**

# Osteoporosis

• see Endocrinology, E43

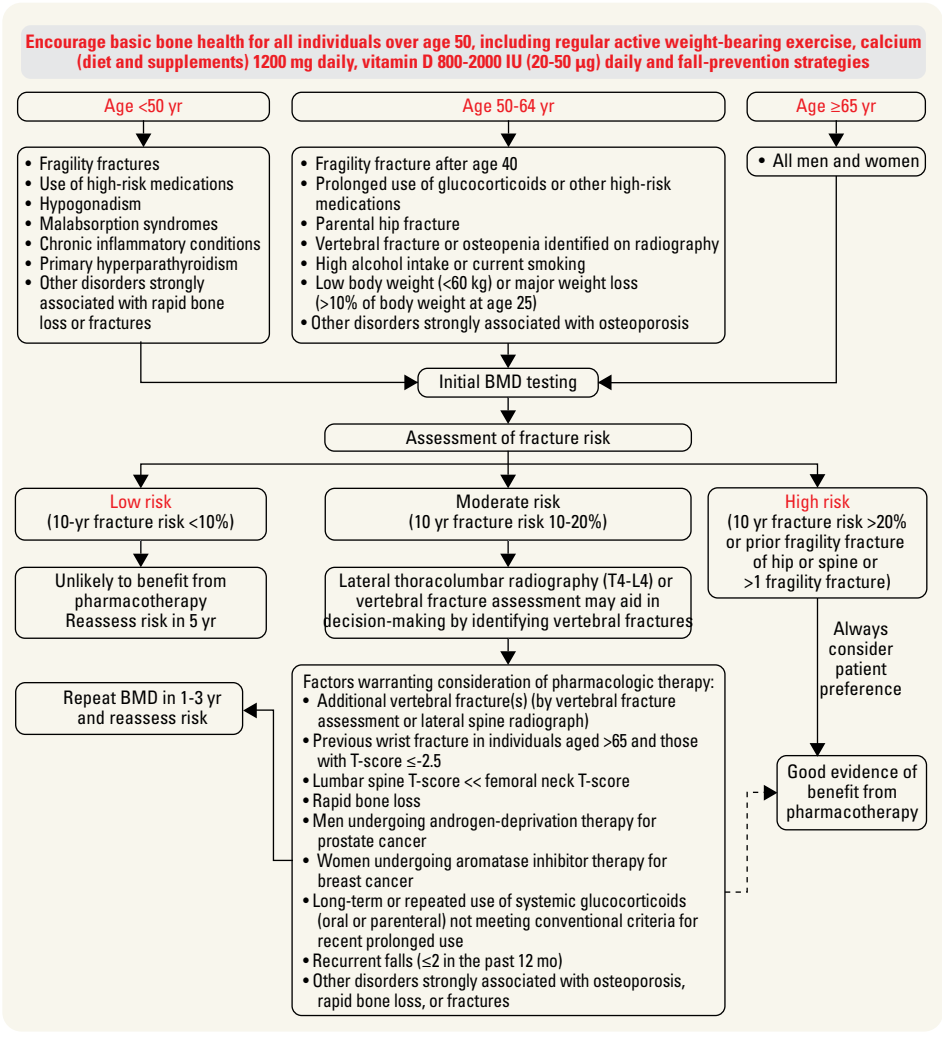

**Figure 15. 2010 Clinical practice guidelines for the diagnosis and management of osteoporosis in Canada**
(integrated management model) Adapted from: CMAJ 2010;182:1864-1873

## Epidemiology

- for current guidelines and tools see www.osteoporosis.ca
- age-related disease characterized by decreased bone mass and increased susceptibility to fractures
- affects 1 in 4 Canadian women and 1 in 8 Canadian men

## Approach to Clinical Assessment

- identify risk factors on history and physical examination
  - history
- prior falls, fragility fractures, parental hip fractures, and gait or balance issues
- glucocorticoid use
- smoking and alcohol intake (≥3 units/d)
- rheumatoid arthritis
  - physical examination
    - height annually (prospective loss >2 cm or historical loss >6 cm) and weight (weight loss >10% since age 25)
    - rib-to-pelvis distance ≤2 fingers' breadth
    - occiput-to-wall distance >5 cm
    - assess fall risk by ability to get up from chair without support with arms, and walking several steps and return

**Disorders Strongly Associated with Osteoporosis Include:**
Primary hyperparathyroidism, type 1 DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. IBD)

**10 Yr Fracture Risk Assessment**
FRAX (WHO Fracture Risk Assessment Tool) and CAROC (Canadian Association of Radiologists and Osteoporosis Canada) have been validated in the Canadian Population
FRAX and CAROC are available online from: https://www.osteoporosis.ca/health-care-professionals/clinical-tools-and-resources/

**How Much Calcium Do We Need?**

| Age | |
|---|---|
| 4-8 | 1000 mg |
| 9-18 | 1300 mg |
| 19-50 | 1200 mg |
| >50 | 1200 mg |
| Pregnant and lactating women 19-50 | 1000 mg |

**Calcium Content of Common Foods**
- 1 cup milk = 300 mg
- ¾ cup yogurt = 332 mg
- ½ can salmon with bones = 240 mg
- ½ cup cooked broccoli = 33 mg
- 1 medium orange = 50 mg

**Vitamin D Content in Food**
- Milk fortified with vitamin $D_3$ contains 100 IUs per 250 mL glass
- Foods such as margarine, eggs, chicken livers, salmon, sardines, herring, mackerel, swordfish, and fish oils (halibut and cod liver oils) all contain small amounts; supplementation is necessary to obtain adequate levels as dietary intake has minimal impact
- Most multivitamins provide 400 IUs of vitamin $D_3$

### Investigations
- CBC, Cr, corrected $Ca^{2+}$, ALP, TSH, 25-OH-D (after 3-4 mo of adequate supplementation), and serum protein electrophoresis if there are vertebral fractures

### Indications for Bone Mineral Density Testing and Management
- see Endocrinology, E43

# Rash

- see Dermatology, D13

# Sexually Transmitted Infections

- see Gynecology, GY26

### Definition
- diverse group of infections caused by multiple microbial pathogens
- transmitted by either secretions or fluids from mucosal surfaces

### Epidemiology
- high incidence rates worldwide
- Canadian prevalence in clinical practice
  - common: chlamydia (most common), gonorrhea (2nd most common), HPV, genital herpes
  - less common: hepatitis B, HIV, syphilis, trichomoniasis
  - rare: chancroid, granuloma inguinale, lymphogranuloma venereum
- non-sexually transmitted genital tract infections: vulvovaginal candidiasis (VVC), bacterial vaginosis (BV)
- three most common infections associated with vaginal discharge in adult women are BV, VVC, and trichomoniasis

### History
- sexual history
  - age of first intercourse, sexual orientation, sexual activity (oral, anal, and/or vaginal intercourse), sexual activity during travel
  - total number of partners in the past year/month/week and duration of involvement with each
- STI history
  - STI awareness, contraception, previous STIs and testing (including Pap tests), partner communication regarding STIs
  - local symptoms such as burning, itching, discharge, sores, vesicles, testicular pain, dysuria, abdominal pain
  - systemic symptoms such as fever, lymphadenopathy, arthralgia

### Investigations/Screening
- individuals at increased risk should be screened for chlamydia, gonorrhea, hepatitis B, HIV, and syphilis
- Pap test if none performed in preceding 3 yr

### Management
- primary prevention is vastly more effective than treating STIs and their sequelae
- offer hepatitis B vaccine if not immune
- offer Gardasil® to women over 9 yr
- discuss STI risk factors (e.g. decreasing the number of sexual partners)
- direct advice to ALWAYS use condoms or to abstain from intercourse
- condoms are not 100% effective against HPV or HSV
- an STI patient is not considered treated until the management of his/her partner(s) is ensured (contact tracing by Public Health)
- patients diagnosed with bacterial STI or trichomonal infection should abstain from sexual activity until treatment completion and for 7 d after treatment for both partners, or until test of cure completed
- mandatory reporting: chlamydia, gonorrhea, hepatitis B, HIV, syphilis

When an STI is detected in a child, evaluation for sexual abuse is mandatory

**STI Risk Factors**
- Sexually active males and females <25 yr old
- Unprotected sex, sexual contact with a known case of STI, previous STI
- New sexual partner or >2 sexual partners in the past 12 mo
- Street involved, homeless, and/or substance abuse

**Sexual History**
**5 P's**
**P**artners (numbers, gender)
**P**ractices (vaginal, oral, anal insertive/receptive)
**P**rotection
**P**ast history of STIs
**P**regnancy prevention

**Efficacy of Human Papillomavirus Vaccines – A Systematic Quantitative Review**
Int J Gynecol Cancer 2009;19:1166-1176
**Purpose**: To evaluate two vaccines for human papillomavirus (HPV) in terms of efficacy, safety and immunogenicity.
**Methods**: Systematic review of RCTs involving women between the ages of 9 and 26 yr, randomly assigned to receive vaccination with HPV L1 virus-like particle in either quadrivalent (HPV 6, 11, 16, 18), bivalent (HPV 16, 18), or univalent (HPV 16) form or placebo. Main outcomes were prevention of cytologically and/or histologically proven lesions (including LSIL, HSIL, VIN, VAIN, AIN, adenocarcinoma in situ of the cervix, or cancer of the cervix associated with HPV infection).
**Results**: Six studies involving 47,236 women were included. Bivalent and quadrivalent vaccines reduced the rate of lesions in the cervix, vulva, vagina, and anogenital region with efficacy of 93% (95% CI 87-96%) and 62% (95% CI 27-70), respectively. More symptoms were found in the bivalent vaccine group (35%, 5-73%) compared to control groups.
**Conclusion**: Prophylactic vaccination can prevent HPV infection in women aged 9 to 26 yr not previously infected with HPV subtypes covered by the vaccines.

**Table 22. Diagnosis and Treatment of Common STIs**

| | Signs and Symptoms | Investigations | Treatment | Complications |
|---|---|---|---|---|
| **Gonococcal Urethritis/ Cervicitis** (*Neisseria gonorrhoeae*) | M: urethral discharge, unexplained pyuria, dysuria, irritation, testicular swelling, Sx of epididymitis<br><br>F: mucopurulent endocervical discharge, vaginal bleeding, dysuria, pelvic pain, dyspareunia<br><br>M and F: often asymptomatic, can involve rectal symptoms in cases of unprotected anal sex | M: urethral swab for Gram stain and culture<br><br>F: urine PCR, endocervical swab for Gram stain and culture, vaginal swab for wet mount (to rule out trichomonas)<br><br>M and F: urine PCR, rectal/ pharyngeal swabs if indicated | Ceftriaxone 250 mg IM single dose*<br>If risk factors for treatment failure (e.g. pregnancy, pharyngeal/rectal infection, potentially reduced susceptibility)<br>Test of cure: culture 4 d post-treatment (preferred) or urine PCR 2 wk post treatment (alternative)<br>If no risk factors, rescreen 6-12 mo post treatment | M: urethral strictures, epididymitis, infertility<br><br>F: PID, infertility, ectopic pregnancy, perinatal infection, chronic pelvic pain<br><br>M and F: Arthritis, increased risk of acquiring and transmitting HIV |
| **Non-Gonococcal Urethritis/Cervicitis** (Usually *Chlamydia trachomatis***) | ~70% asymptomatic<br>If symptoms appear (usually 2-6 wk after infection) then similar to gonococcal symptoms (see above) | Same as above | Azithromycin 1 g PO single dose + gonococcal urethritis/cervicitis Rx*<br>Same follow-up as above | Same as above |
| **Human Papillomavirus** (genital warts, cervical dysplasia) | Most are asymptomatic<br>M: cauliflower lesions (condylomata acuminata) on skin/mucosa of penile or anal area<br><br>F: cauliflower lesions and/or pre-neoplastic/neoplastic lesions on cervix/vagina/vulva | None needed if simple condylomata<br>Potential biopsy of suspicious lesions<br><br>F: screening for cervical dysplasia through regular Pap smears | For condylomata: cryotherapy, electrocautery, laser excision, topical therapy (patient-applied or office-based)<br>For cervical dysplasia: colposcopy and possible excision, dependent on grade of lesion | M and F: anal cancer MSM and F who have receptive anal sex: rectal cancer<br><br>F: cervical/vaginal/vulvar cancer |
| **Genital Herpes** (HSV-1 and -2) | 1° episode: painful vesicoulcerative genital lesions ± fever, tender lymphadenopathy, protracted course<br>Recurrent episodes: less extensive lesions, shorter course may have "trigger factors" | Swab of vesicular content for culture, type-specific serologic testing for HSV-1 vs. HSV-2 antibodies and to determine 1° vs. recurrent episode | 1° Episode<br>Acyclovir 200 mg PO 5x/d x 5-10 d or<br>Famciclovir 250 mg PO tid x 5 d or<br>Valacyclovir 1000 mg PO bid x 10 d<br><br>Recurrent Episode<br>Acyclovir 200 mg PO 5x/d x 5d or 800 mg PO tid x 2 d or<br>Famciclovir 125 mg PO bid x 5 d or<br>Valacyclovir 500 mg PO bid x 3 d or 1000 mg PO OD x 3 d | Genital pain, urethritis, cervicitis, aseptic meningitis, increased risk of acquiring and transmitting HIV |
| **Infectious Syphilis** (*Treponema pallidum*) | 1°: chancre (painless sore), regional lymphadenopathy<br>2°: rash and flu-like symptoms, meningitis, headache, uveitis, retinitis, condyloma lata, mucus lesions, alopecia<br>Latent Phase: asymptomatic<br>3°: neurologic, cardiovascular, and tissue complications | Specimen collection from 1° and 2° lesions, screen high risk individuals with serologic syphilis testing (VDRL), universal screening of pregnant women | Benzathine penicillin G IM (dose depends on stage and patient population. Check Public Health Canada guidelines )<br>Notify partners (last 3-12 mo)<br>Continuous follow-up and testing until patients are seronegative | Chronic neurologic and cardiovascular sequelae, increased risk of acquiring and transmitting HIV |

F = females; M = males
*N.B. if urethritis/cervicitis is suspected, always treat for both gonococcal and non-gonococcal types (i.e. ceftriaxone AND azithromycin)
**Most common reportable STI in Canada

# Sinusitis

- see Otolaryngology, OT24

## Etiology

- viral etiology is more common
- viral: rhinovirus, influenza, parainfluenza
- bacterial: *S. pneumoniae, H. influenzae, M. catarrhalis*

## Management of Acute Sinusitis

- for symptom relief: oral analgesics (acetaminophen, NSAIDs), nasal saline rinse, short-term use of topical/ or oral decongestants
- do not prescribe antihistamines
- mild to moderate acute bacterial sinusitis: intra-nasal corticosteroids
- severe acute bacterial sinusitis: antibiotics and intra-nasal corticosteroids
  - first-line antibiotic is amoxicillin, and second line is amoxicillin-clavulanic acid or a fluoroquinolone
  - ENT referral if: anatomic defect (e.g. deviated septum, polyp, adenoid hypertrophy), failure of second-line therapy, or ≥4 episodes/yr, refer urgently when there is development of complications (e.g. orbital extension, meningitis, intra-cranial abscess, venous sinus thrombosis), altered mental status, headache, systemic toxicity, or neurological findings

**Red Flags for Urgent Referral**
- Altered mental status
- Headache
- Systemic toxicity
- Swelling of the orbit or change in visual acuity or extraocular muscles
- Hard neurological findings
- Signs of meningeal irritation
- Suspected intra-cranial complications (meningitis, intra-cranial abscess, cavernous sinus thrombosis)
- Involvement of associated structures (periorbital cellulitis, Pott's puffy tumour)

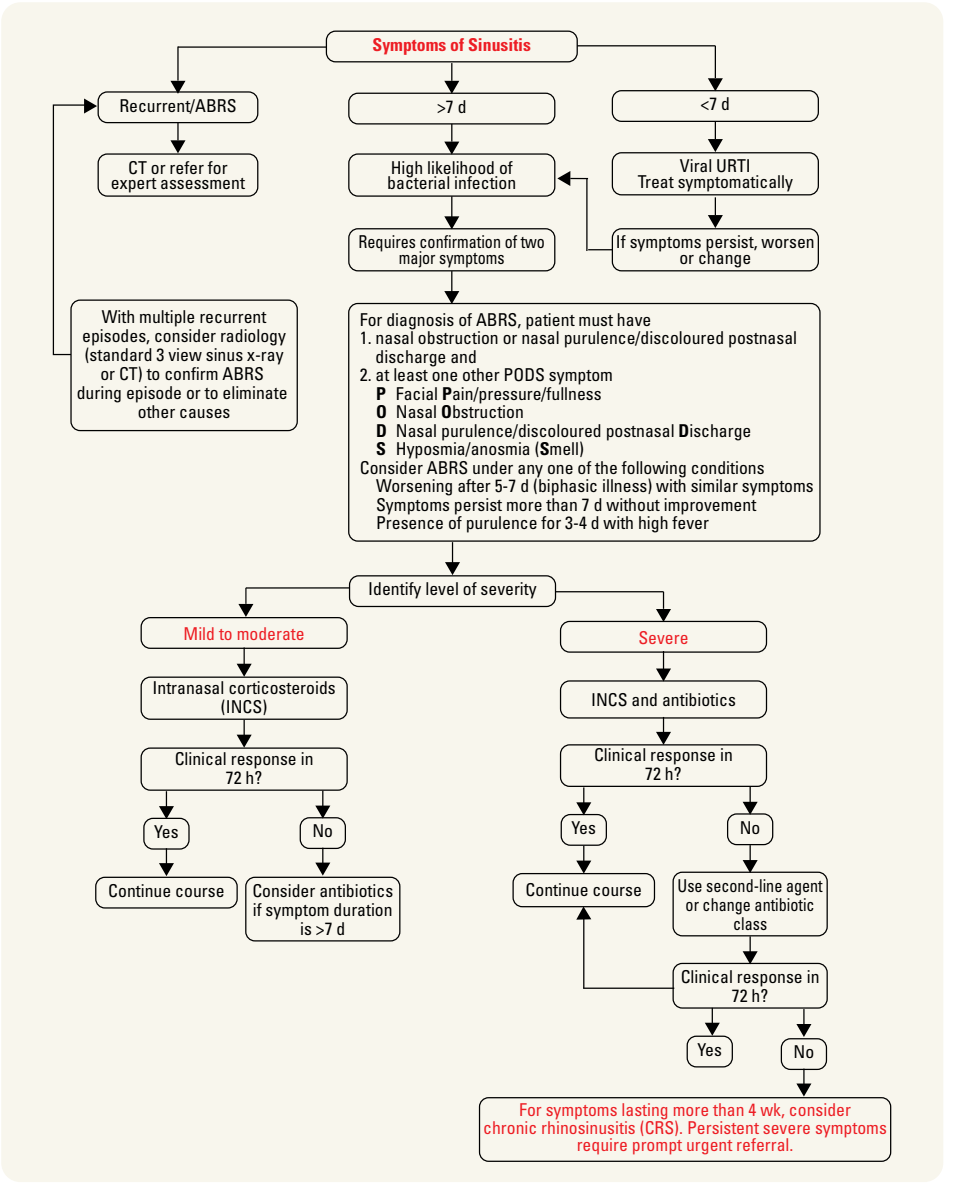

**Figure 16. Diagnosis and management of sinusitis**
ABRS = acute bacterial rhinosinusitis
Adapted from: Desrosiers M, et al. Allergy Asthma Clin Immunol 2011;7:doi:10.1186/1710-1492-7-2

# Sleep Disorders

- see Respirology, R28 and Neurology, N46

## Definition

- most often characterized by one of three complaints
  - insomnia
- difficulty falling asleep, difficulty maintaining sleep, early morning wakening, non-refreshing sleep
  - parasomnias
- night terrors, nightmares, restless leg syndrome, somnambulism (performing complex behaviour during sleep with eyes open but without memory of event)
  - excessive daytime sleepiness

## Epidemiology

- 1/3 of patients in primary care setting have occasional sleep problems, 10% have chronic sleep problems

## Etiology

- primary sleep disorders
  - primary insomnia, narcolepsy, obstructive sleep apnea, restless leg syndrome, periodic limb movements of sleep
- secondary causes
  - medical: COPD, asthma, CHF, hyperthyroidism, chronic pain, BPH, menopause, GERD, PUD, pregnancy, neurological disorders

- drugs: alcohol, caffeine, nicotine, nicotine replacement therapy, β-agonists, antidepressants, steroids
- psychiatric: mood and anxiety disorders
- lifestyle factors: shift work, jet-lag

## Investigations

- complete sleep diary every morning for 1-2 wk
  - record bedtime, sleep latency, total sleep time, awakenings, quality of sleep
- rule out specific medical problems (e.g. CBC and differential, TSH)
- refer for sleep study, nocturnal polysomnogram, or daytime multiple sleep latency test if suspicion of sleep apnea or periodic leg movements of sleep

## Management of Specific Problems

- **Primary Insomnia**
  - person reacts to insomnia with fear or anxiety around bedtime or with a change in sleep hygiene, which can progress to a chronic disorder (psychophysiological insomnia)
  - treat any suspected medical or psychiatric cause
  - exercise regularly, avoid heavy exercise within 3 h of bedtime
  - first-line treatment (CBT)
    - sleep hygiene: avoid alcohol, caffeine, nicotine; comfortable sleep environment; regular sleep schedule; no napping
    - relaxation therapy: deep breathing, meditation, biofeedback
    - stimulus control therapy: re-association of bed/bedroom with sleep, re-establishment of a consistent sleep-wake schedule, reduce activities that cue staying awake
    - sleep restriction therapy: total time in bed should closely match the total sleep time of the patient
    - address inappropriate beliefs and attitudes that perpetuate dysfunctional sleep
  - pharmacologic treatment (used to supplement CBT; short-term prescription of <14 d with appropriate follow-up in 7-14 d):
    - short-acting benzodiazepines (e.g. lorazepam) are used to:
      - break the cycle of chronic insomnia
      - manage an exacerbation of previously controlled insomnia
    - non-benzodiazepines: zoplicone, zolpidem, melatonin, sedating anti-depressants (e.g. amitriptyline, trazadone)
    - if no progress or limited improvement on pharmacotherapy, consider referral to sleep medicine program
  - other treatment: exercise regularly, avoid heavy exercise within 3 h of bedtime
- **Snoring**
  - results from soft tissue vibration at the back of the nose and throat due to turbulent airflow through narrowed air passages
  - physical exam: obesity, nasal polyps, septal deviation, hypertrophy of the nasal turbinates, enlarged uvula and tonsils
  - investigations (only if severely symptomatic): nocturnal polysomnography and airway assessment (CT/MRI)
  - treatment
    - sleep on side (position therapy), weight loss
    - nasal dilators, tongue-retaining devices, mandibular advancement devices
  - at risk of developing obstructive sleep apnea
- **Obstructive Sleep Apnea (OSA)**
  - apnea (no breathing for ≥10 s) resulting from partial or complete upper airway obstruction due to collapse of the base of the tongue, soft palate with uvula, and epiglottis; respiratory effort is present
  - leads to a distinctive snorting, choking, awakening type pattern as the body rouses itself to open the airway
  - apneic episodes can last from 20 s-3 min and occur 100-600 episodes/night
  - diagnosis is based on nocturnal polysomnography: >15 apneic/hypopneic episodes per hour of sleep
  - consequences
    - daytime somnolence, non-restorative sleep
    - poor social and work performance
    - mood changes: anxiety, irritability, depression
    - sexual dysfunction: poor libido, impotence
    - morning headache (due to hypercapnia)
    - HTN (2x increased risk), CAD (3x increased risk), stroke (4x increased risk), arrhythmias
    - OSA is an independent risk factor for CAD
    - pulmonary HTN, right ventricular dysfunction, cor pulmonale (due to chronic hypoxemia)
    - memory loss, decreased concentration, confusion
  - investigations
    - evaluate BP, inspect nose, and oropharynx (enlarged adenoids or tonsils)
    - blood gas not helpful, TSH if clinically indicated
    - nocturnal polysomnography
  - treatment
    - modifiable factors: avoid sleeping supine; weight loss; avoid alcohol, sedatives, opioids; inhaled steroids if nasal swelling present; dental appliances to modify mandibular position
    - primary treatment of OSA is CPAP: maintains patent airway in 95% of OSA cases
    - surgery: somnoplasty, uvulopalatopharyngoplasty (UPPP), tonsillectomy, and adenoidectomy (in children)
    - report patient to Ministry of Transportation if OSA is not controlled by CPAP

**Risk Factors for Obstructive Sleep Apnea**

- 2% of women, 4% of men between ages 30-60
- Obesity (due to upper airway narrowing). BMI >28 kg/m$^2$ present in 60-90% of cases
- Children (commonly due to large tonsils and adenoids)
- Aging (due to decreased muscle tone)
- Persistent URTIs, allergies, nasal tumours, hypothyroidism (due to macroglossia), neuromuscular disease
- Family history

# Sore Throat (Pharyngitis)

## Definition
- inflammation of the oropharynx
- may be caused by a wide range of infectious organisms, most of which produce a self-limited infection with no significant sequelae

## Etiology
- viral: adenovirus, rhinovirus, influenza virus, RSV, EBV, coxsackie virus, herpes simplex virus, CMV, HIV
- bacterial: Group A β-Hemolytic *Streptococcus* (GABHS), Group C and Group β-Hemolytic *Streptococcus, Neisseria gonorrhoeae, Chlamydia pneumoniae, Mycoplasma pneumoniae, Corynebacterium diphtheriae*

## Epidemiology
- viral
  - most common cause (90% in adults is viral), occurs year round
- bacterial
  - GABHS (Group A β-Hemolytic Streptococcal Infections)
    - most common bacterial cause
    - occurs most often in winter months
    - 5-15% of adult cases and up to 50% of all pediatric cases of acute pharyngitis
    - most prevalent between 5-17 yr old

## Clinical Features
- viral
  - pharyngitis, conjunctivitis, rhinorrhea, hoarseness, cough
  - nonspecific flu-like symptoms such as fever, malaise, and myalgia
  - often mimics bacterial infection
  - common viral infections
    - EBV (infectious mononucleosis)
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
    - coxsackie virus (hand, foot, and mouth disease)
      - primarily late summer, early fall
      - sudden onset of fever, pharyngitis, headache, abdominal pain, and vomiting
      - appearance of small vesicles that rupture and ulcerate on soft palate, tonsils, pharynx
      - ulcers are pale grey and several mm in diameter, have surrounding erythema, and may appear on hands and feet
    - herpes simplex virus
      - like coxsackie virus but ulcers are fewer and larger
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
- bacterial
  - symptoms: pharyngitis, fever, malaise, headache, abdominal pain, absence of cough
  - signs: fever, tonsillar or pharyngeal erythema/exudate, swollen/tender anterior cervical nodes, halitosis
  - complications:
    - suppurative: abscess, sinusitis, otitis media, cervical adenitis, pneumonia
    - non-suppurative: acute rheumatic fever, acute glomerulonephritis

## Investigations
- suspected GABHS
  - see Table 23 for approach to diagnosis and management of GABHS
  - gold standard for diagnosis is throat culture
  - rapid test for streptococcal antigen: high specificity (95%) but low sensitivity (50-90%)
  - suspected EBV (infectious mononucleosis)
- peripheral blood smear, heterophile antibody test (i.e. the latex agglutination assay or "monospot")

**Red Flags in Patients with "Sore Throat"**
- Persistence of symptoms longer than 1 wk without improvement
- Respiratory difficulty (particularly stridor, croup, etc.)
- Difficulty in handling secretions (peritonsillar abscess)
- Difficulty in swallowing (Ludwig's angina)
- Severe pain in the absence of erythema (supraglottitis/epiglottitis)
- Palpable mass (neoplasm)
- Blood in the pharynx or ear (trauma)

**Table 23. Modified Centor Score: Approach to Diagnosis and Management of GABHS**

| | POINTS |
|---|---|
| Cough absent? | 1 |
| History of fever >38°C? | 1 |
| Tonsillar exudate? | 1 |
| Swollen, tender anterior nodes? | 1 |
| Age 3-14 | 1 |
| Age 15-44 | 0 |
| Age >45 | –1 |

In communities with moderate levels of strep infection (10-20% of sore throats):

| Score | 0 | 1 | 2 | 3 | 4 or more |
|---|---|---|---|---|---|
| Chance patient has strep | 1-2.5% | 5-10% | 11-17% | 28-35% | 51-53% |
| Suggested action | NO culture or antibiotic | | Culture all, treat with antibiotics only if culture is positive | | Culture all, treat with antibiotics on clinical grounds[1], discontinue antibiotics if culture comes back negative |

[1]Clinical grounds include a high fever or other indicators that the patient is clinically unwell and is presenting early in the course of the illness
Limitations: *This score is not applicable to patients <3 yr of age
*If an outbreak or epidemic of illness caused by GABHS is occurring in any community, the score is invalid and should not be used
Adapted from: Centor RM, et al. Med Decis Making 1981;1:239-46; McIssac WI, et al. *CMAJ* 1998;158:75-83

### Management
- viral pharyngitis
  - antibiotics not indicated
  - symptomatic therapy: acetaminophen/NSAIDs for fever and muscle aches, decongestants
- GABHS
  - antibiotic treatment decreases severity and duration of symptoms, risk of transmission (after 24 h of treatment), and risk of rheumatic fever and suppurative complications
  - 10 d of treatment required
  - incidence of glomerulonephritis is not decreased with antibiotic treatment
  - no increased incidence of rheumatic fever with 48 h delay in antibiotic treatment; if possible, delay antibiotic treatment until culture confirms diagnosis
  - routine F/U and/or post-treatment throat cultures are not required for most patients
  - F/U throat culture only recommended for: patients with history of rheumatic fever, patients of family member(s) with history of acute rheumatic fever, suspected streptococcal carrier
- infectious mononucleosis (EBV)
  - self-limiting course; antibiotics are not indicated
  - symptomatic treatment: acetaminophen/NSAIDs for fever, pharyngitis, malaise
  - avoid heavy physical activity and contact sports for at least 1 mo or until splenomegaly resolves because of risk of splenic rupture
  - if acute airway obstruction, give corticosteroids and consult ENT

# Palliative Care

## Principles and Quality of Life

- support, educate, and treat both patient and family
- address physical, psychological, social and spiritual needs
- focus on symptom management and comfort measures
- offer therapeutic environment and bereavement support
- ensure maintenance of human dignity

## End-of-Life Care Discussions

### When to Initiate End-of-Life Care Discussions
- recent hospitalization for serious illness
- severe progressive medical condition(s)
- death expected within 6-12 mo
- patient request
- medical aid in dying
  - important to discuss grief/bereavement with loved ones

## Power of Attorney

- see Ethical, Legal, and Organizational Medicine, ELOM10

## Instructional Advance Directives

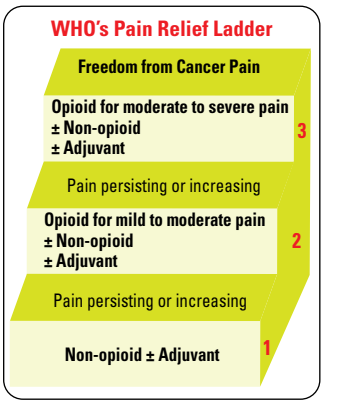
- see Ethical, Legal, and Organizational Medicine, ELOM10

## Symptom Management

### Assessment Tools
- Edmonton Symptom Assessment System (ESAS): asks patients to rate intensity of 9 common cancer/palliative symptoms (pain, tiredness, nausea, depression, anxiety, drowsiness, appetite, well-being, shortness of breath, "other") and monitor over time
- Palliative Performance Scale (PPS): assesses 5 functional components (ambulation, activity and evidence of disease, self-care, intake, conscious level) to predict survival in terminally-ill patients
  - PPS scores are determined by reading from left to right at each PPS level until the level that best fits the patient's functional status is found
  - PPS <30% indicative of <3 mo prognosis

**Guidance on the Management of Pain in Older People**
Age Aging 2013; 42:1-57
The three most common sites of pain in older adults are the back, leg/knee and hip. Acetaminophen should be considered first-line treatment for the management of both acute and persistent pain, particularly that which is of musculoskeletal origin. NSAIDs should be prescribed with caution and co-prescribed with a PPI.

## Table 24. Palliative Performance Scale



| PPS Level | Ambulation | Activity and Evidence of Disease | Self Care | Intake | Conscious Level |
|---|---|---|---|---|---|
| 100% | Full | Normal activity and work<br>No evidence of disease | Full | Normal | Full |
| 90% | Full | Normal activity and work<br>Some evidence of disease | Full | Normal | Full |
| 80% | Full | Normal activity with effor<br>Some evidence of disease | Full | Normal or reduced | Full |
| 70% | Reduced | Unable to do normal job/ work<br>Significant disease | Full | Normal or reduced | Full |
| 60% | Reduced | Unable to do hobby/ housework<br>Significant disease | Occasional assistance necessary | Normal or reduced | Full or confusion |
| 50% | Mainly sit/lie | Unable to do any work<br>Extensive disease | Occasional assistance necessary | Normal or reduced | Full or confusion |
| 40% | Mainly in bed | Unable to do most activities<br>Extensive disease | Mainly assisted | Normal or reduced | Full or drowsy ± confusion |
| 30% | Totally bed bound | Unable to do any activities<br>Extensive disease | Total care | Normal or reduced | Full or drowsy ± confusion |
| 20% | Totally bed bound | Unable to do any activities<br>Extensive disease | Total care | Minimal to sips | Full or drowsy ± confusion |
| 10% | Totally bed bound | Unable to do any activities<br>Extensive disease | Total care | Minimal to sips | Drowsy or coma ± confusion |
| 0% | Death | — | — | — | — |

Adapted from: Medical care of the dying, 4th ed. Victoria: Victoria Hospice Society, 2006. Version 2

## Table 25. Common Symptoms at the End of Life

| Symptom | Non-Pharmacologic Management | Pharmacologic Management |
|---|---|---|
| **Constipation** | Rule out obstruction, impaction, anorectal disease, spinal cord pathology; hydration; high fibre intake; increase mobility; medication review | Sennosides, lactulose, percutaneous endoscopic gastrostomy (PEG) |
| **Terminal Pulmonary Secretions ("Death Rattle")** | Oral suctioning, discontinue unnecessary IV solutions, oral hygiene, re-positioning (on side, elevated) | Scopolamine SC or transdermal<br>Hyoscine, Glycopurronium; monitor for adverse effects (xerostomia, delirium, sedation) |
| **Dyspnea** | Elevate head of bed, eliminate allergens, open window/ use fan | 1st line: opioids (e.g. morphine, hydromorphone);<br>Adjuncts: oxygen if hypoxemic, benzodiazepines if anxiety symptoms present, bronchodilators |
| **Hiccups** | Dry sugar, breathing in paper bag | Chlorpromazine, haloperidol, metoclopramide, baclofen, marijuana |
| **Nausea and Vomiting** | Frequent and small meals, avoid offensive strong odours, treat constipation if present | Raised intracranial pressure: dexamethasone<br>Anticipatory nausea, anxiety: lorazepam<br>Vestibular disease, vertigo: dimenhydrinate<br>Drug induced, hepatic or renal failure: prochlorperazine, haloperidol<br>GERD: PPI or H2 antagonist<br>Gastric stasis: metoclopramide<br>Bowel obstruction: metoclopramide, dexamethasone, octreotide |
| **Pain** | Hot and cold compresses, music therapy, relaxation techniques, individualized program of physical activity designed to improve flexibility, strength and endurance, and CBT | Nociceptive pain: non-opioids (NSAIDs, acetaminophen), weak opioids (codeine, hydrocodone, oxycodone), strong opioids (morphine, hydromorphone, oxycodone, fentanyl)<br>Neuropathic pain: anticonvulsants (gabapentin, pregabalin), antidepressants (TCAs, SSRIs), steroids (dexamethasone)<br>Bony pain: non-opioids, weak opioids, bisphosphonates, radiation therapy |
| **Pruritus** | Bathing with tepid water, avoid soap, bath oils; sodium bicarbonate for jaundice | Antihistamines, phenothiazines, topical corticosteroids, calamine lotion |
| **Fatigue** | Modify environment and activities to decrease energy expenditure, optimize fluid and electrolyte intake<br>Educate and support patient and family, exercise | Treat underlying condition if present |
| **Psychiatric** | CBT<br>Support groups<br>Art/Music Therapy | Agitation: antipsychotics<br>Confusion/Delirium: treat underlying etiology<br>Depression: Standard SSRIs, SNRIs may be too slow depending on patient prognosis, consider psychostimulants (e.g. methyphenidate, ketamine)<br>Treat underlying condition if present |

Source: J Am Geriatr Soc 2002;50:S205-S224, Am Fam Physician 2009;79(12):1059-1065, and N Engl J Med 2015; 373: 2549-2561

**Terminal Respiratory Secretions ("Death Rattle")**
Noise caused by the oscillatory movement of mucous secretions in the upper airway with inspiration and expiration

Serum creatinine does not reflect creatinine clearance in the elderly

Instead, use:
CrCl = (weight in kg)(140 – age)(1.23)
(mL/min) (serum creatinine in μmol/L)

Multiply by 0.85 for females

Limitations:
- Underestimates CrCl in patients without significant age-related decline in renal function
- Overestimates CrCl in patients with muscle mass reduced beyond normal aging

**Approach to Medication Review in the Elderly**
Ask patient to bring all their current medications
- Review Beer's Criteria (2015) to identify potentially inappropriate medications
- Screen for adverse drug effects and drug interactions
- Eliminate unnecessary (duplicate therapies or pharmacologic effects) medications
- Simplify dosing regimen where possible
- Discuss patient's goals of care to guide pharmacologic management of symptoms/disease

# Complementary and Alternative Medicine

## Epidemiology

- 50-75% of Canadians report some use of CAM over their lifetime, and only half will disclose this use to their physician
- use is highest in Western provinces and lowest in Atlantic provinces
- more likely to be used by younger patients and those with higher education and income
- examples: chiropractic, acupuncture, massage, naturopathy, homeopathy, traditional Chinese medicine, craniosacral therapy, osteopathy

**Most Common Uses of CAM**

- Back/neck problems
- Gynecological problems
- Anxiety
- Headaches
- Digestive problems
- Chronic fatigue syndromes

## Herbal Products

- over 50% of Canadians use natural health products (NHPs)
- most commonly used include echinacea, ginseng, ginkgo, garlic, St. John's wort, and soy
- relatively few herbal products have been shown to be effective in clinical trials
- many patients believe herbal products are inherently safe and are unaware of potential side effects and interactions with conventional medicines
- all NHPs must be regulated under The Natural Health Products Regulations as of January 1, 2004, including herbal remedies, homeopathic medicines, vitamins, minerals, traditional medicines, probiotics, amino acids, and essential fatty acids (e.g. omega-3)
- always ask patients whether they are taking any herbal product, herbal supplement, or other natural remedy. Further questions may include:
  - Are you taking any prescription or non-prescription medications for the same purpose as the herbal product?
  - Are you allergic to any plant products?
  - Are you pregnant or breastfeeding?
- information resources: National Centre for CAM (www.nccam.nih.gov), Health Canada website

**Table 26. Common Herbal Products**

| Common Name | Reported Uses | Possible Adverse Effects | Possible Drug Interactions |
|---|---|---|---|
| **Black Cohosh** | Menopausal symptoms, PMS, labour induction, arthritis | Hepatitis, liver failure, headaches, GI discomfort, heaviness in legs, weight problems | None reported |
| **Chamomile** | Mild sedative, anxiolytic, GI complaints, common cold | Allergic/contact dermatitis, anaphylaxis | Anxiolytics, sedatives |
| **Echinacea** | Common cold, flu, wound treatment, UTI, cancer | Hypersensitivity, hepatotoxicity with prolonged use, avoid use if immunosuppressed | Potentiates warfarin |
| **Evening Primrose** | Dysmenorrhea, menopausal Sx, inflammation, allergies, eczema, arthritis, MS | Headache, restlessness, nausea, diarrhea, may decrease seizure threshold | Anticoagulants, antiplatelets |
| **Feverfew** | Migraine prevention, RA, anti-inflammatory | Anxiety, upset stomach, skin rash, miscarriage | Anticoagulants, antiplatelets |
| **Flaxseed Oil** | Laxative, menopausal symptoms, source of omega-3 fatty acids | Diarrhea | Do not take with other medications as fibre content can bind drugs |
| **Garlic** | Elevated lipids, HTN, hyperglycemia, antimicrobial | GI irritation, contact dermatitis, may increase post-operative bleeding | Anticoagulants, potentiates antihypertensives |
| **Ginger** | Nausea, motion sickness, dyspepsia, anti-inflammatory | Heartburn, not to be used for morning sickness | None known |
| **Ginkgo Biloba** | Increases peripheral circulation (Alzheimer's disease, dementia, intermittent claudication), premenstrual syndrome, vertigo | Headache, cramping, bleeding, mild digestive problems; reports of intracranial hemorrhage | Anticoagulants, thiazide diuretics, MAO inhibitors |
| **Ginseng** | Energy enhancer, decreases stress, adjunct support for chemotherapy/ radiation | HTN, nervousness,insomnia, breakthrough bleeding, palpitations | Stimulant medications, antihypertensives, hormonal therapies |
| **Glucosamine** (Chondroitin) | Osteoarthritis | GI distress, headache, drowsiness, palpitations | Caution if shellfish allergy |
| **Saw Palmetto** | BPH, adjunct to finasteride | Mild GI distress | α-adrenergics, finasteride |
| **St. John's Wort** | Mild to moderate depression | Photosensitivity, increased liver enzymes, drowsiness, dizziness, nausea, headache | CNS depressants, contraindicated with indinavir |
| **Valerian Root** | Sedative, anxiolytic, muscle relaxant, PMS | Drowsiness, headache, digestive problems, paradoxical insomnia | CNS depressants, antihistamines |

Zink T, Chaffin J. Herbal "health"products: What family physicians need to know. *American Family Physician* 1998;58:1133-1140; NIH National Centre for Complementary and Alternative Medicine website (http://nccam.nih.gov/)

# Primary Care Models

**Table 27. Primary Care Models (Adapted from www.healthforceontario.ca)**

| | Characteristics |
|---|---|
| **Comprehensive Care Model** | FPs/GPs in solo practice with limited after-hours availability<br>Payment model: fee-for-service |
| **Family Health Team** | Groups of health care professionals (e.g. FPs, GPs, RNs, NPs, dieticians, social workers)<br>Wider range of services (e.g. rehabilitation, palliative care), with increased after-hours availability<br>Receives provincial funding for allied health<br>Patient enrolment is strongly encouraged<br>Payment model: blended capitation model i.e. age- and sex-adjusted base rate remuneration plus bonuses and incentives |
| **Family Health Group** | Group of ≥3 FPs, can utilize nurse-staffed, telephone health advisory services to provide around the clock primary care coverage<br>Physicians commit to enroll patients<br>Payment model: blended capitation model i.e. age- and sex-adjusted base rate remuneration plus bonuses and incentives |
| **Family Health Network** | Group of ≥3 FPs, can utilize NPs, with telephone health advisory services to provide around the clock primary care coverage<br>Payment model: salary-based |
| **Family Health Organization** | Same as FHT but usually larger in scale in terms of personnel<br>Physicians commit to enroll patients<br>Must sign governance and Family Health Organization agreements to join<br>Payment model: blended capitation model i.e. age- and sex-adjusted base rate remuneration plus bonuses and incentives |

FP = family physician; GP = general practitioner; RN = registered nurse; NP = nurse practitioner; FHT = family health teadm

# Antimicrobial Quick Reference

| Condition | Microorganisms | Antimicrobial |
|---|---|---|
| **RESPIRATORY/ENT** | | |
| **Acute Rhinitis** (common cold) | Rhinovirus, coronavirus, influenza, RSV, parainflunenza, adenovirus | None |
| **Pharyngitis** (sore throat) | Rhinovirus, adenovirus, influenza, parainfluenza, coxsackie virus, coronavirus | None |
| **Strep Pharyngitis** | Group A β-Hemolytic *Streptococcus* | *Children:*<br>1st line: penicillin V 40 mg/kg/d PO div bid-tid (max 750 mg/d) x 10 d (use adult dose if >27 kg)<br>amoxicillin 40 mg/kg/d PO div bid-tid x 10 d<br>2nd line: erythromycin estolate 40 mg/kg/d PO div bid-tid x 10 d<br>3rd line: cephalexin 25-50 mg/kg/d PO div qid x 10 d<br>cefprozil 15 mg/kg/d PO div bid x 10 d<br>*Adults:*<br>1st line: penicillin V 300 mg PO tid or 600 mg bid x 10 d<br>2nd line: erythromycin 250 mg PO qid x 10 d<br>3rd line: cephalexin 250 mg PO qid x 10 d<br>cefadroxil 500 mg PO bid x 10 d |

# Anatomy Review

## Overview of Gastrointestinal Tract

- the gastrointestinal tract runs from mouth to anus ("gum to bum")

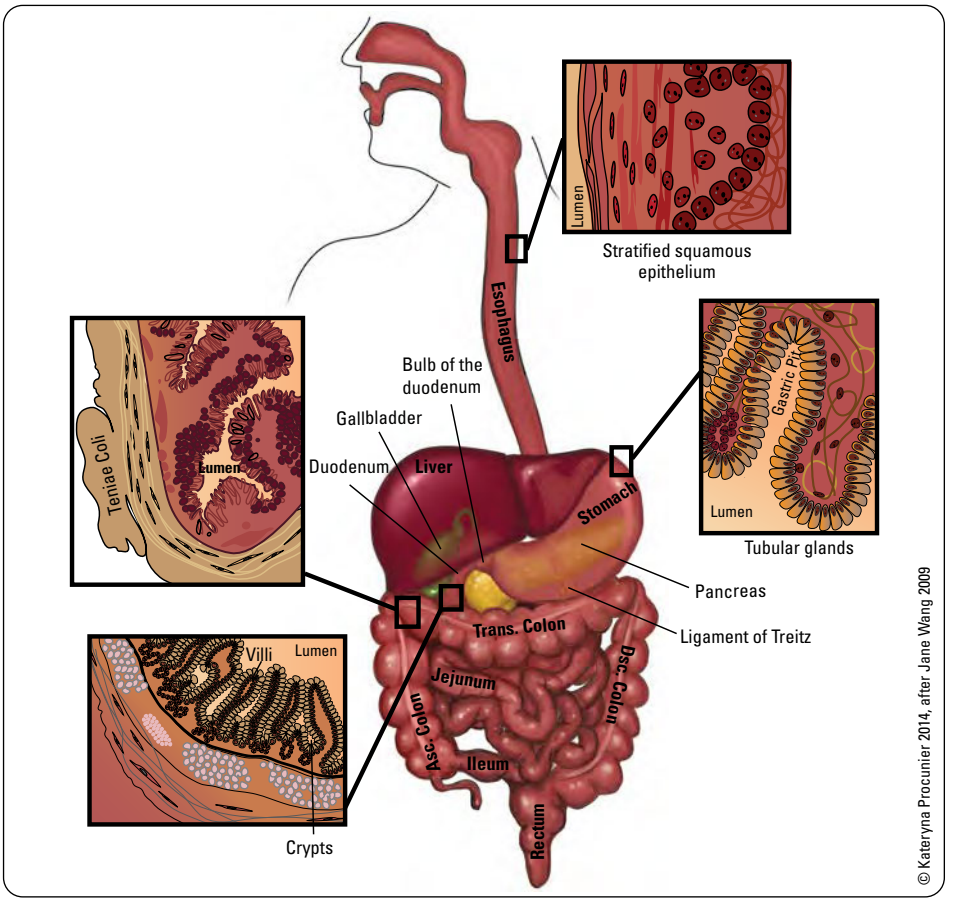

**Figure 1. Overview of gastrointestinal tract**

**Table 1. Summary of Gastrointestinal Tract Structure and Function**

| Organ | Function | Blood Supply | Innervation | Histology and Structural Features |
|---|---|---|---|---|
| **Esophagus** | Muscular tube approximately 40 cm long with a diameter of 2 cm<br>Extends from pharynx to the stomach | Arterial: left gastric artery and left inferior phrenic artery<br>Venous:<br>Left gastric vein → portal venous system<br>Esophageal veins → azygos vein → IVC (systemic) | Parasympathetic innervation via anterior and posterior gastric nerves (vagal trunks)<br>Sympathetic innervation via thoracic trunks of the greater splanchnic nerves | Mucosa: stratified squamous epithelium<br>Submucosa: connective tissue, lymphocytes, plasma cells, nerve cells<br>Muscularis propria (muscularis externa): inner circular, outer longitudinal muscle<br>Upper 1/3: striated muscle<br>Middle 1/3: transition zone<br>Lower 1/3: smooth muscle |
| **Stomach** | Delivers food to intestine for digestion and absorption<br>Secretes acid, probably to reduce enteric infections/pneumonia; facilitate digestion of protein and absorption of iron/B12<br>Secretes intrinsic factor to facilitate B12 absorption<br>Minor contribution to initial protein digestion via pepsin | Lesser curvature<br>Right and left gastric arteries (from celiac trunk)<br>Greater curvature<br>Right and left gastro-omental (gastroepiploic) arteries (from gastroduodenal and splenic arteries respectively)<br>Fundus: short and posterior gastric arteries (from the splenic artery) | Parasympathetic innervation via vagus nerve<br>Sympathetic innervation via celiac plexus (from T6-T9) | 5 parts<br>Cardia<br>Fundus<br>Body<br>Antrum<br>Pylorus |
| **Duodenum** | Modulates enteral pH via secretin → decreased gastric acid secretion, increased bicarbonate secretion<br>Secretes CCK to stimulate gallbladder contraction<br>Site of iron absorption | Branches of celiac artery and superior mesenteric artery | Parasympathetic innervation via vagus nerve<br>Sympathetic innervation via greater and lesser splanchnic nerves | 4 parts<br>Superior (5 cm)<br>Descending (7-10 cm)<br>Horizontal (6-8 cm)<br>Ascending (5 cm)<br>1st part is intraperitoneal; rest is retroperitoneal |
| **Jejunum** | Absorption of sodium, water, and nutrients (protein, carbohydrates, fat, folic acid, and vitamin A, B, C, D, E, K) | Superior mesenteric artery | Parasympathetic innervation via fibres of the posterior vagal trunk<br>Sympathetic innervation via fibres of T8-T10 | Deep red colour<br>2-4 cm in thickness<br>Thick and heavy wall<br>Plicae circulares are large, tall, and closely packed<br>Has long vasa recta<br>Scant fat in mesentery<br>Scant Peyer's patches |
| **Ileum** | Absorption of sodium, water, nutrients, soluble vitamins (only site of vitamin B12 absorption), and bile salts (entero-hepatic circulation) | Superior mesenteric artery | Same as jejunum | When compared to jejunum<br>Paler pink colour<br>2-3 cm in thickness<br>Thin and light walls<br>Plicae circulares are small and sparse<br>Contains more mesenteric fat<br>Many Peyer's patches |
| **Large Bowel** | Absorption of water (5-10% of total water)<br>Bacteria: further digestion of chyme and metabolism of undigested CHO to short chain fatty acids<br>Formation and storage of feces | Branches of superior and inferior mesenteric arteries<br>Rectal blood supply: sigmoid, right pudendal, and rectal arteries | Parasympathetic innervation via vagus nerve<br>Sympathetic innervation via greater and lesser splanchnic nerves | Consists of cecum, colon (ascending, transverse, descending, and sigmoid), rectum and anal canal<br>Features include teniae coli, haustra, and omental appendices |
| **Liver** | Glucose homeostasis<br>Plasma protein synthesis<br>Lipid and lipoprotein synthesis<br>Bile acid synthesis and secretion<br>Vitamin A, D, E, K, B12 storage<br>Biotransformation, detoxification<br>Excretion of compounds | 2 sources<br>Portal vein (75-80%)<br>Hepatic artery (20-25%) | Parasympathetic innervation via fibres of the anterior and posterior vagal trunks<br>Sympathetic innervation via fibres of the celiac plexus | Largest internal organ<br>Composed of 4 lobes (left, right, caudate, quadrate), and divided into 8 segments |
| **Biliary Tract** | Gallbladder functions to store and release bile that is produced in the liver<br>Bile is used to emulsify fat and is composed of cholesterol, lecithin, bile acids, and bilirubin<br>CCK stimulates gallbladder emptying while trypsin and chymotrypsin inhibit bile release | Cystic artery | Parasympathetic innervation via vagus nerve<br>Sympathetic and visceral innervation via celiac nerve plexus<br>Somatic afferent fibres via right phrenic nerve | Consists of the hepatic ducts (intrahepatic, left, right and common), gallbladder, cystic duct, common bile duct, and ampulla of Vater |
| **Pancreas** | Endocrine function: islets of Langerhans produce glucagon, insulin, and somatostatin (from the α, β, and δ cells, respectively)<br>Exocrine function: digestive enzymes are produced including amylase, lipase, trypsin, chymotrypsin, and carboxypeptidase | Anterior superior pancreaticoduodenal artery (from the celiac trunk)<br>Anterior inferior pancreaticoduodenal artery (from the superior mesenteric artery)<br>Dorsal pancreatic artery (from the splenic artery)<br>Pancreatic veins drain into the portal, splenic, and superior mesenteric veins | Parasympathetic innervation via vagus nerve<br>Sympathetic innervation via abdominopelvic splanchnic nerves | 4 parts of pancreas: head (includes uncinate process), neck, body, and tail<br>(Major) pancreatic duct connecting to common bile duct prior to ampulla of Vater<br>Accessory pancreatic duct connected directly to duodenum |

# Visualizing the Gaastrointestinal Tract

- see Medical Imaging, MI16

### Esophagus, Stomach, Duodenum

- OGD: best visualization of mucosa; also allows for therapeutic intervention (e.g. banding varices, thermal therapy/clipping/injecting bleeding ulcers, and dilatation e.g. treatment of esophageal strictures)
  - consider barium swallow first if dysphagia, decreased level of consciousness (increases risk of aspiration), inability to cooperate (increases risk of pharyngeal trauma during intubation), possibility of fistulas
  - endotracheal intubation first if massive upper GI bleed, acidemia, or inability to protect airway

### Small Bowel

- most difficult to visualize, especially if mucosal detail is needed
- CT enterography more accurate than small bowel follow through, but both have low sensitivity
- MRI small bowel imaging increasingly available, especially useful if radiation exposure is an issue (e.g. young patient, multiple radiological images already done)
  - note: MRI enteroclysis: luminal contrast administered by nasojejunal tube to dilate the small bowel – disliked by both radiologist and patient, but may improve sensitivity
- "double balloon" enteroscopy (enteroscope with proximal and distal balloons to propel endoscope into jejunum from mouth or into jejunum/ileum or into ileum from anus) may be most sensitive but currently available only in selected centres; technically demanding
- wireless endoscopy capsule (26 x 11 mm capsule is swallowed, transmits images to a computer; contraindicated in bowel obstruction) is also accurate in diagnosis but unable to provide any therapeutic intervention

### Colon and Terminal Ileum

- colonoscopy, with biopsy if required; contraindicated in perforation, acute diverticulitis, and severe colitis (increased risk of perforation)
- CT colonography ("virtual colonoscopy") more accurate in diagnosing diverticulosis, extrinsic pressure on colon (e.g. ovarian cancer compressing sigmoid colon), and fistulae; increasing evidence for use in colorectal cancer screening, especially for assessment of right side of colon in cases where colonoscopy is less sensitive
  - most often used when optical endoscopic colonoscopy is a risk (e.g. frail elderly) or unsuccessful (e.g. stricture)

### Pancreatic/Biliary Duct

- MRCP almost as sensitive as ERCP in determining if bile duct obstruction present, but less accurate in determining cause of obstruction (tumour, stone, stricture)
- ERCP if therapeutic intervention likely to be required: strong suspicion of stone, obstruction requiring stenting, or if tissue sampling required
- Endoscopic ultrasound can provide detailed anatomy of biliary tree and pancreas with potential for sampling/intervention (cyst drainage)

**Acute Upper Abdominal Pain**
Remember to rule out thoracic sources, e.g. myocardial infarction, pneumonia, dissecting aneurysm

# Differential Diagnosis of Common Complaints

- see General Surgery, GS4

**Table 2. Differential Diagnosis of Common Presenting Complaints**

| CHRONIC/ RECURRENT ABDOMINAL PAIN | Inflammatory | Neoplastic/ Vascular | Toxin | Other |
|---|---|---|---|---|
| | PUD<br>Biliary colic<br>IBD<br>Chronic pancreatitis | Recurrent bowel obstruction<br>Mesenteric ischemia<br>Sickle cell anemia | Lead poisoning | Mittleschmertz<br>Endometriosis<br>Porphyria<br>IBS<br>Radiculopathy<br>Abdominal wall pain syndrome |
| **ACUTE DIARRHEA** | **Inflammatory** | | **Non-Inflammatory** | |
| *Causes of bloody diarrhea | **Bacterial**<br>*Shigella**<br>*Salmonella**<br>*Campylobacter**<br>*Yersinia**<br>*E. coli* (EHEC 0157:H7)* | **Protozoal**<br>*E. histolytica** (amoebiasis)<br>*Strongyloides*<br><br>**Others**<br>NSAIDs<br>IBD*<br>Ischemic* | **Bacterial**<br>*S. aureus*<br>*C. perfringens*<br>*B. cereus*<br>*E. coli* (enterotoxigenic, enteropathogenic )<br>*Salmonella enteritidis*<br>*Vibrio cholera*<br>**Protozoal**<br>*Giardia lamblia* | **Viral**<br>Rotavirus<br>Norwalk<br>CMV<br>**Drugs**<br>Antibiotics<br>Colchicine<br>Laxatives<br>Antacids (magnesium) |

**Obscure But Treatable Causes of Abdominal Pain**
- Acute Intermittent Porphyria
- Hereditary Angioedema
- Familial Mediterranean Fever
- Vasculitis (e.g. polyarteritis nodosa)

**Inflammatory Diarrhea**: Occurs when there is damage to the mucosal lining or brush border, which leads to a passive loss of protein-rich fluids and a decreased ability to absorb these lost fluids. Diarrhea may be profuse or very small in volume. Often associated with abdominal pain ± fever and chills
**Non-Inflammatory Diarrhea**: No damage to the mucosal lining. Nausea/vomiting may be present. Fever, chills, blood in the stool, severe abdominal pain or tenderness are not present

**Table 2. Differential Diagnosis of Common Presenting Complaints** (continued)

| **CHRONIC DIARRHEA** | **Organic** | | | | **Functional** |
|---|---|---|---|---|---|
| *Causes of bloody diarrhea | **Inflammatory** | **Secretory** | **Steatorrhea** | **Osmotic** | |
| | IBD*<br>Infectious (TB, CMV, HSV)<br>Ischemic bowel*<br>Radiation colitis<br>Neoplasia<br><br>*C. difficile* rarely causes bleeding | Stimulant laxatives<br>Post-ileal resection/ cholecystectomy (bile salts)<br>Bacterial toxins<br>Vasculitis<br>Neoplasia* (colon ca, carcinoid, VIPoma)<br>Addison's disease<br>Congenital syndromes | *Giardia lamblia*<br>Celiac sprue<br>Chronic pancreatitis<br>Chronic cholestasis | Osmotic laxatives<br>Lactose intolerance<br>Chewing gum (sorbitol, mannitol) | IBS<br>Constipation (overflow diarrhea)<br>Anal sphincter dysfunction |
| **CONSTIPATION: if no associated rectal bleeding/weight loss, etc., usually no cause found (and dysmotility assumed)** | | | | | |
| | Colorectal cancer<br>Stricture<br>Extrinsic compression<br>Anal disease<br>Rectocele | Medications (narcotics, antidepressants, calcium channel blockers)<br>Metabolic (DM, thyroid, hypercalcemia) | Neurologic (Parkinson's, MS, stroke)<br>Collagen vascular disease (scleroderma, dermatomyositis) | | |
| **NAUSEA/VOMITING** | **With Abdominal Pain** | | **Without Abdominal Pain** | | |
| | **Relieved by Vomiting** | **Not Relieved by Vomiting** | **Headache/Dizziness** | **No Other Symptoms** | |
| | Gastric outlet obstruction<br>Small bowel obstruction<br>GERD (regurgitation more common) | Gallbladder disease<br>Pancreatitis<br>Myocardial infarction<br>Hepatitis<br>Infectious Gastroenteritis | Cerebral tumour<br>Migraine<br>Vestibular disease<br>Increased ICP | Drugs<br>Uremia<br>Pregnancy<br>Metabolic (e.g. hypercalcemia)<br>Gastroparesis (e.g. DM)<br>Ketoacidosis | |

IBD Is a common cause of bloody diarrhea but can be diagnosed only if mimickers are excluded. Chiefly, infection, ischemia and medication side-effects

**Commonly Forgotten Causes of Vomiting**

- Drugs
- Uremia
- CNS Disease
- Pregnancy
- Marijuana (cannabinoid hyperemesis)

**Difference Between Dysphagia and Odynophagia**

- **Dysphagia**: Difficulty swallowing due to mechanical obstruction or dysmotility of the esophagus or pharynx
- **Odynophagia**: Pain when swallowing due to ulceration or inflammation (e.g. eosinophilic esophagitis) in the esophagus pharynx

**Differential Diagnosis of Abdominal Distention**

**6 Fs**
**F**at
**F**eces
**F**etus
**F**latus
**F**luid
**F**atal Growth

**Table 2. Differential Diagnosis of Common Presenting Complaints** (continued)

| | | | |
|---|---|---|---|

**Bowel Ischemia**
The splenic flexure and rectosigmoid junction are watershed areas and are susceptible to ischemia. History and symptoms include acute onset crampy left abdominal pain, absence of abdominal tenderness on exam, rectal bleeding, and risk factors for embolization, atherosclerosis and atrial fibrillation

# Esophagus

## Gastroesophageal Reflux Disease

### Definition
- a condition which develops when the reflux of gastric content causes troublesome symptoms or complications

### Etiology
- inappropriate transient relaxations of LES – most common cause
- low basal LES tone (especially in scleroderma)
- contributing factors include: delayed esophageal clearance, delayed gastric emptying, obesity, pregnancy, acid hypersecretion (rare) from Zollinger-Ellison syndrome (gastrin-secreting tumour)
- hiatus hernia worsens reflux, does not cause it (see General Surgery, GS13)

### Clinical Features
- "heartburn" (pyrosis) and regurgitation (together are 80% sensitive and specific for reflux); less sensitive and less specific: water brash, sensation of a lump in the throat (globus sensation), and frequent belching
  - non-esophageal symptoms are increasingly recognized of being poor predictors of reflux

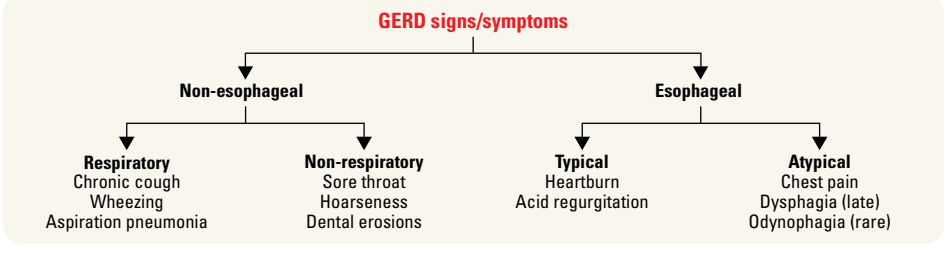

**Figure 2. Signs and symptoms of GERD**

**Dyspepsia** = postprandial fullness, early satiety, epigastric pain, or burning

**Foods/Substances that may aggravate GERD Symptoms (but diet does not change the underlying disease)**
- EtOH
- Caffeine
- Tobacco
- Fatty/fried foods
- Chocolate
- Peppermint
- Spicy foods
- Citrus fruit juices

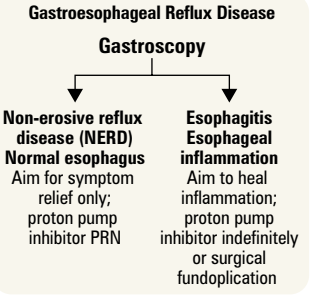

**Figure 3. Classification and gastroscopic findings of GERD**

### Investigations
- usually, a clinical diagnosis is sufficient based on symptom history and relief following a trial of pharmacotherapy (PPI: symptom relief 80% sensitive for reflux)
- however, response to anti-secretory agents such as PPI is not a requirement for GERD diagnosis
- gastroscopy indications (Ann Intern Med 2012;157:808-816)
  - absolute indications
    - heartburn accompanied by red-flags (bleeding, weight loss, dysphagia, persisting vomiting, family history of GI cancer etc.)
    - persistent reflux symptoms or prior severe erosive esophagitis after therapeutic trial of 4-8 wk of PPI 2x daily
    - history suggests esophageal stricture especially dysphagia
    - high risk for Barrett's (male, age >50, obese, white, tobacco use, long history of symptoms)
- repeat endoscopy after 6-8 wk of PPI therapy indicated if: severe esophagitis because it can mask Barrett's esophagus or symptoms

- esophageal manometry (study of esophageal motility): indicated in patients who have a normal gastroscopy but with chest pain and/or dysphagia
  - done to diagnose abnormal peristalsis and/or decreased LES tone, but cannot detect presence of reflux; indicated before surgical fundoplication to ensure intact esophageal function; exclude alternative diagnoses like scleroderma and achalasia
  - surgical fundoplication (wrapping of gastric fundus around the lower end of the esophagus) more likely to alleviate symptoms if lower esophageal pressure is diminished; less likely to be successful if abnormal peristalsis
- 24 h pH monitoring: most accurate test for reflux, but not required or performed in most cases
  - most useful if PPIs do not improve symptoms

### Treatment
- PPIs are the most effective therapy and usually need to be continued as maintenance therapy
- on-demand: antacids ($Mg(OH)_2$, $Al(OH)_3$, alginate), H2-blockers, or PPIs can be used for NERD
- diet helps symptoms, not the disease; avoid alcohol, coffee, spices, tomatoes, and citrus juices
- only beneficial lifestyle changes are weight loss (if obese) and elevating the head of bed (if nocturnal symptoms)
- symptoms may recur if therapy is discontinued

### Complications
- esophageal stricture disease – scarring can lead to dysphagia (solids)
- esophagitis
- ulcer
- bleeding
- Barrett's esophagus and esophageal adenocarcinoma – gastroscopy is recommended for patients with chronic GERD or symptoms suggestive of complicated disease (e.g. anorexia, weight loss, bleeding, dysphagia)

**Side-Effects of Long-Term Use of Proton Pump Inhibitors**
- Only some (pneumonia, *Clostridium difficile* diarrhea, hypomagnesemia, vitamin B12 deficiency, small bowel bacterial overgrowth) seem to be related to suppressing gastric acid whereas others (fractures, chronic kidney disease, dementia, death) have no apparent pathophysiological relationship
- Stopping proton pump inhibitors can increase gastric acid above baseline by a "rebound effect" causing heartburn even in healthy volunteers
- These associations do not preclude long term use of proton pump inhibitors in patients with esophagitis and peptic ulcer, or those needing gastric protection when taking NSAIDs or anti-platelet drugs, but do emphasize the importance of being as definitive as possible when making these diagnoses and accurately assessing risk-benefit ratios (as is true for all drugs)

## Barrett's Esophagus

### Definition
- metaplasia of normal squamous esophageal epithelium to intestinal columnar epithelium containing-type intestinal mucosa (intestinal metaplasia)

### Etiology
- thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

### Epidemiology
- in North America and Western Europe, 0.5-20% of adults are thought to have Barrett's esophagus
- up to 10% of GERD patients will have already developed BE by the time they seek medical attention
- more common in males, age >50, Caucasians, smokers, overweight, hiatus hernia, and long history of reflux symptoms

### Pathophysiology
- endoscopy shows erythematous epithelium in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
- BE predisposes first to premalignant changes characterized as low or high-grade dysplasia, which then progresses to adenocarcinoma

### Significance
- rate of malignant transformation is approximately 0.12% per yr for all BE patients prior to dysplasia
- risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 5-8 yr of surveillance
- increased gastric acid secretion is more frequently associated with Barrett's esophagus as opposed to reflux alone

### Treatment
- acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication)
- surveillance gastroscopy every 3 yr if no dysplasia
- high grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/resection, or esophagectomy produce similar outcomes; however, evidence increasingly favouring endoscopic ablation with mucosal resection or radiofrequency ablation
- if low grade dysplasia, both surveillance (every 6 mo for 1 yr then annually) and endoscopic ablation/resection are satisfactory options

Up to 25% of patients with Barrett's esophagus do not report symptoms of GERD

**Should Patients with Barrett's Esophagus Undergo Periodic Upper GI Endoscopy for Esophageal Cancer Screening?**
**Impact of Endoscopic Surveillance on Mortality From Barrett's Esophagus - Associated Esophageal Adenocarcinomas**
Gastroenterology 2013;145:312-319
There is no question that Barrett's esophagus (BE) increases the incidence of esophageal adenocarcinoma, which can be recognized early on with a safe procedure, endoscopy. Indeed, because early cancer is often asymptomatic and curable, most clinicians recommend period upper endoscopy. Yet Corley et al. found no difference in endoscopy rates in BE patients who died of esophageal adenocarcinoma compared to BE patients who died of other diseases. Perhaps this result is due to statistics, but as the accompanying editorial emphasizes (Gastroenterology 2013; 145:273-6) at the very least this finding should question the value of a screening program. In fact, there are multiple other lines of evidence indicating that endoscopic surveillance is of marginal benefit at most. Possible explanations for this disappointing finding include: most esophageal adenocarcinomas may not arise from BE, esophageal carcinoma is too rare a cause of death in BE, morbidity from esophageal cancer treatments, or that endoscopic screening is just not that effective in the real world. The situation is analogous to the disappointing value of serum PSA screening for prostate cancer. Therefore, adoption of screening programs require more than theoretical calculations.

# Dysphagia

## Definition
- difficulty swallowing

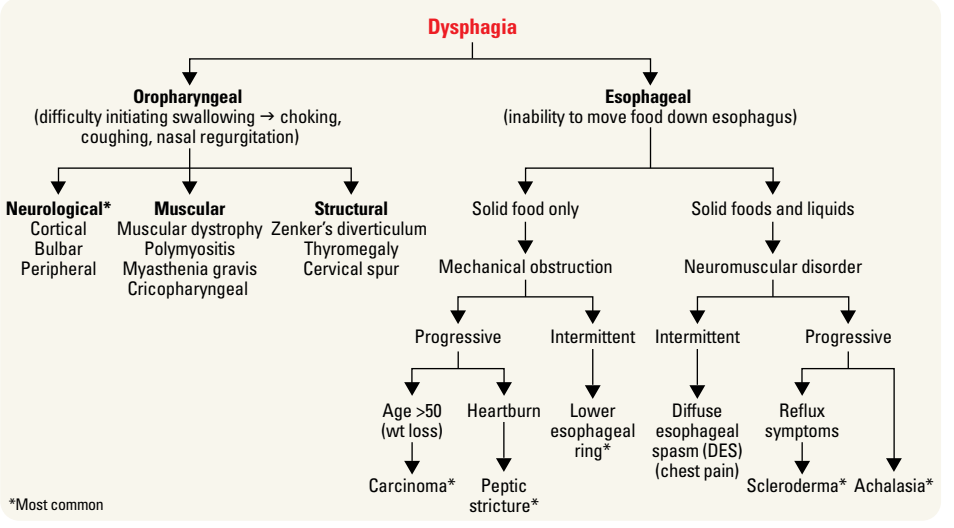

**Figure 4. Approach to dysphagia (eosinophilic esophagitis omitted)**

**Remember:**
**Dysphagia** = Difficulty in swallowing
**Odynophagia** = Pain on swallowing

**Key Questions in Dysphagia**
- Difficulty in starting swallowing?
- Associated symptoms? (regurgitation, change in voice pitch, weight loss)
- Solids, liquids, or both?
- Intermittent or progressive?
- History of heartburn?
- Change in eating habits/diet?

# Esophageal Motor Disorders

## Clinical Features
- dysphagia with solids and liquids
- chest pain (in some disorders)

## Diagnosis
- motility study (esophageal manometry)
- barium swallow sometimes helpful

## Causes
- idiopathic
- achalasia
- scleroderma
- DM
- DES: rare and can be difficult to diagnose due to intermittent presentation

**Table 3. Esophageal Motor Disorder**

| Disorder | Achalasia | Scleroderma | Diffuse Esophageal Spasm |
|---|---|---|---|
| **Definition** | Failure of smooth muscle relaxation at LES<br>Increased LES pressure<br>Progressive loss of peristaltic function | See Rheumatology, RH13<br>Systemic disease characterized by vasculopathy and tissue fibrosis (especially skin thickening) | Normal peristalsis interspersed with frequent, repetitive, spontaneous, high pressure, non-peristaltic waves (tertiary peristalsis) |
| **Etiology** | Usually idiopathic<br>2° or pseudo-achalasia: e.g. malignancy, Chagas disease (*Trypanosoma cruzi*) | Involves autoimmune, genetic, hormonal, and environmental factors<br>Dysphagia: caused by reflux, dysmotility, or both | Idiopathic |
| **Pathophysiology** | Inflammatory degeneration of Auerbach's plexus → increase in LES pressure, incomplete relaxation of LES with swallowing, aperistalsis | Blood vessel damage → intramural neuronal dysfunction → distal esophageal muscle weakening → aperistalsis and loss of LES tone → reflux → stricture → dysphagia | Potential mechanisms include impaired inhibitory innervation to esophageal body, malfunction in endogenous nitric oxide synthesis |
| **Diagnosis** | CXR: no air in stomach, dilated esophagus<br>Barium studies: esophagus terminates in narrowing at LES ("bird's beak")<br>Endoscopy: normal mucosa<br>Manometry: definitive diagnosis (signs listed above) | Clinical features of scleroderma<br>Manometry: decreased pressure in LES, decreased peristalsis in body of esophagus | Barium x-ray: "Corkscrew pattern"<br>Manometry: >30% (but <100%) of esophageal contractions are aperistaltic<br>Endoscopy: normal mucosa |
| **Treatment** | Dilatation of LES with balloon, ± GERD prophylaxis, 50% good response, can repeat, risk of perforation (5%)<br>Injection of botulinum toxin into LES (temporary)<br>POEM (perioral endoscopicmyotomy) | Medical: aggressive GERD therapy (PPIs bid)<br>Surgery: anti-reflux surgery (gastroplasty, last resort) | Reassurance not cardiac pain<br>Medical: nitrates, calcium channel blockers, anticholinergics have variable benefit<br>Surgical: long esophageal myotomy if unresponsive to above treatment (rarely helpful); balloon dilatation |

# Esophageal Diverticula

### Definition
- outpouchings of one or more layers of the esophageal tract

### Clinical Features
- commonly associated with motility disorders
- dysphagia, regurgitation, retrosternal pain, intermittent vomiting, may be asymptomatic

### Classification
- pharyngoesophageal (Zenker's) diverticulum
  - most frequent form of esophageal diverticulum
  - posterior pharyngeal outpouching most often on the left side, above cricopharyngeal muscle and below the inferior pharyngeal constrictor muscle
  - symptoms: dysphagia, regurgitation of undigested food, halitosis (bad breath)
  - treatment: small and asymptomatic: no treatment required, large and symptomatic: endoscopic or surgical myotomy of cricopharyngeal muscle ± surgical excision of sac

# Peptic Stricture (from Esophagitis)

- presents as dysphagia alongside a long history of reflux symptoms, but reflux symptoms may disappear as stricture develops
- diagnosed with endoscopy or barium study if endoscopy contraindicated or unavailable

### Treatment
- endoscopic dilatation and indefinite PPI

# Esophageal Carcinoma

- see General Surgery, GS15

# Webs and Rings

- web = partial occlusion (upper esophagus)
- ring = circumferential narrowing (lower esophagus)

### Clinical Features
- asymptomatic with lumen diameter >12 mm, provided peristalsis is normal
- dysphagia with large food boluses
- Schatzki ring
  - mucosal ring at squamo-columnar junction
  - causes intermittent dysphagia with solids
  - treatment involves disrupting ring with endoscopic dilation

**Plummer-Vinson Syndrome Triad**
- Iron deficiency anemia
- Dysphagia
- Esophageal webs

* rare (prevalence <1 in 1,000,000) but good prognosis when treated with iron and esophageal dilatation

# Infectious Esophagitis

### Definition
- severe mucosal inflammation and ulceration as a result of a viral or a fungal infection

### Risk Factors
- DM
- chemotherapeutic agents
- immunocompromised states

### Clinical Features
- characteristically odynophagia, less often dysphagia

### Appearance
- *Candida* (most common): whitish-yellow plaques without visible ulceration or inflammation
- Herpes (second most common), CMV: focal ulcers

### Investigations
- diagnosis via endoscopic visualization and biopsy

### Treatment
- *Candida*: nystatin swish and swallow, ketoconazole, fluconazole
- Herpes: often self-limiting; acyclovir, valacyclovir, famciclovir
- CMV: IV ganciclovir, famciclovir, or oral valganciclovir

**Eosinophilic Esophagitis**
- Eosinophils infiltrate the epithelium of the esophagus
- Causes odynophagia, dysphagia, common cause of bolus food impaction
- Usually primary, but can be part of the spectrum of eosinophilic gastroenteritis, secondary to drugs, parasites etc.
- Often associated with allergies
- Most characteristically occurs in young men
- Diagnosis established by endoscopic biopsy, suggested by mucosal rings seen in the esophageal mucosa at endoscopy
- Treatment: (a) diet, (b) swallowed corticosteroid nasal spray (fluticasone), (c) swallowed viscous corticosteroid (budesonide mixed with sucralose)

# Stomach and Duodenum

## Dyspepsia

### Definition

- predominant epigastric pain/burning lasting at least 1 mo (predominant associated symptoms are vomiting, weight loss, etc. Differential diagnosis revolves around these more ominous symptoms)
- other symptoms under umbrella of dyspepsia: post-prandial fullness, early satiation
- although the most common cause is functional (investigations show no organic disease but pain persists), sinister disease can present similarly (e.g., pancreatic cancer)

### History and Physical Exam

- history: most important are age, associated symptoms (such as weight loss and vomiting), and drugs (especially NSAIDs)
- physical exam: adenopathy, abdominal mass/organomegaly, Carnett's sign (if pain is due to abdominal wall muscle problem then the pain will increase during muscle contraction, such as during a sit-up)

### Investigations

- consider blood tests including CBC, liver enzymes, calcium, *H. pylori* serology, and ultrasound
- gastroscopy to investigate dyspepsia: most causes of dyspepsia are either functional or diagnosable by either blood tests or proton pump inhibitor trial (for peptic disease); however, gastric cancer should not be missed. Consensus guidelines of the Canadian Association of Gastroenterology/American College of Gastroenterology suggest age should be the chief criteria: gastroscopy if age >60 (and if age <60 or under special circumstances such as risk factors for gastric cancer)

The most common cause of dyspepsia is functional (idiopathic) dyspepsia

**Red Flags of Dyspepsia**
(raise suspicion of gastric malignancy):

- Unintended weight loss
- Persistent vomiting
- Progressive dysphagia
- Odynophagia
- Unexplained anemia or iron deficiency
- Hematemesis
- Jaundice
- Palpable abdominal mass or lymphadenopathy
- Family history of upper GI cancer
- Previous gastric surgery

## Stomach

**Table 4. Cells of the Gastric Mucosa**

| Cell Type | Secretory Product | Important Notes |
|---|---|---|
| **Parietal Cells** | Gastric acid (HCl) and intrinsic factor | Stimulated by histamine, ACh, gastrin |
| **Chief Cells** | Pepsinogen | Stimulated by vagal input and local acid |
| **D-Cells** | Somatostatin | Inhibits release of hormones including gastrin |
| **G-Cells** | Gastrin | Stimulates $H^+$ production from parietal cells |
| **Superficial Epithelial Cells** | Mucus, $HCO_3^-$ | Protect gastric mucosa |

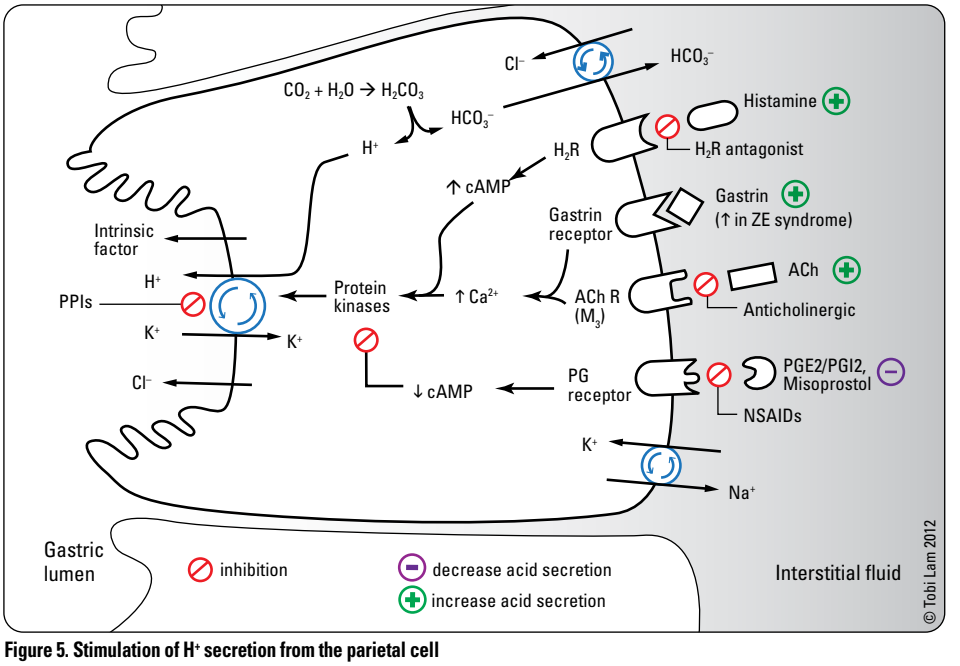

**Figure 5. Stimulation of $H^+$ secretion from the parietal cell**

# Gastritis

## Definition
- defined histologically: inflammation of the stomach mucosa

## Etiology
- some causative agents may play a role in more than one type of gastritis and an individual patient may have histopathological evidence of more than one type of gastritis

**Table 5. Updated Sydney Classification of Gastritis**

| Type | Common Etiology |
|---|---|
| **Acute Gastritis** | |
| Hemorrhagic/erosive gastritis | Alcohol, Aspirin®/NSAID, shock/physiological stress (seen in ICU patients) |
| Helicobacter gastritis | *H. pylori** |
| **Chronic Gastritis** | |
| Non-atrophic | *H. pylori* |
| Atrophic | *H. pylori*, dietary, environmental factors (multi-focal), autoimmunity |
| Chemical | NSAID, bile |
| Radiation | Radiation injury |
| Lymphocytic | Celiac disease, drug |
| Eosinophilic | Food allergies |
| Non-infectious granulomatous | Crohn's disease, sarcoidosis |
| Other infectious gastritides | Bacteria, viruses, fungi, parasite, TB, syphilis |

## Clinical Features
- non-erosive gastritis is asymptomatic (except in certain rare causes like Crohn's disease), does not cause pain; difficult to diagnose clinically or endoscopically – requires biopsy for diagnosis
- erosive gastritis can cause bleeding (pain only if progresses to ulcers – rare); can be seen endoscopically

## Treatment
- determined by etiology (see *H. pylori*, G13, *NSAID*, G13 and *Stress-Induced Ulceration*, G14)
- non-pharmacological: avoidance of mucosal irritants such as alcohol, NSAIDs, and foods that trigger symptoms

# Peptic Ulcer Disease

## Definition
- focal defects in the mucosa that penetrate the muscularis mucosal layer; results in scarring (defects superficial to the muscularis mucosa are erosions and do not cause scarring)
- peptic ulcer disease includes defects located in the stomach (gastric ulcers) and duodenum (duodenal ulcers)

## Etiology

**Table 6. Etiology of Peptic Ulcer Disease**

| | Duodenal | Gastric |
|---|---|---|
| ***H. pylori* Infection** | 90% | 60% |
| **NSAIDs** | 7% | 35% |
| **Physiologic Stress-Induced** | <3% | <5% |
| **Zollinger-Ellison Syndrome** | <1% | <1% |
| **Idiopathic** | 15% | 10% |

- NSAID negative, *H. pylori* negative ulcers becoming more commonly recognized
- others: CMV, ischemic, idiopathic
- alcohol: damages gastric mucosa but rarely causes ulcers
- peptic ulcer associated with cigarette smoking, cirrhosis of liver, COPD, and chronic renal failure

**Cigarette Smoking and PUD**
- Increased risk of ulcer
- Increased risk of complications
- Increased chance of death from ulcer
- Impairs healing

## Clinical Features
- dyspepsia: most common presenting symptom
  - only 5% of patients with dyspepsia have ulcers, while most have functional disease
  - however, 70% of peptic ulcers are asymptomatic
- may present with complications
  - bleeding 10% (severe if from gastroduodenal artery), perforation 2% (usually anterior ulcers), gastric outlet obstruction 2%
  - posterior inflammation (penetration) 2%; may also cause pancreatitis

- duodenal ulcers: 6 classical features, but history alone cannot distinguish from functional dyspepsia
  - epigastric pain; may localize to tip of xiphoid
  - burning
  - develops 1-3 h after meals
  - relieved by eating and antacids
  - interrupts sleep
  - periodicity (tends to occur in clusters of weeks with subsequent periods of remission)
- gastric ulcers: more atypical symptoms; a biopsy is necessary to exclude malignancy

## Investigations

- endoscopy (most accurate)
- upper GI series
- *H. pylori* tests (see Table 7)
- fasting serum gastrin measurement if Zollinger-Ellison syndrome suspected (but most common cause of elevated serum gastrin level is atrophic gastritis)

**Gastric vs. Duodenal Ulcers**
Gastric ulcers must always be biopsied to rule out malignancies; duodenal ulcers are rarely malignant

## Treatment

- specific management depends on etiology; (see *H. pylori*, G13, *NSAID-Induced Ulceration*, G13 and *Stress-Induced Ulceration*, G14)
- treat *H. pylori* infection if present; chief advantage of quadruple therapy is to lower recurrence rate of peptic ulcer disease
- stop NSAIDs if possible
- start PPI: inhibits parietal cell $H^+/K^+$-ATPase pump which secretes acid
  - heals most ulcers, even if NSAIDs are continued
- other medications (e.g. histamine H2-antagonists) less effective
- discontinue cigarette smoking
- no diet modifications required but some people have fewer symptoms if they avoid caffeine, alcohol, and spices

**Approach to PUD**
- Stop NSAIDs
- Acid neutralization
- *H. pylori* eradication
- Quit smoking

## Management of Bleeding Peptic Ulcers

- OGD to explore upper GI tract
- IV pantoprazole continuous drip
- establish risk of rebleeding/continuous bleed (since most ulcers stop bleeding spontaneously)
  - clinical risk factors: increased age (>60), bleeding diathesis, history of PUD, comorbid disease, hemodynamically unstable
  - endoscopic signs of recurrent bleeding (active bleeding, visible vessel, clot, red spot) more predictive than clinical risk factors
    - if ulcer possesses high risk stigmata, then endoscopic therapy should be performed, consider ICU admission

**Bleeding Peptic Ulcers**
**Risk Factors for Increased Mortality**
- Co-existent illness
- Hemodynamic instability
- Age >60 yr
- Transfusion required

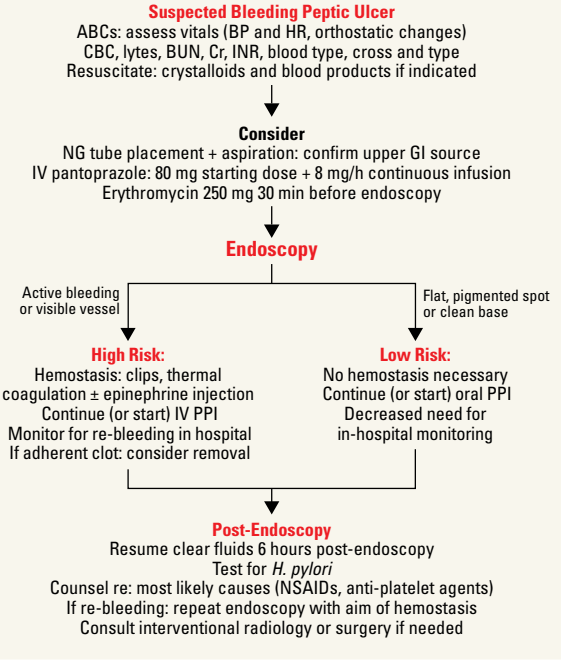

**Figure 6. Approach to management of suspected bleeding peptic ulcer**
Adapted from: Gralnek I, Barkun A, Bardou M. Management of acute bleeding from a peptic ulcer. NEJM 2008;359:928-937

# *H. pylori*-Induced Peptic Ulceration

### Pathophysiology
- *H. pylori*: Gram-negative flagellated rod that resides within the gastric mucosa, causing persistent infection and inflammation
- acid secreted by parietal cells (stimulated by vagal acetylcholine, gastrin, histamine) necessary for most ulcers
- etiology of peptic ulcer disease secondary to *H. pylori* is not well understood; however, the pattern of colonization correlates with outcome
- gastritis only in antrum (15% of patients), high gastric acid, associated with duodenal ulcer, may progress to gastric metaplasia of duodenum where ulcer forms
- gastritis throughout stomach ("pangastritis" – 85% of patients), low gastric acid, associated with stomach ulcer and cancer

### Epidemiology
- *H. pylori* is found in about 20% of all Canadians
- highest prevalence in those raised during 1930s
- infection most commonly acquired in childhood, presumably by fecal-oral route
- high prevalence in developing countries, low socioeconomic status (poor sanitation and overcrowding)

### Outcome
- gastritis (non-erosive) occurs in 100% of patients but is asymptomatic
- peptic ulcer in 15% of patients
- gastric carcinoma and mucosal associated lymphomatous tissue [MALT] lymphoma in 0.5% of patients
- most are asymptomatic but still worthwhile eradicating to lower future risk of peptic ulcer/gastric malignancy and prevent spread to others (mostly children <5 yr of age)

### Diagnosis

**Table 7. Diagnosis of *H. pylori* Infection**

| Test | Sensitivity | Specificity | Comments |
|---|---|---|---|
| **Non-invasive Tests** | | | |
| Urea breath test | 90-100% | 89-100% | Affected by PPI therapy (false negatives) |
| Serology | 88-99% | 89-95% | Can remain positive after treatment |
| Fecal antigen | | | Only rarely used in clinical practice |
| **Invasive Tests (require endoscopy)** | | | |
| Histology | 93-99% | 95-99% | Gold standard; affected by PPI therapy (false negatives) |
| Rapid urease test (on biopsy) | 89-98% | 93-100% | Rapid |
| Microbiology culture | 98% | 95-100% | Research only |

### Treatment: *H. pylori* Eradication
- bismuth quadruple therapy recommended for 10-14 d: PPI (e.g. lansoprazole 30 mg bid) + bismuth 525 mg qid + metronidazole 250 mg qid + tetracycline 500 mg qid
- alternatively, concomitant nonbismuth quadruple therapy for 10-14 d: PPI + amoxicillin + metronidazole + clarithromycin

***Helicobacter pylori* Therapy for the Prevention of Metachronous Gastric Cancer**
N Engl J Med 2018;378:1085-1095
**Purpose**: To evaluate the role of *H. pylori* eradication in the prevention of metachronous gastric cancer.
**Study**: Double-blinded randomized controlled trial.
**Population**: 470 patients with a subtotal gastrectomy for gastric cancer and *H. pylori* infection with or without antibiotic treatment.
**Outcome**: Incidence of metachronous gastric cancer.
**Results**: After almost 6 yr, 7.2% of the antibiotics-treated group developed another cancer in the gastric remnant vs. 13.4% in the placebo control group.
**Conclusions**: This provides definitive evidence that *H. pylori* is worthwhile treating no matter how advanced the gastric carcinogenic process.

# NSAID-Induced Ulceration

- NSAID use causes gastric mucosal petechiae in virtually all, erosions in most, ulcers in some (25%)
- erosions bleed, but usually only ulcers cause significant clinical problems
- most NSAID ulcers are clinically asymptomatic: dyspepsia is as common in patients with ulcers as in patients without ulcers; NSAID-induced ulcers characteristically present with complications (bleeding, perforation, obstruction)
- NSAIDs more commonly cause gastric ulcers than duodenal ulcers
- may exacerbate underlying duodenal ulcer disease

### Pathophysiology
- direct: erosions/petechiae – are due to local (direct) effect of drug on gastric mucosa
- indirect: systemic NSAID effect (intravenous NSAID causes ulcers, but not erosions). NSAIDs also inhibit mucosal cyclooxygenase, leading to decreased prostaglandin synthesis. This results in ulcers from reduced secretion of protective bicarbonate and mucous, and decreased mucosal blood flow

### Risk Factors for NSAID-induced Peptic Ulcer
- previous peptic ulcers/upper GI bleed
- age (≥65 yr)
- high dose of NSAID/multiple NSAIDs being taken
- concomitant corticosteroid use
- concomitant cardiovascular disease/other significant diseases

### Treatment
- prophylactic cytoprotective therapy with a PPI is recommended if any of the above risk factors exist concomitantly with ASA/NSAID use
- lower NSAID dose or stop all together and replace with acetaminophen
- combine NSAID with PPI or misoprostol (less effective) in one tablet
- enteric coating of Aspirin® (ECASA) provides minor benefit since this decreases incidence of erosion, not incidence of ulceration

If at high risk for development of ulcers, prophylaxis with PPI indicated

## Stress-Induced Ulceration

### Definition
- ulceration or erosion in the upper GI tract of ill patients, usually in ICU (stress is physiological, not psychiatric)
- lesions most commonly in fundus of stomach

### Pathophysiology
- unclear: likely involves ischemia; may be caused by CNS disease, acid hypersecretion, Cushing's ulcers
- mechanical ventilation is the most important risk factor

### Risk Factors
- mechanical ventilation
- anti-coagulation
- multi-organ failure
- septicemia
- severe surgery/trauma
- CNS injury ("Cushing's ulcers")
- burns involving more than 35% of body surface

**Curling's and Cushing's Ulcers**
- **Curling's ulcer**: acute peptic ulcer of the duodenum resulting as a complication from severe burns when reduced plasma volume leads to ischemia and cell necrosis (sloughing) of the gastric mucosa (think BURN from a CURLing iron)
- **Cushing's ulcer**: peptic ulcer produced by elevated intracranial pressure (may be due to stimulation of vagal nuclei secondary to elevated ICP which leads to increased secretion of gastric acid)

### Clinical Features
- UGIB (see *Upper Gastrointestinal Bleeding*, G28)
- painless

### Treatment
- prophylaxis with gastric acid suppressants decreases risk of UGIB; PPI most potent but may increase risk of pneumonia; H2 blockers less potent but less likely to cause pneumonia
- treatment same as for bleeding peptic ulcer but often less successful

## Gastric Carcinoma

- see General Surgery, GS24

# Small and Large Bowel

## Classification of Diarrhea

### Definition
- clinically: diarrhea defined as stools that are looser and/or more frequent than normal (i.e. ≥3x/d); physiologically: 24 h stool weight >200 g (less useful clinically)

### Classification
- acute vs. chronic
- small volume (tablespoons of stool; typical of colonic diseases) vs. large volume (>1/2 cup stool; typical of small bowel diseases)
- watery: secretory (diarrhea persists with fasting) vs. osmotic (diarrhea stops with fasting)
- steatorrhea
- inflammatory
- functional

# Acute Diarrhea

• see Pediatrics, P37

## Definition
• passage of ≥3 loose or liquid stools/d OR >200 g stool/d for >2 d but ≤14 d

## Epidemiology
• one of the top five leading causes of death worldwide, according to the World Health Organization
• significant morbidity in developed countries (over 900,000 hospitalizations in the United States each year)

## Etiology
• most commonly due to infections
• most infections are self-limiting and resolve within 7 d

## Risk Factors
• food (raw or undercooked meat and seafood, unpasteurized dairy products)
• medications: antibiotics, laxatives
• others: high risk sexual activity, infectious outbreaks, occupational exposures (daycare workers), family history (IBD)

## Approach to Acute Diarrhea
• the vast majority of acute diarrhea is caused by infection
• in most cases, acute diarrheal illness is viral and/or self-limited, and lasts <3 d
• investigations are costly and are necessary only in certain circumstances
  ▪ therefore, evaluation of acute diarrhea involves identifying characteristics of the patient or illness that warrant further investigation and assessing volume status to determine appropriate method of rehydration

## Physical Exam
• volume status: appearance, level of alertness, pulse, BP, orthostatic vitals, JVP, mucous membranes, skin turgor, capillary refill
• abdominal exam: pain, guarding, peritoneal signs

**Table 8. Classification of Acute Diarrhea**

| | Inflammatory | Non-Inflammatory |
|---|---|---|
| **Definition** | Disruption of intestinal mucosa | Intestinal mucosa intact |
| **Site** | Usually colon | Usually small intestine |
| **Mechanism** | Organisms and cytotoxins invade mucosa, killing mucosal cells, and further perpetuating the diarrhea | Stimulation of intestinal water secretion and inhibition of water absorption (i.e. secretory problem) |
| **Sigmoidoscopy** | Usually abnormal mucosa seen | Usually normal |
| **Symptoms** | Bloody (not always)<br>Small volume, high frequency<br>Often lower abdominal cramping with urgency ± tenesmus<br>May have fever ± shock | Watery, little or no blood<br>Large volume<br>Upper/periumbilical pain/cramp ± shock |
| **Investigations** | Fecal WBC and RBC positive | Fecal WBC negative |
| **Etiology** | See *Differential Diagnosis of Presenting Complaints*, G4 | See *Differential Diagnosis of Presenting Complaints*, G4 |
| **Differential Diagnosis** | Acute presentation of idiopathic inflammatory bowel disease | Acute presentation of non-inflammatory chronic diarrhea (e.g. celiac disease) |
| **Significance** | Higher yield with stool C&S<br>Can progress to life-threatening megacolon, perforation, hemorrhage<br>Antibiotics may benefit | Lower yield with stool C&S<br>Chief life-threatening problem is electrolyte disturbances/ fluid depletion<br>Antibiotics unlikely to be helpful |

## Investigations
• stool cultures/microscopy (C&S/O&P) are required only if diarrhea is inflammatory, severe, or for epidemiological purposes (daycare worker, nursing home resident, community outbreaks, e.g. Walkerton, etc.)
  ▪ C&S only tests *Campylobacter, Salmonella, Shigella, E. coli*
    ◆ other organisms must be ordered separately
• flexible sigmoidoscopy (without bowel preparation): useful if inflammatory diarrhea suspected
  ▪ biopsies are the most useful method of distinguishing idiopathic IBD (Crohn's disease and ulcerative colitis) from infectious colitis or acute self-limited colitis
• *C. difficile* toxin: indicated when recent/remote antibiotic use, hospitalization, nursing home, or recent chemotherapy

**Useful Questions in Acute Diarrhea**

**Those Fads Wilt**
**T**ravel
**H**omosexual contacts
**O**utbreaks
**S**eafood
**E**xtra-intestinal signs of IBD
**F**amily history
**A**ntibiotics
**D**iet
**S**teatorrhea
**W**eight loss
**I**mmunosuppressed
**L**axatives
**T**umour history

**Infectious Causes of Inflammatory Diarrhea**

**Your Stool Smells Extremely Crappy**
***Y**ersinia*
***S**higella*
***S**almonella*
***E**. coli* (EHEC 0157:H7), ***E**. histolytica*
***C**ampylobacter, **C**. difficile*

**Finally: A Role for Bacteriotherapy**
**Duodenal Infusion of Donor Feces for Recurrent *Clostridium difficile***
NEJM 2013; 368:407-15
For centuries, out-of-the-box thinkers have speculated that the colonic bacteria all of us have, but which differs among individuals, play a role in disease. More recently, the colonic microbiome has become the hottest area of research in gastroenterology. The best documented medical indication for manipulating the colonic bacteria is recurrent *C. difficile* infection. In this randomized study of this disease, infusion of donor feces via a nasoduodenal tube resolved diarrhea in 81% of patients, without side-effects, compared to 31% given the standard treatment of oral vancomycin, and 23% of patients given oral vancomycin plus bowel lavage. It takes little prescience to predict an onslaught of future studies investigating the therapeutic potential of altering the human microbiome.

## Treatment

- fluid and electrolyte replacement orally in most cases, intravenous if severe extremes of age/coma
- anti-diarrheals
  - antimotility agents: diphenoxylate, loperamide (Imodium®); contraindicated in mucosal inflammation
    - side effects: abdominal cramps, toxic megacolon
  - absorbants: kaolin/pectin (Kaopectate®), methylcellulose, activated attapulgite
    - act by absorbing intestinal toxins/micro-organisms, or by coating intestinal mucosa
    - much less effective than antimotility agents
  - modifiers of fluid transport: bismuth subsalicylate (Pepto-Bismol®) may be helpful (but should not be used in the presence of bloody diarrhea or fever)
- antibiotics: rarely indicated
  - risks
    - prolonged excretion of enteric pathogen (especially *Salmonella*)
    - drug side effects (including *C. difficile* infection)
    - development of resistant strains
    - renal failure/hemolysis (enterohemorrhagic *E. coli* O157:H7)
  - indications for antimicrobial agents in acute diarrhea
    - septicemia
    - prolonged fever with fecal blood or leukocytes
    - clearly indicated: *Shigella, V. cholerae, C. difficile*, traveller's diarrhea (enterotoxigenic *E. coli* [ETEC]), *Giardia, Entamoeba histolytica, Cyclospora*
    - situational: *Salmonella, Campylobacter, Yersinia*, non-enterotoxigenic *E. coli*
    - *Salmonella*: always treat *Salmonella typhi* (typhoid or enteric fever); treat other *Salmonella* only if there is underlying immunodeficiency, hemolytic anemia, extremes of age, aneurysms, prosthetic valve grafts/joints, sickle cell disease

**Causes of Acute Bloody Diarrhea**
**CHESS**
***C****ampylobacter*
**H**emorrhagic *E. coli* (e.g. O157:H7)
***E****ntamoeba histolytica*
***S****almonella*
***S****higella*

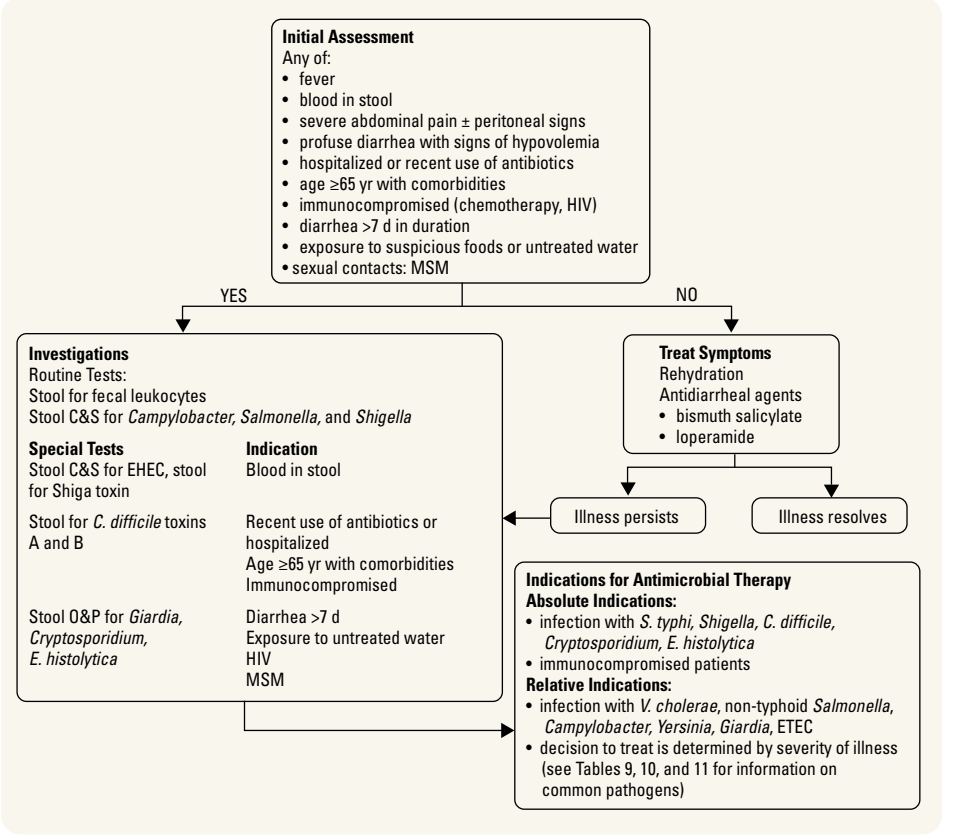

**Figure 7. Approach to acute diarrhea**
Note: *S. typhi* has a rose spot rash (transient maculopapular rash on anterior thorax, upper abdomen), and a prodrome of high fever, bradycardia, headache, and abdominal pain. Diarrhea is not the initial presentation

**Table 9. Bacteria in Infectious Diarrhea**

| Pathogen | Source or Mode of Transmission | Incubation | Clinical Features | | | | Duration | Antimicrobial Therapy | Notes |
|---|---|---|---|---|---|---|---|---|---|
| | | | Fever | Bloody Stool | Abdo Pain | Nausea/ vomiting | | | |
| ***B. cereus* – Type A (emetic)** | Rice dishes | 1-6 h | – | – | – | + | <12 h | None | Preformed exotoxin |
| ***B. cereus* – Type B (diarrheal)** | Meats, vegetables, dried beans, cereals | 8-16 h | – | – | – | – | <24 h | None | Secondary endotoxin |
| ***Campylobacter jejuni*** | Uncooked meat, especially poultry | 2-10 d | + | ± | + | ± | <1 wk | Macrolide or fluoroquinolone if diarrhea >1 wk, bloody diarrhea, or immunocompromised | Most common bacterial cause of diarrhea in Canada<br>Associated with Guillain-Barré syndrome |
| ***Clostridium difficile*** | Can be normally present in colon in small numbers (primary risk factor for disease is exposure to antimicrobials) | Unclear | ± | ± | ± | – | Variable | Stop culprit antibiotic therapy, if possible<br>Supportive therapy (IV fluids)<br>Empiric treatment with either vancomycin or fidaxomicin<br>If access to empiric treatment is limited, then metronidazole may be used<br>For fulminant C. difficile infection (previously called severe), oral vancomycin is used. IV metronidazole added to regimen if ileus present | Usually follows antibiotic treatment (especially clindamycin, fluoroquinolones, penicillins, cephalosporins)<br>Can develop pseudomembranous colitis |
| ***Clostridium perfringens*** | Contaminated food, especially meat and poultry | 8-12 h | ± | – | + | – | <24 h | None | Clostridium spores are heat resistant<br>Secondary enterotoxin<br>Enteroinvasive |
| ***E. coli* (EIEC)** | Contaminated food/ water | 1-3 d | + | ± | + | – | 7-10 d | None | Relatively uncommon<br>Enterotoxigenic |
| ***E. coli* (ETEC)** | Contaminated food/ water | 1-3 d | – | – | + | – | 3 d | Fluoroquinolone or azithromycin for moderate to severe symptoms | Most common cause of traveller's diarrhea<br>Heat-labile and heat-stable toxins |
| **Enterohemorrhagic *E. coli* (EHEC/STEC) i.e. O157:H7** | Contamination of hamburger, raw milk, drinking, and recreational water | 3-8 d | – | + | + | ± | 5-10 d | None: antibiotics increase risk of HUS | Shiga toxin production<br>Monitor renal function:10% develop HUS<br>Antidiarrheals increase risk of HUS |
| ***Salmonella Typhi S. Paratyphi* (i.e. Enteric Fever, Typhoid)** | Fecal-oral<br>Contaminated food/ water<br>Travel to endemic area | 10-14 d | + | ± | + | ± | <5-7 d | Empiric treatment with ceftriaxone, ciprofloxacin, or azithromycin<br>Fluoroquinolone resistance is increasing | Salmonella typhi: "Rose spot" rash (on anterior thorax, upper abdomen), fever, and abdominal pain precedes diarrhea |
| **Non-typhoidal *Salmonellosis S. Typhimurium, S. Enteritidis*** | Contaminated animal food products, especially eggs, poultry, meat, milk | 12-72 h | + | ± | + | + | 3-7 d | Ciprofloxacin only in severe illness, extremes of age, joint prostheses, valvular heart disease, severe atherosclerosis, cancer, uremia | |
| ***Shigella dysenteriae*** | Fecal-oral<br>Contaminated food/ water | 1-4 d | + | ± | + | + | <1 wk | Fluoroquinolone | Very small inoculum needed for infection<br>Complications include toxic megacolon, HUS<br>Antidiarrheals may increase risk of toxic megacolon |
| ***Staphylococcus aureus*** | Unrefrigerated meat and dairy products (custard, pudding, potato salad, mayo) | 2-4 h | – | – | + | + | 1-2 d | None | Heat-stable preformed exotoxin |
| ***Vibrio cholerae*** | Contaminated food/ water, especially shellfish | 1-3 d | – | – | – | – | 3-7 d | Tetracycline or quinolones (ciprofloxacin) | Massive watery diarrhea (1-3 L/d)<br>Mortality <1% with treatment |
| ***Yersinia*** | Contaminated food<br>Unpasteurized milk | 5 d | + | ± | + | ± | Up to 3 wk | Fluoroquinolone only for severe illness | Majority of cases in children 1-4 yr<br>Mesenteric adenitis and terminal ileitis can occur without diarrhea, mimicking appendicitis |

**Table 10. Parasites in Infectious Diarrhea**

| Pathogen | Source or Mode of Transmission | Incubation | Clinical Features | | | | Duration | Antimicrobial Therapy | Notes |
|---|---|---|---|---|---|---|---|---|---|
| | | | Fever | Bloody Stool | Abdo Pain | Nausea/ vomiting | | | |
| ***Cryptosporidium*** | Fecal-oral | 7 d | ± | – | – | + | 1-20 d | Paromomycin + nitazoxanide | Immune reconstitution if immunosuppressed |
| ***Entamoeba histolytica*** | Worldwide endemic areas<br>Fecal-oral | 2-4 wk | ± | + | – | + | Variable | Metronidazole + iodoquinol or paromomycin if symptomatic infection<br>Only iodoquinol or paromomycin for asymptomatic cyst passage | If untreated, potential for liver abscess<br>Sigmoidoscopy shows flat ulcers with yellow exudates |
| ***Giardia lamblia*** | Fecal-oral<br>Contaminated food/ water | 1-4 wk | – | – | + | + | Variable | Metronidazole or nitazoxanide Treatment of asymptomatic carriers NOT recommended | Higher risk in: daycare children, intake of untreated water ("beaver fever"), MSM, immunodeficiency (decreased IgA)<br>May need duodenal biopsy |

**Table 11. Viruses in Infectious Diarrhea**

| Pathogen | Source or Mode of Transmission | Incubation | Clinical Features | | | | Duration | Antimicrobial Therapy | Notes |
|---|---|---|---|---|---|---|---|---|---|
| | | | Fever | Bloody Stool | Abdo Pain | Nausea/ vomiting | | | |
| **Norovirus** | Fecal-oral | 24 h | – | – | + | + | 24 h | None | Noroviruses includes Norwalk virus |
| **Rotavirus** | Fecal-oral | 2-4 d | ± | – | – | ± | 3-8 d | None | Can cause severe dehydration<br>Virtually all children are infected by 3 yr of age<br>Oral vaccine given at 2 and 4 mo of age |

# Traveller's Diarrhea

## Epidemiology
- most common illness to affect travellers
- up to 50% of travellers to developing countries affected in first 2 wk and 10-20% after returning home

## Etiology
- bacterial (80-90%): *E. coli* most common (ETEC), *Campylobacter, Shigella, Salmonella, Vibrio* (non-cholera); wide regional variation (e.g. Campylobacter more common in Southeast Asia)
- viral: norovirus, rotavirus, and astrovirus account for 5-8%
- protozoal (rarely): *Giardia, Entamoeba histolytica, Cryptosporidium*, and *Cyclospora* for ~10% in long-term travellers
- pathogen-negative traveller's diarrhea common despite exhaustive microbiological workup

## Treatment
- rehydration is the mainstay of therapy
  - rehydrate with sealed beverages
  - in severe fluid loss, use oral rehydration solutions (1 package in 1 L boiled or treated water)
- treat symptoms: antidiarrheal agents (e.g. rifamycin antibiotics, bismuth salicylate, loperamide)
- empiric antibiotics in moderate or severe illness: ciprofloxacin or azithromycin or rifaximin
  - note: there is increasing fluoroquinolone resistance in causative agents, especially in South and Southeast Asia

## Prevention
- proper hygiene practices
  - avoid consumption of: foods or beverages from establishments with unhygienic conditions (e.g. street vendors), raw fruits or vegetables without a peel, raw or undercooked meat and seafood
  - avoid untreated water
- bismuth salicylate (Pepto-Bismol®): 60% effective (2 tablets qid according to CDC website)
- CDC Guidelines: antibiotic prophylaxis not recommended
  - increased risk of infection with resistant organisms
  - high risk groups (e.g. immunocompromised) likely to be infected with pathogen not covered by standard antimicrobial agents

- Dukoral®: oral vaccine that offers protection against *V. cholerae* (efficacy ~80%) and ETEC (efficacy ~50-67%)
  - Public Health Agency of Canada recommends that it may be considered for the following situations (not recommended for routine use in travellers):
    - short-term travellers >2 yr old who are high-risk (e.g. chronic illness) for whom there is an increased risk of serious consequences for traveller's diarrhea (e.g. chronic renal failure, CHF, type 1 DM, inflammatory bowel disease)
    - immunosuppressed
    - history of repeat traveller's diarrhea
    - increased risk of acquiring traveller's diarrhea (gastric hypochlorhydria or young children >2 yr)
    - travellers to cholera endemic countries at increased risk of exposure
- two vaccines against *Salmonella typhi* are available and their effectiveness is estimated to be between 50-70%

# Chronic Diarrhea

### Definition
- passage of frequent unformed stool for >4 wk (persistent diarrhea as 14-30 d)
- approach is similar to that of acute diarrhea except that the majority of cases are non-infectious

### Etiology/Classification
- see *Differential Diagnosis of Common Presenting Complaints*, G4

### Investigations
- guided by history
- stool analysis for: *C. difficile* toxin, C&S, O&P ± fecal fat, WBC
- blood for: CBC, electrolytes, CRP, TSH, celiac serology (IgA anti-tTG; ask for serum protein electrophoresis or immunoglobulin quantitation to rule out IgA deficiency which has an increased frequency in celiac disease)
- colonoscopy and ileoscopy with biopsy
- upper GI endoscopy with duodenal biopsy
- wireless small bowel endoscopy capsule (low yield)
- trial of lactose free diet
  - caveat: may delay diagnosis of IBD and celiac disease

# Maldigestion and Malabsorption

### Definition
- maldigestion: inability to break down large molecules in the lumen of the intestine into their component small molecules
- malabsorption: inability to transport molecules across the intestinal mucosa into circulation

### Etiology
- maldigestion
  - inadequate mixing of food with enzymes (e.g. post-gastrectomy)
  - pancreatic exocrine deficiency
  - primary diseases of the pancreas (e.g. cystic fibrosis [remember CF can result in pancreatic exocrine insufficiency as well], pancreatitis, cancer)
  - bile salt deficiency
    - terminal ileal disease (impaired recycling in view of loss greater than synthesis), bacterial overgrowth (deconjugation of bile salts), rarely liver disease (cholestatic, e.g. primary biliary cirrhosis)
  - specific enzyme deficiencies (e.g. lactase)
- malabsorption
  - inadequate absorptive surface
    - infections/infestations (e.g. Whipple's disease, Giardia)
    - immunologic or allergic injury (e.g. celiac disease)
    - infiltration (e.g. lymphoma, amyloidosis)
    - fibrosis (e.g. systemic sclerosis, radiation enteritis): fibrosis can lead to loss of surface area but also areas of stasis with small bowel overgrowth
    - small bowel resection (length, site, location, presence/absence of ileocecal valve and integrity of colon are important)
    - congenital (e.g. short bowel syndrome)
    - inflammatory: extensive ileal Crohn's disease (pivotal number is 100 cm as <100 cm = bile salt or choleretic diarrhea, >100 cm = fatty diarrhea or steatorrhea)
  - drug-induced
    - cholestyramine, ethanol, neomycin, tetracycline, and other antibiotics
  - endocrine
    - DM (complex pathogenesis)

## Clinical Features

- symptoms usually vague unless disease is severe
- weight loss, diarrhea, steatorrhea, weakness, fatigue
- manifestations of malabsorption/deficiency

**Fat Soluble Vitamins: ADEK**
vitamin **A**, vitamin **D**, vitamin **E**, vitamin **K**

**Table 12. Absorption of Nutrients and Fat Soluble Vitamins**

| Deficiency | Absorption | Clinical Disease and/or Features | Investigations |
|---|---|---|---|
| **Iron** | Duodenum, upper jejunum | Hypochromic, microcytic anemia, glossitis, koilonychia (spoon nails), pica | ↓ Hb, ↓ serum Fe, ↓ serum ferritin |
| **Calcium** | Duodenum, upper jejunum (binds to $Ca^{2+}$ binding-protein in cells; levels increased by Vit D) | Metabolic bone disease, may get tetany and paresthesias if serum calcium falls (see Endocrinology, E39) | ↓ serum $Ca^{2+}$, ↓ serum $Mg^{2+}$, and ↑ ALP<br>Evaluate for ↓ bone mineralization radiographically (DEXA) |
| **Folic Acid** | Jejunum | Megaloblastic anemia, glossitis, ↓ red cell folate (may see ↑ folic acid with bacterial overgrowth) | ↓ serum folic acid |
| **Vitamin $B_{12}$** | $B_{12}$ ingested and bound to R proteins mainly from salivary glands; stomach secretes intrinsic factor (IF) in acidic medium; in basic medium, proteases from the pancreas cleave R protein and $B_{12}$-IF complex forms, protecting $B_{12}$ from further protease attack; $B_{12}$ absorbed in ileum and binds to transcobalamin (TC) | Subacute combined degeneration of the spinal cord, peripheral/optic neuropathy, dementia, megaloblastic anemia, glossitis | Differentiate causes by nuclear Schilling test (when available)<br>Positive anti-intrinsic factor antibodies and atrophic gastritis point toward pernicious anemia (see Hematology, H24) |
| **Carbohydrate** | Complex polysaccharides hydrolyzed to oligosaccharides, and disaccharides by salivary and pancreatic enzymes<br>Monosaccharides absorbed in duodenum/jejunum | Generalized malnutrition, weight loss, flatus, and diarrhea | Hydrogen breath test<br>Trial of carbohydrate-restricted diet<br>D-xylose test |
| **Protein** | Digestion at stomach, brush border, and inside cell<br>Absorption occurs primarily in the jejunum | General malnutrition and weight loss, amenorrhea, and ↓ libido if severe | ↓ serum albumin (low sensitivity) |
| **Fat** | Lipase, colipase, phospholipase A (pancreatic enzymes), and bile salts needed for digestion<br>Products of lipolysis form micelles which solubilize fat and aid in absorption<br>Absorption occurs primarily in the jejunum<br>Fatty acids diffuse into cell cytoplasm | Generalized malnutrition, weight loss, and diarrhea<br>Foul-smelling feces + gas<br>Steatorrhea | Small bowel biopsy<br>MRCP, ERCP, pancreatic function tests (not routinely available)<br>Quantitative stool fat test (72 h)<br>May start with qualitative stool fat test (Sudan stain of stool)<br>C-triolein breath test (not routinely available) |
| **Vitamin A** | Dietary sources (e.g. milk, eggs, liver, carrots, sweet potatoes) | Night blindness<br>Dry skin<br>Keratomalacia | |
| **Vitamin D** | Skin (via UV light) or diet (e.g. eggs, fish oil, fortified milk) | Osteomalacia in adults<br>Ricketts in children | |
| **Vitamin E** | Dietary sources (e.g. vegetable oils, nuts, leafy green vegetables) | Retinopathy, neurological problems | |
| **Vitamin K** | Synthesized by intestinal flora<br>↑ risk of deficiency after prolonged use of broad spectrum antibiotics and/or starvation | Prolonged INR may cause bleeding | |

* Calcium malabsorption more commonly causes decreased bone density rather than hypocalcemia because serum calcium levels are protected by leaching calcium from the bone

## Investigations

- tissue transglutaminase (tTG) antibody serology/immunoglobulin A quantitation and abdominal imaging are most useful because celiac disease and chronic pancreatitis are the two most common causes of steatorrhea
- 72 h stool collection (weight, fat content) documents steatorrhea (gold standard)
- fecal elastase to screen for pancreatic insufficiency and/or consider empiric trial of pancreatic enzymes based on clinical context
- serum carotene (precursor to vitamin A), folate, Ca2+, Mg2+, vitamin B12, albumin, ferritin, serum iron solution, INR/PTT
- stool fat globules on fecal smear stained with Sudan (used as an initial screening tool)
- other tests specific for etiology (e.g. CT scan/MRI to visualize pancreas)

## Treatment

- dependent on underlying etiology

# Celiac Disease (Gluten Enteropathy/Sprue)

## Definition
- abnormal small intestine mucosa due to intestinal reaction to gluten, a protein found in wheat, barley, rye, and possibly oats (certified gluten-free oats may be acceptable in a subgroup of patients)

## Etiology
- the only autoimmune disease in which autoantigen (various gliadin peptides) is recognized
- associated with other autoimmune diseases, especially Sjögren's, thyroid disease, DM Type 1
- gluten is broken down to gliadin, which is the toxic factor
- HLA-DQ2 (chromosome 6) found in 80-90% of patients compared with 20% in general population; celiac also associated with HLA-DQ8 (note: up to 40% of Caucasians carry the HLA alleles, but will never develop celiac disease)

## Epidemiology
- more common in women
- family history: 10-15% of first-degree relatives
- may present any time from infancy (when cereals introduced) to elderly
- peak presentation in infancy

## Clinical Features
- classic presentation: diarrhea, weight loss, anemia, symptoms of vitamin/mineral deficiency, failure to thrive; more common current presentation: bloating, gas, iron deficiency
- improves with gluten-free diet, deteriorates when gluten reintroduced
- disease is usually most severe in proximal bowel
  - iron, calcium, and folic acid deficiency (proximal absorption) more common than vitamin B12 deficiency (absorbed in ileum)
- gluten enteropathy may be associated with dermatitis herpetiformis skin eruption, epilepsy, myopathy, depression, paranoia, infertility, bone fractures/metabolic bone disease

## Investigations
- serological tests
  - serum anti-tTG antibody, IgA, is 90-98% sensitive, 94-97% specific
  - patients with selective IgA deficiency have false-negative anti-tTG
    - therefore, measure serum IgA concomitantly (via serum immunoglobulin quantitation)
- incorporate serum testing tTG and/or DGP IgG in IgA deficiencies
- small bowel mucosal biopsy (usually duodenum) is diagnostic with increased intraepithelial lymphocytes (earliest pathologic finding)
  - crypt hyperplasia
  - villous atrophy
  - note: villous atrophy also seen in small bowel overgrowth, Crohn's, lymphoma, Giardia, HIV
- improvement with a gluten-free diet, but should not be started before serological tests and biopsy
- consider CT enterography to visualize small bowel to rule out lymphoma
- evidence of malabsorption (localized or generalized)
  - steatorrhea
  - low levels of ferritin/iron saturation, $Ca^{2+}$, Fe, albumin, cholesterol, carotene, B12 absorption
- quantitative fecal fat >7%

## Treatment
- dietary counselling
  - gluten free diet; avoid barley, rye, wheat (as these grains are related and also have toxic factor, similar to gliadin)
  - oats allowed if not contaminated by other grains (grown in soil without cross-contamination)
  - rice and corn flour are acceptable
  - iron, folate supplementation (with supplementation of other vitamins as needed)
- if poor response to diet change, consider
  - alternate diagnosis
  - non-adherence to gluten-free diet
  - concurrent disease (e.g. microscopic colitis, pancreatic insufficiency)
  - development of intestinal (enteropathy-associated T-cell) lymphoma (abdominal pain, weight loss, palpable mass)
  - development of diffuse intestinal ulceration, characterized by aberrant intraepithelial T-cell population (precursor to lymphoma)

**Gluten Found in BROW**
**B**arley
**R**ye
**O**ats (controversial)
**W**heat

## Prognosis
- associated with increased risk of lymphoma, carcinoma (e.g. small bowel and colon; slight increase compared with general population), autoimmune diseases
- risk of lymphoma may be lowered by dietary gluten restriction

# Inflammatory Bowel Disease

## Definition

- complex, multifactorial etiology
- most likely a sustained response of the immune system, perhaps to enteric flora
- lack of appropriate down-regulation of immune responsiveness after an infection in a genetically predisposed individual

## Genetics

- increased risk of both UC and CD in relatives of patients with either disease, especially siblings, early onset disease
  - familial risk greater if proband has CD rather than UC
- likely polygenomic pattern: 9 gene loci are associated
- CARD15/NOD2 gene mutation associated with CD (relative risk in heterozygote is 3, in homozygote is 40), especially in Ashkenazi Jews, early onset disease, ileal involvement, and fistulizing, fibrostenotic or structuring disease
  - CARD15 gene product modulates NFκβ, which is required for the innate immune response to microbial pathogens, best expressed in monocytes-macrophages

## Clinical Features

**Table 13. Clinical Differentiation of Ulcerative Colitis from Crohn's Disease**

| | Crohn's Disease | Ulcerative Colitis |
|---|---|---|
| **Location** | Any part of GI tract<br>Small bowel + colon: 50%<br>Small bowel only: 30%<br>Colon only: 20% | Isolated to large bowel<br>Always involves rectum, may progress proximally |
| **Rectal Bleeding** | Uncommon; possible if colonic disease | Very common (90%) |
| **Diarrhea** | Less prevalent, large volume, watery<br>Usually non-bloody (may be bloody, particularly if distal colonic involvement) | Frequent, mucous, bloody, small volume stools |
| **Abdominal Pain** | Post-prandial/colicky | Uncommon; predefecation |
| **Fever** | Common | Uncommon |
| **Urgency/Tenesmus** | Uncommon (unless rectum involved) | Common |
| **Palpable Mass** | Frequent (25%), RLQ | Rare (if present, often related to cecum full of stool) |
| **Recurrence After Surgery** | Common | None post-colectomy (with permanent ileostomy) |
| **Endoscopic Features** | Segmental inflammation, ulcers (aphthous, stellate, linear), patchy lesions, pseudopolyps, cobblestoning | Continuous diffuse inflammation, erythema, friability, loss of normal vascular pattern, pseudopolyps |
| **Histologic Features** | Transmural distribution with skip lesions<br>Focal inflammation<br>± noncaseating granulomas, deep fissuring + aphthous ulcerations, strictures<br>Glands intact | Mucosal distribution, continuous disease (no skip lesions)<br>Architectural distortion, gland disruption, crypt abscess<br>Granulomas absent |
| **Radiologic Features** | Cobblestone mucosa<br>Frequent strictures and fistulae<br>AXR: bowel wall thickening "string sign" | Lack of haustra<br>Strictures rare; need to rule out complicating cancer |
| **Complications** | Strictures, fistulae, perianal disease | Toxic megacolon |
| **Colon Cancer Risk** | Increased if >30% of colon involved | Increased except in proctitis |

**Table 14. Extraintestinal Manifestations (EIM) of IBD**

| System | Crohn's Disease | Ulcerative Colitis |
|---|---|---|
| **Dermatologic** | | |
| Erythema nodosum | 15% | 10% |
| Pyoderma gangrenosum | 10% | Less common |
| Perianal skin tags | 75-80% | Rare |
| Oral mucosal lesions | Common | Rare |
| Psoriasis | Statistically associated in 5-10% of those with IBD but not an EIM | |
| Stomatitis | | |
| **Rheumatologic** | | |
| Peripheral arthritis | 15-20% of those with IBD (CD>UC) | |
| Ankylosing spondylitis | 10% of those with IBD (CD>UC) | |
| Sacroiliitis | Occurs equally in CD and UC | |
| **Ocular (~10% of IBD)** | | |
| Uveitis (vision threatening) | | |
| Episcleritis (benign) | 3-4% of IBD patients (CD>UC) | |
| **Hepatobiliary** | | |
| Cholelithiasis | 15-35% of patients with ileal Crohn's | |
| PSC | 1-5% of IBD cases involving colon | |
| Fatty liver | | |
| Gallstones | Pigment stones in CD | |
| **Urologic** | | |
| Calculi | Most common in CD, especially follow ileal resection or extensive terminal ileal disease (oxalate stones) | |
| Ureteric obstruction | | |
| Fistulae | Characteristic of Crohn's | |
| **Others** | | |
| Thromboembolism | | |
| Vasculitis | | |
| Osteoporosis | Increased in CD with/without prior steroids, in UC only after steroids usage | |
| Vitamin deficiencies (B12, Vit ADEK) | | |
| Cardiopulmonary disorders | | |
| Pancreatitis (rare) | | |
| Phlebitis | | |

# Crohn's Disease

## Definition
- chronic transmural inflammatory disorder potentially affecting the entire gut from mouth to perianal region ("gum to bum")

## Epidemiology
- worldwide incidence 3-15 to 10-20/100,000; 135,000 Canadians living with Crohn's
- bimodal: onset before 30 yr, second smaller peak age 60; M=F
- incidence of Crohn's increasing (relative to UC) especially in young females
- more common in Caucasians, Ashkenazi Jews
  - risk in Asians increases with move to Western countries
- smoking incidence in Crohn's patients is higher than general population

## Pathology
- most common location: ileum + right colon
- linear ulcers leading to mucosal islands and "cobblestone" appearance
- granulomas are found in 50% of surgical specimens, 15% of mucosal biopsies

## Clinical Features
- natural history unpredictable; young age, perianal disease, and need for corticosteroids have been associated with poor prognosis, but associations are not strong enough to guide clinical decisions
- most often presents as recurrent episodes of abdominal cramps, non-bloody diarrhea, and weight loss
- ileitis may present with post-prandial pain, vomiting, RLQ mass; mimics acute appendicitis
- extra-intestinal manifestations are more common with colonic involvement
- fistulae, fissures, abscesses are common
- deep fissures with risk of perforation into contiguous viscera (leads to fistulae and abscesses)
- enteric fistulae may communicate with skin, bladder, vagina, and other parts of bowel

## Investigations
- colonoscopy with biopsy to visualize (less often gastroscopy)
- CT/MR enterography to visualize small bowel
- CRP elevated in most new cases, useful to monitor treatment response (especially acutely in UC)
- bacterial cultures, O&P, *C. difficile* toxin to exclude other causes of inflammatory diarrhea

## Management (see Figure 8)

**Effect of Tight Control Management on Crohn's Disease (CALM): A Multi-Centre, Randomized Controlled Phase 3 Trial**
Lancet 2017; 390:2779-2789
**Purpose**: To define the role of incorporating laboratory biomarkers in the management algorithm of active Crohn's disease.
**Study**: Randomized controlled trial.
**Population**: 224 adult patients (22 countries at 74 hospitals) with active Crohn's disease were randomized to intensify treatment based on either laboratory biomarkers (serum C-reactive protein, fecal calprotectin) plus clinical evaluation (Crohn's disease activity index and prednisone use) or treatment based on clinical evaluation alone.
**Outcomes**: Mucosal healing via the absence of deep ulcers.
**Results**: At 2 years, more patients receiving treatment criteria that included laboratory tests had complete mucosal healing (i.e. no ulcers) than the group treated on basis of symptoms alone (46% vs 30%). Admittedly, the end-point of mucosal healing is not a strong clinically relevant result, but other studies have shown that the greater the mucosal ulceration, the more likely are complications, (strictures, fistulas, abscesses, hospitalizations and surgery).
**Conclusions**: This is not definitive data but adds to other evidence showing that the traditional management paradigm needs reversing, so in most patients it is worthwhile aiming for endoscopic healing of Crohn's disease irrespective of symptoms.

**Table 15. Management of Crohn's Disease**

| Management | Notes |
|---|---|
| **Lifestyle/Diet** | Smoking cessation<br>Fluids only during acute exacerbation<br>Enteral diets may aid in remission only for Crohn's ileitis, not colitis<br>No evidence for any non-enteral diet changing the natural history of Crohn's disease, but may affect symptoms<br>Those with extensive small bowel involvement or extensive resection require electrolyte, mineral, and vitamin supplements (vitaminD, $Ca^{2+}$, $Mg^{2+}$, zinc, Fe, $B_{12}$) |
| **Antidiarrheal Agents*** | Loperamide (Imodium®) > diphenoxylate (Lomotil®) > codeine (cheap but addictive)<br>All work by decreasing small bowel motility, used only for symptom relief<br>CAUTION if colitis is severe (risk of precipitating toxic megacolon), therefore avoid during flare-ups |
| **5-ASA**** | Efficacy controversial: Is currently used for mild ileitis<br>Sulfasalazine (Salazopyrin®): 5-ASA bound to sulfapyridine<br>Hydrolysis by intestinal bacteria releases 5-ASA (active component)<br>Dose-dependent efficacy<br>Mesalamine (Pentasa®): coated 5-ASA releases 5-ASA in the ileum and colon when inflammation is mild |
| **Antibiotics** | e.g. metronidazole (20 mg/kg/d, bid or tid dosing) or ciprofloxacin<br>Best described for perianal Crohn's, although characteristically relapse when discontinued |
| **Corticosteroids** | Prednisone: starting dose 40 mg OD for acute exacerbations; IV methylprednisolone if severe<br>No proven role for steroids in maintaining remissions; masks intra-abdominal sepsis |
| **Immunosuppressives** | 6-mercaptopurine (6-MP), azathioprine (Imuran®); methotrexate (used less often)<br>More often used to maintain remission than to treat active inflammation<br>Most commonly used as steroid-sparing agents<br>i.e. to lower risk of relapse as corticosteroids are withdrawn<br>May require >3 mo to have beneficial effect; usually continued for several years<br>May help to heal fistulae, decrease disease activity<br>Increases efficacy of biologicals plus lowers chances of biological dosing efficacy (tolerance) so often given in combination with biologics<br>Side effects: vomiting, pancreatitis, bone marrow suppression, increased risk of malignancy (i.e. lymphoma) |
| **Biologics** | Infliximab IV (Remicade®) or adalimumab SC (Humira®): both = antibody to TNF-α<br>Proven effective for treatment of fistulae and patients with medically refractory CD<br>First-line immunosuppressive therapy with infliximab + azathioprine more effective than using either alone<br>Ustekinumab, monoclonal antibody against P40 subunit of interleukin 12 and 23<br>Vedolizumab, monoclonal antibody directed against integrin α4β7 thereby reducing lymphocyte traffic to gut – now indicated for UC and Crohn's |
| **Surgical/ Experimental** | Surgical treatment (see General Surgery, GS33)<br>Surgery generally reserved for complications such as fistulae, obstruction, abscess, perforation, bleeding, and for medically refractory disease<br>If <50% or <200 cm of functional small intestine, risk of short bowel syndrome<br>At least 50% clinical recurrence within 5 yr; 85% within 15 yr; endoscopic recurrence rate even higher<br>40% likelihood of second bowel resection, 30% likelihood of third bowel resection<br>Complications of ileal resection<br><100 cm resected → watery diarrhea or cholorrhea (impaired bile salt absorption)<br>Treatment: cholestyramine or anti-diarrheals e.g. loperamide<br>>100 cm resected → steatorrhea (reduced mucosal surface area, bile salt deficiency)<br>Treatment: fat restriction, medium chain triglycerides |

*Cholestyramine: a bile-salt binding resin; for watery diarrhea with <100 cm of terminal ileum diseased or resected; however, non-specific anti-diarrheals are more convenient and often more potent
** 5-ASA use in Crohn's is controversial; however, initial trial for mild ilelitis only is warranted (induction and maintenance if clinical response)

**Traditional Medical Management of Crohn's**

| | Induction of Remission | Maintenance |
|---|---|---|
| 5-ASA* | ? | ? |
| Steroids | + | |
| Immunosuppressive | + | + |
| Antibiotics | + | |
| MTX | + | + |
| Infliximab | + | + |

*5-ASA use in Crohn's is controversial. However, initial trial for mild ilelitis only is warranted (induction and maintenance if clinical response)

**Note:** Starting with immunosupressives plus immunomodulators ("top-down approach") increasingly being used (Lancet 2008;371;660-67). Combination of azathioprine and infliximab has the highest remission rate yet described with medical treatment (NEJM 2010;362;1383-95). Characteristically more than 1 yr between onset of symptoms and diagnosis of Crohn's disease.

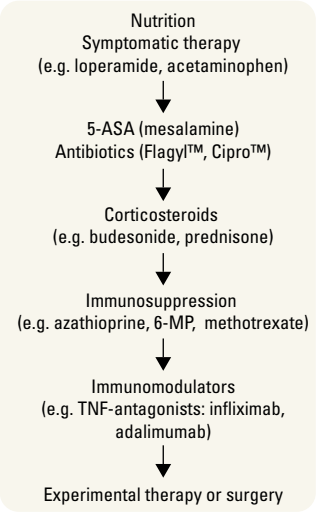

**Figure 8. Traditional graded approach to induction therapy in Crohn's disease**
Note: immunosuppressants and immunomodulators are increasingly used initially ("top-down management strategy")

## Prognosis

- highly variable course
- 10% disabled by the disease eventually, spontaneous remission also described
- increased mortality, especially with more proximal disease, greatest in the first 4-5 yr
- complications include
  - intestinal obstruction/perforation
  - fistula formation
  - malignancy (lower risk compared to UC)
- surveillance colonoscopy same as ulcerative colitis (see Ulcerative Colitis) if more than 1/3 of colon involved

# Ulcerative Colitis

## Definition

- inflammatory disease affecting colonic mucosa anywhere from rectum (always involved) to cecum

## Epidemiology

- worldwide incidence 3-15 to 10-20/100,000; 120,000 Canadians living with UC (less common than Crohn's)
- 2/3 onset by age 30 (with second peak after 50); M=F
- small hereditary contribution (15% of cases have 1st degree relative with disease)
- risk is less in smokers
- inflammation limited to rectum or left colon is more common than pancolitis

## Pathology
- disease can involve any portion of lower bowel ranging from rectum only (proctitis) to entire colon (pancolitis)
- inflammation is diffuse, continuous and confined to mucosa

## Clinical Features
- rectal bleeding is the hallmark feature; diarrhea present if more than the rectum is involved
  - can also have abdominal cramps/pain, especially with defecation
- severity of colonic inflammation correlates with symptoms (stool volume, amount of blood in stool)
- tenesmus, urgency, incontinence
- systemic symptoms: fever, anorexia, weight loss, fatigue in severe cases
- extra-intestinal manifestations (see Table 14, G23)
- characteristic exacerbations and remissions; 5% of cases are fulminant

In UC, non-bloody diarrhea is frequently the initial presentation; eventually progressing to bloody diarrhea

## Investigations
- sigmoidoscopy with mucosal biopsy (to exclude self-limited colitis) without bowel prep often sufficient for diagnosis
- colonoscopy helpful to determine extent of disease; contraindicated in severe exacerbation
- CT colonography (formerly barium enema) if colonoscopy cannot be done; contraindicated in severe disease
- stool culture, microscopy, *C. difficile* toxin assay necessary to exclude infection
- no single confirmatory test

**Medical Management of Ulcerative Colitis**

| | Induction of Remission | Maintenance |
|---|---|---|
| 5-ASA | + | + |
| Steroids | + | |
| Immunosuppressive | ± | + |

## Treatment
- mainstays of treatment: 5-ASA (mesalamine) derivatives (only in mild to moderate disease) and corticosteroids, with azathioprine used in steroid-dependent or resistant cases
- diet of little value in decreasing inflammation but may alleviate symptoms
- anti-diarrheal medications generally not indicated in UC
  - 5-ASA
    - topical (suppository or enema): effective for distal disease (rectum to splenic flexure) if inflammation is mild, preferable to corticosteroids
    - oral: effective for mild to moderate, but not severe colitis (e.g. sulfasalazine 3-4 g/d, mesalamine 4 g/d)
    - commonly used in maintaining remission (decreases yearly relapse rate from 60% to 15%)
    - may decrease rate of colorectal cancer
- corticosteroids
  - to remit acute disease, especially if severe or first attack; may need maximum dose IV steroids initially (e.g. methylprednisolone 30 mg IV q12h)
  - limited role as maintenance therapy for mild to moderate disease
  - use suppositories (predominantly available in compound pharmacies) for proctitis
  - use enemas and topical steroids (e.g. hydrocortisone foam, budesonide enemas) for inflammation distal to splenic flexure
- immunosuppressants (steroid-sparing)
  - in hospitalized patients with severe UC – add IV infliximab if no response to IV methylprednisolone within 3 d; then consider colectomy if inadequate response
  - biologics (infliximab, adalimumab, golimumab, vedolizumab, tofacitinib) can also be used for outpatients with moderate-severe disease, particularly those that are steroid-unresponsive or steroid-dependent, some evidence that they are best used early in course of disease
  - azathioprine and 6-mercaptopurine: too slow to rapidly resolve acute relapse
    - most commonly used to maintain remission as corticosteroids withdrawn
    - given with biologics: increase efficacy of infliximab and decrease likelihood of developing tolerance to infliximab (~10% chance/yr)
- surgical treatment curative
  - aim for cure with colectomy; bowel continuity can be restored with ileal pouch-anal anastamosis (IPAA)
  - indications: failure of adequate medical therapy, toxic megacolon, uncontrollable bleeding, pre-cancerous changes detected either by endoscopy or endoscopic biopsies (dysplasia), inability to taper corticosteroids, overt malignancy

**When Considering Complications of IBD, Think:**

**ULCERATIVE COLITIS**
**U**rinary calculi
**L**iver problems
**C**holelithiasis
**E**pithelial problems
**R**etardation of growth/sexual maturation
**A**rthralgias
**T**hrombophlebitis
**I**atrogenic complications
**V**itamin deficiencies
**E**yes
**C**olorectal cancer
**O**bstruction
**L**eakage (perforation)
**I**ron deficiency
**T**oxic megacolon
**I**nanition (wasting)
**S**trictures

## Complications
- similar to CD, except:
  - more liver problems (especially PSC in men)
  - greater risk of colorectal cancer
    - risk increases with duration and extent of disease (5% at 10 yr, 15% at 20 yr for pancolitis; overall relative risk is 8%)
    - risk also increases with active mucosal inflammation and sclerosing cholangitis
    - thus, regular colonoscopy and biopsy in pancolitis of ≥8 yr is indicated
  - toxic megacolon (transverse colon diameter >6 cm on abdominal x-ray) with immediate danger of perforation (see General Surgery, GS42)

### Prognosis
- chronic relapsing pattern in most patients
- 10-15% chronic continuous pattern
- >1 attack in almost all patients
- more colonic involvement in the 1st yr correlates with increased severity of attacks and increased colectomy rate
  - colectomy rate = 1% for all patients after the 1st yr; 20-25% eventually undergo colectomy
- normal life expectancy
- if proctitis only, usually benign course, lifetime risk of extension is 15%
- stool calprotectin increasingly recognized as a marker of bowel mucosal inflammation, reported especially to be useful in monitoring the activity of inflammatory bowel disease, but accuracy is still controversial

## Irritable Bowel Syndrome

### Definition
- a form of functional bowel disease; more than just a label for GI symptoms unexplained after normal investigations

### Epidemiology
- 11% worldwide prevalence
- onset of symptoms usually in young adulthood
- F>M

### Clinical Features
- Rome IV Criteria are used for diagnosis
- diagnosis is based chiefly on history; no specific diagnostic test available

### Pathophysiology
- associated with either abnormal perception of intestinal activity or abnormal intestinal motility
- abnormal motility: multiple abnormalities described; unclear if associations or if causative
- psychological: stress may increase IBS symptoms but probably does not cause IBS
- 4 main types of IBS
  - IBS-D: IBS with predominant diarrhea
  - IBS-C: IBS with predominant constipation
  - IBS-M: IBS-mixed with both diarrhea and constipation (each >25% of all abnormal bowel movements)
  - IBS untyped: insufficient abnormality in stool consistency to meet other types

### Diagnosis

**Table 16. Rome IV Criteria for Diagnosing Irritable Bowel Syndrome**

| **IBS Rome IV Criteria** | |
|---|---|
| Recurrent abdominal pain for more than 6 mo, of at least 1/d/wk in the last 3 mo, associated with 2 or more of the following:<br>1. Related to defecation<br>2. Associated with a change in frequency of stool<br>3. Associated with a change in form (appearance) of stool | |
| Symptom onset at least 6 mo before diagnosis and criteria present during the last 3 mo | |
| The following are supportive, but not essential to the diagnosis:<br>Abnormal stool frequency (>3/d or <3/wk)<br>Abnormal stool form (lumpy/hard/loose/watery) >1/4 of defecations<br>Abnormal stool passage (straining, urgency, feeling of incomplete evacuation) >1/4 of defecations<br>Passage of mucus >1/4 of defecations<br>Bloating | |
| **Diagnosis of IBS Less Likely in Presence of "Red Flag" Features** | |
| Weight loss | Anemia |
| Fever | Blood or pus in stool |
| Nocturnal defecation | Abnormal gross findings on flexible sigmoidoscopy |
| **Normal Physical Exam** | |

### Investigations
- if history consistent with Rome IV criteria, no alarm symptoms, and no family history of IBD or colorectal cancer, limited investigations required
- aim is to rule out diseases which mimic IBS, particularly celiac disease and IBD
- investigations can be limited to CBC, inflammatory markers (ESR, CRP) and celiac serology
- if available, fecal calprotectin is likely more reliable test to rule out IBD
- consider TSH, stool cultures depending on clinical circumstances
- consider colonoscopy (e.g. if alarming features present, family history of IBD or age >50)

**IBS Mimickers**
- Enteric infections e.g. *Giardia*
- Lactose intolerance/other disaccharidase deficiency
- Crohn's disease
- Celiac sprue
- Drug-induced diarrhea
- Diet-induced (excess tea, coffee, colas)

### Treatment
- education: reassurance, explanation, support, aim for realistic goals
- relaxation therapy, biofeedback, hypnosis, stress reduction, probably exercise
- dietary: low FODMAP (Fermentable Oligo-, Di-, Monosaccharides And Polyols) diet for pain, bloating gas, irregular bowel movements

- no therapeutic agent consistently effective, pain most difficult to control, no drug changes natural history so the drug should be "wanted, since it is not needed"
- symptom-guided treatment
  - pain predominant
    - antispasmodic medication before meals (e.g. hyoscine, pinaverium, trimebutine - low level evidence)
    - tricyclic antidepressants (TCA), selective serotonin reuptake inhibitors (SSRI - moderate level of evidence)
  - IBS-D
    - increase fibre (bran or psyllium) to increase stool consistency but may worsen abdominal gas (controversial)
    - gluten avoidance (gluten shown to alter barrier)
    - loperamide (Imodium®)
    - diphenoxylate (Lomotil®)
    - cholestyramine
    - eluxadoline
    - rifaxamin
  - IBS-C
    - increase fibre in diet
    - linaclotide
    - osmotic or other laxatives (help more with the constipation than the pain)

### Prognosis
- 80% improve over time
- most have intermittent episodes
- normal life expectancy

**Rifaximin Therapy for Patients with Irritable Bowel Syndrome Without Constipation**
NEJM 2011;364:22-32
**Purpose**: Previous evidence suggests that gut flora may play an important role in the pathophysiology of IBS. This study evaluated rifaximin, a minimally absorbed antibiotic, in treating IBS without constipation.
**Methods**: Two phase 3, double-blind, placebo-controlled trials (TARGET 1 and TARGET 2). 1260 patients who had IBS without constipation were randomly assigned to rifaximin (550 mg dose) or placebo, 3 times daily for 2 wk, with a follow-up of 10 wk. The primary endpoint was adequate self-reported relief of global IBS symptoms.
**Results**: Significantly more patients in the rifaximin group had adequate self-reported relief of global IBS symptoms compared to the placebo group during the first 4 wk after treatment (40.8% vs. 31.2% respectively). Also, more patients in the rifaximin group had adequate relief of bloating compared to the placebo group (39.5% vs. 28.7% respectively).
**Conclusions**: Rifaximin therapy for 2 wk provided significant relief of symptoms, bloating, abdominal pain, and stool consistency associated with IBS without constipation.

# Constipation

### Definition
- passage of infrequent/hard stools and/or difficult stool evacuation (ex. straining, sensation of anorectal blockage)

### Epidemiology
- increasing prevalence with age; F>M
- rare in Africa and India where stool weight is 3-4x greater than in Western countries

### Risk Factors
- female sex
- older age

**Causes of Constipation**

**DOPED**
**D**rugs
**O**bstruction
**P**ain
**E**ndocrine dysfunction
**D**epression

### Etiology
- most common: functional, idiopathic attributed to colon dysmotility but this is difficult to measure
- organic causes: likely only if there are symptoms other than constipation
  - medication side effects (narcotics, antidepressants) are the most common
  - intestinal obstruction, left sided colon cancer (consider in older patients), and fecal impaction
  - metabolic
    - DM
    - hypothyroidism
    - hypercalcemia, hypokalemia, uremia
  - neurological
    - intestinal pseudo-obstruction
    - Parkinson's disease
    - MS
  - collagen vascular disease (e.g. scleroderma)
  - painful anal conditions (e.g. fissures)

### Clinical Feature
- overlaps with IBS
- stool firm, difficult to expel, passed with straining, abdominal pain relieved by defecation, flatulence, overflow diarrhea, tenesmus, abdominal distension, infrequent BMs (<3/wk)

### Investigations
- underlying disease rarely found if constipation is the only presenting symptom
  - only test indicated in this situation is a CBC (2013 recommendation of American Gastroenterology Association), but also consider TSH, calcium, and glucose, X-ray of abdomen
- colon visualization (colonoscopy, CT colonography) if concomitant symptoms such as rectal bleeding, weight loss, anemia or age above 50
- if refractory to treatment, consider classification based on colon transit time; can measure colonic transit time with radio-opaque markers that are ingested and followed with a series of plain film abdominal x-rays (normal: 70 h)
  1. normal = misperception of normal defecation (IBS)
  2. prolonged throughout = "colonic inertia" (infrequent bowel movements with gas/bloating, tends to occur in youth)
  3. outlet obstruction = inability to coordinate pelvic floor muscles to empty rectum, straining, stool in rectum on digital exam, tends to occur in old age
- combination of 1 and 3 common

### Treatment (in order of Increasing Potency)

- dietary fibre
  - useful if mild or moderate constipation, but not if severe
  - aim for 30 g daily, increase dose slowly
- surface-acting (soften and lubricate)
  - docusate salts (likely limited efficacy based on evidence), mineral oils
- osmotic agents (effective in 2-3 d)
  - polyethylene glycol 3350, lactulose, sorbitol, magnesium salts (e.g. magnesium hydroxide, i.e. milk of magnesia), lactitol (β-galactosido-sorbitol)
- cathartics/stimulants (effective in 24 h)
  - senna, bisacodyl
- enemas and suppositories (e.g. saline enema, phosphate enema, glycerin suppository, bisacodyl suppository)
- prokinetic agents (prucalopride)
- linaclotide (secretagogue, increases water secretion into the intestinal lumen)

# Upper Gastrointestinal Bleeding

### Definition

- bleeding proximal to the ligament of Treitz, see *Gastrointestinal Tract*, G2 (75% of GI bleeds)
  - ligament of Treitz: suspensory ligament where fourth portion of the duodenum transitions to jejunum

### Etiology

- above the GE junction
  - epistaxis
  - esophageal varices (10-30%)
  - esophagitis
  - esophageal cancer
  - Mallory-Weiss tear (10%)
- stomach
  - gastric ulcer (20%) (see *Peptic Ulcer Disease*, G11)
  - erosive gastritis (e.g. from EtOH or post-surgery) (20%)
  - gastric cancer
  - gastric antral vascular ectasia (rare, associated with cirrhosis and connective tissue disease)
  - Dieulafoy's lesion (very rare)
- duodenum
  - ulcer in bulb (25%)
  - aortoenteric fistula: usually only if previous aortic graft (see sidebar)
- coagulopathy (drugs, renal disease, liver disease)
- vascular malformation (Dieulafoy's lesion, arteriovenous malformation)

### Clinical Features

- in order of decreasing severity of the bleed: hematochezia (brisk upper GI bleed) > hematemesis > coffee ground emesis > melena > occult blood in stool

### Treatment

- stabilize patient (1-2 large bore IVs, IV fluids, monitor)
- send blood for CBC, cross and type, platelets, PT, PTT, electrolytes, BUN, Cr, LFTs
- keep NPO
- consider NG tube to determine upper vs. lower GI bleeding in some cases
- IV PPI: decrease risk of rebleed if endoscopic predictors of rebleeding seen (see prognosis section)
  - given to stabilize clot, not to accelerate ulcer healing
  - if given before endoscopy, decreases need for endoscopic therapeutic intervention
- for variceal bleeds, octreotide 50 μg loading dose followed by constant infusion of 50 μg/h and antibiotics for those with cirrhosis (reduces risk of infections)
- consider IV erythromycin (or metoclopramide) to accelerate gastric emptying prior to gastroscopy to remove clots from stomach
- endoscopy (OGD): establish bleeding site + treat lesion
  - if bleeding peptic ulcer: most commonly used method of controlling bleeding is injection of epinephrine around bleeding point + thermal hemostasis (bipolar electrocoagulation or heater probe); less often thermal hemostasis may be used alone, but injection alone not recommended
  - endoclips
  - hemospray

### Prognosis

- 80% stop spontaneously
- peptic ulcer bleeding: low mortality (2%) unless rebleeding occurs (25% of patients, 10% mortality)
- endoscopic predictors of rebleeding (Forrest classification): spurt or ooze, visible vessel, fibrin clot
- can send home if clinically stable, bleed is minor, no comorbidities, endoscopy shows clean ulcer with no high risk predictors of rebleeding
- H2-antagonists should not be used since they impact minimally on rebleeding rates and need for surgery
- esophageal varices have a high rebleeding rate (55%) and mortality (29%)

Always ask about NSAID/Aspirin® or anticoagulant therapy in GI bleed

**Aortoenteric Fistula** is a rare and lethal cause of GI bleed, most common in patients with a history of aortic graft surgery. Therefore, perform emergency endoscopy if suspected, emergency surgery if diagnosed
Note: The window of opportunity is narrow. Suspect if history of aortic graft, abdominal pain associated with bleeding

**Transfusion Strategies for Acute Upper Gastrointestinal Bleeding**
NEJM 2013;368:11-21
**Study**: Prospective, unblinded, RCT, follow-up up to 45 d.
**Populations**: 921 patients with hematemesis, bloody nasogastric aspirate, melena, or both. Exclusion criteria included massive bleed, ACS, stroke/TIA or transfusion within previous 90 d; recent trauma/surgery; lower GI bleed.
**Intervention**: Patients randomized to restrictive (<70 g/L) or liberal (<90 g/L) transfusion.
**Outcome**: Mortality, further bleeding, adverse events.
**Results**: Fewer patients in the restrictive group required transfusion (51% vs. 15%; p<0.001). The hazard ratio for death for restrictive compared to liberal transfusion was 0.55; 95% CI 0.33-0.92; p=0.02. Further bleeding occurred in 10% vs. 16% (p=0.01) of patients, while adverse effects occurred in 40% vs. 48% (p=0.02) of patients in the restrictive and liberal strategies, respectively. The restrictive strategy had a better survival rate in patients with bleeding associated with cirrhosis Child-Pugh class A or B (HR: 0.30; 95% CI 0.11-0.85), but not in cirrhosis Child-Pugh class C (HR: 1.04; 95% CI 0.45-2.37) or a peptic ulcer (HR: 0.70; 95% CI 0.26-1.25).
**Conclusions**: Transfusing patients with an acute upper GI bleed at hemoglobin of <70 g/L rather than 90 g/L is associated with fewer transfusions, better survival, and fewer adverse events.

**Forrest Prognostic Classification of Bleeding Peptic Ulcers**

| Forrest Class | Type of Lesion | Risk of Rebleed (%) |
|---|---|---|
| I | Arterial bleeding (oozing/spurting) | 55-100 |
| IIa | Visible vessel | 43 |
| IIb | Sentinel clot | 22 |
| IIc | Hematin covered flat spot | 10 |
| III | No stigmata of hemorrhage | 5 |

*Lancet* 1974;2:394-397

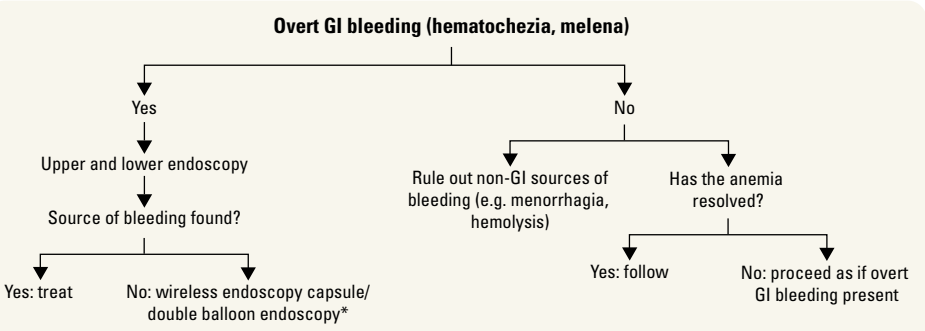

**Figure 9. Approach to iron deficiency anemia**

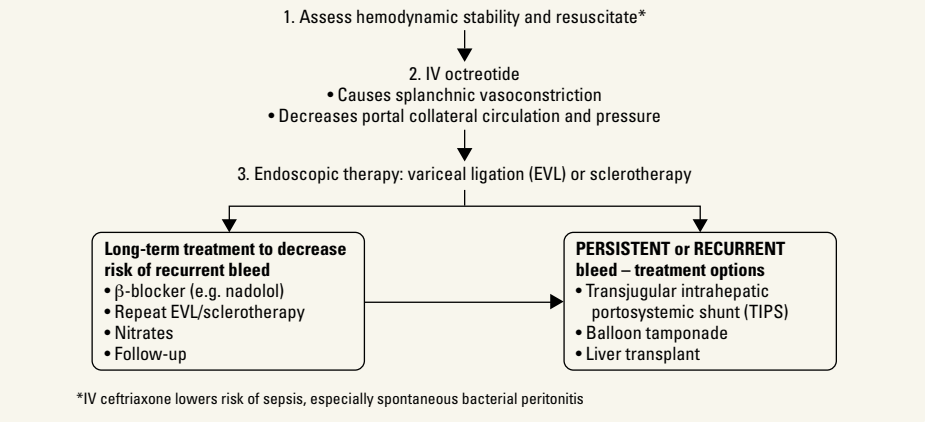
# Esophageal Varices



### Etiology
- almost always due to portal hypertension

### Clinical Features
- characteristically massive upper GI bleeding

### Prognosis
- risk of bleeding: 30% in 1st yr
- risk of rebleeding: 50-70% (20% mortality at 6 wk)

### Investigations
- endoscopy

### Management

If varices isolated to stomach, think of splenic vein thrombosis

Gastric varices best treated by endoscopic injection of cyanoacetate ("crazy glue")

**Figure 10. Management of bleeding esophageal varices**

# Mallory-Weiss Tear

### Definition
- longitudinal laceration in gastric mucosa on lesser curvature near GE junction (20% straddle junction, 5% in distal esophagus)

### Etiology
- due to rapid increases in gastric pressure from retching/vomiting against a closed glottis
- hiatus hernia usually present

### Clinical Features
- hematemesis ± melena, classically following an episode of retching without blood
- can lead to fatal hematemesis

### Management
- 90% stop spontaneously
- if persistent: endoscopy with epinephrine injection ± clips or surgical repair

# Lower Gastrointestinal Bleeding

## Definition
- bleed distal to ligament of Treitz

## Etiology
- if blood per rectum with hemodynamic instability, rule out upper GI source
- diverticular (60% from right colon)
- vascular
  - angiodysplasia (small vascular malformations of the gut)
  - anorectal (hemorrhoids, fissures)
- neoplasm
  - cancer
  - polyps
- inflammation
  - colitis (ulcerative, infectious, radiation, ischemic)
- post-polypectomy

**Lower GI Bleed**

**CHAND**
**C**olitis (radiation, infectious, ischemic, IBD [UC > CD])
**H**emorrhoids/fissure
**A**ngiodysplasia
**N**eoplastic
**D**iverticular disease

## Clinical Features
- hematochezia
- anemia
- occult blood in stool
- occasionally melena due to slow small bowel or right-colonic course

## Treatment
- treat underlying cause

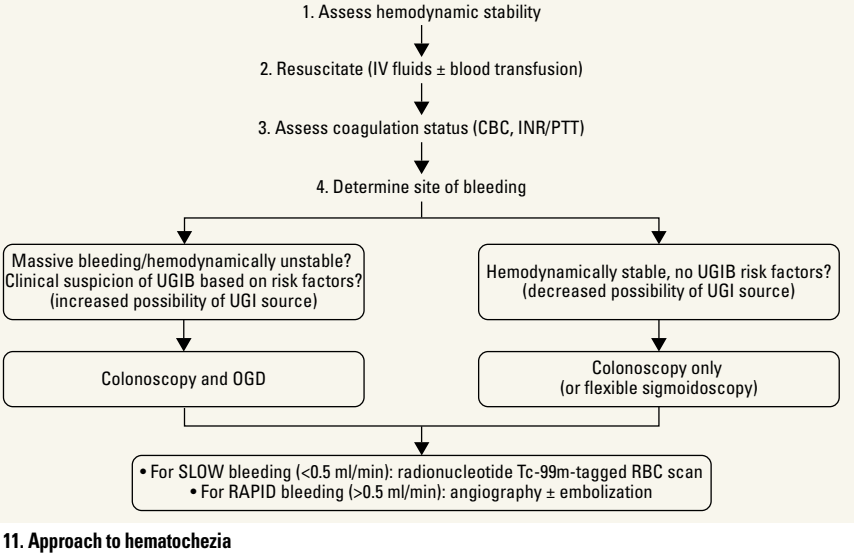


**Figure 11. Approach to hematochezia**

Always exclude upper GI lesion before localizing the site of the bleeding to the lower GI tract

# Colorectal Carcinoma

- see General Surgery, GS39

# Colorectal Polyps

- see General Surgery, GS38

# Familial Colon Cancer Syndromes

- see General Surgery, GS38

# Benign Anorectal Disease

- see General Surgery, GS44

# Liver

## Investigations of Hepatobiliary Disease

### A. Tests of Liver Function

**Table 17. Liver Function Tests**

| Test | What Do Levels Correlate With? | Increased by | How to Interpret |
|---|---|---|---|
| **Prothrombin Time (PT or INR)** | Hepatic protein synthesis<br>All coagulation factors except VIII | Hepatocellular dysfunction<br>Vitamin K deficiency (due to malnutrition, malabsorption, etc.) | PT/INR will promptly correct if vitamin K is administered, so increased PT/INR in absence of vitamin K deficiency is a reliable marker of hepatocellular dysfunction |
| **Serum Albumin** | Hepatic protein synthesis (and other causes listed in next column) | Hepatocellular dysfunction<br>Malnutrition<br>Renal or GI losses<br>Significant inflammation<br>Malignancy | Rule out potential causes other than hepatocellular dysfunction |
| **Serum Direct Bilirubin*** | Hepatic excretion from hepatocyte to biliary system | Liver dysfunction | Conjugation is preserved even in end stage liver failure, thus increased direct bilirubin indicates liver dysfunction |

*Serum Bilirubin
- canaliculus breakdown product of hemoglobin; metabolized in the reticuloendothelial system of liver, transported through biliary system, excreted via gut
- direct bilirubin = conjugated; indirect = unconjugated bilirubin

All clotting factors except factor VIII and von Willebrand factor are exclusively synthesized in the liver. Factor VIII is also produced in the endothelium. In cirrhosis, risk of bleeding does not correlate closely with elevations in INR/PTT since so many of the proteins in the coagulation cascade are affected

### B. Tests of Liver Injury
- disproportionately increased AST or ALT = hepatocellular damage
  - ALT more specific to liver; AST from multiple sources (especially muscle)
  - elevation of both highly suggestive of liver injury
  - most common cause of elevated ALT is fatty liver
- disproportionately increased ALP (and GGT) = cholestasis (stasis of bile flow)
  - if ALP is elevated alone, rule out bone disease by fractionating ALP and/or checking GGT
  - if ALP elevation out of proportion to ALT/AST elevation, consider:
    1. obstruction of common bile duct (e.g. extraluminal = pancreatic cancer, lymphoma; intraluminal = stones, cholangiocarcinoma, sclerosing cholangitis, helminths)
    2. destruction of microscopic ducts (e.g. PBC)
    3. bile acid transporter defects (e.g. drugs, intrahepatic cholestasis of pregnancy)
    4. infiltration of the liver (e.g. liver metastases, lymphoma, granulomas, amyloid)

ALT > AST = most causes of hepatitis
AST > ALT = alcoholic liver disease or other causes of hepatitis (i.e. non-alcoholic liver disease) that have progressed to advanced cirrhosis

## Acute Viral Hepatitis (General)

### Definition
- viral hepatitis lasting <6 mo

### Clinical Features
- most are subclinical
- flu-like prodrome may precede jaundice by 1-2 wk
  - nausea/vomiting, anorexia, headaches, fatigue, myalgia, low-grade fever, arthralgia, and urticaria (especially HBV)
- only some progress to icteric (clinical jaundice) phase, lasting days to weeks
  - pale stools and dark urine 1-5 d prior to icteric phase
  - hepatomegaly and RUQ pain
  - splenomegaly and cervical lymphadenopathy (10-20% of cases)

**Serum Transaminases >1000 due to**
- Viral hepatitis
- Drugs/toxins
- Autoimmune hepatitis
- Hepatic ischemia
- Less often, common bile duct stone

**Alcoholic hepatitis**: history of recent alcohol, RUQ abdominal pain, AST/ALT>2, AST usually <300, low grade fever, mildly elevated WBC

### Investigations
- AST and ALT (>10-20x normal in hepatocellular necrosis)
- ALP minimally elevated
- viral serology, particularly the IgM antibody directed to the virus

**Major Sources of ALP**
- Hepatobiliary tree
- Bone
- Placenta

### Treatment
- supportive (hydration, diet)
- usually resolves spontaneously, but if severe HBV infection, treatment with entecavir should be considered; in anicteric hepatitis C, anti-viral treatment should be considered (see *Hepatitis C Virus*, G33)
- indications for hospitalization: encephalopathy, coagulopathy, severe vomiting, hypoglycemia

**DDx for Hepatitis**
- Viral infection
- Alcohol
- Drugs
- Immune-mediated
- Toxins

### Prognosis
- poor prognostic indicators: comorbidities, persistently high bilirubin (>340 mmol; 20 mg/dL), increased INR, decreased albumin, hypoglycemia

### Complications
- cholestasis (most commonly associated with HAV infection)
- hepatocellular necrosis: AST, ALT >10-20x normal, ALP and bilirubin minimally increased, increased cholestasis

## Hepatitis A Virus

- RNA virus
- fecal-oral transmission; incubation period 4-6 wk
- diagnosed by elevated transaminases, positive anti-HAV IgM
- in children: characteristically asymptomatic
- in adults: fatigue, nausea, arthralgia, fever, jaundice, hepatomegaly
- can cause acute liver failure and subsequent death (<1-5%)
- can relapse (rarely), but never becomes chronic
- treatment is supportive (no specific treatments available, disease is often self-limiting)

## Hepatitis B Virus

**Table 18. Hepatitis B Serology**

| | HBsAg | Anti-HBs | HBeAg | Anti-HBe | Anti-HBc | Liver Enzymes |
|---|---|---|---|---|---|---|
| **Acute HBV** | + | – | + | – | IgM | |
| **Chronic** (e-Ag positive) HBV (generally high HBV DNA) | + | – | + | – | IgG | ALT, AST may or may not be elevated |
| **Chronic** (e-Ag negative) HBV (generally low HBV DNA) | + | – | – | + | IgG | ALT, AST may or may not be normal |
| **Resolved Infection** | – | ± | – | ± | IgG | |
| **Immunization** | – | + | – | – | – | |

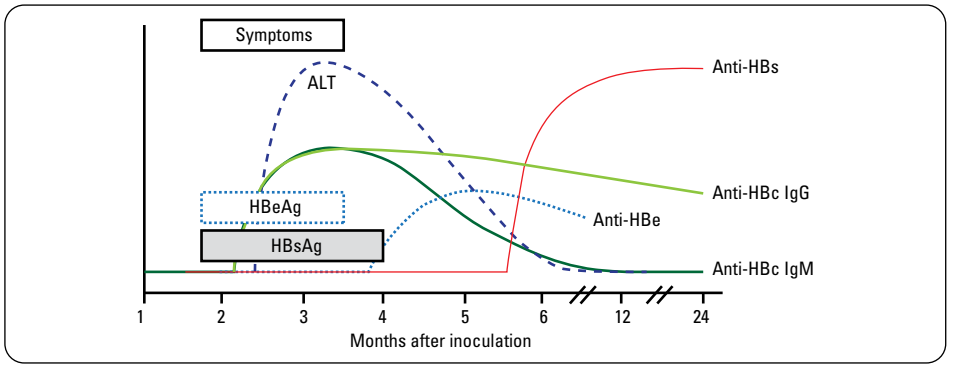

**Figure 12. Time course of acute hepatitis B infection**

### Epidemiology
- 4 phases of chronic hepatitis B: not all carriers will go through all 4 phases, but all carriers will have positive HBsAg
  1. **immune tolerance**: extremely high HBV-DNA (>20,000 IU/mL), HBeAg positive, but normal ALT/AST; due to little immune control and minimal immune-mediated liver damage; characteristic of perinatal infection (or 'incubation period' in adult with newly-acquired HBV)
  2. **immune clearance** (or immunoactive): HBV-DNA levels (>20,000 IU/mL), HBeAg positive; due to immune attack on the virus and immune-mediated liver damage; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment
  3. **inactive carrier** (immune control): lower HBV-DNA (<2000 IU/mL), HBeAg negative, anti-HBe positive, ALT/AST normal; due to immune control without immune-mediated liver damage; risk of reactivation to phase 2 (clinically resembles acute hepatitis B), especially with immunosuppression e.g. corticosteroids or chemotherapy
  4. **HBeAg-negative chronic hepatitis** (immune escape) ("core or precore mutant"): elevated HBV-DNA (>2000 IU/mL), HBeAg negative because of pre-core or core promoter gene mutation, anti-HBe positive, ALT/AST high; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment

**Causes of Elevated Serum Transaminases in Chronic Hepatitis B**
- Ongoing immune-mediated liver injury without immune control of HBV (HBeAg positive)
- Immune escape (anti-HBe positive)
- Reactivation, seroconversion (conversion from anti-HBe to HBeAg)
- Hepatitis D
- Heptocellular carcinoma
- Other liver insult (fatty liver, alcohol, drugs, hepatitis A)

**Risk Factors for Progression**
- EtOH
- HIV coinfection
- Old age at diagnosis

In acute hepatitis B, HDV coinfection increases severity of hepatitis but does not increase risk of progression to chronic hepatitis. However in the context of chronic hepatitis B, superinfection with HDV increases progression to cirrhosis

Without treatment, 8-20% of those with ongoing immunoactive chronic hepatitis can develop cirrhosis within 5 yr. In contrast, those in the immune tolerant phase (with extremely high HBV-DNA levels) are at minimal risk for liver fibrosis as they do not have immune-mediated liver injury

Risk of hepatocellular carcinoma in HBV increases with increasing age, which is likely a surrogate for increasing liver fibrosis/cirrhosis, and serum HBV-DNA
Risk of hepatocellular carcinoma in HCV increases only after cirrhosis develops

HCV (and HBV) treatment lowers the risk of hepatocellular carcinoma

**Risk Factors for Contracting Hepatitis B**
- Infants born to a hepatitis B-infected parent (maternal or paternal)
- Unprotected sexual intercourse (especially if multiple partners)
- Needle sharing (e.g. injection drug users)
- Travel to endemic regions
- Exposure to human blood, semen, and other bodily fluids

**Clinical Features of Hepatitis B**
- Many patients are asymptomatic, both in the acute and chronic phases
- Acute hepatitis can manifest as jaundice, nausea, arthritis, constitutional symptoms
- Patients with chronic hepatitis can be asymptomatic, experience exacerbations, develop extrahepatic complications (e.g. glomerular disease), or develop cirrhosis

### Treatment
- counselling: 40% of men and 10% of women with perinatal infection without treatment will die from HBV-related complications
- prolonged immune-mediated damage leads to higher risk of liver fibrosis
- hepatocellular carcinoma screening with ultrasound q6mo, especially if high serum HBV-DNA levels, cirrhosis, men, (age >40 in Asian men, >50 in Asian women, and >20 in African descent)
- consider pharmacological therapy if:
  1. HBeAg positive + HBV-DNA >20,000 IU/mL + elevated ALT; or
  2. HBeAg negative + HBV-DNA >2000 IU/mL + elevated ALT ± stage ≥2 fibrosis on liver biopsy
  3. treat to prevent flare when placed on immunosuppressive therapy such as prednisone, chemotherapy, biologics, etc.
- treatment goal: reduce serum HBV-DNA to undetectable level
- treatment options: interferon, tenofovir, entecavir, lamivudine
- vaccinate against HAV if serology negative (to prevent further liver damage)
- follow blood and sexual precautions

## Hepatitis D Virus

- defective RNA virus requiring HBsAg for entry into hepatocyte, therefore infects only patients with HBV; causes more aggressive disease than hepatitis B virus alone
- coinfection: acquire HDV and HBV at the same time
- HDV can present as Acute Liver Failure and/or accelerate progression to cirrhosis
- treatment: low-dose interferon (20% response) and liver transplant for end-stage disease

## Hepatitis C Virus

- RNA virus (7 genotypes; genotype 1 is most common in North America)
- blood-borne transmission; sexual transmission is "inefficient"
- major risk factor: injection drug use
- other risk factors: blood transfusion received before 1992 (or received in developing world), tattoos, intranasal cocaine use
- clinical manifestation develops 6-8 wk after exposure
  - symptoms mild and vague (fatigue, malaise, nausea) therefore not commonly diagnosed in acute stage

### Diagnosis
- suspected on basis of elevated ALT/AST and positive serum anti-HCV
- diagnosis established by detectable HCV-RNA in serum
- virus genotype correlates with response to treatment but not prognosis
  - serum HCV-RNA inversely correlates with response to treatment
- normal transaminases can have underlying cirrhosis on biopsy, but otherwise excellent prognosis

### Treatment
- blood-borne precautions; vaccinate for hepatitis A and B if serology negative; avoid alcohol
- clearest indication for treatment is in subgroups likely to develop clinically significant liver disease, i.e. persistently elevated transaminases, liver biopsy showing fibrosis/cirrhosis, and at least moderately severe necrosis/inflammation
  - now that safe, effective cure is available, the risk/benefit ratio favours treating everyone with chronic hepatitis C
- treatment depends partly on genotype; length of treatment depends on degree of fibrosis, level of serum HCV-RNA, comorbidities, and previous treatment
- oral interferon-free regimens (for all genotypes) (e.g. sofosbuvir/ledipasvir, ombitasvir/paritaprevir/ritonavir+dasabuvir, or elbasvir/grazoprevir and sofosbuvir/velpatasvir) are now the standard of care with >90% success rate without significant side-effects including those who failed previous interferon-based treatment

### Prognosis
- 80% of acute hepatitis C become chronic (of these 20% evolve to cirrhosis)
- risk of hepatocellular carcinoma increases if cirrhotic
- can cause cryoglobulinemia; associated with membranoproliferative glomerulonephritis, lymph

**DDx for Hepatomegaly**
- Congestive (right heart failure, Budd-Chiari syndrome)
- Infiltrative
  - Malignant (primary, secondary, lymphoproliferative, leukemia)
  - Benign (fatty liver, cysts, hemochromatosis, extramedullary hematopoiesis, amyloid)
- Proliferative
  - Infectious (viral, tuberculosis, abscess, echinococcus)
  - Inflammatory (granulomas [sarcoid], histiocytosis X)

**From Description to Cure in One Generation**
Ledipasvir and Sofosbuvir for Untreated HCV Genotype 1 Infection
NEJM 2014;370:1889-1898
If you ever need an example to demonstrate the miraculous advances of modern medicine, consider using chronic hepatitis C. It inflicts about 6 per 1000 of Canadians and is the commonest reason for liver transplant in most studies. Yet until 1989, when the virus was first cloned, this condition was so poorly understood that it was labelled as what it wasn't - it was called hepatitis non-A, non-B because there was insufficient evidence to even appreciate that it was one disease, let alone an infection. Today it can be cured by taking a safe drug regimen for 6-24 wk, depending on the virus strain, previous treatments, and the degree of liver damage. This recent study showed that sofosbuvir (nucleoside polymerase inhibitor) and ledispavir (NS5A inhibitor) led to a 99% cure rate in genotype 1 (the most common) infection with only minimal side-effects. These antiviral drugs are designer drugs: specifically tailored in the laboratory to combat pathogenic features of the hepatitis C virus.

**Treatment of Hepatitis C: A Systematic Review**
JAMA 2014;312(6):631-40
**Purpose**: To evaluate the evidence for the safety, efficacy, and tolerability of interferon and non-interferon based, oral therapies in the treatment of Hepatitis C virus (HCV).
**Study**: Literature review of phase 2, 3, and 4 studies published from January 1, 2009 – May 30, 2014, with data graded according to Oxford Centre for Evidence-Based Medicine criteria.
**Population**: 19, 063 adult patients infected with HCV genotype 1, 2, or 3 with or without HIV coinfection.
**Outcome**: Sustained virologic response (SVR) of undetectable plasma HCV RNA at 12 or 24 wk post-therapy.
**Results**: Achievement of SVR was more difficult in HCV genotype 1 patients. Treatment of HCV genotype 1 patients with sofosvubir with pegylated interferon and ribavirin yielded high rates of SVR (89-90%) and shorter duration of therapy. HCV genotype 2 or 3 patients treated with sofosbuvir and ribavirin alone achieved SVR of 82-93% and 80-95% for genotype 2 at 12 wk and genotype 3 at 24 wk, respectively. Patients with HCV and HIV coinfection with compensated cirrhosis should be treated in the same manner as HCV-monoinfected patients.
**Conclusions**: High SVR rates can be achieved for HCV patients with or without HIV coinfection using shorter durations of non-interferon therapies. HCV genotype 1 patients are likely to benefit from co-treatment with interferon and non-interferon therapies.

**Table 19. Characteristics of the Viral Hepatitides**

| | HAV | HBV | HCV | HDV | HEV | CMV | EBV | Yellow Fever |
|---|---|---|---|---|---|---|---|---|

| **Transmission** | Fecal-oral | Parenteral/sexual or equivalent<br>Vertical | Parenteral/sexual (transfusion, IV drug user, sexual [<HBV])<br>40% have no known risk factors | Non-parenteral (close contact in endemic areas)<br>Parenteral (blood products, IV drug user)-sexual transmission is inefficient | Fecal-oral (endemic: Africa, Asia, central America, India, Pakistan) | Close contacts, most body fluids | Saliva-oral | Vector (mosquito) |
| **Incubation** | 4-6 wk | 6 wk-6 mo | 2-26 wk | 3-13 wk | 2-8 wk | 20-60 d | 30-50 d | 3-6 d |
| **Onset** | Usually abrupt | Usually insidious | Insidious | Usually abrupt | Usually abrupt | Variable | Variable | Usually abrupt |
| **Communicability** | 2-3 wk in late incubation to early clinical phase<br>Acute hepatitis in most adults, 10% of children | HBsAg+ state highly communicable<br>Increased during third trimester or early post-partum | Communicable prior to overt symptoms and throughout chronic illness | Infectious only in presence of HBV (HBsAg required for replication) | Unknown | Variable – dormant or persistent | Communicable highest during year after primary infection but never zero | Variable, vector-dependent |
| **Chronicity** | None, although can relapse | 5% adults, 90% infants | 80%, 20% of which develop cirrhosis | 5% | None | Common; latent | Common; latent | Infection confers lifelong immunity |
| **Serology** | Anti-HAV (IgM) | See Table 18 | HCV-RNA<br>Anti-HCV (IgG/IgM) | HBsAg<br>Anti-HDV (IgG/IgM) | Anti-HEV (IgG/IgM) | Anti- CMV (IgM/IgG) | Monospot; anti-EBV IgM/IgG, EBV DNA quantitation | Anti-YF (IgM/IgG) |
| **Vaccine** | Havrix, 2 doses q6mo, combined with Twinrix at 0, 7, and 21 d | Recombivax HBTM, age 11-15, 2 doses q6mo | No | No | No | No | No | YF-VAX, 1 dose booster q10yr |
| **Management** | General hygiene<br>Treat close contacts (anti-HAV Ig)<br>Prophylaxis for high-risk groups (HAV vaccine ± HAV Ig) unless immune | Prevention: HBV vaccine and/or hepatitis B Ig (HBIG) for needlestick, sexual contact, infants of infected mothers unless already immune<br>Rx: oral antivirals vs. interferon if indications met | Prevention: no vaccine<br>Rx: interferon + ribavirin ± protease inhibitor; although all oral anti-viral (IFN-free) therapy now available is highly efficacious | Prevention: HBV vaccine | Prevention: general hygiene, no vaccine | In high risk transplant patients: CMV IG and anti-virals (ganciclovir, valganciclovir) | Supportive treatment post infection | Prevention<br>Supportive treatment post infection |
| **Acute Mortality** | 0.1-0.3% | 0.5-2% | 1% | 2-20% coinfection with HBV, 30% superinfection<br>Predisposes HBV carriers to more severe hepatitis and faster progression to cirrhosis | 1-2% overall, 10-20% in pregnancy | Rare in immunocompetent adults | Rare | 20-60% in developing countries |
| **Oncogenicity** | No | Yes | Yes | Yes | No | No | Yes | No |
| **Complications** | Can cause acute liver failure and subsequent death (<1-5%) | Hepatocellular carcinoma secondary to cirrhosis, serum sickness-like syndrome, glomerulonephritis, cryoglobulinemia, polyarteritis nodosa, porphyria cutanea tarda | Hepatocellular carcinoma in 2-5% of cirrhosis per yr, cryoglobulinemia, B-cell non-Hodgkin lymphoma | Leukocytoclastic vasculitis, membranous glomerulonephropathy | Mild, except in third trimester (10-20% fulminant liver failure) | 5% of newborns with multiple handicaps<br>Immunocomprimised patients at risk of CMV-induced hepatitis, retinitis, colitis, esophagitis, pneumonitis | Associated with Burkitt's lymphoma and nasopharyngeal carcinoma (rare in Western world) | Can cause a recurrent toxic phase with liver damage, GI bleeding, and high mortality rates |

# Autoimmune Liver Disease

- diagnosis of exclusion: rule out viruses, drugs/alcohol, metabolic, or genetic causes
- can be severe: 40% mortality at 6 mo without treatment
- extrahepatic manifestations
  - sicca, Raynaud's, thyroiditis, Sjögren's, arthralgias
  - hypergammaglobulinemia (particularly elevated IgG)
  - typical auto-antibodies: antinuclear antibody (ANA) and/or anti-smooth muscle antibody
  - infrequently may see anti-LKM elevation (liver kidney microsome), especially in children
  - can have false positive viral serology (especially anti-HCV)
  - biopsy – periportal (zone 1) and interface inflammation and necrosis
- treatment: corticosteroids (80% respond) ± azathioprine (without this, most will relapse as corticosteroids are withdrawn)

# Drug-Induced Liver Disease

**Table 20. Classification of Hepatotoxins**

| | Direct | Indirect |
|---|---|---|
| **Example** | Acetaminophen, CCl4 | Phenytoin, INH |
| **Dose-Dependence** | Usual | Unusual |
| **Latent Period** | Hours-days | Weeks-months |
| **Host Factors** | Not important | Very important |
| **Predictable** | Yes | No (idiosyncratic) |

- many different patterns of liver injury (i.e. hepatocellular, cholestatic, mixed, granulomatous, acute liver failure) can be seen in drug-induced liver injury and thus this requires a high index of suspicion.
- see: LiverTox for Information regarding drug-specific risks and patterns of hepatotoxicity (http://livertox.nih.gov)

**Hy's Law**: drug-induced hepatocellular jaundice indicates a mortality of at least 10%

### Specific Drugs

- acetaminophen
  - metabolized by hepatic cytochrome P450 system
  - can cause acute liver failure (transaminases >1000 U/L followed by jaundice and encephalopathy)
  - requires 10-15 g in healthy, 4-6 g in alcoholics/anticonvulsant users
  - mechanism: high acetaminophen dose saturates glucuronidation and sulfation elimination pathways → reactive metabolite is formed → covalently binds to hepatocyte membrane
  - presentation
    - first 24 h: nausea and vomiting (usually within 4-12 h of overdose)
    - 24-48 h: asymptomatic, but ongoing hepatic necrosis resulting in increased transaminases
    - >48 h: continued hepatic necrosis possibly complicated with acute liver failure or resolution
    - note: potential delay in presentation in sustained-release products
  - blood levels of acetaminophen correlate with the severity of hepatic injury, particularly if time of ingestion known
  - therapy
    - gastric lavage/emesis (if <2 h after ingestion)
    - oral activated charcoal
    - N-acetylcysteine (NAC, Mucomyst®) can be given PO or IV (most effective within 8-10 h of ingestion, but should be given no matter when time of ingestion)
      - promotes hepatic glutathione regeneration
    - no recorded fatal outcomes if NAC given before increase in transaminases
- chlorpromazine: cholestasis in 1% after 4 wk; often with fever, rash, jaundice, pruritus, and eosinophilia
- INH (isoniazid)
  - 20% develop elevated transaminases but <1% develop clinically significant disease
  - susceptibility to injury increases with age
- methotrexate
  - causes fibrosis/cirrhosis; increased risk in the presence of obesity, DM, alcoholism (i.e. with underlying risk for pre-existing fatty liver)
  - scarring develops without symptoms or changes in liver enzymes, therefore biopsy may be needed in long-term treatment
- amiodarone: can cause same histology and clinical outcome as alcoholic hepatitis
- others: azoles, statins, methyldopa, phenytoin, propylthiouracil (PTU), rifampin, sulfonamides, tetracyclines
- herbs: chaparral, Chinese herbs (e.g. germander, comfrey, bush tea)

# Wilson's Disease

### Definition

- autosomal recessive defect in copper elimination (gene ATP7B)

### Etiology

- decreased biliary excretion of copper plus decreased incorporation of copper into ceruloplasmin
- worldwide incidence 1/40,000

### Clinical Features

- liver: acute hepatitis, acute liver failure, chronic active hepatitis, cirrhosis, low risk of hepatocellular carcinoma
- eyes: Kayser-Fleischer rings (copper deposits in Descemet's membrane); more common in patients with CNS involvement, present in only 50% of isolated liver involvement
- CNS: basal ganglia (wing flapping tremor, Parkinsonism), cerebellum (dysarthria, dysphagia, incoordination, ataxia), cerebrum (psychosis, affective disorder)
- kidneys: Fanconi's syndrome (proximal tubule transport defects) and stones
- blood: intravascular hemolysis; may be initial presentation in fulminant hepatitis
- joints: arthritis, bone demineralization, calcifications

**Clinical Manifestations of Wilson's Disease**

**ABCD**
**A**sterixis
**B**asal ganglia degeneration: suspect if parkinsonian features in the young
**C**eruloplasmin decreases
**C**irrhosis
**C**orneal deposits (Kayser-Fleischer ring)
**C**opper
**D**ementia

### Investigations
- suspect if increased liver enzymes with clinical manifestations at young age (<40); especially combination of liver disease with dystonia, psychiatric symptoms
- screening tests
  1. reduced serum ceruloplasmin (<50% of normal)
  2. Kayser-Fleischer rings (usually require slit-lamp examination)
  3. increased urinary copper excretion (measure 24-hour urine copper)
- gold standard
  1. increased copper on liver biopsy by quantitative assay
  2. genetic analysis imperfect as many mutations in ATP7B are possible

### Treatment
- 4 drugs available
  1. penicillamine chelates copper, poorly tolerated
  2. trientine chelates copper
  3. zinc impairs copper excretion in stool and decreases copper absorption from gut
  4. tetrathiomolybdate preferred if neurological involvement
- hepatic presentations are best treated with a trientine + zinc combination; neurologic presentations are best treated with zinc; maintenance therapy with zinc
- liver transplant in severe cases of liver failure
- screen relatives

## Hemochromatosis

### Definition
- excessive iron storage causing multiorgan system dysfunction (liver, in particular) with total body stores of iron increased to 20-40 g (normal 1 g)

### Etiology
- primary (hereditary) hemochromatosis
  - hepcidin deficiency results in ongoing gut absorption of iron despite adequate iron stores
- secondary hemochromatosis
  - parenteral iron overload (e.g. transfusions)
  - chronic hemolytic anemia: thalassemia, pyruvate kinase deficiency
  - excessive iron intake

### Epidemiology
- hereditary hemochromatosis most common in Northern European descent
- primarily due to the recessive gene, *HFE* (or high iron), which has a homozygous genetic prevalence of 1/400

### Clinical Features
- usually presents with trivial elevation in serum transaminases
- liver: cirrhosis (less common nowadays due to earlier detection), HCC (200x increased risk)
- pancreas: DM, chronic pancreatitis
- skin: bronze or grey (due to melanin, not iron)
- heart: dilated cardiomyopathy
- pituitary: hypogonadotropic hypogonadism (impotence, decreased libido, amenorrhea)
- joints: arthralgia (any joint, but especially MCP joints), chondrocalcinosis

**Hemochromatosis Clinical Features ABCD**
- Arthralgia
- Bronze skin
- Cardiomyopathy, cirrhosis of liver
- Diabetes (pancreatic damage)
- Hypogonadism (anterior pituitary damage)

### Investigations
- screening for individuals with clinical features and/or family history (1/4 chance of sibling having the disease)
  - transferrin saturation (free $Fe^{2+}$/TIBC) >45%
  - serum ferritin >400 ng/mL
  - HFE gene analysis: 90% of primary hemochromatosis involves C282Y allele, while H63D and S65C alleles also commonly involved and screened
- liver biopsy (generally used to detect cirrhosis or if potential for other causes of liver disease)
  - markers of advanced fibrosis: if any of the following are present at the time of diagnosis → age >40, elevated liver enzymes, or ferritin >1000
  - considered if compound heterozygote and potential other cause of liver injury (e.g. fatty liver, etc.)
  - if C282Y/C282Y and no markers of advanced fibrosis, then biopsy generally not needed
- HCC screening if cirrhosis

Ferritin may never normalize if other causes of high ferritin present (e.g. fatty liver from metabolic syndrome or alcohol)

Gene mutation not 100% penetrant, so not all with homozygous gene defect have clinically significant iron overload

### Treatment
- phlebotomy: weekly or q2wk then lifelong maintenance phlebotomies q2-6mo
- deferoxamine if phlebotomy contraindicated (e.g. cardiomyopathy, anemia)
- primary hemochromatosis responds well to phlebotomy
- secondary hemochromatosis usually requires chelation therapy (administration of agents that bind and sequester iron, and then excreted)

### Prognosis
- normal life expectancy if treated before the development of cirrhosis or DM

# Alcoholic Liver Disease

## Definition
- spectrum of diseases, ranging from:
  - fatty liver (common amongst individuals with alcohol use disorder): reversible if alcohol stopped
  - alcoholic hepatitis (35% of individuals with alcohol use disorder): usually reversible if alcohol stopped
  - cirrhosis (10-15% of individuals with alcohol use disorder): potentially irreversible

## Pathophysiology
- several mechanisms, poorly understood
- ethanol oxidation to acetaldehyde
  - reduces NAD+ to NADH; increased NADH decreases ATP supply to liver, impairing lipolysis so fatty acids and triglycerides accumulate in liver
  - binds to hepatocytes evoking an immune reaction
- EtOH increases gut permeability leading to increased bacterial translocation
- alcohol metabolism causes:
  - relative hypoxia in liver zone III (near central veins; poorly oxygenated) > zone I (around portal tracts, where oxygenated blood enters)
  - necrosis and hepatic vein sclerosis
- histology of alcoholic hepatitis
  - ballooned (swollen) hepatocytes often containing Mallory bodies, characteristically surrounded by neutrophils
  - large fat globules
  - fibrosis: space of Disse and perivenular

## Clinical Features
- >2-3 standard drinks/d in females and >3-6 standard drinks/d in men for >10 yr leads to cirrhosis, but only in about 10-20% of those who consume this amount daily on a continuous basis; cirrhosis risk increases with amount of alcohol consumed above threshold
- clinical findings do not accurately predict type of liver involvement
- fatty liver
  - mildly tender hepatomegaly; jaundice rare
  - mildly increased transaminases <5x normal
- alcoholic hepatitis
  - variable severity: mild to fatal liver failure
  - mild: stops drinking because feels unwell, resumes when feeling better (if assessed, findings of hepatitis, potentially mild jaundice, and mildly elevated INR)
  - severe: stops drinking but feels unwell, low grade fever, RUQ discomfort, increased white blood cell count – mimics RLL pneumonia and cholecystitis

## Investigations
- blood tests are non-specific, but in general
  - AST:ALT >2:1 (both usually <300)
  - CBC: increased MCV, increased WBC often seen with alcoholic hepatitis but not necessarily in other alcohol-related liver injury
  - increased GGT

## Treatment
- alcohol cessation (see Psychiatry, PS27)
  - Alcoholics Anonymous, disulfiram, naltrexone, acamprosate
- multivitamin supplements (especially thiamine)
- caution with drugs metabolized by the liver
- prednisolone if severe alcoholic hepatitis based on Maddrey's discriminant function or MELD score as described in Prognosis
  - pentoxifylline less used since most definitive trial did not demonstrate efficacy

## Prognosis
- Maddrey's discriminant function (based on PT and bilirubin) and Model for End-Stage Liver Disease (MELD) predict mortality and guide treatment (consideration for corticosteroids for severe disease based on Maddrey ≥ 32 or MELD ≥21)
- fatty liver: complete resolution with cessation of alcohol intake
- alcoholic hepatitis mortality
  - immediate: 30%-60% in the first 6 mo if severe
  - with continued alcohol: 70% in 5 yr
  - with cessation: 30% in 5 yr

**Standard Drink Equivalent**
1 standard drink= 14 g EtOH
= 12 oz beer (5% alcohol)
= 5 oz wine (12-17%)
= 3 oz fortified wine (17-22%)
= 1.5 oz liquor (40%)
Tip: percentage alcohol multiplied by oz in 1 standard drink roughly equals 60

**Biopsy + Histology of Alcoholic Hepatitis (triad)**
- Hepatocyte necrosis with surrounding inflammation in zone III
- Mallory bodies (intracellular eosinophilic aggregates of cytokeratins)
- Chicken-wire fibrosis (network of intralobular connective tissue surrounding cells and venules)

**GI Complications of Alcohol Abuse**
- Esophagus
  - Mallory-Weiss tear
  - Esophageal varices (secondary to portal hypertension)
- Stomach
  - Alcoholic gastritis
- Pancreas
  - Acute pancreatitis
  - Chronic pancreatitis
- Liver
  - Alcoholic hepatitis
  - Fatty liver
  - Cirrhosis
  - Hepatic encephalopathy
  - Portal hypertension
  - Ascites
  - HCC

# Non-Alcoholic Fatty Liver Disease

### Definition
- spectrum of disorders characterized by macrovesicular hepatic steatosis, sometimes with inflammation and/or fibrosis
- most common cause of liver disease in North America

### Etiology
- pathogenesis not well elucidated; insulin resistance implicated as key mechanism, leading to hepatic steatosis
- histological changes indistinguishable from those of alcoholic hepatitis despite negligible history of alcohol consumption

### Risk Factors
- likely a component of the metabolic syndrome along with obesity, T2DM, HTN, hypertriglyceridemia
- rapid weight loss or weight gain

### Clinical Features
- often asymptomatic
- may present with fatigue, malaise, and vague RUQ discomfort
- elevated serum triglyceride/cholesterol levels and insulin resistance

### Investigations
- elevated serum AST, ALT ± ALP; AST/ALT <1
- presents as echogenic liver texture on ultrasound
- non-invasive testing of fibrosis: FIB4, NAFLD fibrosis score, Fibrotest, FibroScan®
- liver biopsy cannot distinguish fatty liver from alcohol vs non-alcoholic fatty liver, but considered when investigating alternative etiologies or assessing for level of fibrosis

### Treatment
- mainstay is gradual weight loss (0.5-1 kg/wk) as rapid weight loss can worsen liver disease
  - ideally, aim to lose at least 7-10% of body weight
- some evidence for vitamin E (800 U daily) if there is hepatic inflammation
- some evidence for benefits of coffee drinking (3 cups/d) and vitamin D

### Prognosis
- most die from cardiovascular or cerebrovascular disease
- better prognosis than alcoholic hepatitis
  - <25% progress to cirrhosis over a 7-10 yr period
- risk of progression increases if inflammation or scarring occurs alongside fat infiltration (non-alcoholic steatohepatitis)
- other clinical indicators of unfavourable prognosis: DM, age, metabolic syndrome, higher levels of fibrosis

# Acute Liver Failure (formerly Fulminant Hepatic Failure)

### Definition
- severe decline in liver function characterized by coagulation abnormality (INR >1.5) and encephalopathy
- in setting of previously normal liver
- rapid (<26 wk duration)

### Etiology
- drugs (especially acetaminophen), hepatitis B (measure anti-HBc, IgM fraction because sometimes HBV-DNA and even HBsAg rapidly becomes negative), hepatitis A, hepatitis C (rare), ischemic, idiopathic

### Treatment
- correct hypoglycemia, monitor level of consciousness, prevent GI bleeding with PPI, monitor for infection and multiorgan failure (usually requires ICU)
- consider liver biopsy before INR becomes too high
- chief value of biopsy is to exclude chronic disease, less helpful for prognosis
- liver transplant (King's College criteria can be used as prognostic indicator): consider early, especially if time from jaundice to encephalopathy >7 d (e.g. not extremely rapid), age <10 or >40, cause is drug or unknown, bilirubin >300 μmol/L, INR >3.5, creatinine >200 μmol/L

# Cirrhosis

## Definition

- liver damage characterized by diffuse distortion of the basic architecture with fibrosis and formation of regenerative nodules
- Biopsy gold standard for diagnosis
- Stage 1 cirrhosis is compensated and asymptomatic, can last for 10-20 yr with almost normal life expectancy
- Stage 2 cirrhosis is decompensation, typically development of ascites (most common), variceal bleeding, encephalopathy, characteristically presents abruptly even though histologically the liver fibrosis is gradually progressive

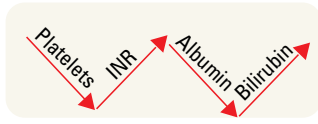

**Figure 13. Progression of liver dysfunction based on liver function tests – the "W"**

## Etiology

- fatty liver (alcoholic or non-alcoholic fatty liver disease)
- chronic viral hepatitis (B, B+D, C; not A or E)
- autoimmune hepatitis
- drugs (e.g. chronic methotrexate or amiodarone use)
- hemochromatosis
- primary biliary cholangitis
- chronic hepatic congestion
  - cardiac cirrhosis (chronic right heart failure, constrictive pericarditis)
  - hepatic vein thrombosis (Budd-Chiari)
- cryptogenic (i.e. no identifiable cause, although many of these patients may represent "burnt-out non-alcoholic steatohepatitis [NASH]")
- rare: Wilson's disease, Gaucher's disease, α1-antitrypsin deficiency

## Investigations

- definitive diagnosis is histologic (liver biopsy)
- other tests may be suggestive
  - blood work: fall in platelet count <150 is the earliest finding, followed many years later with rise in INR, fall in albumin, rise in bilirubin, fall in glucose level (pre-terminal event)
  - FibroTest: combination of various clinical and biochemical markers that can predict degree of fibrosis
  - imaging
    - U/S is the primary imaging modality but only finds advanced cirrhosis
    - CT to look for varices, nodular liver texture, splenomegaly, ascites
    - Transient Ultrasound Elastograhy (FibroScan®): non-invasive tool using elastography (variable availability) for measuring liver compliance
      - rapidly replacing liver biopsy to determine extent of liver fibrosis and make the diagnosis of cirrhosis
- gastroscopy: varices or portal hypertensive gastropathy

## Treatment

- treat underlying disorder
- decrease insults (e.g. alcohol cessation, hepatotoxic drugs, immunize for Hep A and B if non-immune)
- follow patient for complications (esophageal varices, ascites, HCC defines stage 2 cirrhosis)
- prognosis: Child-Pugh Score and MELD score
- liver transplantation for end-stage disease if no alcohol for >6 mo; use MELD score

**MELD-Na (Model for End-Stage Liver Disease)**

- Predicts 3 mo survival and used to stratify patients on transplant list
- Based on creatinine, INR, total bilirubin, and serum sodium concentration

**Cirrhosis Complications**

**VARICES**
**V**arices
**A**scites/**A**nemia
**R**enal failure (hepatorenal syndrome)
**I**nfection
**C**oagulopathy
**E**ncephalopathy
**S**epsis

**Table 21. Child-Pugh Score and Interpretation**

| Classification | 1 | 2 | 3 |
|---|---|---|---|
| Serum bilirubin (μmol/L) | <34 | 34-51 | >51 |
| Serum albumin (g/L) | >35 | 28-35 | <28 |
| INR | <1.7 | 1.7-2.3 | >2.3 |
| Presence of ascites | Absent | Controllable | Refractory |
| Encephalopathy | Absent | Minimal | Severe |
| **Interpretation** | | | |
| **Points** | **Class** | **Life Expectancy** | **Perioperative Mortality** |
| 5-6 | A | 15-50 yr | 10% |
| 7-9 | B | Candidate for transplant | 30% |
| 10-15 | C | 1-3 mo | 82% |

Score: 5-6 (Child's A), 7-9 (Child's B), 10-15 (Child's C)
*Note: Child's classification is rarely used for shunting (TIPS or other surgical shunts), but is still useful to quantitate the severity of cirrhosis

### Complications

- hematologic changes in cirrhosis
  - pancytopenia from hypersplenism: platelets first, then WBC, then hemoglobin
  - decreased clotting factors resulting in elevated INR
  - relationship of INR to bleeding tendency is controversial; some patients may be hypocoagulable, others may be hypercoagulable
- variceal bleeds
  - half of patients with cirrhosis have gastroesophageal varices and one-third of these develop hemorrhage with an overall mortality of >30%
  - hepatic venous pressure gradient (HVPG) ≥10 mmHg is the strongest predictor of variceal development
  - treatment: resuscitation, antibiotic prophylaxis, vasoactive drugs (e.g. octreotide IV) combined with endoscopic band ligation or sclerotherapy, Transjugular Intrahepatic Portosystemic Shunt (TIPS)
- renal failure in cirrhosis
  - classifications
    - pre-renal (usually due to over-diuresis)
    - acute tubular necrosis
    - Hepatorenal Syndrome (HRS)
      - Type I: sudden and acute renal failure (rapid doubling of creatinine over 2 wk)
      - Type II: gradual increase in creatinine with worsening liver function (creatinine doubling over years)
    - HRS can occur at any time in severe liver disease, especially after:
      - overdiuresis or dehydration, such as diarrhea, vomiting, etc.
      - GI bleed
      - sepsis
    - treatment for hepatorenal syndrome (generally unsuccessful at improving long-term survival)
      - for type I HRS: octreotide + midodrine + albumin (increases renal blood flow by increasing systemic vascular resistance)
      - definitive treatment is liver transplant
- hepatopulmonary syndrome
  - majority of cases due to cirrhosis, though can be due to other chronic liver diseases, such as non-cirrhotic portal HTN
  - thought to arise from ventilation-perfusion mismatch, intrapulmonary shunting and limitation of oxygen diffusion, failure of damaged liver to clear circulating pulmonary vasodilators vs. production of a vasodilating substance by the liver
  - clinical features
    - hyperdynamic circulation with cardiac output >7 L/min at rest and decreased pulmonary + systemic resistance (intrapulmonary shunting)
    - dyspnea, platypnea (increase in dyspnea in upright position, improved by recumbency), and orthodeoxia (desaturation in the upright position, improved by recumbency)
    - diagnosis via contrast-enhanced echocardiography: inject air bubbles into peripheral vein; air bubbles appear in left ventricle after third heartbeat (normal = no air bubbles; in ventricular septal defect, air bubbles seen <3 heart beats)
    - only proven treatment is liver transplantation

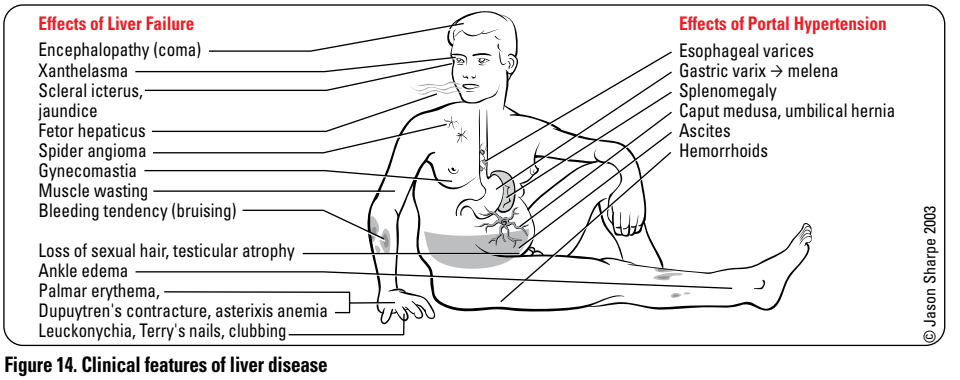

**Figure 14. Clinical features of liver disease**

Usual causes of death in cirrhosis: renal failure (hepatorenal syndrome), sepsis, GI bleed, or HCC

**Hepatorenal Syndrome vs. Pre-Renal Failure – Difficult to Differentiate**
- Similar blood and urine findings
- Urine sodium: very low in hepatorenal; low in pre-renal
- Intravenous fluid challenge: giving volume expanders improves pre-renal failure, but not hepatorenal syndrome

**Hepatopulmonary Syndrome Clinical Triad**
- Liver disease
- Increased alveolar-arterial gradient while breathing room air
- Evidence for intrapulmonary vascular abnormalities

Fibrosis may regress and disappear if cause of liver injury is treated or resolves

## Hepatocellular Carcinoma

- see General Surgery, GS49

## Liver Transplantation

- see General Surgery, GS50

# Portal Hypertension

### Definition
- pressure gradient between hepatic vein pressure and wedged hepatic vein pressure (corrected sinusoidal pressure) >5 mmHg

### Pathophysiology
- 3 sites of increased resistance (remember pressure = flow x resistance)
  - pre-sinusoidal (e.g. portal vein thrombosis, schistosomiasis, sarcoidosis)
  - sinusoidal (e.g. cirrhosis, alcoholic hepatitis)
  - post-sinusoidal (e.g. right-sided heart failure, hepatic vein thrombosis, veno-occlusive disease, constrictive pericarditis)

### Complications
- GI bleeding from varices in esophagus, less commonly in stomach, even less frequently from portal hypertensive gastropathy
- ascites
- hepatic encephalopathy
- thrombocytopenia
- renal dysfunction
- sepsis
- arterial hypoxemia

### Treatment
- non-selective β-blockers (propanolol, nadolol, carvedilol) decrease risk of bleeding from varices
- TIPS: to decrease portal venous pressure
  - radiologically inserted stent between portal and hepatic vein via transjugular vein catheterization and percutaneous puncture of portal vein
  - can be used to stop acute bleeding or prevent rebleeding or treat ascites
  - complications: hepatic encephalopathy, deterioration of hepatic function
  - contraindicated with severe liver dysfunction, uncontrolled hepatic encephalopathy, and congestive heart failure
  - most commonly used as a "bridge" to liver transplant
- other surgically created shunts: portacaval, distal spleno-renal (Warren shunt) - all used only rarely in the modern era

**Portal Hypertension**

**Signs**
- Esophageal varices
- Melena
- Splenomegaly
- Ascites
- Hemorrhoids

**Management**
- β-blockers
- Nitrates
- Shunts (e.g. TIPS)

# Hepatic Encephalopathy

### Definition
- spectrum of potentially reversible neuropsychiatric syndromes secondary to liver disease diagnosed after ruling out other causes for symptoms (e.g. structural/metabolic)

### Pathophysiology
- portosystemic shunt around hepatocytes and decreased hepatocellular function increase level of systemic toxins (believed to be ammonia from gut, mercaptans, fatty acids, amino acids) which go to the brain

### Precipitating Factors
- nitrogen load (GI bleed, protein load from food intake, renal failure, constipation)
- drugs (narcotics, CNS depressants)
- electrolyte disturbance (hypokalemia, alkalosis, hypoxia, hypovolemia)
- infection (spontaneous bacterial peritonitis)
- deterioration in hepatic function or superimposed liver disease

### Stages
- I: apathy, restlessness, reversal of sleep-wake cycle, slowed intellect, impaired computational abilities, impaired handwriting
- II: asterixis, lethargy, drowsiness, disorientation
- III: stupor (rousable), hyperactive reflexes, extensor plantar response (upgoing Babinski)
- IV: coma (response to painful stimuli only)

### Investigations
- clinical diagnosis: supported by laboratory findings and exclusion of other neuropsychiatric diseases
- rule out
  - non-liver-related neuropsychiatric disease in a patient with liver problems (e.g. alcohol withdrawal or intoxication, sedatives, subdural hematoma, metabolic encephalopathy)
  - causes of metabolic encephalopathy (e.g. renal failure, respiratory failure, severe hyponatremia, hypoglycemia)
- characteristic EEG findings: diffuse (non-focal), slow, high amplitude waves
- serum ammonia levels increased, but not often necessary to measure in routine clinical use

**Precipitating Factors for Hepatic Encephalopathy**

**Hepatics**
**H**emorrhage in GI tract/**H**ypokalemia
**E**xcess dietary protein
**P**aracentesis
**A**lkalosis/**A**nemia
**T**rauma
**I**nfection
**C**olon surgery
**S**edatives

**A Randomized, Double-Blind, Controlled Trial Comparing Rifaximin Plus Lactulose With Lactulose Alone in Treatment of Overt Hepatic Encephalopathy**
American J Gastroenterol 2013;108:1458-63
**Study**: prospective double-blind RCT.
**Objectives**: Efficacy and safety of rifaximin plus lactulose vs. lactulose alone for treatment of overt HE.
**Results**: Of the patients, 48 (76%) in group A (lactulose plus rifaximin 1200 mg/d, n=63) compared with 29 (50.8%) in group B (lactulose (n=57) plus placebo) had complete reversal of HE (P<0.004). There was a significant decrease in mortality after treatment with lactulose plus rifaximin vs. lactulose and placebo (23.8% vs. 49.1%, P<0.05). There were significantly more deaths in group B because of sepsis (group A vs. group B: 7:17, P=0.01), whereas there were no differences because of gastrointestinal bleed (group A vs. group B: 4:4, P=nonsignificant (NS)) and hepatorenal syndrome (group A vs. group B: 4:7, P=NS). Patients in the lactulose plus rifaximin group had shorter hospital stay (5.8±3.4 vs. 8.2±4.6 d, P=0.001).
**Conclusion**: Combination of lactulose plus rifaximin is more effective than lactulose alone in the treatment of overt HE.

### Treatment
- treat underlying precipitating factors
- decrease generation of nitrogenous compounds
  - routine protein restriction is no longer recommended given patients generally have concurrent malnutrition and muscle wasting; however, vegetable protein is better tolerated than animal protein
  - lactulose: titrated to achieve 2-3 soft stools/d
    - prevents diffusion of NH3 (ammonia) from the colon into blood by lowering pH and forming non-diffusible NH4 (ammonium)
    - serves as a substrate for incorporation of ammonia by bacteria, promotes growth in bowel lumen of bacteria which produce minimal ammonia
    - also acts as a laxative to eliminate nitrogen-producing bacteria from colon
- oral rifaximin for both acute treatment and maintenance therapy has high level evidence for efficacy
- best acute treatment in comatose patient is lactulose enemas

## Ascites

### Definition
- accumulation of excess fluid in the peritoneal cavity

### Etiology

**Table 22. Serum-Ascites Albumin Gradient in the Evaluation of Ascites**

| Serum [Alb] – Ascitic [Alb] >11 g/L (1.1 g/dL)<br>Portal Hypertension Related | Serum [Alb] – Ascitic [Alb] <11 g/L (1.1 g/dL)<br>Non-Portal Hypertension Related |
|---|---|
| Cirrhosis/severe hepatitis | Peritoneal carcinomatosis |
| Chronic hepatic congestion (right heart failure, Budd-Chiari) | TB |
| Massive liver metastases | Pancreatic disease |
| Myxedema | Serositis |
| | Nephrotic syndrome* |

* In nephrotic syndrome: decreased serum [Alb] to begin with therefore gradient not helpful

### Pathophysiology
- key factor in pathogenesis is increased sodium (and water) retention by the kidney for reasons not fully understood. Theories include:
  - underfill hypothesis
  - overfill hypothesis
  - peripheral arterial vasodilation theory (most popular): as portal hypertension develops in cirrhosis, production of local mediators such as nitric oxide leads to splanchnic arterial vasodilation, ultimately pulling blood away from the systemic circulation and resulting in reduced effective arterial volume, which causes compensatory sodium and fluid retention by the kidneys (i.e. circulatory volume is increased, as per the overfill hypothesis, but effective volume is decreased as per the underfill hypothesis)

**Underfill Hypothesis**
First step in ascites formation is increased portal pressure and low oncotic pressure (e.g. low serum albumin) driving water out of the splanchnic portal circulation into abdominal cavity; the resulting decreased circulating volume causes secondary sodium retention by the kidney

**Overfill Hypothesis**
Cirrhosis directly causes increased sodium retention by the kidney in the absence of hypovolemia and ascites arises secondarily

### Diagnosis
- abdominal ultrasound
- physical exam (clinically detectable when >500 mL)
  - bulging flanks, shifting dullness, fluid-wave test positive
  - most sensitive symptom: ankle swelling

### Investigations
- diagnostic paracentesis
  - 1st aliquot: cell count and differential
  - 2nd aliquot: chemistry (especially albumin, but also total protein; amylase if pancreatitis; TG and chylomicrons if turbid and suspect chylous ascites)
  - 3rd aliquot: C&S, Gram stain
  - 4th aliquot: cytology (usually positive in peritoneal carcinomatosis)

### Treatment
- diuretic-sensitive ascites
  - $Na^+$ restriction (daily sodium intake <2 g)
  - diuretics: spironolactone, furosemide
  - aim for weight loss 0.5-1 kg/d, more if concomitant peripheral edema (which is mobilized quicker than ascitic fluid); overly rapid weight loss increases risk of renal failure
  - if target weight loss is not achieved and there are no complications, increase dose to achieve target while monitoring for complications
- refractory ascites (diuretics are inadequate or not tolerated)
  - therapeutic paracentesis with intravenous albumin
  - TIPS in an appropriate patient (no contraindications) with potential transplant-free survival advantage
  - liver transplantation should be considered in every case, since development of ascites in patients with cirrhosis is associated with 50% 2 yr mortality

### Complication: Primary/Spontaneous Bacterial Peritonitis

- primary/spontaneous bacterial peritonitis (SBP)
  - complicates ascites, but does not cause it (occurs in 10% of cirrhotic ascites); higher risk in patients with GI bleed
  - 1/3 of patients are asymptomatic, thus do not hesitate to do a diagnostic paracentesis in ascites even if no clinical indication of infection
  - fever, chills, abdominal pain, ileus, hypotension, worsening encephalopathy, acute kidney injury
  - Gram-negatives compose 70% of pathogens: *E. coli* (most common), *Streptococcus, Klebsiella*
- diagnosis
  - absolute neutrophil count in peritoneal fluid >0.25x109 cells/L (250 cells/mm$^3$)
  - Gram stain positive in only 10-50% of patients
  - culture positive in <80% of patients (not needed for diagnosis)
- prophylaxis: consider in patients with:
  - cirrhosis or GI bleed: ceftriaxone IV daily or norfloxacin bid x 7 d
  - previous episode of SBP: long-term prophylaxis with daily norfloxacin or TMP-SMX
- treatment
  - IV antibiotics (cefotaxime 2 g IV q8h or ceftriaxone 2 g IV daily is the treatment of choice for 5 d; modify if response inadequate or culture shows resistant organisms)
  - IV albumin (1.5 g/kg at time of diagnosis and 1 g/kg on day 3) decreases mortality by lowering risk of acute renal failure

**Serum Ascites Albumin Gradient (SAAG) = serum albumin – ascites albumin**

- >11 g/L portal HTN
  - ascitic fluid total protein >25 g/L, suggests cardiac portal hypertension
  - ascitic fluid total protein <25 g/L, suggests cirrhosis portal hypertension
- <11 g/L unrelated to portal HTN

# Biliary Tract

## Jaundice

- see Table 2 and Figures 15 and 16

### Signs and Symptoms

- dark urine, pale stools: suggests that bilirubin elevation is from direct fraction
- pruritus: suggests chronic disease, cholestasis
- abdominal pain: suggests biliary tract obstruction from stone or pancreatic tumour (obstructive jaundice)
- painless jaundice in the elderly: think of pancreatic cancer, although most patients with pancreatic cancer have pain
- kernicterus: rarely seen in adults due to maturation of blood brain barrier

### Investigations

- blood work: CBC, bilirubin (direct and total), liver enzymes (AST, ALT, ALP, GGT), liver function tests (INR/PT, PTT, albumin), amylase
- U/S or CT for evidence of bile duct obstruction (e.g. bile duct dilation)
- direct bile duct visualization
- magnetic resonance cholangiopancreatography (MRCP): non-invasive
- endoscopic ultrasound (EUS): sensitive for stones and pancreatic tumours
- endoscopic retrograde cholangiopancreatography (ERCP): invasive, most accurate, allows for therapeutic intervention
- percutaneous transhepatic cholangiography (PTC): if ERCP fails (endoscopic access not possible)

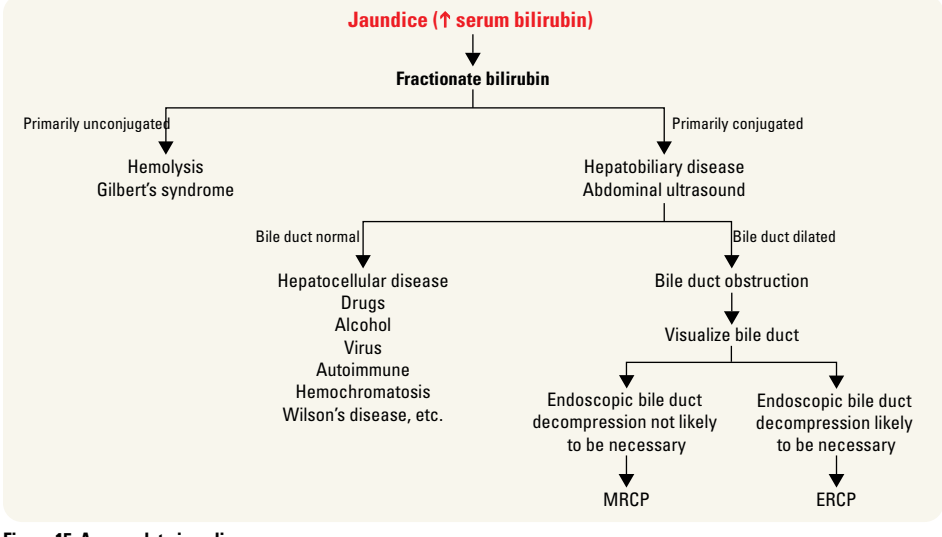

**Figure 15. Approach to jaundice**

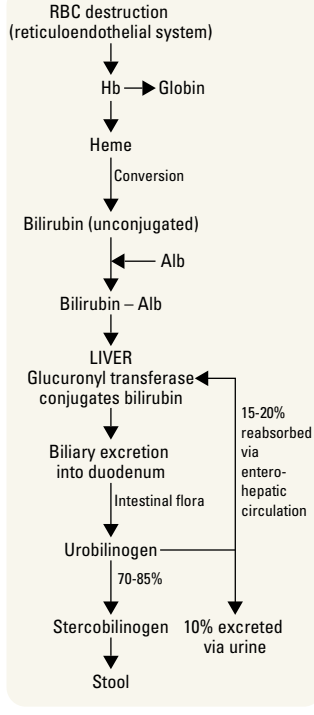

**Figure 16. Production and excretion of bilirubin**

# Gilbert's Syndrome

### Etiology/Epidemiology
- some patients have decreased hepatobiliary uptake
- affects 7% of population, especially males
- autosomal dominant, 70% due to a mutation in the UGT gene

### Clinical Features
- presents in teens-20s, often an incidental finding
- only manifestation is intermittent jaundice with increased serum unconjugated bilirubin developing most characteristically while fasting, or at times of acute illness; no other clinical implications

### Treatment
- none indicated (entirely benign)

**Gilbert's Syndrome vs. Crigler-Najjar Syndrome**
**Gilbert's Syndrome**: mild decrease in glucuronyltransferase activity
**Crigler-Najjar Syndrome**: complete deficiency of glucuronyltransferase

# Primary Sclerosing Cholangitis

### Definition
- narrowing of biliary tree (intra and/or extrahepatic bile ducts) from scarring

### Etiology
- primary/idiopathic (most common)
  - associated with IBD, more commonly UC, in up to 70-80% of patients (usually male) with PSC
- secondary (less common)
  - long-term choledocholithiasis
  - cholangiocarcinoma
  - surgical/traumatic injury (iatrogenic)
  - contiguous inflammatory process
  - post-ERCP
  - associated with HIV/AIDS ("HIV cholangiopathy")
  - IgG4-related disease

### Signs and Symptoms
- often insidious, may present with fatigue and pruritus
- may present with signs of episodic bacterial cholangitis secondary to biliary obstruction

### Investigations
- increased ALP (hallmark), less often increased bilirubin
- mildly increased AST, usually <300 U/L
- p-ANCA (30-80%), elevated IgM (40-50%)
- MRCP and ERCP shows narrowing and dilatations of bile ducts that may result in "beading", both intrahepatic and extrahepatic bile ducts
  - if intrahepatic narrowing only, do anti-mitochondrial antibody to rule out PBC

### Complications
- repeated bouts of cholangitis may lead to complete biliary obstruction with resultant secondary biliary cirrhosis and hepatic failure
- increased incidence of cholangiocarcinoma (10-15%): difficult to diagnose and treat

### Treatment
- image bile duct (MRCP) at least annually for early detection of cholangiocarcinoma (controversial)
- endoscopic sphincterotomy, biliary stent in selected cases of dominant common bile duct stricture
- antibiotics for cholangitis
- suppurative cholangitis requires emergency drainage of pus in common bile duct
- liver transplantation appears to be the best treatment for advanced sclerosing cholangitis (nearly 90% 1 yr survival; mean follow-up time from diagnosis to need for transplant is 10 yr)
- ursodiol: previously recommended, but studies suggest that at least in high doses it increases mortality

### Prognosis
- unfavourable regardless of treatment
- mean survival after diagnosis remains 4-10 yr

# Primary Biliary Cholangitis (formerly cirrhosis)

## Definition
- chronic inflammation and fibrous obliteration of intrahepatic bile ductules

## Etiology/Epidemiology
- likely autoimmune (associated with Sjögren's syndrome, scleroderma, CREST syndrome, rheumatoid arthritis (RA), thyroiditis)
- affects mainly middle-aged women (M:F = 1:9)

## Signs and Symptoms
- often asymptomatic
- initial symptoms: pruritus, fatigue
- chronic: jaundice and melanosis (darkening skin) and other signs of cholestasis
- end-stage: hepatocellular failure, portal HTN, ascites
- high incidence of osteoporosis

## Investigations
- increased ALP, GGT; bilirubin rises in later stage
- positive anti-mitochondrial antibodies (AMA; 95% specificity and sensitivity)
- elevated IgM
- increased serum cholesterol (mild increase in LDL, larger increase in HDL)
  - may have: xanthelasmas, xanthomas
- liver biopsy confirms diagnosis and stages severity
- normal bile duct on MRCP rules out bile duct obstruction which can mimic PBC
- recently described "overlap" syndromes with autoimmune cholangitis, autoimmune hepatitis, sclerosing cholangitis

## Treatment
- drugs that treat the underlying disease:
  - ursodiol (usual first line treatment)
  - obeticholic acid (particularly if inadequate response to urosiol)
- cholestyramine (for pruritus and hypercholesterolemia)
- calcium and vitamin D for low bone density; bisphosphonates if osteoporosis severe
- monitor for thyroid disease
- liver transplant if disease severe, progressive

## Prognosis
- can be fatal, although not all asymptomatic patients show progression

**Table 23. Primary Sclerosing Cholangitis vs. Primary Biliary Cholangitis**

| | Primary Sclerosing Cholangitis | Primary Biliary Cholangitis |
|---|---|---|
| **Predominant Gender** | Male | Female |
| **Associated Comorbidities** | IBD, especially UC | Other autoimmune disorders (Sjögren's, CREST, RA) |
| **Affected Ducts** | Both intra- and extra-hepatic | Intrahepatic only |
| **Investigations** | ERCP/MRCP (narrowing and dilatations of ducts visualized) | Anti-mitochondrial antibodies, IgM, increased lipids, liver biopsy (absence of duct narrowing on ERCP) |

**MRCP/ERCP**
- Absence of narrowing in PBC
- Narrowing of intra and extrahepatic ducts in PSC

**Endoscopic or Surgical Step-Up Approach for Infected Necrotising Pancreatitis: A Multicentre Randomised Trial**
Lancet 2018;391:51-58
**Purpose**: To compare the outcomes of endoscopic versus the standard surgical removal of infected necrotising pancreatitis.
**Study**: Randomized controlled trial.
**Population**: 98 patients with pancreatic or extrapancreatic necrosis were randomized to either endoscopic removal or surgical removal of the infected necrosis.
**Outcomes**: Major complications and death at 6 mo follow-up.
**Results**: The primary end-points of mortality and major complications was the same in the two groups, but the endoscopic group had shortened hospital stays and less pancreatic fistulas.
**Conclusions**: Three points are worth emphasizing: (1) necrotising pancreatitis is a severe disease: about 15% in each group died; (2) it is best to wait at least 4 wk after the necrosis has developed to allow it to be encapsulated; (3) the management of severe acute pancreatitis should include experts skilled in therapeutic endoscopy.

# Biliary Colic, Cholecystitis

- see General Surgery, GS52

# Ascending Cholangitis

- see General Surgery, GS54

## Definition
- infection of the biliary tree

## Etiology
- stasis in the biliary tract due to obstruction or stricture (usually from previous cholecystectomy)
- infection originates in the duodenum or spreads hematogenously from the portal vein
- bacteria
  - *E. coli, Klebsiella, Enterobacter, Enterococcus*
  - co-infection with *Bacteroides* and *Clostridia* can occur

### Signs and Symptoms
- Charcot's triad: fever, RUQ pain, jaundice (50-70%)
- Reynolds' pentad in patients with suppurative cholangitis: fever, RUQ pain, jaundice, hypotension, altered mental status

**Charcot's Triad**
- RUQ pain
- Fever
- Jaundice

**Reynolds' Pentad**
- Charcot's triad
- Hypotension
- Altered mental status

### Investigations
- increased WBC
- usually increased ALP and bilirubin, ALT variably elevated
- blood culture
- abdominal U/S: CBD dilation, stones

### Treatment
- most important is drainage, ideally via ERCP; perform by percutaneous biliary or by surgical routes (least often) if ERCP not possible
- antibiotic therapy: broad spectrum to cover Gram-negatives, *Enterococcus*, and anaerobes (especially if CBD manipulation); no clear consensus on antibiotic choice but consider:
  - ampicillin + sulbactam or piperacillin/tazobactam
  - metronidazole + 3rd generation cephalosporin (e.g. ceftriaxone) or fluoroquinolone (e.g. ciprofloxacin or levofloxacin)
  - carbapenem monotherapy (e.g. imipenem or meropenem)

### Prognosis
- good with effective drainage and antibiotics in mild to moderate cases
- high mortality (~50%) in patients with Reynolds pentad

# Pancreas

## Pancreatic Enzyme Abnormalities

### Causes of Increased Serum Amylase
- pancreatic disease
  - pancreatitis, pancreatic duct obstruction (e.g. ampullary cancer), pseudocyst, abscess, ascites, trauma, cancer
- non-pancreatic abdominal disease
  - biliary tract disease, bowel obstruction/ischemia, perforated or penetrating ulcer, ruptured ectopic pregnancy, aneurysm, chronic liver disease, peritonitis
- non-abdominal disease
  - cancer (lung, ovary, esophagus, etc.), salivary gland lesions, bulimia, renal transplant/insufficiency, burns, ketoacidosis
  - macroamylasemia

**Pancreatic Enzymes**

**TALC**
**T**rypsin
**A**mylase
**L**ipase
**C**hymotrypsin

### Causes of Increased Serum Lipase
- pancreatic disease: same as above
- non-pancreatic abdominal disease (mild elevations only): same as above
- non-abdominal disease
  - macrolipasemia
  - renal failure

When serum amylase >5x normal, the cause is almost always pancreatitis or renal disease

## Acute Pancreatitis

### Etiology (most common are alcohol and gallstones)
**I**diopathic: thought to be hypertensive sphincter or microlithiasis
**G**allstones (45%)
**E**thanol (35%)
**T**umours: pancreas, ampulla, choledochocele
**S**corpion stings
**M**icrobiological
- bacterial: *Mycoplasma, Campylobacter*, TB, *M. avium intracellulare, Legionella,* leptospirosis
- viral: mumps, rubella, varicella, viral hepatitis, CMV, EBV, HIV, Coxsackie virus, echovirus, adenovirus
- parasites: ascariasis, clonorchiasis, echinococcosis

**A**utoimmune: SLE, *polyarteritis nodosa* (PAN), Crohn's disease
**S**urgery/trauma
- manipulation of sphincter of Oddi (e.g. ERCP), post-cardiac surgery, blunt trauma to abdomen, penetrating peptic ulcer

**H**yperlipidemia (TG >11.3 mmol/L; >1000 mg/dL), hypercalcemia, hypothermia
**E**mboli or ischemia
**D**rugs/toxins
- azathioprine, mercaptopurine, furosemide, estrogens, methyldopa, H2-blockers, valproic acid, antibiotics, acetaminophen, salicylates, methanol, organophosphates, steroids (controversial)

When thinking about the causes of acute pancreatitis remember: **I GET SMASHED**, but vast majority due to gallstones or ethanol

## Pathophysiology

- activation of proteolytic enzymes within pancreatic cells, starting with trypsin, leading to local and systemic inflammatory response
- in gallstone pancreatitis, this is due to mechanical obstruction of the pancreatic duct by stones
- in ethanol-related pancreatitis, pathogenesis is unknown
- in rare genetic diseases, mutations prevent the physiological breakdown of trypsin required normally to stop proteolysis (e.g. mutant trypsin in hereditary pancreatitis or mutation in SPINK 1 gene, which normally inhibits activated trypsin); may be model for ethanol-related pancreatitis

Gallstones only cause acute pancreatitis (not chronic pancreatitis)

## Pathology

- mild (interstitial)
  - peri-pancreatic fat necrosis
  - interstitial edema
- severe (necrotic)
  - extensive peri-pancreatic and intra-pancreatic fat necrosis
  - parenchymal necrosis and hemorrhage → infection in 60%
  - release of toxic factors into systemic circulation and peritoneal space (causes multi-organ failure)
- severity of clinical features may not always correlate with pathology
- 3 phases
  - local inflammation + necrosis → hypovolemia
  - systemic inflammation in multiple organs, especially in lungs, usually after IV fluids given → pulmonary edema
  - local complications 2 wk after presentation → pancreatic sepsis/abscess

## Signs and Symptoms

- pain: epigastric, noncolicky, constant
- can radiate to back
- may improve when leaning forward (Inglefinger's sign)
- tender rigid abdomen; guarding
- nausea/vomiting
- abdominal distention from paralytic ileus
- fever: chemical, not due to infection
- jaundice: compression or obstruction of bile duct
- Cullen's/Grey-Turner's signs
- tetany: transient hypocalcemia
- hypovolemic shock: can lead to renal failure
- acute respiratory distress syndrome
- coma

**Cullen's Sign**
Periumbilical ecchymosis

**Grey-Turner's Sign**
Flank ecchymosis

## Investigations

- increased serum pancreatic enzymes: amylase, lipase (more specific)
- ALT >150 specific for biliary cause
- increased WBC, glucose, low calcium
- imaging: CT most useful for diagnosis and prognosis
  - x-ray: "sentinel loop" (dilated proximal jejunem), calcification, and "colon cut-off sign" (colonic spasm)
  - U/S: useful for evaluating biliary tree (67% sensitivity, 100% specificity)
  - CT scan with IV contrast: useful for diagnosis and prognosis because contrast seen only in viable pancreatic tissue, non-viable areas can be biopsied percutaneously to differentiate sterile from infected necrosis
  - ERCP or MRCP if cause uncertain, assess for duct stone, pancreatic or ampullary tumour, pancreas divisum

**Increased Amylase**
- Sensitive, not specific

**Increased Lipase**
- Higher sensitivity and specificity
- Stays elevated longer

## Classification

- interstitial edematous vs. necrotizing
- mild, moderate, severe

## Prognosis

- usually a benign, self-limiting course, single or recurrent
- occasionally severe leading to:
  - shock
  - pulmonary edema
  - multi-organ dysfunction syndrome
  - GI ulceration due to stress
  - death
    - numerous scales to describe severity: probably most useful is proportion of pancreas not taking up contrast on CT done 48 h after presentation (necrotic pancreas does not take up the contrast dye)
    - presence of organ failure, particularly organ failure that persists >48 h, is associated with worse outcomes

**Table 24. Collections in Pancreatitis (Revised 2012 Atlanta Classification)**

| | Liquid | Solid |
|---|---|---|
| **Acute** | Acute peripancreatic fluid collection (APFC) | Acute necrotic collection (ANC) |
| **Chronic** | Pancreatic pseudocyst | Walled-off necrosis (WON) |

All of these collections are classified as infected or not infected

### Treatment
- goals (only supportive therapy available)

1. hemodynamic stability
2. analgesia
3. oxygen
4. stop progression of damage (difficult)
5. treat local and systemic complications

- antibiotics controversial except in documented infection (use cephalosporins, imipenem)
- aspirate necrotic areas of pancreas to diagnose infection; drain if infected
- IV fluids (crystalloid or colloid)
  - beware third spacing of fluid, monitor urine output carefully
- NG suction (lets pancreas rest) if vomiting, stomach very dilated
- endoscopic sphincterotomy if severe gallstone pancreatitis (i.e. cholangitis or ongoing obstruction)
- nutritional support: nasojejunal feeding tube or TPN if cannot tolerate enteric feeds
  - recent evidence supports nasogastric enteral (or oral if feasible) feeds
- no benefit: glucagon, atropine, aprotinin, H2-blockers, peritoneal lavage
- follow clinically and CT/ultrasound to exclude complications
- chief role of invasive intervention is to excise necrotic tissue (necrosectomy) in the case of infected pancreatic necrosis (try to delay for >2 wk to allow demarcation between viable and necrotic tissue), better done endoscopically or radiologically, rather than surgically if technically possible

### Late Complications
- pseudocysts: follow if asymptomatic, drain if symptomatic or growing
  - drain: choice of endoscopic, percutaneous under radiological guidance, or surgical
- infected necrosis/abscesses: antibiotics + percutaneous drainage, endoscopic vs. surgical
- bleeding: (1) gastric varices if splenic vein thrombosis, (2) pseudoaneurysm of vessels in areas of necrosis, especially splenic artery, (3) duodenal ulcer related to compression of duodenum by enlarged pancreas
- splenic and portal vein thrombosis: no effective therapy described, anticoagulation not proven, hazardous
- rare: DM, pancreatic duct damage

## Chronic Pancreatitis

### Definition
- irreversible damage to pancreas characterized by

1. pancreatic cell loss (from necrosis)
2. inflammation
3. fibrosis

### Etiology/Pathophysiology
- alcohol (most common)
  - causes a larger proportion (>90%) of chronic pancreatitis than acute pancreatitis
  - changes composition of pancreatic juice (e.g. increases viscosity)
  - decreases pancreatic secretion of pancreatic stone protein (lithostathine), which normally solubilizes calcium salts
    - precipitation of calcium within pancreatic duct results in duct and gland destruction
  - toxic effect on acinar and duct cells – directly or via increasing free radicals
  - acinar cell injury leads to cytokine release, which stimulates pancreatic stellate cells to form collagen (leading to fibrosis)
  - varying degrees of ductular dilatation, strictures, protein plugs, calcification
  - no satisfactory theory to explain why only a minority of individuals with alcohol use disorder develop pancreatitis
  - unusual causes
- cystic fibrosis
- severe protein-calorie malnutrition
- hereditary
- idiopathic

### Signs and Symptoms
- early stages
  - recurrent attacks of severe abdominal pain (upper abdomen and back)
  - chronic painless pancreatitis: 10%
- late stages: occurs in 15% of patients
  - steatorrhea (maldigestion) when >90% of function is lost
  - diabetes, calcification, jaundice, weight loss, pseudocyst, ascites, GI bleed

**When to Call the Surgeon in Acute Pancreatitis? Endoscopic Transgastric vs. Surgical Necrosectomy for Infected Necrotizing Pancreatitis: A Randomized Trial**
JAMA 2012; 307:1053-61
Once it was recognized that severe acute (necrotizing) pancreatitis had a terrible prognosis because of an exuberant inflammatory response leading to multiorgan failure, pancreatectomy was attempted. However, contrary to the expected favourable results, clinical experience has shown that surgical pancreatectomy is usually not helpful, perhaps because once the inflammatory cascade starts, it persists as a self-perpetuating cycle. The problems caused by acute pancreatitis can be thought of a widespread burn initiated by inflammation in the pancreas, but having little do with ongoing problems within the pancreas itself. Studies suggest that the only compelling indication for surgery is infected necrotizing pancreatitis not responding to antibiotics. As predicted, without removal of such infected pancreatic tissue, death is likely from sepsis.
In this recent randomized trial, transgastric necrosectomy, an endoscopic technique that also removes infected necrotic pancreatic tissue, reduced both a composite end-point of major pancreatitis complications (especially new onset organ failure) and the pro-inflammatory response (as measured by serum IL-6 levels) to a greater extent than surgical necrosectomy. Of course, not all necrotic collections are in areas amenable to endoscopic intervention, and the advice of an experienced surgeon should always be welcomed in severe acute pancreatitis, but the role of surgery in this previously considered surgical disease is rapidly diminishing.

**Prophylactic Antibiotics Cannot Reduce Infected Pancreatic Necrosis and Mortality in Acute Necrotizing Pancreatitis: Evidence from a Meta-Analysis of Randomized Controlled Trials**
Am J Gastroenterol 2008;103:104-110
**Purpose**: To review the effectiveness of IV antibiotics on pancreatic necrosis.
**Study Selection**: RCTs comparing antibiotics with placebo or no treatment.
**Results**: Seven trials (n=467) were included. Antibiotics were not statistically superior to controls in reduction of infected necrosis and mortality.
**Conclusion**: Prophylactic antibiotics cannot reduce infected pancreatic necrosis and mortality in patients with acute necrotizing pancreatitis.
**Note**:In practice, the temptation to give antibiotics for pancreatitis is mainly in the setting of a sick patient with fever and suggestive pancreatic necrosis on CT scan. It is difficult to determine whether pancreatic necrosis has become infected without aspiration biopsy (see Curr Gastroenterol Rep 2009;11:104-110).

**Symptoms of Chronic Pancreatitis**
- Abdominal pain
- Diabetes
- Steatorrhea

**Etiology** = Almost Always Alcohol

**Treatment**
- Alcohol abstinence
- Pancreatic enzyme replacement
- Analgesics
- Pancreatic resection if ductular blockage

### Investigations
- laboratory
  - increase in serum glucose
  - increase in serum ALP, less commonly bilirubin (jaundice)
  - serum amylase and lipase usually normal
  - stool elastase is low in steatorrhea
- abdominal X-ray: pancreatic calcifications
- U/S or CT: calcification, dilated pancreatic ducts, pseudocyst
- MRCP or ERCP: abnormalities of pancreatic ducts-narrowing and dilatation
- EUS: abnormalities of pancreatic parenchyma and pancreatic ducts, most sensitive test
- 72 h fecal fat test: measures exocrine function
- secretin test: gold standard, measures exocrine function but difficult to perform, unpleasant for patient, expensive
- fecal pancreatic enzyme measurement (elastase-1, chymotrypsin): available only in selected centres

### Treatment
- most common problem is pain, difficult to control
- general management
  - complete abstinence from alcohol
  - enzyme replacement may help pain by resting pancreas via negative feedback
  - analgesics
  - celiac ganglion blocks
  - time: pain decreases with time as pancreas "burns out"
- endoscopy: sphincterotomy, stent if duct dilated, remove stones from pancreatic duct
- surgery: drain pancreatic duct (pancreaticojejunostomy) if duct dilated (more effective than endoscopy); resect pancreas if duct contracted
- steatorrhea
  - pancreatic enzyme replacement
  - restrict fat, increase carbohydrate and protein (may also decrease pain)
  - neither endoscopy nor surgery can improve pancreatic function

## Autoimmune Pancreatitis

- most commonly presents as a mimicker of pancreatic cancer (pancreatic mass detected because of jaundice ± abdominal pain)

### Investigations
- histology: lymphocyte and plasma cell infiltration of pancreas
- imaging: focal or diffuse enlargement of pancreas on CT or MRI, sausage shaped, low density rim around pancreas
- serology: increased serum IgG4
- other organ involvement: sialadenitis, retroperitoneal fibrosis, biliary duct narrowing, nephritis

### Treatment
- responds to prednisone

# Clinical Nutrition

## Determination of Nutritional Status

### Challenging to differentiate markers of malnutrition from markers of disease
- most important feature in assessing the need for nutritional support is weight loss (expressed as change body mass index [kg/m$^2$])
- Subjective Global Assessment divides nutritional status into A) adequately nourished, B) mild or moderate malnutrition and C) severe malnutritionin in order to identify those who will benefit from nutritional support
- includes weight change in past 6 mo, weight change in past 2 weeks, dietary intake change, current dietary intake, GI symptoms, functional capacity, effect of disease on nutritional requirements and physical examination, including loss of subcutaneous fat/muscles wasting/edema/ascites

**Table 25. Small Bowel Nutrient Absorption**

| | Fe | CHO | Proteins, Lipids $Na^+$, $H_2O$ | Bile Acids | Vit $B_{12}$ |
|---|---|---|---|---|---|
| **Duodenum** | +++ | +++ | +++ | + | |
| **Jejunum** | + | + | ++ | + | + |
| **Ileum** | + | + | ++ | +++ | +++ |

### Determining Nutritional Requirements
- calories: total energy expenditure (TEE) = resting energy expenditure (REE) X stress factor (eg 1.7 for burns) usually works out to be 25-35 kcal/kg depending on how disease affects metabolism, with intravenous nutrition delivered as about 60% carbohydrate, 40% fat. Current trend is to provide fewer calories ("permissive underfeeding"), especially in ICU, to prevent hyperglycemia
- protein: 1-2 g/kg/d, depending on effect of disease on protein metabolism. In disease a greater proportion of energy expenditure comes from protein than in health
- electrolytes, minerals and vitamins also required

### Indications for Aggressive Nutritional Support:
- inability to meet nutritional needs; logical, but convincing evidence from literature not available for ICU and other acute illnesses
- evidence that nutritional support improves outcome available for short bowel syndrome (home TPN), when provided before major abdominal or thoracic surgery if there is substantial malnutrition, before radiation therapy for cancer of esophagus, head and neck, decompensated alcoholic liver disease, pancreatitis (acute and chronic)
- nutritional support at best prevents protein loss but usually no gain

## Enteral Nutrition

### Definition
- enteral nutrition (tube feeding) is a way of providing food through a tube placed in the stomach or the small intestine
- nasogastric (NG), or nasojejunal (NJ) if nutritional support required for brief time; percutaneous endoscopic gastrostomy ("G-tube" or "PEG tube")/percutaneous endoscopic jejunostomy (J-tube) if nutrition support required for more than 1 mo
- tubes can also be placed endoscopically, radiologically or surgically

### Indications
- oral feeding inadequate or contraindicated

**Most Common Indications for Artificial Nutrition Support**
- Preexisting nutritional deprivation
- Anticipated or actual inadequate energy intake by mouth
- Significant multiorgan system disease

### Feeds
- polymeric feeds contain whole protein, carbohydrate, fat as a liquid, with or without fibre
- elemental feeds contain protein as amino acids, carbohydrate as simple sugars, fat content low (therefore high osmolarity)
- specific diets: low carbohydrate/high fat solution for ventilated patients (carbohydrate has a high respiratory quotient so minimizes carbon dioxide production), high energy, low electrolyte solutions for dialysis patients

### Relative Contraindications
- non-functioning gut (e.g. intestinal obstruction, enteroenteral or enterocutaneous fistulae)
- uncontrolled diarrhea
- GI bleeding

### Complications
- aspiration
- diarrhea
- refeeding syndrome (rare): carbohydrate can stimulate excessive insulin release, leading to cellular uptake and low serum levels of phosphate, magnesium, potassium
- overfeeding syndrome (rare): hypertonic dehydration, hyperglycemia, hypercapnea, azotemia (from excess protein)

Whenever possible, enteral nutrition is ALWAYS preferable over parenteral nutrition

## Parenteral Nutrition

### Definition
- parenteral nutrition (PN) is the practice of feeding a person intravenously, bypassing the usual process of eating and digestion

### Indications
- short-term (<1 mo)
  - use whenever GI tract not functioning
  - only situations where PN has been well shown to increase survival are after bone marrow transplant and in short bowel syndrome, some evidence for benefit in gastric cancer, but often used in ICU, perioperatively, and in difficult-to-control sepsis
  - pre-operative: only useful in severely malnourished (e.g. loss of >15% of pre-morbid weight, serum albumin <28 g/L or <2.8 g/dL), and only if given for ≥2 wk
  - renal failure: PN shown to increase rate of recovery; no increase in survival
  - liver disease: branched chain amino acids may shorten duration of encephalopathy; no increase in survival
  - IBD: PN closes fistulae and heals acute exacerbations of mucosal inflammation, but effect is transient (EN is equally effective)

- some evidence for efficacy, but convincing data not available for:
  - radiation/chemotherapy-induced enteritis
  - AIDS with wasting diarrhea
  - severe acute pancreatitis
- long-term (>1 mo): can be given at home
  - severe untreatable small bowel disease (e.g. radiation enteritis, extensive CD, high output fistulae)
  - following surgical resection of >70% of small bowel (e.g. small bowel infarction)
  - severe motility diseases (e.g. scleroderma affecting bowel)

### Relative Contraindications
- functional GI tract for enteral nutrition
- active infection; at least until appropriate antibiotic coverage
- inadequate venous access; triple-lumen central venous lines usually prevent this problem

### Complications of PN
- sepsis: most serious of the common complications
- mechanical pneumothorax from insertion of central line, catheter migration and thrombosis, air embolus
- metabolic: congestive heart failure, hyperglycemia, gallstones, cholestasis

### Enteral Nutrition vs. Parenteral Nutrition
- fewer serious complications (especially sepsis) with enteral nutrition
- nutritional requirements for enterally administered nutrition better understood
- can supply gut-specific fuels such as glutamine and short chain fatty acids with enteral nutrition
- nutrients in the intestinal lumen prevent atrophy of the gut and pancreas
- enteral nutrition prevents gallstones by stimulating gallbladder motility
- enteral nutrition much less expensive

Hypomagnesemia may be an initial sign of short bowel syndrome in patients who have undergone surgical bowel resection

**Enteral vs. Parenteral Nutrition for Acute Pancreatitis**
Cochrane DB of Syst Rev 2010;1:CD002837
**Purpose**: Compare EN vs. TPN on mortality, morbidity, and hospital stay in patients with pancreatitis.
**Study Selection**: RCTs of TPN vs. EN in pancreatitis.
**Results**: Eight trials (n=348) were included. Enteral nutrition decreases RR of death (0.50), multiple organ failure (0.55), infection (0.39), and other local complications (0.70). It also decreased hospital stay by 2.37 d.
**Conclusion**: EN reduces mortality, organ failure, infections, and length of hospital stay in patients with pancreatitis.

# Common Medications

**Table 26. Common Drugs Prescribed in Gastroenterology**

| Class | Generic Drug Name | Trade Name | Dosing | Mechanism of Action | Indications | Contraindications | Side Effects |
|---|---|---|---|---|---|---|---|
| **Proton Pump Inhibitors** ($H^+/K^+$-ATPase inhibitors) | omeprazole | Losec®/Prilosec® | 20 mg PO OD | Inhibits gastric enzymes $H^+/K^+$-ATPase (proton pump) | Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, reflux esophagitis, symptomatic GERD, dyspepsia, Zollinger-Ellison syndrome, eradication of *H. pylori* (combined with antibiotics) | Hypersensitivity to drug | Dizziness, headache, flatulence, abdominal pain, nausea, rash, increased risk of osteoporotic fracture (secondary to impaired calcium absorption) |
| | lansoprazole or dexlansoprazole | Prevacid® Dexilant® | Oral therapy: lansoprazole 15-30 mg OD (before breakfast), dexlansoprazole 30-60 mg OD (does not need to be taken before breakfast) | Same as above | Same as above | Same as above | Same as above |
| | pantoprazole | Pantoloc® Protonix® | 40 mg PO OD for UGIB: 80 mg IV bolus then 8 mg/h infusion | Same as above | Same as above and UGIB | Same as above | Same as above |
| | rabeprazole | Pariet®/Aciphex® | 40 mg PO OD | Same as above | Same as above | Same as above | Same as above |
| | esomeprazole | Nexium® | 20-40 mg PO OD | Same as above | Same as above | Same as above | Same as above |
| **Histamine H2-Receptor Antagonists** | ranitidine | Zantac® | 300 mg PO OD or 150 mg bid<br>IV therapy: 50 mg q8h (but tachyphylaxis a problem) | Inhibits gastric histamine H2-receptors | Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, ulcer prophylaxis, reflux esophagitis, symptomatic GERD; not useful for acute GI bleeds | Hypersensitivity to drug | Confusion, dizziness, headache, arrhythmias, constipation, nausea, agranulocytosis, pancytopenia, depression |
| | famotidine | Pepcid® | Oral therapy: duodenal/gastric ulcers: 40 mg qhs<br>GERD: 20 mg bid<br>IV therapy: 20 mg bid | Same as above | Same as above | Same as above | Same as above |
| **Stool Softener** | docusate sodium | Colace® | 100-400 mg PO OD, divided in 1-4 doses | Promotes incorporation of water into stool | Relief of constipation | Presence of abdominal pain, fever, nausea/vomiting | Throat irritation, abdominal cramps, rashes |
| **Osmotic Laxatives** | lactulose | Lactulose Constulose® | Constipation: 15-30 mL PO OD to bid<br>Encephalopathy: 15-30 mL bid to qid | Poorly absorbed in GI tract and is broken down by colonic bacteria into lactic acid in the colon, increases osmotic colonic contents, increases stool volume | Chronic constipation, prevention, and treatment of portal-systemic encephalopathy | Patients who require a low galactose diet | Flatulence, intestinal cramps, nausea, diarrhea if excessive dosage |
| | PEG3350 | Lax-a-day® RestoraLAX Golytely® | Constipation: 17 g powder dissolved in 4-8 oz liquid PO OD | Osmotic agent causes water retention in stool and promotes frequency of stool | Relief of constipation<br>Colonoscopy prep | Hypersensitivity to drug | Abdominal distension, pain, anal pain, thirst, nausea, rigor, tonic-clonic seizures (rare) |
| | magnesium hydroxide | Milk of Magnesia/Pedia-Lax® | Constipation (adult): 400 mg/5 mL: 30-60 mL PO qhs | Osmotic retention of fluid which distends the colon and increases peristaltic activity | Relief of constipation | Patients with myasthenia gravis or other neuromuscular disease<br>Renal impairment | Abdominal pain, vomiting, diarrhea |

**Table 26. Common Drugs Prescribed in Gastroenterology** (continued)

| Class | Generic Drug Name | Trade Name | Dosing | Mechanism of Action | Indications | Contraindications | Side Effects |
|---|---|---|---|---|---|---|---|
| **Stimulant Laxatives** | senna | Senokot® | Tablets: 1-4 PO qhs<br>Syrup: 10-15 mL PO qhs | Induce peristalsis in lower colon | Constipation | Patients with acute abdomen | Abdominal cramps, discolouration of breast milk, urine, feces, melanosis coli and atonic colon from prolonged use (controversial) |
| | bisacodyl | Bisacodyl® | 5-30 mg PO OD (start at 10 mg for bowel preparation) | Enteric nerve stimulation and local contact-induced secretory effects<br>Colonic movements | Constipation<br>Preparation of bowel for procedure | GI obstruction<br>Gastroenteritis | Abdominal colic, abdominal discomfort, proctitis (with suppository use), diarrhea |
| **Bulk Laxatives** | psyllium | Metamucil | Start at one heaping tablespoon daily | Increases stool bulk → water retention in stool | Constipation | Hypersensitivity to drug<br>GI obstruction | GI obstruction, diarrhea, constipation, abdominal cramps |
| **Guanylate Cyclase C Agonist** | linaclotide | Constella | 75-145 ug once daily | Opens water channels in bowel epithelial cells to add water to stool | Chronic constipation<br>Irritable bowel syndrome-constipation | Children | Diarrhea |
| **Antidiarrheal Agents** | loperamide | Imodium® | Acute diarrhea: 4 mg PO initially, followed by 2 mg after each unformed stool | Acts as antidiarrheal viacholinergic, noncholingeric, opiate, and nonopiate receptor-medicated mechanisms; decreases activity of myenteric plexus | Adjunctive therapy for acute non-specific diarrhea, chronic diarrhea associated with IBD and for reducing the volume of discharge for ileostomies, colostomies, and other intestinal resections | Children <2 yr, known hypersensitivity to drug, acute dysentery characterized by blood in stools and fever, acute ulcerative colitis or pseudomembranous colitis associated with broad-spectrum antibiotics | Abdominal pain or discomfort, drowsiness or dizziness, tiredness, dry mouth, N/V, hypersensitivity reaction |
| | diphenoxylate/ atropine | Lomotil® | 5 mg PO tid to qid | Inhibits GI propulsion via direct action on smooth muscle, resulting in a decrease in peristaltic action and increase in transit time | Adjunctive therapy for diarrhea, as above | Hypersensitivity to diphenoxylate or atropine, jaundice, pseudomembranous enterocolitis, diarrhea caused by enterotoxin producing bacteria | Dizziness, drowsiness, insomnia, headache, N/V, cramps, allergic reaction |
| | eluxadoline | Viberzil | 75-100 mg bid | Bowel opioid modulator | Irritable bowel syndrome<br>Diarrhea | Pancreatic disease Excess alcohol, gallstones or other biliary disease | Pancreatocbiliary pain including sphincter of Oddi dysfunction |
| **Anti-Emetics** | dimenhydrinate | Gravol® | 25-50 mg PO/IV/IM q4-6h prn | Competitive H1 receptor antagonist in GI tract, blood vessels, and respiratory tract. Blocks chemoreceptor trigger zone. Diminishes vestibular simulation and disrupts labyrinthine function through central anticholinergic action | Motion sickness, radiation sickness, postoperative vomiting, and drug-induced nausea/vomiting | Hypersensitivity to drug | Xerostomia, sedation |
| | prochlorperazine | Stemetil® | 5-10 mg PO/IV/IM bid-tid prn | D1, D2 receptor antagonist in chemoreceptor trigger zone and α adrenergic and anti-cholinergic effects<br>Depresses reticular activating system (RAS) affecting emesis | Post-operative N/V, antipsychotic, anxiety | Hypersensitivity to drug | Dystonia, extrapyramidal symptoms (EPS), seizure, neuroleptic malignant syndrome (NMS) (rarely) |
| | metoclopramide | Maxeran® | 10 mg IV/IM q2-3h pm, 10-15 mg PO qid (30 min before meals and qhs) | Dopamine and 5-HT receptor antagonist in chemoreceptor trigger zone. Enhances response to ACh in upper GI tract, enhancing motility and gastric emptying. Increases LES tone | GERD, diabetic gastroparesis, post-operative and chemotherapy induced N/V, migraines, constipation | Hypersensitivity to drug, GI obstruction, perforation, hemorrhage, pheochromocytoma, seizures, and EPS | Restlessness, drowsiness, dizziness, fatigue, EPS, some rare serious side effects include NMS, agranulocytosis |
| | ondansetron | Zofran® | Depends on procedure, generally 8-16 mg PO | Selective 5HT3 receptor antagonist in central chemoreceptor trigger zone and peripherally on vagus nerve | N/V caused by cancer chemotherapy and radiation therapy; multiple off label uses, including gastroenteritis N/V | Morphine, hypersensitivity to drug | Constipation, diarrhea, increased liver enzymes, headache, fatigue, malaise, cardiac dysrhythmia |
| | granisetron | Kytril® | 1 mg PO bid (for nausea from chemotherapy/radiation) | Same as above | N/V caused by cancer chemotherapy and radiation therapy | Same as above | Constipation, prolonged QT interval (rarely) |
| **IBD Agents** | mesalamine | Pentasa®<br>Salofalk®<br>Asacol®<br>Mesasal® | CD: 1 g PO tid/qid<br>Active UC: 1 g PO qid<br>Maintenance UC: 1.6 g PO divided doses daily also as suppositories and enemas | 5-ASA: Blocks arachidonic acid metabolism to prostaglandins and leukotrienes | IBD | Hypersensitivity to mesalamine salicylates; Asacol contains phthalate, potential urogenital teratogenicity for male fetus | Abdominal pain, constipation, arthralgia, headache |
| | sulfasalazine | Salazopyrin® | 3-4 g/d PO in divided doses | Compound composed of 5-ASA bound to sulfapyridine, hydrolysis by intestinal bacteria releases 5-ASA, the active component | Colonic disease | Hypersensitivity to sulfasalazine, sulfa drugs, salicylates; intestinal or urinary obstruction, porphyria | Rash, loss of appetite, N/V, headache, oligospermia (reversible) |
| | prednisone | | 20-40 mg PO OD for acute exacerbation | Anti-inflammatory | Mod-severe CD and UC | | Complications of steroid therapy |

**Table 26. Common Drugs Prescribed in Gastroenterology** (continued)

| Class | Generic Drug Name | Trade Name | Dosing | Mechanism of Action | Indications | Contraindications | Side Effects |
|---|---|---|---|---|---|---|---|
| **Immuno-suppressive Agents** | 6-mercaptopurine (6-MP) | Purinethol® | CD: 1.5 mg/kg/d PO | Immunosuppressive | IBD: active inflammation and to maintain remission | Hypersensitivity to mercaptopurine, prior resistance to mercaptopurine or thioguanine, history of treatment with alkylating agents, hypersensitivity to azathioprine, pregnancy | Pancreatitis, bone marrow suppression, increased risk of cancer |
| | azathioprine | Azasan® Imuran® | IBD: 2-3 mg/kg/d PO | Same as above | Same as above | Same as above | Same as above |
| **Biologics** | infliximab | Remicade® | 5-10 mg/kg IV over 2 h | Monoclonal antibody to TNFα | Medically refractory CD | Heart failure, moderate to severe, doses >5 mg/kg | Reported cases of reactivated TB, PCP, lymphoma, other infections Other TNFα share similar serious side-effects |
| | adalimumab | Humira® | CD induction: four 40 mg SC on day 1, then 80 mg 2 wk later (day 15)<br>CD maintenance: 40 mg every other wk beginning day 29 | Monoclonal antibody to TNFα | Medically refractory CD or poor response to infliximab | Hypersensitivity to adalimumab<br>Severe infection<br>Moderate-to-severe heart failure | Headaches, skin rashes, upper respiratory tract infection |
| | golimumab | Simponi® | RA: 2 mg/kg at wk 0, 4 and then every 8 wk thereafter (use with methotrexate)<br>UC induction: 200 mg SC at wk 0, then 100 mg at wk 2<br>UC maintenance: 50 mg every 4 wk | Monoclonal antibody to TNFα | Active ankylosing spondylitis<br>Psoriatic arthritis<br>Moderate-to-severe active RA (combined with methotrexate)<br>UC: medically refractory UC | Hypersensitivity to golimumab or latex<br>Severe infection<br>Moderate-to-severe heart failure | |
| | vedolizumab | Entyvio | CD/UC: 300 mg at 0, 2, 6 wk and then every 8 wk thereafter | Monoclonal antibody to α4β7 integrin | Medically refractory CD/UC, including other TNFα inhibitors and corticosteroids | Hypersensitivity to vedolizumab | Infections, liver injury, and progressive multifocal leukoencephalopathy |
| | tofactinib | Xeljanz | 5-10 mg bid | JAK inhibitor | Ulcerative colitis | TB, hepatitis B | Infections |
| **Antibiotics** | rifaximin | Zaxine | 550 mg bid or tid | Non-absorable antibiotic, affects dysbiosis of microbiome | Hepatic encephalopathy<br>Non-constipation irritable bowel syndrome<br>Traveller's diarrhea | nil | nil |

# Landmark Gastroenterology Trials

| Trial | Reference | Results |
|---|---|---|
| MELD score as a predictor of death in chronic liver disease | Gastroenterology 2003;124:91-6 | MELD score can be applied for allocation of donor livers as it accurately predicts 3 mo mortality in patients with chronic liver failure |
| Infliximab, azathioprine, or combination for Crohn's disease | NEJM 2010;362:1383-95 | In moderate-severe Crohn's disease, infliximab + azathioprine was more likely to result in corticosteroid-free remission than infliximab monotherapy. Infliximab monotherapy was more effective than azathioprine monotherapy. Similar results have been reported for ulcerative colitis (Gastroenterology 2014; 146:392-400) |
| Enteral versus parenteral nutrition for acute pancreatitis | Cochrane DB Syst Rev 2010;1:CD002837 | For acute pancreatitis, no trial was convincing alone, but in aggregate, enteral feeds via nasogastric tube is preferable to either no feeding or parenteral nutrition |
| Rifaximin treatment in hepatic encephalopathy | NEJM 2010;362:1071-81 | The most convincing of several articles establishing this non-absorbable antibiotic as the treatment of choice for hepatic encephalopathy for maintaining remission from hepatic encephalopathy and reducing hospitalization associated with the disease |
| Adenoma detection rate and risk of colorectal cancer and death | NEJM 2014;370:1298-1306 | A high miss rate for colorectal cancers has been suggested, chiefly in the right colon. This study demonstrates a method of assessing the competence of endoscopists in detecting cancers using adenoma detection rate (the proportion of colonoscopic exams in which a physician detects one or more adenomas) as a surrogate marker. Adenoma detection rate was associated with lower risk of interval colorectal cancer and has launched quality assurance programs for screening colonoscopies |
| Prednisolone or pentoxifylline for alcoholic hepatitis | NEJM 2015;372:1619-28 | For alcoholic hepatitis, prednisolone improved survival when the Maddrey's discriminant function >32, but the benefit did not reach statistical significance and pentoxifylline was of no advantage at all. Other studies had shown some benefit with pentoxifylline, but this study was the most definitive |

| VTE | venous thromboembolism |

# Basic Anatomy Review

| | |
|---|---|
| **Kocher's (subcostal)** | Access to RUQ or LUQ contents i.e. gallbladder, spleen |
| **Upper Midline** | Access to stomach, duodenum, gallbladder, liver, transverse colon |
| **Paramedian** | Can make similar incision in each quadrant for access to each quadrant's contents<br>Not commonly used<br>Post-operative ventral hernias common |
| **Lateral Paramedian** | Incision made at outer 1/3 - medial 2/3 border of rectus<br>Modification of paramedian but with lower risk of dehiscence or ventral hernia<br>Not commonly used |
| **Lower Midline** | Access to pelvic organs, sigmoid colon, and rectum |
| **Pfannenstiel** | Suprapubic incision for access to pelvic cavity |
| **McBurney's** | Access to appendix |

© Cassandra Catlin 2014, after Agnes Chan 2012

**Figure 1. Abdominal incisions**

### Lateral Abdominal Wall Layers and their Continuous Spermatic and Scrotal Structures (superficial to deep)

1. skin (epidermis, dermis, subcutaneous fat)
2. superficial fascia
   - Camper's fascia (fatty) → Dartos muscle/fascia
   - Scarpa's fascia (membranous) → Colles' superficial perineal fascia
3. muscle (see Figure 2 and Figure 3)
   - external oblique → inguinal ligament → external spermatic fascia and fascia lata
   - internal oblique → cremasteric muscle/fascia
   - transversus abdominis → posterior inguinal wall
4. transversalis fascia → internal spermatic fascia
5. preperitoneal fat
6. peritoneum → tunica vaginalis

### Midline Abdominal Wall Layers (superficial to deep)

1. skin
2. superficial fascia
3. rectus abdominis muscle: in rectus sheath, divided by linea alba (see Figure 3)
   - above arcuate line (midway between symphysis pubis and umbilicus)
     - anterior rectus sheath = external oblique aponeurosis and anterior leaf of internal oblique aponeurosis
     - posterior rectus sheath = posterior leaf of internal oblique aponeurosis and transversus abdominis aponeurosis
   - below arcuate line
     - aponeuroses of external oblique, internal oblique, transversus abdominis all pass in front of rectus abdominis
4. arteries: superior epigastric (branch of internal thoracic), inferior epigastric (branch of external iliac); both arteries anastomose and lie behind the rectus muscle (superficial to posterior rectus sheath above arcuate line)
5. transversalis fascia
6. peritoneum

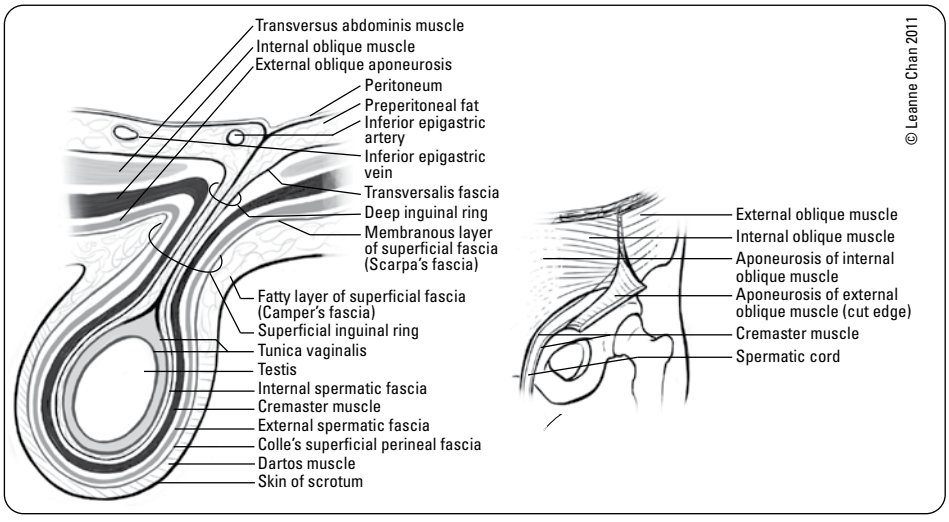

**Figure 2. Continuity of the abdominal wall with layers of the scrotum and spermatic cord**

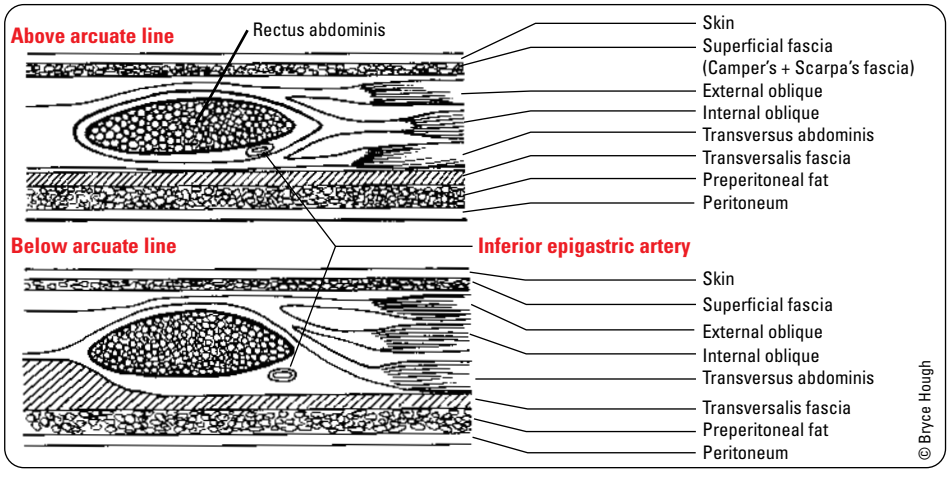

**Figure 3. Midline cross-section of abdominal wall**

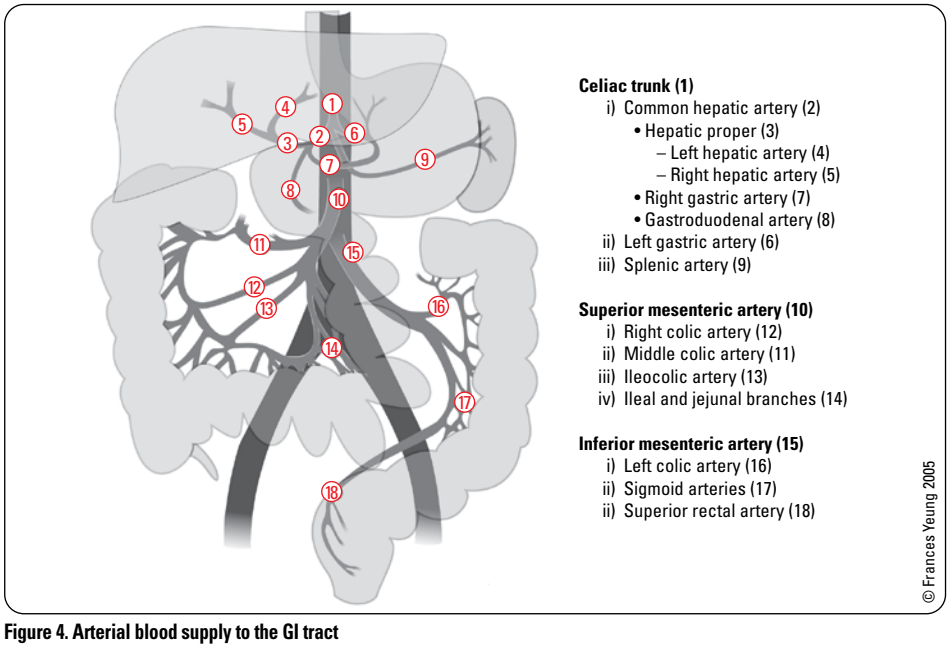

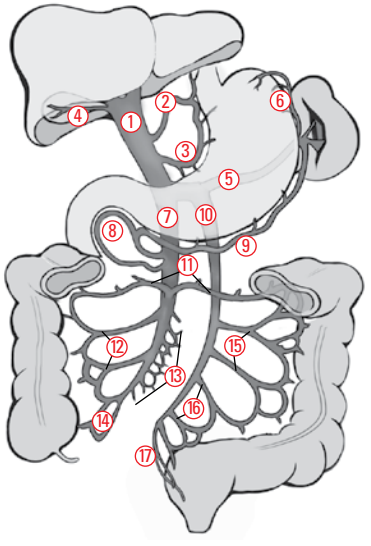

**Figure 4. Arterial blood supply to the GI tract**

### Venous Flow

**Portal vein (1)**

**Superior mesenteric vein (7)**
- i) Ileal and jejunal veins (13)
- ii) Ileocolic vein (14)
- iii) Right colic vein (12)
- iv) Middle colic vein (11)
- v) Pancreaticoduodenal vein (8)
- vi) Right gastroepiploic vein (9)

**Splenic vein (5)**
- i) Inferior mesenteric vein (10) (superior rectal vein until crossing common iliac vessels)
  - Left colic veins (15)
  - Sigmoid veins (16)
  - Superior rectal veins (17)
- ii) Pancreatic veins
- iii) Left gastroepiploic vein
- iv) Short gastric veins (6)

**Left gastric (coronary) vein (2)**

**Right gastric vein (3)**

**Cystic vein (4)**

**Paraumbilical vein – (within round ligament, not shown)**

© Carly Vanderlee 2011

**Figure 5. Venous drainage of the GI tract**

| Organ | Arterial Blood Supply |
|---|---|
| **Liver** | Left and right hepatic (branches of hepatic proper) |
| **Spleen** | Splenic |
| **Gallbladder** | Cystic (branch of right hepatic) |
| **Stomach** | 1. Lesser curvature: right and left gastric<br>2. Greater curvature: right (branch of gastroduodenal) and left (branch of splenic) gastroepiploic<br>3. Fundus: short gastrics (branches of splenic) |
| **Duodenum** | 1. Gastroduodenal<br>2. Pancreaticoduodenals (superior branch of gastroduodenal, inferior branch of superior mesenteric) |
| **Pancreas** | 1. Pancreatic branches of splenic<br>2. Pancreaticoduodenals |
| **Small intestine** | Superior mesenteric branches: jejunal, ileal, ileocolic |
| **Large intestine** | 1. Superior mesenteric branches: right colic, middle colic<br>2. Inferior mesenteric branches: left colic, sigmoid, superior rectal |

# Differential Diagnoses of Common Presentations

## Acute Abdominal Pain

- acute abdomen = severe abdominal pain of acute onset and requires urgent medical attention
- in patients with acute abdominal pain, the first diagnoses that you should consider are those requiring potential urgent surgical intervention
- two main patterns constituting urgent general surgery referrals are peritonitis and obstruction

**Table 1. Differential Diagnosis of Acute Abdominal Pain**

| RUQ | RLQ |
|---|---|
| **Hepatobiliary** | **Gastrointestinal** |
| Biliary colic | Appendicitis* |
| Cholecystitis* | Crohn's disease |
| Cholangitis | Tuberculosis of the ileocecal junction |
| CBD obstruction (e.g stone, tumour) | Cecal tumour |
| Hepatitis (includes perihepatitis/Fitz-Hugh-Curtis syndrome) | Intussusception |
| Portal vein thrombosis | Mesenteric lymphadenitis (*Yersinia*) |
| Budd-Chiari syndrome | Cecal diverticulitis |
| Hepatic abscess/mass | Cecal volvulus* |
| Right subphrenic abscess* | Hernia: femoral, inguinal obstruction, Amyand's (and resulting cecal distention) |
| **Gastrointestinal** | **Gynecological** |
| Pancreatitis | See 'suprapubic' |
| Presentation of gastric, duodenal, or pancreatic pathology | **Genitourinary** |
| Hepatic flexure pathology (e.g. CRC, subcostal incisional hernia) | See 'suprapubic' |
| **Genitourinary** | **Extraperitoneal** |
| Nephrolithiasis* | Abdominal wall hematoma/abscess |
| Pyelonephritis | Psoas abscess |
| Renal: mass, ischemia, trauma | |
| **Cardiopulmonary** | |
| RLL pneumonia | |
| Effusion/empyema | |
| CHF (causing hepatic congestion and R pleural effusion) | |
| MI | |
| Pericarditis | |
| Pleuritis | |
| **Miscellaneous** | |
| Herpes zoster | |
| Trauma | |
| Costochondritis (Infectious*) | |

**In All Patients Presenting with an Acute Abdomen, Order the Following:**

**KEY TESTS FOR SPECIFIC DIAGNOSIS**
- ALP, ALT, AST, bilirubin
- Lipase/ amylase
- Urinalysis
- β-hCG (in women of childbearing age)
- Troponins
- Lactate

**KEY TESTS FOR OR PREPARATION**
- CBC, electrolytes, creatinine, glucose
- INR/PTT
- CXR (if history of cardiac or pulmonary disease)
- ECG if clinically indicated by history or if >69 yr and no risk factors

Note: Choosing Wisely does not recommend routine preoperative blood work for ambulatory/elective surgery

**Types of Peritonitis**
- Primary peritonitis: spontaneous without clear etiology
- Secondary peritonitis: due to a perforated viscus
- Tertiary peritonitis: recurrent secondary peritonitis more often with resistant organisms

**Localization of Pain**

Most digestive tract pain is perceived in the midline because of bilaterally symmetric innervation; kidney, ureter, ovary, or somatically innervated structures are more likely to cause lateralized pain

Parietal peritoneum: supplied by somatic sensory nerves of body wall. Pain is sharp and well-localized.

Visceral peritoneum: supplied by autonomic sensory fibres. Pain is colicky and poorly-localized.

**Table 1. Differential Diagnosis of Acute Abdominal Pain** (continued)

| LUQ | LLQ |
|---|---|
| **Pancreatic**<br>Pancreatitis (acute vs. chronic)<br>Pancreatic pseudocyst<br>Pancreatic tumours* | **Gastrointestinal**<br>Diverticulitis*<br>Diverticulosis<br>Colon/sigmoid/rectal cancer<br>Fecal impaction<br>Proctitis (e.g. ulcerative colitis, infectious; i.e. *gonococcus* or *Chlamydia*)<br>Sigmoid volvulus* |
| **Gastrointestinal**<br>Gastritis<br>PUD<br>Splenic flexure pathology (e.g. CRC, ischemia) | Hernia (incarcerated/strangulated*) |

*indicated need for urgent surgical evaluation

**Referred Pain**
- Biliary colic: to right shoulder or scapula
- Renal colic: to groin
- Appendicitis: periumbilical to right lower quadrant (RLQ)
- Pancreatitis: to back
- Ruptured aortic aneurysm: to back or flank
- Perforated ulcer: to RLQ (right paracolic gutter)
- Hip pain: to groin
- Ovarian Torsion: to flank or groin

**Most Common Presentations of Surgical Pain**
- Sudden onset with rigid abdomen = perforated viscus
- Pain out of proportion to physical findings = ischemic bowel
- Vague pain that subsequently localizes = appendicitis or other intra-abdominal process that irritates the parietal peritoneum
- Waves of colicky pain = bowel obstruction

**Acute Abdominal Pain Mnemonic**
**A**ppendicitis
**B**iliary Tract Disease
**D**iverticulitis
**O**varian disease
**M**alignancy
**I**ntestinal Obstruction
**N**ephritic Disorders
**A**cute Pancreatitis
**L**iquor/Ethanol

# Abdominal Mass

**Table 2. Differential Diagnosis of Abdominal Mass**

| Right Upper Quadrant (RUQ) | Upper Midline | Left Upper Quadrant (LUQ) |
|---|---|---|
| **Gallbladder**: cholecystitis, cholangiocarcinoma, peri-ampullary malignancy, cholelithiasis<br>**Biliary tract**: Klatskin tumour<br>**Liver**: hepatomegaly, hepatitis, abscess, tumour (hepatocellular carcinoma, metastatic tumour, etc.) | **Pancreas**: pancreatic adenocarcinoma, other pancreatic neoplasm, pseudocyst<br>**Abdominal aorta**: AAA (pulsatile)<br>**GI**: gastric tumour (adenocarcinoma, gastrointestinal stromal tumour, carcinoid tumour), MALT lymphoma | **Spleen**: splenomegaly, tumour, abscess, subcapsular splenic hemorrhage, can also present as RLQ mass if extreme splenomegaly<br>**Stomach**: tumour |
| **Right Lower Quadrant (RLQ)** | **Lower Midline** | **Left Lower Quadrant (LLQ)** |
| **Intestine**: stool, tumour (CRC), mesenteric adenitis, appendicitis, appendiceal phlegmon or other abscess, typhlitis, intussusception, Crohn's inflammation<br>**Ovary**: ectopic pregnancy, cyst (physiological vs. pathological), tumour (serous, mucinous, struma ovarii, germ cell, Krukenberg)<br>**Fallopian tube**: ectopic pregnancy, tubo-ovarian abscess, hydrosalpinx, tumour | **Uterus**: pregnancy, leiomyoma (fibroid), uterine cancer, pyometra, hematometra<br>**GU**: bladder distention, tumour | **Intestine**: stool, tumour, abscess (see RLQ)<br>**Ovary**: see RLQ<br>**Fallopian tube**: see RLQ |

Pancreatitis can look like a surgical abdomen, but is rarely an indication for immediate surgical intervention

# Gastrointestinal Bleeding

• see Gastroenterology, G25

## Indications for Surgery

- failure of medical management
- exsanguinating hemorrhage: hemodynamic instability despite vigorous resuscitation
- recurrent hemorrhage with up to two attempts of endoscopic hemostasis
- prolonged bleeding with transfusion requirement >3 units
- bleeding at rate >1 unit/8 h

## Surgical Management of GI Bleeding

- UGIB
  - bleeding from a source proximal to the ligament of Treitz
  - often presents with hematemesis and melena unless very brisk (then can present with hematochezia)
  - initial management with endoscopy; if fails, then consider surgical management appropriate to etiology
  - PUD accounts for approximately 55% of severe UGIB
- LGIB
  - bleeding from a source distal to the ligament of Treitz
  - often presents with BRBPR unless proximal to transverse colon
  - may occasionally present with melena
  - initial management with colonoscopy to detect and potentially stop source of bleeding
  - 75% of patients will spontaneously stop bleeding, however if bleeding continues barium enema should NOT be performed
  - angiography or RBC scan to determine source as indicated
  - surgery indicated if bleeding is persistent - aimed at resection of area containing source of bleeding
  - obscure bleed may require blind total colectomy if the source is not found

**Table 3. Differential Diagnosis of GI Bleeding**

| Anatomical Source | Etiology | |
|---|---|---|
| **Hematological** | Excess anticoagulation (coumadin, heparin, etc.)<br>Excess antiplatelet (clopidogrel, ASA) | DIC<br>Congenital bleeding disorders |
| **Nose** | Epistaxis | |
| **Esophagus** | Esophageal varices<br>Mallory-Weiss tear<br>Esophagitis | Aorto-esophageal fistula (generally post endovascular aortic repair)*<br>Esophageal cancer |
| **Stomach** | Gastritis<br>Gastric varices<br>Dieulafoy's lesion | Gastric ulcer<br>Gastric cancer* |
| **Duodenum** | Duodenal ulcer<br>Perforated duodenal ulcer* | Duodenal cancer* |
| **Jejunum** | Tumours*<br>Polyps<br>Ulcers | |
| **Ileum and Ileocecal Junction** | Meckel's diverticulum<br>Small bowel obstruction | Crohn's disease*<br>Tuberculosis of ileocecal junction |
| **Large Intestine** | Colorectal cancer*<br>Mesenteric thrombosis/ischemic bowel*<br>Ulcerative colitis* (subtotal colectomy if failure of medical management)<br>Angiodysplasia<br>Diverticulosis (*if bleeding is persistent) | Crohn's disease (less frequently presents with bleeding)*<br>Pancolitis (infectious, chemotherapy, or radiation induced)<br>Bleeding post-gastrointestinal anastomosis |
| **Sigmoid** | Diverticulosis (*if bleeding is persistent)<br>Sigmoid cancer*<br>Bleeding post-polypectomy | Polyps (*if not amenable to colonoscopic polypectomy)<br>Inflammatory bowel disease (IBD) |
| **Rectum and Anus** | Hemorrhoids<br>Fissures<br>Rectal cancer*<br>Anal varices | Polyps (*if not amenable to colonoscopic polypectomy)<br>Crohn's or ulcerative colitis*<br>Solitary rectal ulcer syndrome |

*Managed surgically in most cases

**Indications for Urgent Operation**

**IHOP**
**I**schemia
**H**emorrhage
**O**bstruction
**P**erforation

**Overt bleeding**: obvious hematemesis, hematochezia or melena per rectum (i.e. visible to naked eye)
**Occult bleeding**: bleeding per rectum is not obvious to naked eye (e.g. positive guaiac FOBT)
**Obscure bleeding**: bleeding with no identifiable source after colonoscopy and endoscopy (source usually in small bowel). Can be either overt or occult

**Transfusion Strategies for Acute Upper Gastrointestinal Bleeding**
NEJM 2013;368:11-21
Recent study by Villanueva et al., demonstrates that a restrictive transfusion strategy (transfusion with hemoglobin below 70 g/L) significantly improves outcomes in patients with acute UGIB, compared to a liberal transfusion strategy (transfusion with hemoglobin below 90 g/L). Refer to study for details.

# Jaundice

• see Gastroenterology, G43

**Biochemical Signs for Differentiating Jaundice**
**Hepatocellular**: Elevated bilirubin + elevated ALT/AST
**Cholestatic**: Elevated bilirubin + elevated ALP/GGT ± duct dilatation upon biliary U/S
**Hemolysis**: ↓ haptoglobin ↑ LDH

Note: cholestatic jaundice is often surgical

# Pre-Operative Preparations

## Considerations

- informed consent (see Ethical, Legal, and Organizational Medicine, ELOM7)
- screening questionnaire to determine risk factors e.g. age, exercise capacity, medication use, allergies
- consider pre-operative anesthesia, medicine consult as indicated to optimize patient status
- NPO according to fasting guidelines (see Anesthesia and Perioperative Medicine, A6)
- IV – balanced crystalloid at maintenance rate (4:2:1 rule for pediatrics, roughly 100-125 cc/h for adults): normal saline or Ringer's lactate (RL most common); bolus to catch up on estimated losses including losses from bowel prep
  - appropriate use of fluids perioperatively decreases risk of cardiorespiratory complications
- patient's regular medications included with the exception of hypoglycemic agents, diuretics and ACEI
- patients on steroids may require stress dose coverage
- anticoagulation/antiplatelet medication must be managed to decrease surgical bleeding but not put patient at risk for increased thrombotic events (e.g. Bridging: switching from warfarin to LMWH, easier to start/stop as needed)
- prophylactic antibiotics depending on wound class (immediately/within 1 h prior to incision): cefazolin (Ancef®) ± metronidazole (Flagyl®) for contaminated cases
- role of MBP: Current evidence suggests that use of MBP pre-operatively has no impact on post-operative complications and therefore routine use of MBP for non-LAR elective colorectal surgery is not recommended
  - MBP is still frequently used for left-sided colonic surgery (i.e. sigmoid and rectum) to facilitate bowel manipulation and colorectal anastomoses
- consider VTE prophylaxis for all inpatient surgery (LMWH or heparin)
- only hold VTE prophylaxis if epidural is expected
- smoking cessation and weight loss pre-operatively can significantly decrease post-operative complications
- infection: delay elective surgery until infection controlled, including respiratory infection (particularly in asthma patients)

## Investigations

- see Anesthesia and Perioperative Medicine, A2
- routine pre-operative laboratory investigations for elective procedures should be selective
  - only ASA class and surgical risk have been found to independently predict post-operative adverse effects
- blood components: group and screen or cross and type depending on procedure
- CBC, electrolytes, creatinine
- INR/PT, PTT
- CXR (PA and lateral) for patients with history of cardiac or pulmonary disease
- ECG as indicated by history or if >69 yr and no risk factors
- β-hCG testing in all women of reproductive age

## Drains

- NGT
  - indications: gastric decompression, analysis of gastric contents, irrigation/dilution of gastric contents, feeding, if necessary
  - 2 types: NGT (for drainage or feeding) and Dobhoff (for feeding only)
  - insertion should be done in stages with x-ray protocol to avoid injury
  - contraindications: suspected basal skull fracture, obstruction of nasal passages, esophageal stricture, esophageal varices
- Foley catheter with urometer
  - indications: to accurately monitor urine output, decompression of bladder, relieve obstruction, rapidly expanding suprapubic mass
  - contraindications: suspected urethral injury, and difficult insertion of catheter

# Surgical Complications

- general principles in preventing complications during the post-operative period include:
  - frequent examination of the patient (daily or more) and their wound
  - removal of surgical tubes as soon as possible (e.g. Foley catheters and surgical drains)
  - early ambulation
  - monitor fluid balance and electrolytes
  - analgesia - enough to adequately address pain, but not excessive (minimize opioids)
  - skillful nursing care

# Post-Operative Fever

- fever does not necessarily imply infection particularly in the first 24-48 h post-operative
- fever may not be present or is blunted if patient is receiving chemotherapy, glucocorticoids, or other immunosuppression

**Bilirubin Levels**

| | Prehepatic | Intrahepatic | Posthepatic |
|---|---|---|---|
| **Serum Bilirubin** | | | |
| Indirect | ↑ | ↑ | N |
| Direct | N | ↑ | ↑ |
| **Urine** | | | |
| Urobilinogen | ↑ | ↑ | – |
| Bilirubin | – | + | + |
| **Fecal** | | | |
| Urobilinogen | ↑ | ↑ | – |

In patients with liver disease and an acute abdomen, spontaneous bacterial peritonitis must be ruled out

**Surgical Emergencies: Take an AMPLE History**
**A**llergies
**M**edications
**P**ast medical/surgical history (including anesthesia and bleeding disorders)
**L**ast meal
**E**vents (HPI)

**Best Practice in General Surgery (BPIGS)**
http://www.bpigs.ca/
BPIGS is a University of Toronto initiative with the goal of standardizing care in general surgery. This link contains EBM based guidelines which have been implemented by consensus within all Toronto teaching hospitals. This is a highly recommended source for the most up-to-date pre-operative and general treatment guidelines

**Mechanical Bowel Preparation Strategies: A Clinical Practice Guideline developed by the University of Toronto's Best Practice in Surgery**
Informed by: Can J Surg 2010;53:385–395
14 RCTs (5071 participants), 8 meta-analyses
1. All open/laparoscopic colorectal procedures (excluding LARs ± diverting stoma)
   - No MBP
   - No dietary restrictions before NPO
   - Fleet enema for left colon anastomoses with transrectal stapling
2. Open/laparoscopic LAR ± diverting stoma
   - MBP
   - No dietary restrictions before MBP; clear fluids after MBP complete

**Drain Size**
Measured by the unit French:
French = diameter (mm) x 3

- timing of fever may help identify cause
  - hours after surgery – POD #1
    - inflammatory reaction in response to trauma from surgery (physiologic); unlikely to be infectious (unless necrotizing fasciitis or another severe infection)
    - reaction to blood products received during surgery
    - malignant hyperthermia
  - POD #1-2 (acute)
    - atelectasis (most common cause of fever on POD #1)
    - early wound infection (especially *Clostridium*, Group A *Streptococcus* – feel for crepitus and look for "dishwater" drainage)
    - aspiration pneumonitis
    - other: Addisonian crisis, thyroid storm, and transfusion reaction
  - POD #3-7: likely infectious
    - UTI, surgical site infection, IV site/line infection, septic thrombophlebitis, and leakage at bowel anastomosis (tachycardia, hypotension, oliguria, and abdominal pain)
  - POD #8+
    - intra-abdominal abscess, DVT/PE (can be anytime post-operative, most commonly POD #8-10, may occur earlier but recognition is often delayed), and drug fever
    - other: cholecystitis, peri-rectal abscess, URTI, infected seroma/biloma/hematoma, parotitis, *C. difficile* colitis, and endocarditis

### Treatment
- treat primary cause
- antipyrexia (e.g. acetaminophen)

**Pre- and Post-Operative Orders**

**ADDAVIDS**
**A**dmit to ward X under Dr. Y
**D**iagnosis
**D**iet
**A**ctivity
**V**itals (q4h from ED and post-operative is standard)
**I**V, Investigations, Ins and Outs
**D**rugs, Dressings, Drains
**S**pecial procedures

**5 Ws of Post-Operative Fever**
**W**ind POD #1-2 (pulmonary – atelectasis, pneumonia)
**W**ater POD #3-5 (urine – UTI)
**W**ound POD #5-8 (wound infection - if earlier think streptococcal or clostridial infection)
**W**alk POD #8+ (thrombosis – DVT/PE)
**W**onder drugs POD #1+ (drug)

**Drugs – 7 As**
**A**nalgesia
**A**nti-emetic
**A**nticoagulation
**A**ntibiotics
**A**nxiolytics
**A**nticonstipation
**A**ll other patient meds (home meds, stress dose steroids, and β-blockers)

**Approach to the Critically Ill Surgical/ Trauma Patient**

**ABC, I'M FINE**
**ABC**
**I**V: 2 large bore IVs with NS, wide open
**M**onitors: $O_2$ sat, ECG, BP
**F**oley catheter to measure urine output
**I**nvestigations: blood work
**N**GT if indicated
"**Ex**" rays (abdomen 3 views, CXR), other imaging – only when stable

# Wound/Incisional Complications

## WOUND CARE (see Plastic Surgery, PL8)
- can shower POD #2-3 after epithelialization of wound (or earlier depending on dressing)
- dressings can be removed POD #2 and left uncovered if dry
- examine wound if wet dressing, signs of infection (fever, tachycardia, and pain)
- skin sutures and staples can be removed POD #7-10
  - exceptions: incision crosses crease (groin), closed under tension, in extremities (hand) or patient factors (elderly, corticosteroid use, or immunosuppressed) removed POD #14, earlier if signs of infection
- negative pressure dressings consist of foam and suction, promote granulation
  - ideal for large (grafted sites) or non-healing wounds (irradiated skin, or ulcer)

## DRAINS
- drains may be placed selectively at the time of surgery to prevent fluid accumulation (blood, pus, serum, bile, and urine)
  - can be used to assess quantity of third space fluid accumulation post-operatively
- potential route of infection; to decrease risk of wound infection bring out through separate incision (vs. operative wound) and remove as soon as possible
- types of drains
  - open (e.g. Penrose), higher risk of infection
  - closed: 1) Gravity drainage (e.g. Foley catheter); 2) Underwater-seal drainage system (e.g. chest tube); 3) Suction drainage (e.g. Jackson-Pratt)
  - sump (e.g. NGT)
- monitor drain outputs daily
- drains should be removed once drainage is minimal (usually <30-50 cc/24 h)
- drains do not guarantee that the patient will not form a collection of fluid
- ridged drains can erode through internal structures, and excessive suction can cause necrosis
- evidence does not support routine post-operative drainage of abdominal cavity

## SURGICAL SITE INFECTION

### Etiology
- *S. aureus, E. coli, Enterococcus, Streptococcus* spp., *Clostridium* spp.

### Risk Factors

**Table 4. Procedures and Their Impact on Surgical Site Infection**

| Classification | Clean | Clean-Contaminated | Contaminated | Dirty/Infected |
|---|---|---|---|---|
| **Definition** | Incision under sterile conditions; nontraumatic; no entrance of hollow organ | Incision under sterile conditions; ENTRANCE of hollow viscus; no evidence of active infection; minimal contamination | Incision under sterile conditions; MAJOR contamination of wound during procedure (i.e. gross spillage of stool, infection in biliary, respiratory, or GU systems) | Established infection present before wound is made in skin |
| **Example** | Hernia repair | Routine cholecystectomy; colon resection | Bowel obstruction with enterotomy and spillage of contents; necrotic bowel resection; fresh traumatic wounds | Appendiceal abscess; traumatic wound with contaminated devitalized tissue; perforated viscus |
| **Infection Rate** | <2% | 3-4% | 7-10% | 30-40% |
| **Wound Closure** | Primary closure | Primary closure | Often secondary closure | Secondary closure |

- patient characteristics
  - age, DM, steroids, immunosuppression, obesity, burn, malnutrition, patient with other infections, traumatic wound, radiation, and chemotherapy
- other factors
  - prolonged pre-operative hospitalization, reduced blood flow, break in sterile technique, multiple antibiotics, hematoma, seroma, foreign bodies (drains, sutures, grafts), skin preparation, hypoxemia, and hypothermia

### Prophylaxis
- pre-operative antibiotics for most surgeries (cefazolin ± metronidazole or if β-lactam allergy, clindamycin ± gentamycin)
  - within 1 h pre-incision; can redose at 1-2 half-lives (~q4-8h) in the OR
  - not required for low risk elective thyroidectomy, cholecystectomy, hemorrhoidectomy, fistulotomy, and sphincterotomy for fissure
  - some evidence suggests role in breast surgery
- reserve post-operative antibiotics for treatment of suspected or documented intra-abdominal infection
- normothermia (maintain patient temperature 36-38°C during OR)
- hyperoxygenation (consider $FiO_2$ of 80% in OR)
- chlorhexidine-alcohol wash of surgical site
- hair removal should not be performed unless necessary; if so, clipping superior to shaving
- consider delayed primary closure of incision for contaminated wounds
- use sterile closing tray for laparotomy

### Clinical Feature
- typically fever POD #5-8 (*Streptococcus* and *Clostridium* can present in 24 h)
- localized pain, blanchable erythema, induration, purulent discharge, and warmth
- complications: fistula, sinus tracts, sepsis, abscess, suppressed wound healing, superinfection, spreading infection to myonecrosis or fascial necrosis (necrotizing fasciitis), wound dehiscence, evisceration, and hernia

### Treatment
- examination of the wound: inspect, compress adjacent areas, swab drainage for C&S and Gram stain
- re-open affected part of incision, drain, pack, heal by secondary intention in most cases
- for deeper or necrotizing infections, debride necrotic and non-viable tissue
- antibiotics and demarcation of erythema only if cellulitis or immunodeficiency

## WOUND HEMORRHAGE/HEMATOMA

### Risk Factors
- anticoagulant therapy, coagulopathies, thrombocytopenia, DIC, severe liver disease, myeloproliferative disorders, severe arterial HTN, and severe cough
- more common with transverse incisions through muscle, due to cutting of muscle
- more clinically relevant in small working spaces such as breast surgery or thyroid surgery

### Clinical Features
- pain, swelling, discolouration of wound edges, and leakage
- rapidly expanding neck hematoma can compromise airway and is a surgical emergency: consider having a suture kit at bedside in all neck surgery in the event of having to open the wound emergently (most important treatment in this case is to protect the airway with intubation)

### Treatment
- pressure dressing
- open drainage ± wound packing (large hematoma only)
- if significant bleeding, may need to re-operate to find source (often do not find a discrete source)

## SEROMA
- fluid collection other than pus or blood
- secondary to transection of lymph vessels
- delays healing
- increased infection risk if drained

### Treatment
- observation
- consider pressure dressing ± needle drainage (this may increase infection risk)
- if significant may need to re-operate

## WOUND DEHISCENCE
- disruption of a wound that was primarily closed, causing loss of barrier of skin or fascia

### Risk Factors
- local: technical failure of closure, technical errors including excessive tension on the wound, increased intra-abdominal pressure (e.g. COPD, ileus, bowel obstruction), hematoma, infection, poor blood supply, radiation, patient not fully paralyzed while closing, and transverse incision

| Complication | Laboratory/Imaging Tests |
|---|---|
| **Wound Complication** | wound culture, CBC, CT scan |
| **Fever** | CBC, electrolytes, glucose, creatinine, BUN, UA, CXR urine/ blood/sputum and wound culture if applicable |
| **Respiratory Distress** | EKG, echo, CXR, ABG, CT-angiography of the chest |
| **AKI/Oliguria** | electrolytes, glucose, creatinine, BUN, UA with microscopy, urine electrolytes, EKG, renal ultrasound |
| **Hypotension** | CBC, electrolytes, glucose, creatinine, BUN, lactate, ABG, ACTH stimulation testing and cortisol level; coagulation studies |
| **Ileus** | electrolytes, glucose, creatinine, BUN, abdominal x-ray |
| **Stress ulcer** | CBC, upper endoscopy |

**Pre-Operative Skin Antiseptics for Preventing Surgical Wound Infections After Clean Surgery**
Cochrane DB Syst Rev 2015;4:CD003949
**Purpose**: To determine if pre-operative skin antisepsis prior to clean surgery prevents surgical-site infection (SSI) and compare the effectiveness of other antiseptics.
**Methods**: Systematic review of randomized-controlled trials (RCTs) part of the Cochrane Wounds Group Specialised Register and the Cochrane Central Register of Controlled Trials (CENTRAL). Main outcome was SSI. Secondary outcomes included quality of life, mortality, and resource use.
**Results**: 13 RCTs (n=2623 patients) were included that made 11 total comparisons between skin antiseptics. A single study found that 0.5% chlorhexidine solution in methylated spirits was significantly superior in preventing SSIs after clean surgery compared to alcohol based povidone iodine solution. No other statistically significant differences were found.
**Conclusions**: Further research is warranted to determine the effectiveness of one antiseptic over the others at preventing SSI post clean surgery.

**Systemic Review and Meta-Analysis of Randomized Clinical Trials Comparing Primary vs. Delayed Primary Skin Closure in Contaminated and Dirty Abdominal Incisions**
JAMA Surg 2013;148:779-786
**Purpose**: To compare rates of surgical site infection (SSI) with delayed primary closure (DPC) vs. primary skin closure (PC).
**Results/Conclusions**: 8 RCTs with 623 patients. Most common diagnosis was appendicitis (77.4%). Although there was significant heterogeneity between studies, DPC (2-5 d time to first review) was found to significantly reduce the chance of SSI (OR 0.65, 95% CI 0.40-0.93). Although current trials are poorly designed, DPC may be a simple and cost-effective way of reducing the rates of SSIs following abdominal surgery with contaminated or dirty wounds.

- systemic: male, smoking, malnutrition (hypoalbuminemia, vitamin C deficiency), connective tissue diseases, immunosuppression, pulmonary disease, ascites, poor nutrition, steroids, chemotherapy, obesity, and other (e.g. age, sepsis, and uremia)
- DM alone is not a risk factor

### Clinical Features
- typically POD #1-3 or #7-10; most common presentation sign is serosanguinous drainage from wound
- ± evisceration
- palpation of wound edge: should normally feel a "healing ridge" from abdominal wall closure (raised area of tissue under incision)

### Treatment
- place moist dressing over wound with binder around abdomen and transfer to OR
- may consider conservative management with debridement of fascial and/or skin margins
- evisceration (i.e. 'burst abdomen') is a surgical emergency: take patient for operative re-closure without abdomen binder

## INCISIONAL HERNIA
- defined as either part or all of an abdominal wound in which the fascial edges have separated
- symptoms aggravated by coughing or straining
- smaller fascial defects such as laparoscopic port sites have a higher risk of incarceration
- definitive treatment: surgical repair
  - large hernias that pose little risk of incarceration do not need to be repaired

**Small Bites versus Large Bites for Closure of Abdominal Midline Incisions (Stitch): A Double-Blind, Multicentre, Randomised Controlled Trial**
Lancet 2015;386:1254-1260
**Purpose**: To compare the large bites suture technique with the small bites technique for fascial closure of midline laparotomy incisions.
**Methods**: Randomized controlled trial conducted at ten hospitals in the Netherlands. Patients undergoing elective abdominal surgery randomized (1:1) to small or large bite technique. Primary outcome was incisional hernia occurrence.
**Results**: At one year follow-up, the large bites group had a greater incidence of incisional hernia occurrence than the small bites group (21% vs 13%, respectively). Rates of adverse events did not differ between the groups.
**Conclusion**: Small bites suture technique is superior to the large bites technique for prevention of incisional hernia in midline incisions and is not associated with a higher rate of adverse events.

# Urinary and Renal Complications

## URINARY RETENTION
- may occur after any operation with general anesthesia or more commonly with spinal anesthesia
- more likely in older males with history of benign prostatic hyperplasia, and patients on anticholinergics

### Clinical Feature
- abdominal discomfort, palpable bladder, overflow incontinence, post-void residual urine volume >100 mL

### Treatment
- Foley catheter to rest bladder, then trial of voiding
- often accompanied by an alpha-blocker such as tamsulosin

## OLIGURIA/ANURIA

### Etiology
- prerenal vs. renal vs. postrenal
- most common post-operative cause is prerenal ± ischemic ATN
  - external fluid loss: hemorrhage, dehydration, and diarrhea
  - internal fluid loss: third-spacing due to bowel obstruction, and pancreatitis

### Clinical Feature
- urine output <0.5 cc/kg/h, increasing Cr, and increasing BUN

### Treatment
- according to underlying cause; fluid deficit is treated with crystalloid (NS or RL)

# Post-Operative Dyspnea

- see *Respiratory Complications and Cardiac Complications*, GS12

### Etiology
- respiratory: atelectasis, pneumonia/pneumonitis, pulmonary embolus (PE), ARDS, asthma, and pleural effusion
- cardiac: MI, arrhythmia, and CHF
- inadequate pain control

# Respiratory Complications

## ATELECTASIS
- comprises 90% of post-operative pulmonary complications

### Risk Factors
- COPD, smoking, obesity, and elderly persons
- upper abdominal/thoracic surgery, oversedation, significant post-operative pain, and poor inspiratory effort

### Clinical Features
- low-grade fever on POD #1, tachycardia, crackles, decreased breath sounds, bronchial breathing, and tachypnea

### Treatment
- pre-operative prophylaxis
  - smoking cessation (best if >8 wk pre-operative)
- post-operative prophylaxis
  - incentive spirometry, deep breathing exercise, chest physiotherapy, and intermittent positive-pressure breathing
  - selective NGT decompression after abdominal surgery
  - short-acting neuromuscular blocking agents
  - minimize use of respiratory depressive drugs, appropriate pain control, and early ambulation

## PNEUMONIA/PNEUMONITIS
- may be secondary to aspiration of gastric contents during anesthetic induction or extubation, causing a chemical pneumonitis

### Risk Factors
- aspiration: general anesthetic, decreased LOC, GERD, full stomach, bowel/gastric outlet obstruction + non-functioning NGT, pregnancy, and seizure disorder
- non-aspiration: atelectasis, immobility, and pre-existing respiratory disease

### Clinical Features
- productive cough, and fever
- tachycardia, cyanosis, respiratory failure, and decreased LOC
- CXR: pulmonary infiltrate

### Treatment
- prophylaxis: see atelectasis prophylaxis, pre-operative NPO/NGT, and rapid sequence anesthetic induction
- immediate removal of debris and fluid from airway
- consider endotracheal intubation and flexible bronchoscopic aspiration
- empiric IV antibiotics to cover oral nosocomial aerobes and anaerobes (e.g. piperacillin-tazobactam, cefepimemetronidazole)

## PULMONARY EMBOLUS

### Clinical Features
- unilateral leg swelling and pain (DVT as a source of PE), sudden onset dyspnea, pleuritic chest pain, tachycardia, and fever
- most commonly POD #8-10, but can occur anytime post-operatively, even after discharge
- diagnosis made by Chest CT scan usually

### Treatment
- initial treatment: IV heparin or subcutaneous LMWH, bridging to therapeutic anticoagulation is required for a minimum of 3 mo (usually 6 mo); for patients with cancer, or other risk factors for hypercoagulability, the duration of anticoagulation may be longer
- Greenfield (IVC) filter if contraindications to anticoagulation helps prevent worsening of PE
- prophylaxis: subcutaneous heparin (5000 U bid) or LMWH, compression stockings (TED™ Hose), and sequential compression devices

## PULMONARY EDEMA

New onset "asthma" and wheezing in the elderly is cardiogenic until proven otherwise

### Etiology
- cardiogenic vs. noncardiogenic
- circulatory overload: excess volume replacement, LV failure, shift of fluid from peripheral to pulmonary vascular bed, negative airway pressure, and alveolar injury due to toxins (e.g. ARDS)
  - more common with pre-existing cardiac disease
- negative pressure pulmonary edema due to inspiratory efforts against a closed glottis upon awakening from general anesthesia

### Clinical Features
- shortness of breath, crackles at lung bases, and CXR abnormal

### Treatment (LMNOP)
- **L**asix
- **M**orphine (decreases symptoms of dyspnea, venodilator, and afterload reduction)
- **N**itrates (venodilator)
- **O**xygen + non-invasive ventilation
- **P**osition (sit patient up)

### RESPIRATORY FAILURE

#### Clinical Features
- dyspnea, cyanosis, and evidence of obstructive lung disease
- earliest manifestations – tachypnea and hypoxemia (RR >25, $pO_2$ <60)
- pulmonary edema, and unexplained decrease in $SaO_2$

#### Treatment
- ABCs, $O_2$, ± positive pressure ventilation, and intubation
- bronchodilators, and diuretics to treat CHF
- adequate blood pressure to maintain pulmonary perfusion
- if these measures fail to keep $PaO_2$ >60, consider ARDS (see Respirology, R26)

## Cardiac Complications

- abnormal ECGs common in post-operative period (compare to pre-operative ECG)
- common arrhythmias: supraventricular tachycardia, atrial fibrillation (secondary to fluid overload, PE, and MI)

### MYOCARDIAL INFARCTION
- see Cardiology and Cardiac Surgery, C39
- surgery increases risk of MI
- incidence
  - 0.5% in previously asymptomatic men >50 yr old
  - 40-fold increase in men >50 yr old with previous MI

#### Risk Factors
- pre-operative HTN, CHF
- previous MI (highest risk ≤6 mo, but risk never returns to baseline)
- increased age
- intra-operative hypotension
- operations >3 h
- angina

#### Clinical Features
- majority of cases on day of operation or POD #3-4 (shifting of third space fluid back into intravascular compartment)
- often silent without chest pain, may only present with new-onset CHF (dyspnea), arrhythmias, and hypotension

## Intra-Abdominal Abscess

#### Definition
- collection of pus walled-off from rest of peritoneal cavity by inflammatory adhesions and viscera

#### Etiology
- usually polymicrobial: Gram-negative bacteria, and anaerobes
  - consider Gram-positives if coexisting cellulitis

#### Risk Factors
- emergency surgery, and contaminated OR
- GI surgery with anastomotic leak
- poor healing risk factors (DM, poor nutrition, etc.)
- may occur POD #3 after laparotomy when third space fluid re-distribution occurs

#### Clinical Features
- persistent spiking fever, dull pain, and weight loss
- mass difficult to palpate
- peritoneal signs if abscess perforation and secondary peritonitis
- leukocytosis or leukopenia (immunocompromised, and elderly)
- co-existing effusion (pleural effusion with subphrenic abscess)
- common sites: pelvis, Morrison's pouch (space between kidney and liver), subphrenic, paracolic gutters, lesser sac, peri-appendiceal, post-surgical anastomosis, diverticular, and psoas

#### Investigations
- CBC, blood cultures x2
- CT ± IV and water-soluble contrast
- DRE (pelvic abscess)

#### Treatment
- drain placement by interventional radiology (preferred), laparoscopy, and open drainage
- subsequent antibiotic coverage; ceftriaxone + metronidazole or piperacilin-tazobactam (Pip-Tazo)

# Paralytic Ileus

# Delirium

- see Psychiatry, PS22 and Neurology, N20

# Thoracic Surgery

## Hiatus Hernia

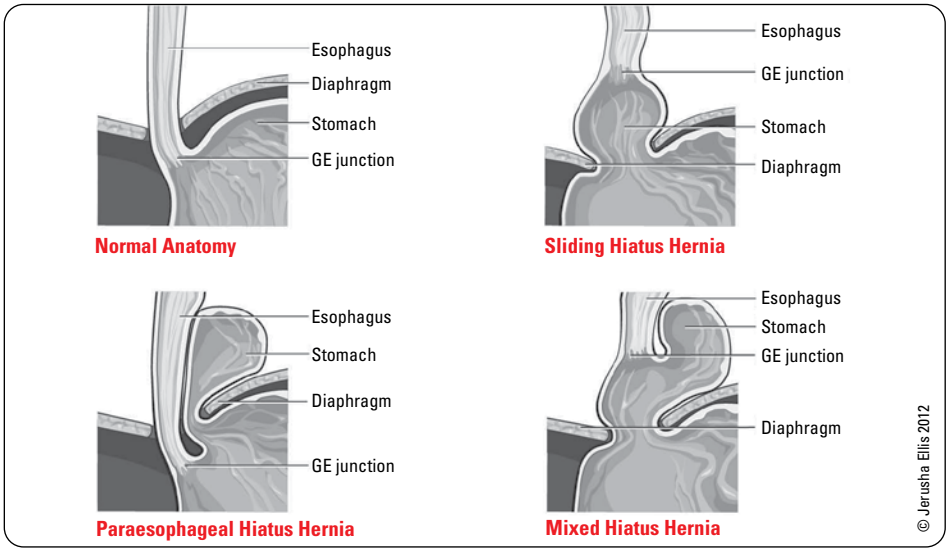

**Figure 6. Types of hiatus hernia:** Type I: Sliding (GE junction above the level of the diaphgram) Type II: Paraesophageal (GE junction below the diaphgram, fundus rolls past it) Type III: Mixed and Type IV: Massive (not shown) (containing another intraabodminal organ: bowel/spleen/etc.)

**Differential Diagnosis of Hiatus Hernia**

| GI Causes | Non-GI Causes |
|---|---|
| Cholelithiasis | MI |
| Diverticulitis | Angina |
| Peptic ulcer | Pericarditis |
| Achalasia | |
| Pancreatitis | |
| GERD | |
| Gastritis | |

### SLIDING HIATUS HERNIA (TYPE I)

- herniation of both the stomach and the gastroesophageal (GE) junction into thorax
- 90% of esophageal hernias

#### Risk Factors

- age
- increased intra-abdominal pressure (e.g. obesity, pregnancy, coughing, and heavy lifting)
- smoking

#### Clinical Features

- majority are asymptomatic
- hernias frequently associated with GERD due to decreased competence of LES

#### Complications

- most common symptom is GERD
- other complications are rare and are related to reflux
- esophagitis (dysphagia, and heartburn)
- consequences of esophagitis (peptic stricture, Barrett's esophagus, and esophageal carcinoma)
- extra-esophageal complications (aspiration pneumonitis/pneumonia, bronchospasm, cough, and laryngitis)

#### Investigations

- barium swallow, endoscopy (esophago-gastroscopy), or esophageal manometry (technique for measuring LES pressure)
- 24 h esophageal pH monitoring to quantify reflux
- endoscopy with biopsy to document type and extent of tissue damage and rule out esophagitis, Barrett's esophagus, and cancer

#### Treatment

- lifestyle modification
  - stop smoking, weight loss, elevate head of bed, no meals <3 h prior to sleeping, smaller and more frequent meals, avoid alcohol, coffee, mint, and fat

- medical
  - antacid, H2-antagonist, PPI, prokinetic agent
- surgical (<15%)
  - consider if: volume regurgitation, patient unwilling or unable to stay on PPI indefinitely, suboptimal medical therapy, complications of GERD such as pharyngitis, esophageal stricture, recurrent nocturnal aspiration, Barrett's esophagus, patient preference
  - hiatus hernia repair and fundoplication
- anti-reflux procedure (usually laparoscopic)
  - fundus of stomach is wrapped around the lower esophagus and sutured in place
  - 360 degree wrap: Nissen Fundoplication, 270 degree wrap: Toupet, 180 degree wrap: Dor
  - complications: dysphagia, gas bloat, diarrhea, recurrence
  - dysphagia and gas bloat may be less with partial fundoplications (Toupet/Dor)
  - 90% success rate for alleviating GERD

### PARAESOPHAGEAL HIATUS HERNIA (TYPE II)
- see Figure 6
- herniation of all or part of the stomach through the esophageal hiatus into the thorax with an undisplaced GE junction
- least common esophageal hernia (<10%)

#### Clinical Features
- usually asymptomatic due to normal GE junction
- pressure sensation in lower chest, dysphagia

#### Complications
- hemorrhage, incarceration, strangulation (gastric volvulus), obstruction, gastric stasis ulcer (Cameron's lesion – causes Fe-deficiency anemia)

### MIXED HIATUS HERNIA (TYPE III)
- see Figure 6
- second most common type of hernia – combination of types I and II
- includes giant hernias or intrathoracic stomach
- rare incidence of gastric volvulus (Borschadt's Triad: chest pain, retching, inability to pass NG tube)
- majority present with long-standing Fe-deficiency anemia of unknown etiology
- symptoms commonly include reflux or heartburn
- most common symptoms: abnormal postprandial fullness after normal-sized meal, chest pain or retrosternal discomfort (gastric angina), and bloating
- can present with gastric outlet obstruction or gastric necrosis secondary to strangulation in the setting of gastric volvulus

#### Treatment
- surgery to address symptoms or treat/prevent complications
- reduce hernia and excise hernia sac, repair defect at hiatus, and anti-reflux procedure (e.g. Nissen fundoplication)
- may consider suturing stomach to anterior abdominal wall (gastropexy)
- in very elderly patients at high surgical risk consider PEG (percutaneous endoscopic gastrostomy) to anchor the stomach in the abdomen

### TYPE IV HERNIA
- herniation of stomach and other abdominal organs into thorax: colon, spleen, and small bowel
- Fe-deficiency anemia is common

## Esophageal Perforation

**Boerhaave's syndrome:** transmural esophageal perforation
**Mallory-Weiss tear:** non-transmural esophageal tear (partial thickness tear)
Both are associated with forceful emesis

**6Ss of SCC**
**S**moking
**S**pirits (alcohol)
**S**eeds (betel nut)
**S**calding (hot liquid)
**S**trictures
**S**ack (diverticula)

#### Etiology
- iatrogenic (most common)
  - endoscopic, dilatation, biopsy, intubation, operative, and NGT placement (rare)
- barogenic
  - trauma
  - repeated, forceful vomiting (Boerhaave's syndrome)
  - other: convulsions, defecation, or labour (rare)
- ingestion injury
  - foreign body or corrosive substance
- carcinoma

#### Clinical Features
- neck or chest pain
- fever, tachycardia, hypotension, dyspnea, and respiratory compromise
- subcutaneous emphysema, pneumothorax, pleural effusion, and hematemesis

#### Investigations
- CXR: pneumothorax, pneumomediastinum, pleural effusion, subdiaphragmatic air, and widened mediastinum

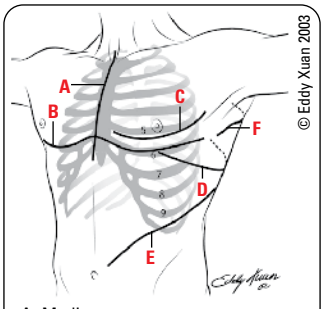
- CT chest: pneumomediastinum, pleural effusion, pneumothorax, contrast in the chest, and subcutaneous emphysema
- upper GI swallow study with water soluble contrast
  - if negative then perform with diluted barium: contrast extravasation
  - barium swallow is gold standard to diagnose esophageal perforation
  - CT esophagram useful to rule out large leaks

### Treatment
- supportive if rupture is contained (see sidebar for Cameron's criteria)
- surgical
  - <24 h from perforation
    - primary closure of a healthy esophagus with buttressed intercostal muscle flap or resection of diseased esophagus
  - >24 h from perforation or non-viable wound edges
    - diversion and exclusion followed by delayed reconstruction (i.e. esophagostomy proximally, close esophagus distally, and gastrostomy/jejunostomy for decompression/feeding)

### Complications
- sepsis, abscess, fistula, empyema, mediastinitis, and death
- post-operative esophageal leak
- mortality 10-50% dependent on timing of diagnosis

**Cameron's criteria for conservative management of esophageal perforation**
Disruption contained in mediastinum
Barium drains back into esophagus
No signs of sepsis
Minimal symptoms

## Esophageal Carcinoma



### Epidemiology
- M:F = 3:1
- onset 50-60 yr of age
- upper (20-33%), middle (33%), and lower (33-50%)
- main types
  - most common worldwide: SCC in upper 2/3 of esophagus
  - most common in Western countries: adenocarcinoma in distal 1/3 of esophagus

### Risk Factors
- SCC
  - underlying esophageal disease such as strictures, diverticula, and achalasia
  - smoking, alcohol, and hot liquids
  - more common in black and Asian populations
- adenocarcinoma
  - Barrett's esophagus (most important), smoking, obesity (increased reflux), and GERD
  - more common in Caucasian populations

### Clinical Features
- progressive dysphagia (mechanical): first solids then liquids
- odynophagia then constant pain
- constitutional symptoms
- regurgitation and aspiration (aspiration pneumonia)
- hematemesis and anemia
- direct, hematogenous, or lymphatic spread
  - trachea (coughing), recurrent laryngeal nerves (hoarseness, vocal paralysis), aortic, liver, lung, bone, celiac, and mediastinal nodes

### Investigations and Staging
- barium swallow: shows narrowing – suggestive but not diagnostic
- endoscopic biopsy and assess resectability
- both SCC and adenocarcinoma use TNM staging system but have separate stage groupings according to histology
- endoscopic U/S (EUS)
  - visualize local disease
  - regional nodal involvement (number of nodes may be more important than location)
- bronchoscopy ± thoracoscopy
  - rule out airway invasion in tumours of the upper and mid esophagus
- full metastatic workup (CXR, bone scan, CT head, CT chest/abdomen/pelvis, and LFTs, etc.)
- PET scan more sensitive than CT in detecting metastatic disease

### Treatment
- if early stage (non-transmural and without evidence of nodal disease)
  - endoscopic mucosal resection can be considered for early mucosal cancer or high grade dysplasia
  - esophagectomy (transthoracic or trans-hiatal approach) and lymphadenectomy
    - anastomosis in chest or neck
    - stomach most often used for reconstruction; may also use colon
  - adjuvant chemotherapy ± radiation usually recommended for post-operative node-positive disease

A. Median sternotomy
B. Transverse thoracotomy (clam shell)
C. Anterolateral thoracotomy
D. Lateral thoracotomy
E. Thoracoabdominal thoracotomy
F. Posterolateral thoracotomy

**Figure 7. Typical thoracic surgery incisions**

**Standard of Care in 2019:**
1) Pre- and post-operative FLOT chemotherapy for gastric and GE junction adenocarcinoma (docetaxel, oxaliplatin and fluorouracil/leucovorin)
2) Neoadjuvant CROSS chemoradiotherapy for esophageal cancer with squamous histology or mid-body adenocarcinoma (carboplatin and paclitaxel plus radiotherapy)

**Perioperative Chemo(radio)therapy vs. Primary Surgery for Resectable Adenocarcinoma of the Stomach, Gastroesophageal Junction, and Lower Esophagus**
Cochrane DB Syst Rev 2013;5:CD008107
**Study**: Review of RCTs to examine the effect of perioperative chemotherapy for gastroesophageal adenocarcinoma on survival and other clinically relevant outcomes.
**Results/Conclusions**: 14 RCTs, 2422 participants.
1) Perioperative chemotherapy was associated with a significantly longer overall survival (HR 0.81, 95% CI 0.73 to 0.89), a relative survival increase of 19% and an absolute increase of 9%.
2) Tumours of the GE junction showed a more pronounced response to perioperative chemotherapy compared to other sites.
3) Combined chemoradiotherapy was more effective for tumours of the esophagus and GE junction compared to chemotherapy alone.
4) Perioperative chemotherapy was more effective in younger patients and is associated with longer disease-free survival, higher rates of R0 resection, and a more favourable tumour stage upon resection.
5) Resection with negative margins is a strong predictor of survival.

- if locally advanced (locally invasive disease or nodal disease on CT or EUS)
  - multimodal therapy
    - concurrent external beam radiation and chemotherapy (cisplatin and 5-FU)
    - possibility of curative esophagectomy after chemoradiation if disease responds well
  - if unable to tolerate multimodal therapy or if highly advanced disease, consider palliative resection, brachytherapy, or endoscopic dilatation/stenting/laser ablation for palliation
- if present with distant metastatic disease
  - treat with systemic therapy and treat symptoms (esophageal stent)

### Prognosis
- TNM status - usually poor because presentation is usually at advanced stage

### OTHER DISORDERS
- esophageal motor disorders (see Gastroenterology, G8)
- esophageal varices (see Gastroenterology, G29)
- Mallory-Weiss tear (see Gastroenterology, G29)

## Thymoma

### Epidemiology
- rare neoplasms in thymus including both thymoma and thymic carcinoma
- patients between 40 and 60 yr
- M = F

### Risk Factors
- no known risk factors, strong association with myasthenia gravis and other paraneoplastic syndromes

### Clinical Feature
- frequently asymptomatic: incidental finding on imaging
- symptoms related to tumour size and location or myasthenia gravis: chest pain, SOB, cough, and phrenic nerve palsy
- ddx includes intrathoracic goitre, lymphoma, and other anterior mediastinal tumours (see Respirology, R22)

### Investigations
- CT chest (and/or MRI)
- Germ cell tumour markers (β-hCG, alpha fetoprotein), thyroid function, and PFTs

### Treatment
- for patients with resectable disease
  - surgical resection of thymus via median sternotomy or VATS depending on the size
  - ± post-operative radiation based on Masaoka staging
  - Masaoka I: completely encapsulated; II: invasion beyond capsule; III: into another organ; IVa pleural/pericardial mets, IVb hematogeous/lymphatic mets
  - radiation considered for stage II/III disease
- for non-surgical patients
  - multimodal therapy including neoadjuvant or palliative chemotherapy and post-operative chemoradiotherapy if de-bulking procedure feasible

### Prognosis
- depends upon stage of disease and resectability
- generally slow growing tumours and have good prognosis, however thymic carcinomas more aggressive and have poorer prognosis

## Pleura, Lung, and Mediastinum

- see Respirology, R22

## Complicated Effusion

- persistent bacteria in the pleural space but fluid is non-purulent
- neutrophils, pleural fluid acidosis (pH <7.00), and high LDH
- often no bacteria grown since rapidly cleared from pleural space
- fibrin layer leading to loculation of pleural fluid
- treatment: antibiotics depending on Gram stain and chest tube drainage

## Empyema

### Definition
- pus in pleural space or an effusion with organisms seen on a Gram stain or culture (e.g. pleural fluid is grossly purulent)
- positive culture is not required for diagnosis

### Etiology
- contiguous spread from lung infection (most commonly anaerobes) or infection through chest wall (e.g. trauma, surgery)

### Signs and Symptoms
- fever, pleuritic chest pain

### Investigations
- CT chest
- thoracentesis
  - PMNs (lymphocytes in TB) ± visible organisms on Gram stain

### Treatment
- antibiotic therapy for at least 4-6 wk (rarely effective alone)
- complete pleural drainage with chest tube
- if loculated, more difficult to drain – may require surgical drainage with video-assisted thorascopic surgery (VATS), or removal of fibrin coating (surgical or tPA/DNAse) to allow lung re-expansion (decortication)

## Pneumothorax

### Definition
- presence of air in the pleural space

### Pathophysiology
- entry of air into pleural space raises intrapleural pressure causing partial lung deflation

### Etiology
- traumatic: penetrating or non-penetrating chest injuries
- iatrogenic: central venous catheter, thoracentesis, mechanical ventilation with barotrauma
- spontaneous: no history of trauma
  - primary (no underlying lung disease)
    - spontaneous rupture of apical subpleural bleb (packets of air) of lung into pleural space
    - smoker, male, family history, Marfan's syndrome
  - secondary (underlying lung disease)
    - rupture of subpleural bleb which migrates along bronchioalveolar sheath to the mediastinum then to the intrapleural space
    - necrosis of lung tissue adjacent to pleural surface
    - pneumonia, abscess, PCP, lung CA, COPD, CF, TB, LAM, Pulmonary Langerhans cell histiocytosis (PLCH)

### Signs and Symptoms
- can be asymptomatic
- acute-onset pleuritic chest pain, dyspnea
- tachypnea, tachycardia
- tracheal deviation (contralateral deviation in tension pneumothorax)
- ipsilateral diminished chest expansion
- decreased tactile/vocal fremitus
- hyperresonance
- ipsilateral diminished breath sounds

### Investigations
- CXR
  - small: separation of visceral and parietal pleura seen as fine crescentic line parallel to chest wall at apex
  - large: decreased density and decreased volume of lung on side of pneumothorax
  - see Medical Imaging, MI9

### Treatment
- primary spontaneous pneumothorax
  - stable, small (<3 cm), minimal symptoms: observation + $O_2$
  - symptomatic or large (>3 cm): aspiration
  - unstable/tension pneumothorax: needle decompression then chest tube, and VATS if unsuccessful (25-50%)
- secondary spontaneous pneumothorax
  - stable, small (<3 cm), minimal symptoms: observation + $O_2$
  - symptomatic, large, or unstable: chest tube, and VATS if unsuccessful

# Tube Thoracostomy

## Indications

- to drain abnormal large-volume air or fluid collections in the pleural space
  - hemothorax, pleural effusion, chylothorax, and empyema
  - pneumothorax, if:
  - large or progressive
  - patient is on mechanical ventilation
  - bronchopleural fistula
  - tension pneumothorax
- to treat symptomatic and/or recurrent pleural effusion
  - see Respirology, R23
  - for long-term drainage of malignant effusions use: 1. Tunneled pleural catheter; 2. Pleural drainage and chemical pleurodesis
  - via facilitation of pleurodesis (obliteration of the pleural space by instilling talc or betadine to cause fibrosis and adherence of parietal and visceral pleura)

## Complications

- overall complications are rare (1-3%)
- malposition (most common complication), especially by inexperienced operators
  - tubes may dissect along the external chest wall, or may be placed below the diaphragm
- bleeding (anticoagulation is a relative contraindication)
- local infection, empyema
- perforation of lung parenchyma or vasculature
- risk of re-expansion pulmonary edema when large volumes of air or fluid are drawn off quickly (>1.0-1.5 L)

Tube thoracostomy can be completed under U/S guidance by an interventional radiologist or surgeon

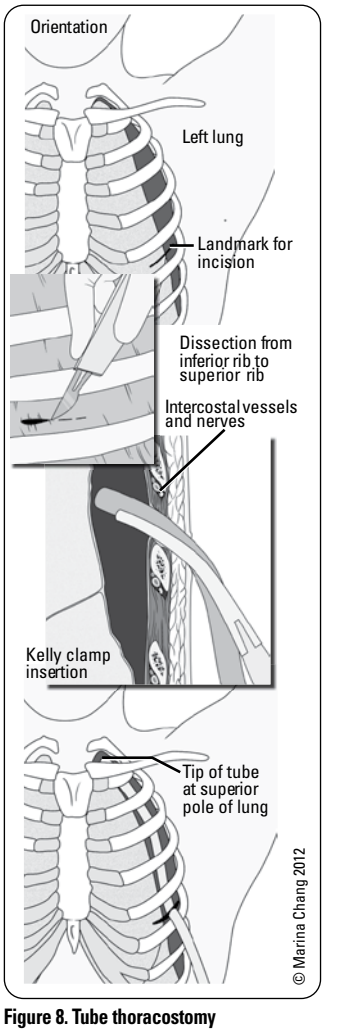


**Figure 8. Tube thoracostomy**

# Lung Cancer

## Classification

- lung tumours can be classified as primary or secondary, benign or malignant, endobronchial or parenchymal
- bronchogenic carcinoma (epithelial lung tumours) are the most common type of primary lung tumour (other types make up less than 1%)
  - small cell lung cancer (SCLC): 10-15%
  - non-small-cell lung cancer (NSCLC): 85-90%
    - squamous cell carcinoma: arise from the proximal respiratory epithelium
    - adenocarcinoma: incidence is increasing; most common subtype in nonsmokers
      - mucinous adenocarcinoma: grows along the alveolar wall in the periphery; may arise at sites of previous lung scarring
    - large cell undifferentiated cancer: diagnosis of exclusion
- benign epithelial lung tumours can be classified as papillomas or adenomas

**Table 5. Characteristics of Bronchogenic Cancer**

| Cell Type | Percentage of Bronchogenic Ca | Correlation with Smoking | Location | Histology | Metastasis | 5 Yr Survival Rates |
|---|---|---|---|---|---|---|
| **SCLC** | 10-15% | Strong | Central | Oat cell, neuroendocrine | Disseminated at presentation<br>Origin in endobronchial cells | 1% (poorest prognosis) |
| **Adenocarcinoma** | M: 35%<br>**F: 40%** | Weak | Peripheral | Glandular, mucin producing | Early, distant | 12% (60% for mucinous adenocarcinoma, a subtype, with a resectable solitary lesion) |
| **Squamous Cell Carcinoma (SCC)** | 30% | Strong | Central | Keratin, intercellular bridges | Local invasion and distant spread, may cavitate | 25% |
| **Large Cell Carcinoma** | 10-15% | Strong | Peripheral | Anaplastic, undifferentiated | Early, distant | 13% |

## Risk Factors

- cigarette smoking: the relative risk of developing lung cancer is 10-30 times higher for smokers than for nonsmokers
- risk of lung cancer increases with number of cigarettes smoked per day (linear) and duration of smoking (exponential)
- other risk factors include cigar smoking, pipe smoking, second-hand smoke, asbestos without smoking (relative risk is 5), asbestos with smoking (relative risk is 92), metals (e.g. chromium, arsenic, nickel), radon gas, ionizing radiation, and genetics

**Canadian Task Force on Preventative Health (2016)**
Screening with low-dose CT recommended for high-risk patients only:
- 55-74 years of age
- ≥30 pack yr smoking Hx
- AND, are a current smoker or quit within last 15 yr

Annual screening low-dose CT up to 3 years ONLY in centres with expertise in diagnosis and treatment of lung cancer

## Signs and Symptoms

- may be due to primary lesion, metastasis, or paraneoplastic syndrome
- primary lesion
  - cough (75%): beware of chronic cough that changes in character
  - dyspnea (60%)
  - chest pain (45%)
  - hemoptysis (35%)
  - other pain (25%)
  - clubbing (21%)
  - constitutional symptoms: anorexia, weight loss, fever, and fatigue
- metastasis
  - lung, hilum, mediastinum, pleura: pleural effusion, atelectasis, wheezing, postobstructive pneumonia
  - pericardium: pericardial effusion, pericardial tamponade
  - esophageal compression: dysphagia
  - phrenic nerve: paralyzed diaphragm
  - recurrent laryngeal nerve: hoarseness
  - superior vena cava syndrome
    - obstruction of SVC causing neck and facial swelling, as well as dyspnea and cough
    - other symptoms: hoarseness, tongue swelling, epistaxis, and hemoptysis
    - physical findings: dilated neck veins, increased number of collateral veins covering the anterior chest wall, cyanosis, edema of the face, arms, and chest, Pemberton's sign (facial flushing, cyanosis, and distension of neck veins upon raising both arms above head)
    - milder symptoms if obstruction is above the azygos vein
  - lung apex (Pancoast tumour): Horner's syndrome, brachial plexus palsy (most commonly C8 and T1 nerve roots)
  - rib and vertebrae: erosion
  - distant metastasis to brain, bone, liver, and adrenals
- paraneoplastic syndromes
  - a group of disorders associated with malignant disease, not related to the physical effects of the tumour itself
  - most often associated with SCLC

Malignant lung tumours are the most common cause of cancer mortality throughout the world in both men and women

**Horner has a MAP of the Coast**
A Pancoast tumour compresses the cervical sympathetic plexus causing a Horner's syndrome:
**M**iosis
**A**nhydrosis
**P**tosis

**Endobronchial Ultrasound (EBUS)**
- Allows visualization of peri-bronchial structures and distal peripheral lung lesions
- Provides detailed assessment of the airway wall layers
- Allows for guided biopsies of lymph nodes and tumours
- Used for diagnosis and staging

**Table 6. Paraneoplastic Syndromes**

| System | Clinical Feature | Associated Malignancy |
|---|---|---|
| **Skeletal** | Clubbing, hypertrophic pulmonary osteoarthropathy (HPOA) | Non-small cell lung cancer (NSCLC) |
| **Dermatologic** | Acanthosis nigricans<br>Dermatomyositis | Bronchogenic cancer<br>Bronchogenic cancer |
| **Endocrine** | Hypercalcemia (osteolysis or PTHrP)<br>Hypophosphatemia<br>Hypoglycemia<br>Cushing's syndrome (ACTH)<br>Somatostatinoma syndrome<br>SIADH | Squamous cell cancer<br>Squamous cell cancer<br>Sarcoma<br>Small cell lung cancer (SCLC)<br>Bronchial carcinoid<br>SCLC |
| **Neuromyopathic** | Lambert-Eaton syndrome<br>Polymyositis<br>Subacute cerebellar degeneration<br>Spinocerebellar degeneration<br>Peripheral neuropathy | SCLC |
| **Vascular/Hematologic** | Nonbacterial endocarditis<br>Trousseau's syndrome (migratory thrombophlebitis)<br>DIC | Bronchogenic cancer<br>NSCLC |
| **Renal** | Nephrotic syndrome | |

2/3 of primary lung cancer is found in the upper lung; 2/3 of metastases occur in the lower lung (hematogenous spread secondary to increased blood flow to the base of the lung)

**Postoperative Radiotherapy for NSCLC**
Cochrane DB Syst Rev 2016;10:CD002142
**Objective**: Evaluate effects of postoperative radiotherapy on survival and recurrence in patients with completely resected NSCLC.
**Methods**: MEDLINE and CANCERLIT searches and trial registers for trials of surgery vs. surgery plus radiotherapy in patients with NSCLC.
**Results**: 14 trials, 2343 participants. Postoperative radiotherapy had a significant adverse effect on survival (HR 1.18, 95% CI 1.07-1.31). This was equivalent to an absolute detriment of 5% at two years, reducing survival from 58 to 55%. Postoperative radiotherapy increased risk of recurrence (HR 1.10, 95% CI 0.99-1.21).
**Conclusions**: Postoperative radiotherapy is detrimental to those with completely resected NSCLC and should not be used in the routine treatment.

## Investigations

- initial diagnosis
  - imaging: CXR, CT chest + upper abdomen, PET scan
  - cytology: sputum
  - biopsy: bronchoscopy, EBUS, CT-guided percutaneous needle biopsy, mediastinoscopy
- staging workup
  - TNM staging system: T – primary tumour (size); N – regional lymph nodes; M – distant metastasis
  - blood work: electrolytes, LFTs, calcium, ALP
  - imaging: CXR, CT thorax and upper abdomen, bone scan, neuroimaging, PET scan
  - invasive: bronchoscopy (EBUS), mediastinoscopy, mediastinotomy, thoracotomy
  - screen adenocarcinoma for EGFR and ALK mutations

**Table 7. SCLC vs. NSCLC**

| | Stage | Definition | Treatment | Median Survival |
|---|---|---|---|---|
| **SCLC** | Limited stage | Confined to single radiation port (one hemithorax and regional lymph nodes) | Radiation ± chemotherapy ± prophylactic to brain | 1-2 yr (12 wk without treatment) |
| | Extensive stage | Extension beyond a single radiation port | Chemotherapy | 6 mo (5 wk without treatment) |
| | **Stage** | **TNM** | **Treatment** | **5 Yr Survival (%)*** |
| **NSCLC** | 0 | TisN0M0 | 1st line is complete surgical resection (VATS or open thoracotomy) with possible post-operative adjuvant chemotherapy with stage IB and stage II; radiotherapy for non-surgical candidates | 50 -73 |
| | IA | T1a-1bN0M0 | | 43-58 |
| | IB | T2aN0M0 | | 36-46 |
| | IIA | T1a-T2a,N1M0 or T2bN0M0 | | |
| | IIB | T2bN1M0 or T3N0M0 | | 25-36 |
| | IIIA | T1a-T2bN2M0 or T3N1-2M0 or T4N0-1M0 | Combined modality approach (chemotherapy, radiation therapy and sometimes surgical resection) | 19-24 |
| | IIIB | T4N2M0 or T1-4N3M0 | | 7-9 |
| | IV | T1-4N0-3M1a-1b | Systemic therapy or molecularly targeted therapy or symptom-based palliative management (radiation); isolated metastasis may be resected | 2-13 |

* Depends on clinical vs. pathologic stage  Refer to AJCC Cancer Staging Manual, 7th ed. 2010 for complete TNM classification

### Treatment

- options include surgery, radiotherapy, chemotherapy, and palliative care for end-stage disease
- surgery not usually performed for SCLC since it is generally non-curable
- contraindications for surgery
  - spread to contralateral lymph nodes or distant sites
    - patients with potentially resectable disease must undergo mediastinal node sampling since CT thorax is not accurate in 20-40% of cases
  - poor pulmonary status (e.g. unable to tolerate resection of lung)
    - post-op estimated $FEV_1$ and DLCO must be at least 40% of predicted to tolerate surgery
- chemotherapy (used in combination with other treatments)
  - common agents: etoposide, platinum agents (e.g. cisplatinum), ifosfamide, vincristine, anthracyclines, paclitaxel, irinotecan, gefitinib (an endothelial growth factor receptor inhibitor)
  - complications
    - acute: tumour lysis syndrome, infection, bleeding, myelosuppression, hemorrhagic cystitis (cyclophosphamide), cardiotoxicity (doxorubicin), renal toxicity (cisplatin), peripheral neuropathy (vincristine)
    - chronic: neurologic damage, leukemia, additional primary neoplasms

**Prevention**
Smoking cessation
Avoidance of exposures
Early detection

**Terminology**
- "nodule" <3 cm
- "mass" >3 cm

**Hamartomas**
- 10% of benign lung lesions
- Composed of tissues normally present in lung (fat, epithelium, fibrous tissue, and cartilage), but they exhibit disorganized growth
- Peak incidence is age 60, more common in men
- Usually peripheral and clinically silent
- CXR shows clustered "popcorn" pattern of calcification (pathognomonic for hamartoma)

Adenocarcinoma present in a non-smoker may be due to endothelial growth factor receptor mutation

**Corona Radiata Sign on Chest CT**
- Fine striations that extend linearly from a nodule in a spiculated fashion
- Highly associated with malignancy

**Carcinoids**
- Early onset (40-60 yr)
- Most are central and can produce symptoms and signs of bronchial obstruction
- Hemoptysis is present in ~50% of cases

# Approach to the Solitary Pulmonary Nodule

- see Medical Imaging, MI7

### Definition

- a round or oval, sharply circumscribed radiographic lesion up to 3 cm, which may or may not be calcified, and is surrounded by normal lung
- can be benign or malignant

Pulmonary neoplasms may present as a solitary pulmonary nodule identified incidentally on a radiographic study (~10% of cases) or as symptomatic disease (most cases)

**Table 8. Differential Diagnosis for Benign vs. Malignant Solitary Nodule**

| Benign (70%) | Malignant (30%) | |
|---|---|---|
| **Infectious granuloma** (histoplasmosis, coccidiomycosis, TB, atypical mycobacteria) - most common<br>**Other infections** (bacterial abscess, PCP, aspergilloma)<br>**Benign neoplasms** (hamartoma, lipoma, fibroma)<br>**Vascular** (AV malformation, pulmonary varix)<br>**Developmental** (bronchogenic cyst)<br>**Inflammatory** (granulomatosis with polyangiitis, rheumatoid nodule, sarcoidosis, amyloidosis)<br>**Other** (infarct, pseudotumour, rounded atelectasis, lymph nodes, amyloidoma) | **Bronchogenic carcinoma**<br>Adenocarcinoma<br>Squamous cell carcinoma<br>Large cell carcinoma<br>Small cell carcinoma | **Metastatic lesions**<br>Breast<br>Head and neck<br>Melanoma<br>Colon<br>Kidney<br>Sarcoma<br>Germ cell tumours<br>Pulmonary carcinoid |

### Investigations
- CXR: always compare with previous CXR
- CT densitometry and contrast enhanced CT of thorax
- sputum cytology: usually poor yield
- biopsy (bronchoscopic or percutaneous) or excision (thoracoscopy or thoracotomy): if clinical and radiographic features do not help distinguish between benign or malignant lesion
  - if at risk for lung cancer, biopsy may be performed regardless of radiographic features
  - if a biopsy is non-diagnostic, whether to observe, re-biopsy, or resect will depend on the level of suspicion
- watchful waiting: repeat CXR and/or CT scan at 3, 6, 12 mo
- PET scan can help distinguish benign from malignant nodules

**Table 9. CT Characteristics of Benign vs. Malignant Solitary Nodule**

| Parameters | Benign | Malignant |
|---|---|---|
| **Size** | Nodule (<3 cm) | Mass (>3 cm) |
| **Borders** | Smooth or lobulated | Irregular or spiculated |
| **Features** | Calcified pattern: diffuse, central, laminated, "popcorn" pattern if hamartoma, usually no cavitation; if cavitating, wall is smooth and thin, no other lung pathology | Usually not calcified; if calcified, pattern is eccentric, stippled, no satellite lesions, cavitation with thick wall, may have pleural effusions, lymphadenopathy |
| **Doubling Time** | Doubles in <20 or >400 d | Doubles between 20 and 400 d |

**Table 10. Evaluation of a Solitary Pulmonary Nodule**

| SOLID NODULES | | | |
|---|---|---|---|
| **Nodule Type** | **Size <6 mm (<100 mm²)** | **Size 6-8 mm (100-250 mm²)** | **Size >8 mm (>250 mm²)** |
| **Single** | | | |
| **Low Risk** | No routine follow-up | CT at 6-12 mo, then consider CT at 18-24 mo | Consider CT a 3 mo, PET/CT or tissue sampling |
| **High Risk** | Optional CT at 12 mo | CT at 6-12 mo then at 18-24 mo | Consider CT a 3 mo, PET/CT or tissue sampling |
| **Multiple** | | | |
| **Low Risk** | No routine follow-up | CT at 3-6 mo, then consider CT at 18-24 mo | CT at 3-6 mo, then consider CT at 18-24 mo |
| **High Risk** | Optional CT at 12 mo | CT at 3-6 mo then at 18-24 mo | CT at 3-6 mo then at 18-24 mo |

| SUBSOLID NODULES | | |
|---|---|---|
| **Nodule Type** | **Size <6 mm (<100 mm²)** | **Size ≥6 mm (>100 mm²)** |
| **Single** | | |
| **Ground Glass** | No routine follow-up | CT at 6-12 mo to confirm persistence then CT every 2 yr until 5 yr |
| **Part Solid** | No routine follow-up | CT at 3-6 mo to confirm persistence<br>If unchanged and solid component remains <6 mm, annual CT should be performed for 5 yr |
| **Multiple** | CT at 3-6 mo. If stable consider CT at 2 and 4 yr | CT at 3-6 mo.<br>Subsequent management based on the most suspicious nodule(s) |

Adapted from: MacMahon H, Naidich DP, Goo JM, et al. Guidelines for Management of Incidental Pulmonary Nodules Detected on CT Images. The Fleischner Society 2017. Radiology Journal. doi:10.1148/radiol.2017161659. Feb 23 2017.

# Lung Transplantation

### Conditions Leading to Transplantation
- chronic acquired lung disease: COPD
- genetic: CF, and emphysema due to α-1 antitrypsin deficiency
- idiopathic interstitial pneumonias: IPF, and nonspecific interstitial pneumonitis
- HTN-related: idiopathic pulmonary arterial HTN (IPAH), secondary pulmonary HTN, and Eisenmenger's syndrome
- other: sarcoidosis, lymphangioleiomyomatosis, and pulmonary Langerhans cell histiocytosis

### Clinical Indications
- transplantation should be considered for patients with advanced lung disease refractory to maximal medical or surgical therapy
- patients who are symptomatic during activities of daily living and have risk of death >50% over the next 2 yr

### Criteria for Transplantation
- lung allocation score based on: 1) post-transplant survival measure, and 2) waiting list urgency measure
- transplant benefit = post-transplant survival (days) – waitlist survival (days)

### Contraindications
- unstable medical condition such as acute sepsis or poorly controlled dysfunction of another organ system (e.g. heart, liver, kidney or brain)
- malignancy in the last 2 yr
- uncorrected CAD with end organ ischemia or CAD not amenable to revascularization
- significant chest wall/spinal deformity
- active cigarette smoking, and BMI ≥35
- HIV infection, ongoing HBV, HCV, or TB infections
- inadequate social supports, functional limitation to participate in rehab, psychological issues reducing compliance with medical regimen

### Post-Operative Complications
- primary graft dysfunction (main cause is ischemia-reperfusion injury)
- airway anastomotic complications (focal infection, bronchial necrosis and dehiscence, excess granulation tissue, tracheobronchomalacia, stenosis, and fistula)
- chronic graft dysfunction (bronchiolitis obliterans syndrome, and restrictive allograft syndrome)
- infectious complications (bacterial, fungal, CMV, community-acquired respiratory viruses, and mycobacteria)
- malignancy (non-melanoma skin cancer, post-transplant lymphoproliferative disease, colon, breast, Kaposi's sarcoma, and bladder)

### Prognosis
- median survival for all adult recipients: 5.7 yr
- 1 yr survival: COPD > IPF > IPAH
- 10 yr survival: CF, α-1 antitrypsin deficiency > IPAH > COPD, IPF

## Chronic Obstructive Pulmonary Disease

- see Respirology, R9

### Treatment
- indications for surgical management
  - dyspnea despite maximal medical therapy and pulmonary rehabilitation
  - CT showing hyperinflation and heterogeneously distributed emphysema predominant in the upper lung zone
  - may be used as a bridging procedure to lung transplantation
- contraindications
  - age >75, cigarette smoking within the prior 6 mo, higher risk of surgical mortality
  - homogeneously distributed emphysematous changes without areas of preserved lung tissue
  - diffusing capacity of lung for carbon monoxide <20% of predicted, $PaCO_2$ >60 mmHg, $PaO_2$ <45 mmHg
- surgical procedures
  - lung volume reduction surgery: wedge excision of emphysematous tissue
  - bilateral or unilateral, thoracotomy or VATS

**Long-Term Survival Analysis of the Canadian Lung Volume Reduction Surgery Trial**
Ann Thorac Surg 2013;96:1217-1222
**Study**: Retrospective observational study assessing the long-term survival of patients enrolled in the CLVRS at 8-10 yr follow-up.
**Results/Conclusions**: Compared with the best medical care group, patients in the LVRS group showed a 16-mo survival advantage and a 20% reduction in mortality. Although not statistically significant, LVRS may provide long-term benefits in the treatment of end-stage emphysema.

### Complications of Treatment
- air leak: may require reintubation and mechanical ventilation
- arrhythmias, pneumonia

### Prognosis
- worse early mortality but better exercise capacity and quality of life with LVRS

# Stomach and Duodenum

## Peptic Ulcer Disease

### GASTRIC ULCERS

- see Gastroenterology, G11

#### Indications for Surgery

- refractory to medical management
- suspicion of malignancy (even if biopsy benign)
- complications of PUD: obstruction, perforation, and bleeding (3x greater risk compared to duodenal ulcers)
- surgery increasingly rare due to H. pylori eradication, medical treatment and endoscopic treatments (injection therapy with adrenaline, polidocanol or fibrin glue) or coagulation therapy (heater probe or argon plasma)

#### Procedures

- ligation of bleeding vessels
- distal gastrectomy with ulcer excision: Billroth II, Roux-en-Y gastrojejunostomy or Billroth I (rarely) reconstruction
- vagotomy and pyloroplasty only if acid hypersecretion (very rare)
- wedge resection if possible
- biopsy for suspicion of malignancy, followed by gastroscopy to minimize further bleeding and aid with healing

### DUODENAL ULCERS

- see Gastroenterology, *Bleeding Peptic Ulcer*, G12, and *Peptic Ulcer Disease*, G11
- most within 2 cm of pylorus (duodenal bulb)

#### Indications for Surgery

- hemorrhage, rebleed in hospital, perforation, gastric outlet obstruction
- refractory to medical and endoscopic management

#### Procedures

- omental (Graham) patch: plication of ulcer supported by overlying omental patch
- oversewing of bleeding ulcer ± pyloroplasty
- treat with *H.plyori* eradication protocol post operatively

#### Complications of Gastric Surgery

- retained antrum
- fistula (gastrocolic/gastrojejunal)
- dumping syndrome, postvagotomy diarrhea, afferent loop syndrome

**Table 11. Complications of Duodenal Ulceration**

| Complication | Clinical Features | Management |
|---|---|---|
| **Perforated Ulcer** (typically on anterior surface) | Sudden onset of pain (possibly in RLQ due to track down right paracolic gutter)<br>Acute abdomen: rigid, diffuse guarding<br>Ileus<br>Initial chemical peritonitis followed by bacterial peritonitis | Investigation<br>CXR – free air under diaphragm (70% of patients)<br><br>Treatment<br>Oversew ulcer (plication) and omental (Graham) patch – most common treatment |
| **Penetration to Nearby Organs** | Elevated amylase/lipase if penetration into pancreas<br>Elevated hepatic transaminases if penetration into liver (rare, but serious)<br>Constant mid-epigastric pain burrowing into back, unrelated to meals | |
| **Hemorrhage** (typically on posterior surface) | Gastroduodenal artery involvement | Resuscitation initially with crystalloids; blood transfusion if necessary<br>Diagnostic and/or therapeutic endoscopy (laser, cautery, or injection); if recurs, may have second scope<br>Consider interventional radiology: angiography with embolization/coiling<br>Surgery if severe or recurrent bleeding, hemodynamically unstable, or failure of endoscopy and IR: oversewing of ulcer, pyloroplasty |
| **Gastric Outlet Obstruction** | Ulcer can lead to edema, fibrosis of pyloric channel, and neoplasm<br>N/V (undigested food, non-bilious), dilated stomach, and crampy abdominal pain<br>Succussion splash (splashing noise heard with stethoscope over the stomach when patient is shaken)<br>Auscultate gas and fluid movement in obstructed organ | NGT decompression and correction of hypochloremic, hypokalemic metabolic alkalosis<br>Medical management initially: high dose PPI therapy<br>Surgical resection if obstruction does not resolve: either Billroth I, pyloroplasty, or gastrojejunostomy |

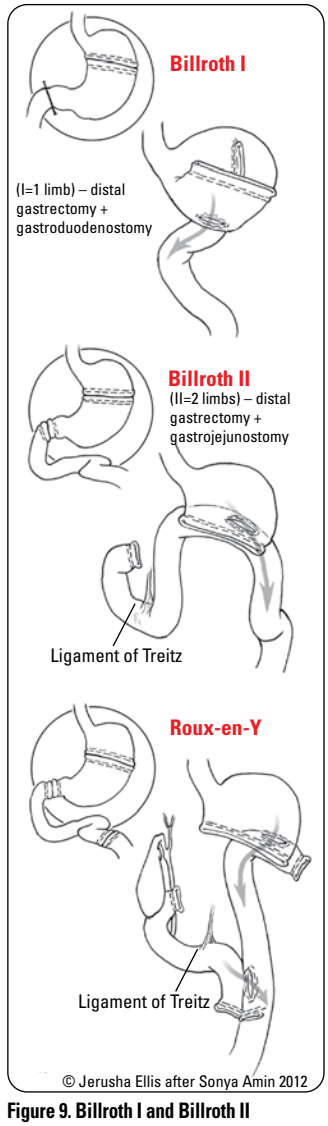

**Figure 9. Billroth I and Billroth II with Roux-en-Y reconstruction (gastrojejunostomy)**

**Kissing Ulcer**: combination of perforation and bleeding

# Gastric Carcinoma

## Epidemiology
- 5th most common cancer in the world
- M:F = 3:2
- most common age group = 50-59 yr
- incidence has decreased by 2/3 in past 50 yr
- incidence of adenocarcinoma <10 (US) vs. 40 (Japan, Korea) per 100,000 (incidence highest in Asia, Latin America, and Caribbean)

**Signs of Metastatic Gastric Carcinoma**
**Virchow's node**: left supraclavicular node
**Blumer's shelf**: mass in pouch of Douglas
**Krukenberg tumour**: metastases to ovary
**Sister Mary Joseph node**: umbilical metastases
**Irish's node**: left axillary nodes

## Risk Factors
- compensatory epithelial cell proliferation via gastric atrophy from:
  - *H. pylori*, causing chronic atrophic gastritis
  - pernicious anemia associated with achlorhydria and chronic atrophic gastritis
  - previous partial gastrectomy (>10 yr post-gastrectomy)
- host-related factors
  - blood type A
  - hereditary nonpolyposis colorectal cancer (HNPCC), hereditary diffuse gastric carcinoma (HDGC)
  - gastric adenomatous polyps
  - hypertrophic gastropathy
  - genetic syndromes: hereditary diffuse gastric cancer E-cahedrin (CDH-1) gene
- patient and lifestyle factors: high BMI, smoking, alcohol, smoked food, and nitrosamines

## Clinical Features
- clinical suspicion
  - ulcer fails to heal
  - lesion on greater curvature of stomach or cardia
- asymptomatic, insidious, or late onset of symptoms
  - postprandial abdominal fullness, pseudoachalasia (in older patients), vague epigastric pain
  - anorexia or weight loss
  - burping, N/V, dyspepsia, and dysphagia
  - hepatomegaly, epigastric mass (25%)
  - hematemesis, fecal occult blood, melena, and iron-deficiency anemia
- metastasis
  - peritoneum, ovarian, liver, lung, and brain

**Staging and 5 Yr Survival Rates for Gastric Cancer**

| Stage | TNM | 5-Yr Survival |
|---|---|---|
| IA | T1N0M0 | 71% |
| IB | T2N0M0 | 57% |
| | T1N1M0 | |
| IIA | T3N0M0 | 45% |
| | T2N1M0 | |
| | T1T2M0 | |
| IIB | T4aN0M0 | 33% |
| | T3N1M0 | |
| | T2N2M0 | |
| | T1N3M0 | |
| IIIA | T4aN1M0 | 20% |
| | T3T2M0 | |
| | T2N3M0 | |
| IIIB | T4bN0M0 | 14% |
| | T4bN1M0 | |
| | T4aN2M0 | |
| | T3N3M0 | |
| IIIC | T4bN2M0 | 9% |
| | T4bN3M0 | |
| | T4aN3M0 | |
| IV | TxNxM1 | 4% |

## Investigations
- OGD and biopsy; consider EUS to assess pre-operative T-stage and N-stage
- CT chest/abdomen/pelvis (for Metastatic Workup see Table 14)

**Table 12. TNM Classification System for Staging of Gastric Carcinoma (AJCC/IUCC 2017, 8th edition)**

| Primary Tumour (T) | | Regional Lymph Nodes (N) | | Distant Metastasis (M) | |
|---|---|---|---|---|---|
| TX | Primary tumour cannot be assessed | NX | Cannot be assessed | M0 | No distant metastasis |
| T0 | No evidence of primary tumour | N0 | No regional node metastasis | M1 | Distant metastasis |
| Tis | *Carcinoma in situ* | N1 | Metastasis in 1-2 regional nodes | | |
| T1a | Invasion into lamina propria or muscularis mucosae | N2 | Metastasis in 3-6 regional nodes | | |
| T1b | Invasion into submucosa | N3a | Metastasis in 7-15 regional nodes | | |
| T2 | Invasion into muscularis propria | N3b | Metastasis in ≥16 regional nodes | | |
| T3 | Penetration of subserosal connective tissue without tissue invasion of visceral peritoneum or adjacent structures | | | | |
| T4a | Invasion into serosa | | | | |
| T4b | Invasion into adjacent structures | | | | |

## Treatment
- adenocarcinoma
  - proximal lesions
    - total gastrectomy and Roux-en-Y esophagojejunostomy
  - distal lesions
    - subtotal gastrectomy: wide margins, en bloc removal of omentum and lymph nodes with Roux-en-Y or Billroth II reconstruction
  - adjuvant therapies
    - perioperative chemotherapy or post-operative chemoradiotherapy in addition to surgery is standard of care in curative intent strategy
  - palliation
    - limited gastric resection or endoscopic stenting to decrease bleeding and relieve obstruction, enables the patient to eat
    - radiation therapy
    - studies are showing larger role for adjuvant/neoadjuvant and palliative chemotherapy
- lymphoma
  - *H. pylori* eradication, chemotherapy ± radiation, and surgery in limited cases (perforation, bleeding, and obstruction)

# Gastrointestinal Stromal Tumour

## Epidemiology
- most common mesenchymal neoplasm of GI tract
- derived from interstitial cells of Cajal (cells associated with Auerbach's plexus that have autonomous pacemaker function which coordinate peristalsis throughout the GI tract)
- 75-80% associated with tyrosine kinase (c-KIT) mutations
- most common in stomach (50%) and proximal small intestine (25%), but can occur anywhere along GI tract
- typically present with vague abdominal mass, feeling of abdominal fullness, or with secondary symptoms of bleeding and anemia
- often discovered incidentally on CT, laparotomy, or endoscopy

## Risk Factors
- Carney's triad: GISTs, paraganglioma, and pulmonary chondroma
- Type I neurofibromatosis

## Investigations
- pre-operative biopsy (endoscopic ultrasound): useful for indeterminate lesions (not recommended if high index of suspicion for GIST)
- contrast-enhanced CT is preferred Imaging for screening and staging; MRI if IV contrast not feasible

## Treatment
- surgical resection if >2 cm; follow with serial endoscopy if <2 cm and resect if growing or symptomatic
- localized GIST
  - surgical resection with preservation of intact pseudocapsule
  - lymphadenectomy NOT required, as GISTs rarely metastasize to lymph nodes
  - consider adjuvant treatment with imatinib (Gleevec) if high risk of relapse (large, >4 cm with significant mitotic activity)
- advanced disease (i.e. metastases to liver and/or peritoneal cavity)
  - palliative intent chemotherapy with imatinib
  - metastectomy may be considered for liver limited disease

## Prognosis
- risk of metastatic potential depends on
  - tumour size (worse if >10 cm)
  - mitotic activity (worse if >5 mitotic figures or 50/hpf)
  - degree of nuclear pleomorphism
  - location: with identical sizes, extra-gastric location has a higher risk of progression than GISTs in the stomach
- metastases to liver, omentum, peritoneum; nodal metastases rare

**Neoadjuvant Chemotherapy in Advanced Gastric and Esophago-Gastric Cancer. Meta-Analysis of Randomized Trials**
Int J Surg 2018;51:120-127
**Study**: Meta-analysis evaluating the effects of neoadjuvant chemotherapy on advanced gastric cancer.
**Results**: Neoadjuvant chemotherapy and resection reduces overall mortality at 3 and 5-years in advanced gastric cancer (RR = 0.74; 0.82 respectively). Morbidity and perioperative mortality rate are not influenced by NACT. Recurrence rate is reduced by NACT + surgery in EGC (RR = 0.80).

**Extent of Lymph Node Dissection for Adenocarcinoma of the Stomach**
Cochrane DB Syst Rev 2015;12:CD001964
**Study**: Systematic review and meta-analysis on the evidence that existed regarding the impact of the three main types of progressively more extended lymph node dissection (that is, D1, D2 and D3 lymphadenectomy) on the clinical outcome of patients with primary resectable carcinoma of the stomach.
**Results/Conclusions**: Data suggested no significant difference in overall survival between D2 and D3 type dissection. There was no significant difference in overall survival between D1 and D2 type node dissection. In contrast, D2 lymphadenectomy was associated with a significantly better disease specific survival compared to D1 lymphadenectomy but was also associated with a higher postoperative mortality rate.

# Bariatric Surgery

- weight reduction surgery for morbid obesity
- indications: BMI ≥40 without illness or BMI ≥35 with 1+ serious comorbidity (e.g. DM, CAD, sleep apnea, GERD, or severe joint disease)

## Surgical Options
- combination malabsorptive and restrictive
  - laparoscopic Roux-en-Y gastric bypass (most common, most effective; higher complication rates)
    - small gastric pouch (restrictive), from distal stomach, anastomosed with Roux limb of small bowel (malabsorptive); connect to biliopancreatic limb to maintain digestive enzymes and bile
  - restrictive laparoscopic sleeve gastrectomy (only consider for severe obesity)
    - creation of tubular stomach via removal of majority of greater curvature
  - laparoscopic adjustable gastric banding (modest expected weight loss, declining in popularity)
    - inflatable silicone band around fundus, adjustable via subcutaneous port
- malabsorptive
  - biliopancreatic diversion with duodenal switch
    - anastomosis of stomach to distal ileum, anastamosis of biliopancreatic limb to terminal Ileum

## Complications
- perioperative mortality ~1% (anastomotic leak with peritoneal signs, PE)
- obstruction at enteroenterostomy (see *Complications of Gastric Surgery*, GS18)
- staple line dehiscence
- dumping syndrome
- cholelithiasis due to rapid weight loss (20-30%)
- band abscess (if long-term)

**Surgery for Weight Loss in Adults**
Cochrane DB Syst Rev 2014;8:CD003641
**Study**: This is an update of a Cochrane review first published in 2003 assessing the effects of bariatric surgery and control of comorbidities.
**Conclusions**: Surgery resulted in decreased BMI one to two years post-op. 3 RCTs found that laparoscopic Roux-en-Y gastric bypass achieved significantly greater weight loss and body mass index (BMI) reduction up to five years after surgery compared with laparoscopic adjustable gastric banding (mean difference -5.2 kg/m$^2$; 95% CI -6.4 to -4.0). More patients experienced remission of diabetes, however, different definitions used. Risks of surgery include leaks, hernias, infection, pulmonary embolism, cholecystitis, and post-operative mortality.

# Complications of Gastric Surgery

- most resolve within 1 yr

### Alkaline Reflux Gastritis
- duodenal contents (bilious) reflux into stomach causing gastritis ± esophagitis
- treatment
  - medical: H2-blocker, metoclopramide, cholestyramine (bile acid sequestrant)
  - surgical: conversion of Billroth I or II to Roux-en-Y

### Afferent Loop Syndrome
- accumulation of bile and pancreatic secretions causes intermittent mechanical obstruction and distention of afferent limb
- clinical features
  - early postprandial distention, RUQ pain, nausea, bilious vomiting, anemia
- treatment: surgery (conversion to Roux-en-Y increases afferent loop drainage)

### Dumping Syndrome
- early: 15-30 min post-prandial
  - etiology
    - rapid emptying of hyperosmotic chyme leads to jejunal distention, stimulating release of vasoactive hormones
  - clinical features
    - post-prandial epigastric cramping, bloating, emesis, nausea, and vasomotor symptoms (dizziness, palpitations, tachycardia, diaphoresis)
  - treatment
    - frequent small meals high in fibre and protein, low in carbohydrates; avoidance of liquids with meals
    - last resort is interposition of antiperistaltic jejunal loop between stomach and small bowel to delay gastric emptying
- late: 3 h post-prandial
  - etiology: hypoglycemia following postprandial insulin peak
  - treatment: small snack 2 h after meals

### Blind-Loop Syndrome
- bacterial overgrowth of colonic Gram-negative bacteria in afferent limb
- clinical features
  - anemia/weakness, diarrhea, malnutrition, abdominal pain, and hypocalcemia
- treatment: broad-spectrum antibiotics, and surgery (conversion to Billroth I)

### Postvagotomy Diarrhea
- up to 25%
- bile salts in colon inhibit water resorption
- treatment: medical (cholestyramine), and surgical (reversed interposition jejunal segment)

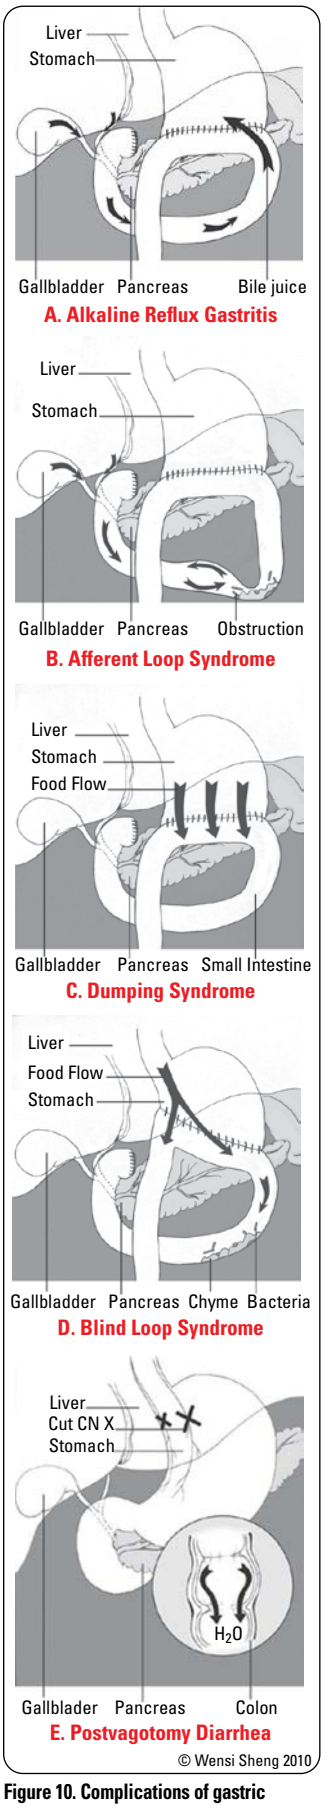

**Figure 10. Complications of gastric surgery**

# SMALL INTESTINE

# Small Bowel Obstruction

## Mechanical Small Bowel Obstruction

### Pathophysiology
- obstruction → gas and fluid (swallowed or GI secretions) accumulate proximal to site of obstruction and distal decompression → intestinal activity increases to overcome obstruction → colicky pain and diarrhea (initially)
- bowel wall edema and disruption of normal bowel absorptive function can lead to increased intraluminal fluid, transudative fluid loss into peritoneal cavity, and electrolyte disturbances, which is worsened by vomiting
- increase intramural pressure can lead to impaired microvascular perfusion leading to intestinal ischemia and necrosis (strangulated bowel obstruction)

### Etiology

**Table 13. Common Causes of SBO**

| Intraluminal | Intramural | Extramural |
|---|---|---|
| Intussusception | Crohn's | Adhesions from previous surgeries (75% SBO) |
| Gallstones | Radiation stricture | Incarcerated hernia |
| Bezoars | Adenocarcinoma | Peritoneal carcinomatosis |

- three types
  - partial SBO: only a portion of intestinal lumen is occluded, allows passage of some gas & fluid, low risk of strangulation
  - complete SBO: the lumen of the intestine is occluded, no passage of gas or stool, at higher risk of strangulation
  - closed-loop obstruction: segment of intestine is obstructed both proximally and distally (e.g. volvulus), leading to rapid rise in intraluminal pressure from gas and fluid that cannot escape, high risk of strangulation due to bowel wall ischemia

## Risk Factors
- prior abdominal or pelvic surgery
- abdominal wall or groin hernia
- history of malignancy
- prior radiation

## Clinical Features
- 1) distinguish mechanical obstruction from ileus; 2) determine likely and easily reversible etiology of obstruction; 3) differentiate complicated (e.g. strangulated) obstruction
- symptoms: colicky abdominal pain, nausea/vomiting, obstipation
  - more feculent vomitus suggests more established obstruction because of bacterial overgrowth
  - passage of gas and/or stool that continues 6-12 h after onset of symptoms suggests partial rather than complete obstruction
- signs: abdominal distention (most prominent if obstruction at distal ileum), hyperactive proceeding to minimal bowel sound
- strangulated obstruction: abdominal pain disproportionate to physical exam findings suggest intestinal ischemia
  - may have tachycardia, localized abdominal tenderness, fever, marked leukocytosis, and lactate acidosis

## Investigations
- radiological
  - abdominal x-ray (3 views): triad of dilated small bowel (>3 cm in diameter), air-fluid levels on upright film, paucity of air in colon (high sensitivity, low specificity as ileus and LBO can present similarly)
  - CT: discrete transition zone/point with proximal bowel dilation, distal bowel decompression, and intraluminal contrast does not pass the transition zone
    - most importantly to rule out ischemic bowel/strangulation: pneumatosis intestinalis (free air in bowel wall) and thickened bowel wall, air in portal vein, free intraperitoneal fluids, and differential wall enhancements (poor uptake of IV contrast into the wall of the affected bowel)
  - other
    - less used: upper GI series/small bowel series (if no cause apparent, i.e. no hernias, and no previous surgeries) or serial CTs with oral contrast
    - may consider U/S or MRI in pregnant patients
- laboratory
  - may be normal early in disease course
  - creatinine, and hematocrit to assess degree of dehydration
  - fluid, and electrolyte abnormalities; metabolic alkalosis due to frequent emesis; amylase elevated
  - if strangulation: leukocytosis with left shift, elevated lactate (late signs)

## Treatment
- IV isotonic fluid resuscitation and urine output monitoring with catheter
  - SBO related vomiting and decrease PO intake leads to volume depletion
- NG tube in the stomach for gastric decompression; decrease nausea, distention, and risk of aspiration from vomiting
- NPO
- Partial SBO/Crohn's/Carcinomatosis: conservative management with fluid resuscitation and NG tube decompression
  - 48 h of watchful waiting; if no improvement or develops complications, surgery
  - For Crohn's patients, consider GI consult for steroid management
- if no clinical features of ischemia, short course of conservative management with fluid resuscitation and NG tube decompression with frequent re-examination by surgical team
  - duration of observation varies from hours to a few days
  - if SBO fails to resolve, or if symptoms of ischemia develop, then surgery

- high risk for ischemia based on clinical symptoms: urgent surgery to prevent irreversible ischemia
  - early post-operative SBO: if bowel function does not return within 3-5 d after surgery; usually partial, extended conservative therapy (2-3 wk) with bowel rest, fluids, and TPN is appropriate
- surgery if presence of ischemia or perforation demonstrated

**MUST DO**
Rule out CRC in constipated patient
Send for TURP in patient with BPH (treat intra-abdominal HTN)

**Increased Risk of Perforation with Distention as seen on Abdomen Imaging**
- Small bowel ≥3 cm
- Distal colon ≥6 cm
- Proximal colon ≥9 cm
- Cecum ≥12 cm

Important to know if chronic vs acute. Chronic distention is tolerated more likely without perforation

Patients presenting with a SBO in setting of "virgin" abdomen should have surgery ASAP – EXCEPTION: malignant obstruction from history and imaging

In a non-virgin abdomen – adhesional SBOs resolve spontaneously with NGT decompression 70% of time

**Top 3 Causes of SBO (in order)**

**ABC**
**A**dhesions
**B**ulge (hernias)
**C**ancer (neoplasms)

**Causes of SBO**

**SHAVING**
**S**tricture
**H**ernia
**A**dhesions
**V**olvulus
**I**ntussusception/**I**BD
**N**eoplasm
**G**allstones

### Prognosis
- related to etiology; mortality: non-strangulating <1%, strangulating 8% (25% if >36 h), ischemic = up to 50%

### Prevention
- open surgery has four fold increase in risk of SBO in 5 yr compared to laparoscopic surgery

## Paralytic Ileus

### Pathogenesis
- temporary, reversible impairment of intestinal motility; mostly frequently caused by:
  - abdominal operations, infections and inflammation, medications (opiates, anesthetics, psychotropics), and electrolyte abnormalities
  - passing gas is the most useful indicator
- NOT the same as intestinal pseudo-obstruction
  - chronic pseudo-obstruction refers to specific disorders that affect the smooth muscle and myenteric plexus, leading to irreversible intestinal dysmotility

### Clinical Features
- symptoms and signs of intestinal obstruction without mechanical obstruction
  - bowel sounds are diminished or absent (in contrast to initial hyperactive bowel sounds in SBO)
  - may have liquid stools as well

### Investigations
- routine post-operative ileus: expected, no investigation needed
- if ileus persists or occurs without abdominal surgery
  - review patient medications (especially opiates)
  - measure serum electrolyte to monitor for electrolyte abnormalities (including extended electrolytes like Mg, Ca, $PO_4$)
  - CT scan to rule out abscess or peritoneal sepsis, or to exclude mechanical obstruction

### Treatment
- most important: NPO + fluid resuscitation
- NGT decompression, correct causative abnormalities (e.g. sepsis, medications, and electrolytes), consider TPN for prolonged ileus
- post-operative: gastric and small bowel motility returns by 24-48 h, colonic motility by 3-5 d
- current interest in novel therapies such as gum chewing and pharmacologic therapy (e.g. alvimopan, an opioid antagonists)

## Intestinal Ischemia

### Etiology
- acute
  - arterio-occlusive mesenteric ischemia (AOMI)
    - thrombotic, embolic, and extrinsic compression (e.g. strangulating hernia)
  - non-occlusive mesenteric ischemia (NOMI)
    - mesenteric vasoconstriction secondary to systemic hypoperfusion (preserves supply to vital organs)
  - mesenteric venous thrombosis (MVT)
    - consider hypercoagulable state (i.e. rule out malignancy), and DVT (prevents venous outflow)
- chronic: usually due to atherosclerotic disease – look for CVD risk factors
- can lead to occlusion in vessels that supplies the small intestine and the large intestine

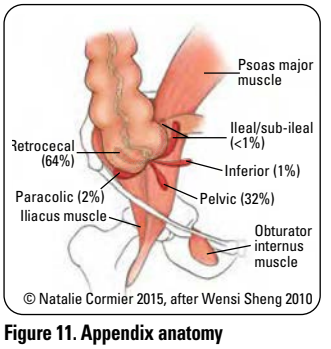

**Figure 11. Appendix anatomy**

### Clinical Features
- acute: severe abdominal pain out of proportion to physical findings, vomiting, bloody diarrhea, bloating, minimal peritoneal signs early in course, hypotension, shock, and sepsis
- chronic: postprandial pain (from mesenteric angina), fear of eating, and weight loss
- common sites: SMA supplied territory, "watershed" areas of colon – splenic flexure, left colon, and sigmoid colon

Pain "out of keeping with physical findings" is the hallmark of early intestinal ischemia

### Investigations
- laboratory: leukocytosis (non-specific), and lactic acidosis (late finding)
  - amylase, lactate, CK, and ALP can be used to observe progress
  - hypercoagulability workup if suspect venous thrombosis
- AXR: portal venous gas, intestinal pneumatosis, and free air if perforation
- contrast CT: thickened bowel wall, luminal dilatation, SMA or SMV thrombus, mesenteric/portal venous gas, and pneumatosis
- CT angiography is the gold standard for acute arterial ischemia

### Treatment

- fluid resuscitation, correct metabolic acidosis, NPO, NGT decompression of stomach, and prophylactic broad-spectrum antibiotics; avoid vasoconstrictors and digitalis
- exploratory laparotomy/laparoscopy to assess extent of viability ± segmental resection of necrotic intestine
  - if extent of bowel viability is uncertain, a second-look laparotomy 12-24 h later is mandatory
- angiogram, embolectomy/thrombectomy, bypass/graft, mesenteric endarterectomy, anticoagulation therapy, and percutaneous transluminal angioplasty ± stent

An acute abdomen + metabolic acidosis is bowel ischemia until proven otherwise

# Tumours of Small Intestine

## BENIGN TUMOURS

- 10x more common than malignant
- usually asymptomatic until large
- most common sites: terminal ileum and proximal jejunum
- polyps
  - adenomas
  - hamartomas
  - FAP (see *Familial Colon Cancer Syndromes*, GS38)
  - juvenile polyps
- other: leiomyomas, lipomas, and hemangiomas

**Carcinoid Syndrome Symptoms**

**FDR**
**F**lushing
**D**iarrhea
**R**ight-sided heart failure

**Table 14. Malignant Tumours of the Small Intestine**

| | Adenocarcinoma | Carcinoid/GI NET-Neuroendocrine Tumour | Lymphoma | Metastatic |
|---|---|---|---|---|
| **Epidemiology** | Usually 50-70 yr<br>M>F | Increased incidence 50-60 yr | Highest incidence in 70s<br>M>F<br>Usually non-Hodgkin's lymphoma | Most common site of GI metastases in patients with metastatic melanoma |
| **Risk Factors** | Crohn's, FAP, history of CRC, HNPCC | | Crohn's, celiac disease, autoimmune disease, immunosuppression, radiation therapy, and nodular lymphoid hyperplasia | Melanoma, breast, lung, ovary, colon, and cervical cancer |
| **Origin/Location** | Usually in proximal small bowel, incidence decreases distally | Classified based on embryological origin (foregut, midgut, and hindgut)<br>Originate from gut enterochromaffin cell<br>Appendix 46%, distal ileum 28%, rectum 17% | Usually distal ileum<br>Proximal jejunum in patients with celiac disease | Hematogenous spread from breast, lung, and kidney<br>Direct extension from cervix, ovaries, and colon |
| **Clinical Features** | Early metastasis to lymph nodes<br>80% metastatic at time of operation<br>Abdominal pain (common) | N/V, anemia, GI bleeding, jaundice, and weight loss (less common)<br>Often slow-growing<br>Usually asymptomatic, incidental finding<br>Obstruction, bleeding, crampy abdominal pain, and intussusception<br>Carcinoid syndrome (<10%)<br>Hot flashes, hypotension, diarrhea, bronchoconstriction, and right heart failure<br>Requires liver involvement: lesion secretes serotonin, kinins, and vasoactive peptides directly to systemic circulation (normally inactivated by liver) | Fatigue, weight loss, fever malabsorption, abdominal pain, anorexia, vomiting, constipation, and mass<br>Rarely – perforation, obstruction, bleeding, and intussusception | Obstruction and bleeding |
| **Investigations** | CT abdomen/pelvis<br>Endoscopy | Most found incidentally at surgery for obstruction or appendectomy<br>CT thorax/abdomen/pelvis<br>Consider small bowel enteroclysis to look for primary<br>Serum chromogranin A as a tumour marker<br>Elevated 5-HIAA (breakdown product of serotonin) in urine or increased 5-HT in blood<br>Radiolabelled octreotide or MIBG scans to search for metastases and locate tumour | CT abdomen/pelvis | CT abdomen/pelvis |
| **Treatment** | Surgical resection ± chemotherapy | Surgical resection ± chemotherapy<br>Carcinoid syndrome treated with steroids, histamine, and octreotide<br>Metastatic risk 2% if size <1 cm, 90% if >2 cm | Low grade: chemotherapy with cyclophosphamide<br>High grade: surgical resection, and radiation<br>Palliative: somatostatin, doxorubicin | Palliation |
| **Prognosis** | 5 yr survival 25% (if node positive) | 5 yr survival 70%; 20% with liver metastases<br>Based on the Ki67 index | 5 yr survival 40% | Poor |
| **Staging System** | TNM | TNM | Ann Arbor | |

# Short Gut Syndrome

### Definition
- reduced surface area (length) of small bowel causing insufficient intestinal absorption leading to diarrhea, malnutrition, and dehydration

### Etiology
- acute mesenteric ischemia: resection of large amount of bowel at once
- Crohn's disease: cumulative resections
- malignancies

### Prognostic Factors
- residual small bowel length, residual colon length (reabsorption of water and electrolytes and some reabsorption of nutrients), condition of the remnant small bowel (healthier bowel facilitate better reabsorption), presence of ileocecal valve (delay transition into colon leading to more reabsorption)
- resection of ileum is less tolerated than resection of jejunum (ileum reabsorbs bile salt and vitamin B12)

### Therapy
- medical
  - TPN: replenish lost fluid and electrolytes in diarrhea
  - HT2R antagonist or PPI to prevent gastric acid secretion
  - antimotility agent to prolong transit time in the small intestine
  - consider octreotide to decrease GI secretion and cholestyramine for bile acid absorption
- surgical: non-transplant
  - to slow transit time: small bowel segmental reversal, intestinal valve construction, or electrical pacing of small bowel
  - to increase intestinal length:
    - LILT (longitudinal intestinal lengthening and tailoring) procedure
    - STEP (serial transverse enteroplasty procedure) in dilated small bowels
- surgical: transplant
  - indication: life-threatening complication from intestinal failure or long-term TPN, including liver failure, thrombosis of major central veins, recurrent catheter-related sepsis, and recurrent severe dehydration

# Abdominal Hernia

- see *Hiatus Hernia*, GS13

### Definition
- defect in abdominal wall causing abnormal protrusion of intra-abdominal contents

### Epidemiology
- M:F = 9:1
- lifetime risk of developing a hernia: males 20-25%, females 2%
- frequency of occurrence: 50% indirect inguinal, 25% direct inguinal, 8-10% incisional (ventral), 5% femoral, and 3-8% umbilical
- most common surgical disease of males

### Risk Factors
- activities which increase intra-abdominal pressure
  - obesity, chronic cough, asthma, COPD, pregnancy, constipation, bladder outlet obstruction, ascites, and heavy lifting
- congenital abnormality (e.g. patent processus vaginalis, and indirect inguinal hernia)
- previous hernia repair, especially if complicated by wound infection
- loss of tissue strength and elasticity (e.g. hiatus hernia, aging, and repetitive stress)

### Clinical Features
- mass of variable size
- tenderness worse at end of day, relieved with supine position or with reduction
- abdominal fullness, vomiting, constipation
- transmits palpable impulse with coughing or straining

### Investigations
- physical examination usually sufficient
- U/S ± CT (CT required for obturator hernias, internal abdominal hernias, and Spigelian and/or femoral hernias in obese patients)

**Indirect Inguinal Hernias: Rule of 5s**
5% lifetime incidence in males
5x more common than direct inguinal hernias
5-10x more common in males than females
Generally occur by 5th decade of life

**Inguinal Hernias – MD's don't LIe**
**MD: M**edial to the inferior epigastric a. = **D**irect inguinal hernia
**LI: L**ateral to the inferior epigastric a. = **I**ndirect inguinal hernia

**Inguinal Canal Walls = MALT x 2**

| | |
|---|---|
| **2M** Roof | 2 muscles (internal oblique, transversus abdominis) |
| **2A** Ant. wall | 2 aponeuroses (external and internal oblique) |
| **2L** Floor | 2 ligaments (inguinal and lacunar) |
| **2Ts** Post. wall | 2T (transversalis fascia, conjoint tendon) |

**Borders of Hesselbach's Triangle**
- Lateral: inferior epigastric artery
- Inferior: inguinal ligament
- Medial: lateral margin of rectus sheath

## Classification
- complete: hernia sac and contents protrude through defect
- incomplete: partial protrusion through the defect
- internal hernia: sac herniating into or involving intra-abdominal structure
- external hernia: sac protrudes completely through abdominal wall
- strangulated hernia: vascular supply of protruded viscus is compromised (ischemia)
  - requires emergency repair
- incarcerated hernia: irreducible hernia, not necessarily strangulated
- Richter's hernia: only part of bowel circumference (usually anti-mesenteric border) is incarcerated or strangulated so may not be obstructed
  - a strangulated Richter's hernia may self-reduce and thus be overlooked, leaving a gangrenous segment at risk of perforation in the absence of obstructive symptoms
- sliding hernia: part of wall of hernia sac formed by retroperitoneal structure (usually colon)

## Anatomical Types
- groin
  - indirect and direct inguinal, femoral
  - pantaloon: combined direct and indirect hernias, peritoneum draped over inferior epigastric vessels
- epigastric: defect in linea alba above umbilicus
- incisional: ventral hernia at site of wound closure, may be secondary to wound infection
- other: Littre's (involving Meckel's), Amyand's (containing appendix), lumbar, obturator, peristomal, umbilical, Spigelian (ventral hernia through linea semilunaris)

## Complications
- incarceration
- strangulation
  - small, new hernias more likely to strangulate
  - femoral >> indirect inguinal > direct inguinal
  - intense pain followed by tenderness
  - intestinal obstruction, gangrenous bowel, sepsis
  - surgical emergency
  - DO NOT attempt to manually reduce hernia if septic or if contents of hernial sac gangrenous. This will result in reduction of gangrenous contents and subsequent need for laparotomy

## Treatment
- surgical treatment (herniorrhaphy) is only to prevent strangulation and evisceration, for symptomatic relief, for cosmesis; if asymptomatic can delay surgery
- repair may be done open or laparoscopic and may use mesh for tension-free closure
  - avoid mesh for emergent cases with bowel compromise given risk of infection
- most repairs are now done using tension free techniques – a plug in the hernial defect and a patch over it or patch alone
- observation is acceptable for small asymptomatic inguinal hernias

## Post-Operative Complications
- recurrence (15-20%)
  - risk factors: recurrent hernia, age >50, smoking, BMI >25, poor pre-operative functional status (ASA ≥3 – see Anesthesia and Perioperative Medicine, A4), associated medical conditions: type 2 DM, hyperlipidemia, immunosuppression, and any comorbid conditions increasing intra-abdominal pressure
  - less common with mesh/"tension-free" repair
- scrotal hematoma (3%)
  - painful scrotal swelling from compromised venous return of testes
  - deep bleeding: may enter retroperitoneal space and not be initially apparent
  - difficulty voiding
- nerve entrapment
  - ilioinguinal (causes numbness of inner thigh or lateral scrotum)
  - genital branch of genitofemoral (in spermatic cord)
- stenosis/occlusion of femoral vein
  - acute leg swelling
- ischemic colitis

**Shouldice Technique vs. Other Open Techniques for Inguinal Hernia Repair**
Cochrane DB Syst Rev 2012;4:CD001543
**Purpose**: To evaluate the efficacy and safety of the Shouldice technique compared to other non-laparoscopic techniques.
**Results/Conclusions**: 16 RCTs or quasi-randomized RCTs with 2566 hernias (1121 mesh; 1608 non-mesh). The recurrence rate with Shouldice was higher than mesh (OR 3.80, 95% CI 1.99-7.26) but lower than non-mesh (OR 0.62, 95% CI 0.45-0.85). There was no difference in chronic pain or complications. In conclusion, with respect to recurrence rates, Shouldice herniorrhaphy is the best non-mesh technique, although inferior to mesh. However, it is also more time consuming and results in slightly longer post-operative hospital stays.

**Long-Term Results of a Randomized Controlled Trial of a Nonoperative Strategy (Watchful Waiting) for Men With Minimally Symptomatic Inguinal Hernias**
ANN SURG 2013;258:508-514
**Objective**: Ascertaining the long-term crossover (CO) rate in patients with asymptomatic or minimally symptomatic inguinal hernias undergoing watchful-waiting (WW) as their primary treatment modality.
**Background**: A 2006 randomized control trial comparing WW with routine inguinal hernia repair, concluded that WW was an acceptable option in the management of male patients with minimal symptoms [JAMA. 2006;295(3):285-292]. This study analyzes the WW group after 7 years of follow-up.
**Conclusions**: The estimated CO rate for the WW cohort was 68%, while men older than 65 had a rate of 79%. Therefore, while WW is a safe strategy, it is likely that symptoms will progress, and definitive surgical management will be indicated.

**Outcomes of Laparoscopic vs. Open Repair of Primary Ventral Hernias**
JAMA Surg 2013;148:1043-1048
**Purpose**: To compare outcomes (surgical site infection (SSI), hernia recurrence, and bulging) of patients undergoing laparoscopic ventral hernia repair (LVHR) versus open ventral hernia repair (OVHR).
**Results/Conclusions**: 79 patients with LVHR matched to 79 patients with OVHR with mesh with a median follow-up of 56 mo. LVHR was associated with fewer SSIs (7.6% vs. 34.1%) but more cases of bulging (21.5% vs. 1.3%) and port-site hernia (2.5% vs. 0.0%). No differences in recurrence were observed.

# Groin Hernias

**Table 15. Groin Hernias**

| | Direct Inguinal | Indirect Inguinal | Femoral |
|---|---|---|---|
| **Epidemiology** | 1% of all men | Most common hernia in men and women<br>M>F | Affects mostly females |
| **Etiology** | Acquired weakness of transversalis fascia<br>"Wear and tear"<br>Increased intra-abdominal pressure | Congenital persistence of processus vaginalis in 20% of adults | Pregnancy – weakness of pelvic floor musculature<br>Increased intra-abdominal pressure |
| **Anatomy** | Through Hesselbach's triangle<br>**Medial** to inferior epigastric artery<br>Usually does not descend into scrotal sac | Originates in deep inguinal ring<br>Lateral to inferior epigastric artery<br>Often descends into scrotal sac (or labia majora) | Into femoral canal, below inguinal ligament but may override it<br>Medial to femoral vein within femoral canal |
| **Treatment** | Surgical repair | Surgical repair | Surgical repair |
| **Prognosis** | 3-4% risk of recurrence | <1% risk of recurrence | |

**Table 16. Superficial Inguinal Ring vs. Deep Inguinal Ring***

| Superficial Inguinal Ring | Deep Inguinal Ring |
|---|---|
| Opening in external abdominal aponeurosis; palpable superior and lateral to pubic tubercle | Opening in transversalis fascia: palpable superior to mid-inguinal ligament |
| Medial border: medial crus of external oblique aponeurosis | Medial border: inferior epigastric vessels |
| Lateral border: lateral crus of external oblique aponeurosis | Superior-lateral border: internal oblique and transversus abdominis muscles |
| Roof: intercrural fibres | Inferior border: inguinal ligament |

*see *Basic Anatomy Review*, Figure 2, GS3

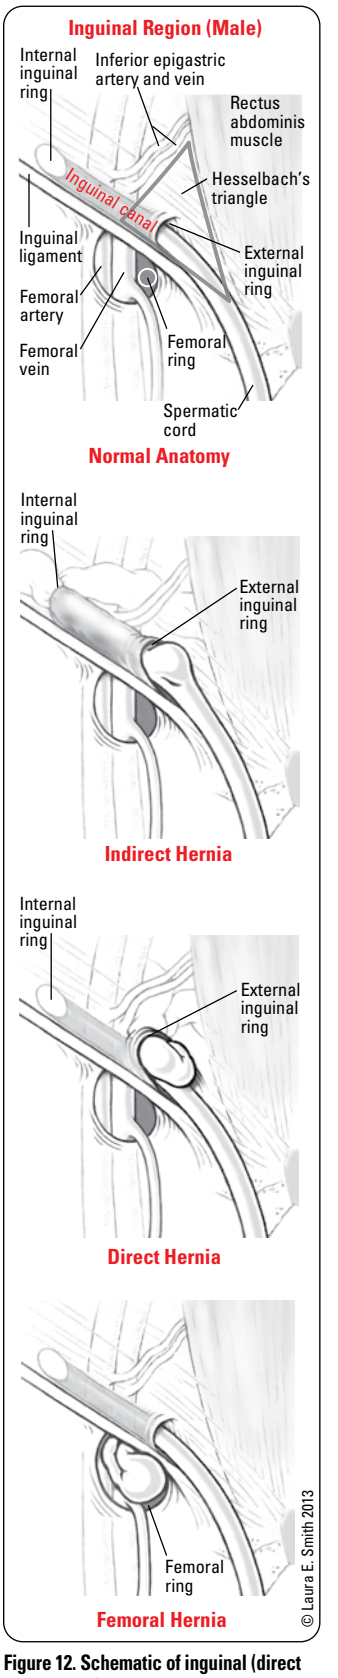

**Figure 12. Schematic of inguinal (direct and indirect) and femoral hernias**

# Appendix

## Appendicitis

### Epidemiology
- 6% of population, M>F
- 80% between 5-35 yr of age

### Pathogenesis
- luminal obstruction → bacterial overgrowth → inflammation/swelling → increased pressure → localized ischemia → gangrene/perforation → localized abscess (walled off by omentum) or peritonitis
- etiology
  - children or young adult: hyperplasia of lymphoid follicles, initiated by infection
  - adult: fibrosis/stricture, fecolith, or obstructing neoplasm
  - other causes: parasites or foreign body

### Clinical Features
- most reliable feature is progression of signs and symptoms
- low grade fever (38°C), rises if perforation
- abdominal pain then anorexia, N/V
- classic pattern: pain initially periumbilical; constant, dull, poorly localized, then well localized pain over McBurney's point
  - due to progression of disease from visceral irritation (causing referred pain from structures of the embryonic midgut, including the appendix) to irritation of parietal structures
- signs
  - inferior appendix: McBurney's sign (see sidebar), Rovsing's sign (palpation pressure to left abdomen causes McBurney's point tenderness). McBurney's sign is present whenever the opening of the appendix at the cecum is directly under McBurney's point; therefore McBurney's sign is present even when the appendix is in different locations
  - retrocecal appendix: psoas sign (pain on flexion of hip against resistance or passive hyperextension of hip)
  - pelvic appendix: obturator sign (flexion then external or internal rotation about right hip causes pain)

### Complications
- perforation (especially if >24 h duration)
- abscess, phlegmon
- sepsis

**McBurney's Sign**
Tenderness 1/3 the distance from the ASIS to the umbilicus on the right side

### Investigations
- laboratory
  - mild leukocytosis with left shift (may have normal WBC counts)
  - higher leukocyte count with perforation
  - β-hCG to rule out ectopic pregnancy
  - urinalysis
- imaging
  - U/S: may visualize appendix, but also helps rule out gynecological causes – overall accuracy 90-94%, can rule in but CANNOT rule out appendicitis (if >6 mm, SENS/SPEC/NPV/PPV 98%)
  - CT scan: thick wall, enlarged (>6 mm), wall enhancement, appendicolith, and inflammatory changes – overall accuracy 94-100%, optimal investigation

### Treatment
- hydrate, correct electrolyte abnormalities
- appendectomy (gold standard)
  - laparoscopic vs. open (see sidebar)
  - complications: intra-abdominal abscess, appendiceal stump leak
  - perioperative antibiotics:
- cefazolin + metronidazole if uncomplicated peri-operative dose is adequate
- consider treatment with post-operative antibiotics for perforated appendicitis
- for patients who present with an abscess (palpable mass or phlegmon on imaging and often delayed diagnosis with symptoms for >4-5 d), consider radiologic drainage + antibiotics x 14 d ± interval appendectomy once inflammation has resolved = (controversial)
- recent research supports antibiotic only treatment as reasonable for uncomplicated appendicitis, with 10-20% recurrence rates
- colonoscopy in the elderly to rule out other etiology (neoplasm)

### Prognosis
- mortality rate: 0.08% (non-perforated), 0.5% (perforated appendicitis)

## Inflammatory Bowel Disease

- see Gastroenterology, G22

### Principles of Surgical Management
- can alleviate symptoms, address complications, and improve quality of life
- conserve bowel: resect as little as possible to avoid short gut syndrome
- perioperative management
  - optimize medical status: may require TPN (especially if >7 d NPO) and bowel rest
  - hold immunosuppressive therapy pre-operative, provide pre-operative stress dose of corticosteroid; if patient had recent steroid therapy, taper steroids post-operative
  - VTE prophylaxis: LMWH or heparin (IBD patients at increased risk of thromboembolic events)

## Crohn's Disease

- see Gastroenterology, G24

### Treatment
- surgery is for symptom management, it is NOT curative, but over lifetime ~70% of Crohn's patients will have surgery
- indications for surgical management
  - failure of medical management
  - SBO (due to stricture/inflammation): indication in 50% of surgical cases
  - abscess, fistula (enterocolic, vesicular, vaginal, cutaneous abscess), quality of life, perforation, hemorrhage, chronic disability, failure to thrive (children), and perianal disease
- surgical procedures
  - resection and anastomosis/stoma if active or subacute inflammation, perforation, or fistula
- resection margin only has to be free of gross disease (microscopic disease irrelevant to prognosis)
  - stricturoplasty – widens lumen in chronically scarred bowel: relieves obstruction without resecting bowel (contraindicated in acute inflammation)

### Complications of Treatment
- short gut syndrome (diarrhea, steatorrhea, malnutrition)
- fistulas
- gallstones (if terminal ileum resected, decreased bile salt resorption → increased cholesterol precipitation)
- kidney stones (loss of calcium in diarrhea → increased oxalate absorption and hyperoxaluria → stones)

### Prognosis
- recurrence rate at 10 yr: ileocolic (25-50%), small bowel (50%), colonic (40-50%)
- re-operation at 5 yr: primary resection (20%), bypass (50%), stricturoplasty (10% at 1 yr)
- 80-85% of patients who need surgery lead normal lives
- mortality: 15% at 30 yr

**Laparoscopic vs. Open Appendectomy**
Cochrane DB Syst Rev 2010;10:CD001546
**Laparoscopic Surgery**
- Wound infection less likely
- Intra-abdominal abscesses 2x more likely
- Reduced pain on POD #1
- Reduced hospital stay by 1.1 d
- Sooner return to normal activity, work, and sport
- Costs outside hospital are reduced

**Open Surgery**
- Shorter duration of surgery
- Lower operation costs

**Overview**
Diagnostic laparoscopy and laparoscopic appendectomy appear to be advantageous over open appendectomy, particularly for young female patients and obese patients.

**Effect of Delay to Operation on Outcomes in Adults with Acute Appendicitis**
Arch Surg 2010;145:886-892
**Purpose**: To examine the effect of delay to appendectomy on morbidity and mortality among adults with appendicitis.
**Method**: Retrospective cohort study with the main exposure being time to operation, and main outcomes being 30 d overall morbidity and serious morbidity/mortality.
**Results**: Of 32,782 patients in the study, 75.2%, 15.1%, and 9.8% underwent surgeries within 6 h, 6-12 h, and >12 h of admission, respectively. Differences in operative duration and length of post-operative stay were statistically significant but not clinically meaningful. No significant differences were observed in adjusted overall morbidity or serious morbidity/mortality. Duration from surgical admission to anesthesia induction was not predictive in regression models for either outcomes.
**Conclusions**: Delay of appendectomy for acute appendicitis among adults does not adversely affect outcomes.

**Antibiotics vs. Placebo for Prevention of Post-Operative Infection After Appendectomy**
Cochrane DB Syst Rev 2005;3:CD001439
**Purpose**: To determine the effectiveness of antibiotics against post-operative infections after appendectomy.
**Method**: Meta-analysis of randomized controlled trials (RCTs) and controlled clinical trials (CCTs), on both adults and children, in which any antibiotic regime was compared to placebo in patients undergoing appendectomy for suspected appendicitis. The main outcomes of interest were wound infection, intra-abdominal abscess, length of hospital stay, and mortality.
**Results**: 45 studies (n=9576) were included. Treatment with antibiotics decreased wound infection and abscess rates.
**Conclusion**: Various prophylactic antibiotic regimens are effective in preventing post-operative complications after appendectomy.

**Crohn's 3 Major Patterns**
- Ileocecal 40% (RLQ pain, fever, weight loss)
- Small intestine 30% (especially terminal ileum)
- Colon 25% (diarrhea)

**Findings in Crohn's**
- "Cobblestoning" on mucosal surface due to edema and linear ulcerations
- "Skip lesions": normal mucosa in between
- "Creeping fat": mesentery infiltrated by fat
- Granulomas: 25-30%

# Ulcerative Colitis

- see Gastroenterology, G24

### Treatment
- indications for surgical management
  - failure of medical management (including inability to taper steroids)
  - complications: hemorrhage, obstruction, perforation, toxic megacolon (emergency), failure to thrive (children)
  - reduce cancer risk (1-2% risk per yr after 10 yr of disease)
- surgical procedures
  - proctocolectomy and ileal pouch-anal anastomosis (IPAA) ± rectal mucosectomy (operation of choice)
  - proctocolectomy with permanent end ileostomy (if not a candidate for ileoanal procedures)
  - colectomy and IPAA ± rectal mucosectomy
  - in emergency: total colectomy and ileostomy with Hartmann closure of the rectum, rectal preservation

### Complications of Treatment
- early: bowel obstruction, transient urinary dysfunction, dehydration (high stoma output), anastomotic leak
- late: stricture, anal fistula/abscess, pouchitis, poor anorectal function, reduced fertility

### Prognosis
- mortality: 5% over 10 yr
- total proctocolectomy will eliminate risk of cancer
- perforation of the colon is the leading cause of death from ulcerative colitis

# LARGE INTESTINE

# Large Bowel Obstruction

## Mechanical Large Bowel Obstruction

### Etiology

**Table 17. Common Causes of LBO**

| Intraluminal | Intramural | Extramural |
|---|---|---|
| Constipation<br>Foreign bodies | Adenocarcinoma<br>Diverticulitis (edema, stricture)<br>IBD stricture<br>Radiation stricture | Volvulus<br>Adhesions<br>Hernias (sigmoid colon in a large groin hernia) |

**Top 3 Causes of LBO (in order)**
- Cancer (>60%)
- Volvulus (10-15%)
- Diverticulitis (10%)

### Clinical Features (unique to LBO)
- open loop (10-20%)
  - incompetent ileocecal valve allows relief of colonic pressure as contents reflux into ileum, therefore clinical feature similar to SBO
- closed loop (80-90%) (dangerous)
  - competent ileocecal valve, resulting in proximal and distal occlusions
  - massive colonic distention → increased pressure in cecum → bowel wall ischemia → necrosis → perforation

**In a patient with clinical LBO consider impending perforation when:**
- Cecum ≥12 cm in diameter
- Tenderness present over cecum

### Treatment
- supportive management: IV fluids, gastrointestinal decompression; 75% require surgical intervention
- surgical correction of obstruction (usually requires resection + temporary diverting colostomy)
- volvulus: initial decompression with flexible sigmoidoscopy, operative reduction or sigmoid resection dependent on severity
- mechanical obstruction: ostomy alone (fecal diversion), colectomy with primary anastomosis or Hartmann procedure. May pursue stenting as bridging (follow with another intervention) or palliation

### Prognosis
- overall mortality: 10%
- cecal perforation + feculent peritonitis: 20% mortality

**Table 18. Bowel Obstruction vs. Paralytic Ileus**

| | SBO | LBO | Paralytic Ileus |
|---|---|---|---|
| **N/V** | Early, may be bilious | Late, may be feculent | Present |
| **Abdominal Pain** | Colicky | Colicky | Minimal or absent |
| **Abdominal Distention** | + (prox SBO), ++ (distal SBO) | ++ | + |
| **Constipation** | + | + | + |
| **Bowel Sounds** | Normal, increased<br>Absent if secondary ileus (delayed presentation) | Normal, increased (borborygmi)<br>Absent if secondary ileus (delayed presentation) | Decreased, absent |
| **AXR Findings** | Air-fluid levels<br>"Ladder" pattern (plicae circularis)<br>Proximal distention (>3 cm) + no colonic gas | Air-fluid levels<br>"Picture frame" appearance<br>Proximal distention + distal decompression<br>No small bowel air if competent ileocecal valve<br>Coffee bean sign (sigmoid volvulus) | Air throughout small bowel and colon |

# Functional LBO: Colonic Pseudo-Obstruction (Ogilvie's Syndrome)

## Definition
- acute pseudo-obstruction
- distention of colon without mechanical obstruction in distal colon
- exact mechanism unknown, likely autonomic motor dysregulation → possibly sympathetic deprivation to colon, unopposed parasympathetic tone, and interruption of sacral parasympathetic tone to distal bowel

## Associations
- most common: trauma, infection, and cardiac (MI, CHF)
- disability (long-term debilitation, chronic disease, bed-bound nursing home patients, and paraplegia), drugs (narcotic use, laxative abuse, and polypharmacy), other (recent orthopedic or neurosurgery, post-partum, electrolyte abnormalities including hypokalemia, retroperitoneal hematoma, and diffuse carcinomatosis)

## Clinical Features
- classically presents with abdominal distention (acute or gradual over 3-7 d)
- abdominal pain, nausea and vomiting, constipation/diarrhea
- watch out for fever, leukocytosis, and presence of peritoneal signs

## Investigations
- AXR: cecal dilatation – if diameter ≥12 cm, increased risk of perforation

## Treatment
- treat underlying cause
- NPO, NGT
- decompression: rectal tube, colonoscopy, neostigmine (cholinergic drug), surgical decompression (ostomy/resection) uncommon
- surgery (extremely rare): if perforation, ischemia, or failure of conservative management

## Prognosis
- most resolve with conservative management

# Diverticular Disease

### Definitions
- diverticulum: abnormal outpouching from the wall of a hollow organ
- diverticulosis: presence of multiple diverticula
- diverticulitis: inflammation of diverticula
- true (congenital) diverticuli: contain all layers of colonic wall, often right-sided
- false (acquired) diverticuli: contain mucosa and submucosa, often left-sided

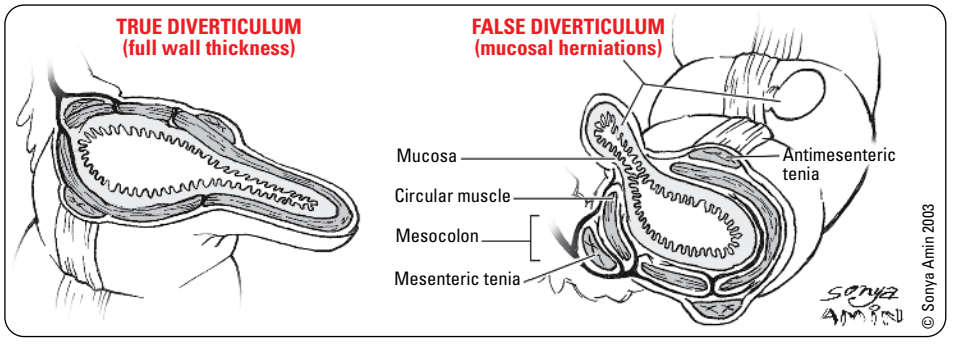

**Figure 13. Diverticular disease – cross-sections of true and false diverticuli**

**Diverticulosis vs. Diverticulitis**
Diverticulosis represents the presence of diverticuli (bulging pouches) within the colonic wall, whereas diverticulitis is the inflammation of one or more diverticuli

## Diverticulosis

### Epidemiology
- 5-50% of Western population, lower incidence in non-Western countries, M=F
- prevalence is age dependent: <5% by age 40, 30% by age 60, 65% by age 85
- 95% involve sigmoid colon (site of highest pressure)

### Pathogenesis
- risk factors
  - lifestyle: low-fibre diet (predispose to motility abnormalities and higher intraluminal pressure), inactivity, and obesity
  - muscle wall weakness from aging and illness (e.g. Ehlers-Danlos, Marfan's)
- high intraluminal pressures cause outpouching to occur at point of greatest weakness, most commonly where vasa recta penetrate the circular muscle layer, therefore increased risk of hemorrhage

### Clinical Features
- uncomplicated diverticulosis: asymptomatic (70-80%)
- episodic abdominal pain (often LLQ), bloating, flatulence, constipation, diarrhea
- absence of fever/leukocytosis
- no physical exam findings or poorly localized LLQ tenderness
- complications
  - diverticulitis (15-25%): 25% of which are complicated (i.e. abscess, obstruction, perforation, fistula)
  - bleeding (5-15%): PAINLESS rectal bleeding, 30-50% of massive LGIB
  - diverticular colitis (rare): diarrhea, hematochezia, tenesmus, and abdominal pain

### Treatment
- uncomplicated diverticulosis: high fibre, education
- diverticular bleed
  - initially workup and treat as any LGIB
  - if hemorrhage does not stop, resect involved region

## Diverticulitis

### Epidemiology
- 95% left-sided in patients of Western countries, 75% right-sided in Asian populations

### Pathogenesis
- erosion of the wall by increased intraluminal pressure or inspissated food particles → inflammation and focal necrosis → micro or macroscopic perforation
- usually mild inflammation with perforation walled off by pericolic fat and mesentery; abscess, fistula, or obstruction can ensue
- poor containment results in free perforation and peritonitis

## Clinical Features

- depend on severity of inflammation and whether or not complications are present; hence ranges from asymptomatic to generalized peritonitis
- LLQ pain/tenderness (2/3 of patients) often for several days before admission
- constipation, diarrhea, N/V, and urinary symptoms (with adjacent inflammation)
- low-grade fever, mild leukocytosis common, and occult or gross blood in stool rarely coexist with acute diverticulitis
- complications (25% of cases)
  - abscess: palpable, tender abdominal mass
  - fistula: colovesical (most common), coloenteric, colovaginal, and colocutaneous
  - colonic obstruction: due to scarring from repeated inflammation
  - perforation: generalized peritonitis (feculent vs. purulent)
- recurrent attacks rarely lead to peritonitis

## Investigations

- CT scan (test of choice): very useful for assessment of severity and prognosis; usually done with rectal contrast
  - 97% sensitive, 99% specific
  - increased soft tissue density within pericolic fat secondary to inflammation, diverticula secondary to inflammation, bowel wall thickening, soft tissue mass (pericolic fluid, abscesses), and fistula
  - 10% of diverticulitis cannot be distinguished from carcinoma
- AXR, upright CXR
  - localized diverticulitis (ileus, thickened wall, SBO, and partial colonic obstruction)
  - free air may be seen in 30% with perforation and generalized peritonitis
- elective evaluation: establish extent of disease and rule out other diagnoses (polyps and malignancy) AFTER resolution of acute episode
  - colonoscopy or barium enema and flexible sigmoidoscopy

## Treatment

- uncomplicated: conservative management
- outpatient: clear fluids only until improvement and antibiotics (e.g. ciprofloxacin and metronidazole) 7-10 d to cover Gram negative rods and anaerobes (e.g. *B. fragilis*)
- hospitalize: if severe presentation, inability to tolerate oral intake, significant comorbidities, or fail to improve outpatient management
- treat with NPO, IVF, and IV antibiotics (e.g. IV ceftriaxone + metronidazole)
- image-guided (CT) percutaneous drainage of abscesses reduces the urgency of surgical resection in most patients
- indications for surgery
  - unstable patient with peritonitis
  - Hinchey stage 3-4 (see Table 19)
  - after 1 attack if immunosuppressed
  - consider if recurrent episodes of diverticulitis (3 or more), recent trend is toward conservative management of recurrent mild/moderate attacks
  - complications: perforation, abscess, fistula, obstruction, hemorrhage, inability to rule out colon cancer on endoscopy, or failure of medical management
- surgical procedures
  - for unstable patient or complex cases: Hartmann procedure
- colon resection + colostomy and rectal stump → colostomy reversal in 3-6 mo
  - for more stable patients with Hinchey stage 3 and 4 acute diverticulitis, colonic resection, primary anastomosis + diverting loop ileostomy is becoming more common, with benefits for mortality and morbidity
  - laparoscopic peritoneal lavage with drain placement near the affected colon, in addition to 4 antibiotics (NO resection) has been proposed for Hinchey stage 3

## Prognosis

- mortality rates: 6% for purulent peritonitis, 35% for feculent peritonitis
- recurrence rates: 13-30% after first attack, 30-50% after second attack

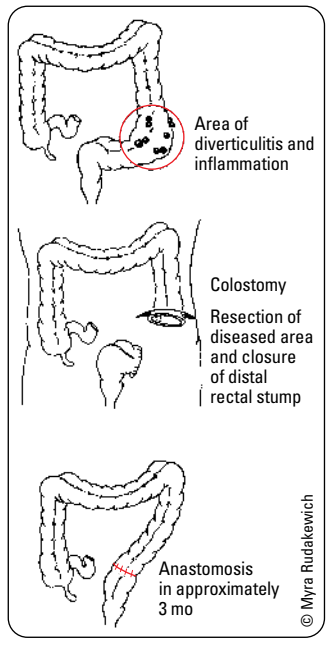

**Figure 14. Hartmann procedure**

**Table 19. Hinchey Staging and Treatment for Diverticulitis**

| Hinchey Stage | Description | Acute Treatment |
|---|---|---|
| 1 | Phlegmon/small pericolic abscess | Medical |
| 2 | Large abscess/fistula | Medical, abscess drainage ± resection with primary anastomosis |
| 3 | Purulent peritonitis (ruptured abscess) | Resection or Hartmann procedure |
| 4 | Feculent peritonitis | Hartmann procedure |

# Colorectal Neoplasms

## Colorectal Polyps

### Definition
- polyp: protuberance into the lumen of normally flat colonic mucosa
- sessile (flat) or pedunculated (on a stalk)

### Epidemiology
- 30% of the population have polyps by age 50, 40% by age 60, 50% by age 70; M>F

### Clinical Features
- 50% in the rectosigmoid region, 50% are multiple
- usually asymptomatic, do not typically bleed, tenesmus, intestinal obstruction, and mucus
- usually detected during routine endoscopy or familial/high risk screening

### Pathology
- non-neoplastic/non-adenomatous
  - hyperplastic: most common non-neoplastic polyp
  - mucosal polyps: small <5 mm, no clinical significance
  - hamartomas: juvenile polyps (large bowel), Peutz-Jegher syndrome (small bowel)
    - malignant risk due to associated adenomas (large bowel)
    - low malignant potential → most spontaneously regress or autoamputate
  - inflammatory pseudopolyps: associated with IBD, no malignant potential
  - submucosal polyps: lymphoid aggregates, lipomas, leiomyomas, and carcinoids
- neoplastic/adenomatous
  - adenomas: premalignant, considered carcinoma in situ if high grade dysplasia
    - some may contain invasive carcinoma ("malignant polyp" – 3-9%): invasion into submucosa
    - malignant potential related to histological type: villous > tubulovillous > tubular

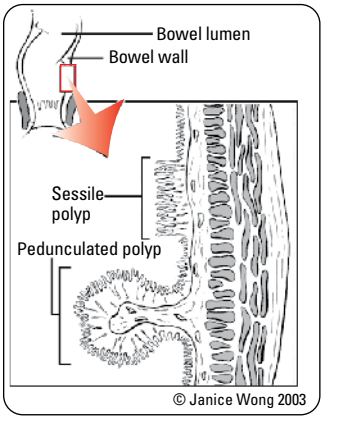

**Figure 15. Sessile and pedunculated polyps**

**Table 20. Characteristics of Tubular vs. Villous Polyps**

| | Tubular | Villous |
|---|---|---|
| **Incidence** | Common (60-80%) | Less common (10%) |
| **Size** | Small (<2 cm) | Large (usually >2 cm) |
| **Attachment** | Pedunculated | Sessile |
| **Malignant Potential** | Lower | Higher |
| **Distribution** | Even | Left-sided predominance |

### Investigations
- colonoscopy with biopsy/resection is the gold standard for diagnosis and treatment of colonic polyps
- CT colonography: increasing in availability; patients still require bowel prep and will require colonoscopy if polyps are identified
- other: flexible sigmoidoscopy if polyps are detected, proceed to colonoscopy for examination of entire bowel and biopsy

### Treatment
- indications: symptoms, malignancy or risk of malignancy (i.e. adenomatous polyps)
- endoscopic removal of entire growth
- indications for segmental resection for malignant polyps: 1) lymphovascular invasion; 2) tumour budding; 3) positive resection margin; 4) poorly differentiated cells; 5) evidence of regional or distant metastases on staging. Most of these cases are usually discussed at multi-disciplinary tumour boards
- follow-up endoscopy:
  - every 5 years: if low-risk polyp (<10 mm tubular adenoma or <10 mm sessile serrated without dysplasia)
  - every 3 years: if high-risk polyp (3-10 tubular adenomas, >10 mm tubular or serrated polyp, adenoma with villous features or high grade dysplasia, or sessile serrated with dysplasia)

## Familial Colon Cancer Syndromes

### FAMILIAL ADENOMATOUS POLYPOSIS

### Pathogenesis
- autosomal dominant inheritance, mutation in adenomatous polyposis coli (APC) gene

### Clinical Features
- hundreds to thousands of colorectal adenomas usually by age 20 (by 40s in attenuated FAP)
- extracolonic manifestations
  - carcinoma of large bowel (i.e. polyps in colon), bile duct, pancreas, stomach, thyroid, adrenal, and small bowel
  - congenital hypertrophy of retinal pigment epithelium presents early in life in 2/3 of patients; 97% sensitivity
  - virtually 100% lifetime risk of colon cancer (because of number of polyps)
- variants
  - Gardner's syndrome: FAP + extra-intestinal lesions (sebaceous cysts, osteomas, desmoid tumours)
  - Turcot syndrome: FAP + CNS tumours (childhood cerebellar medulloblastoma)

**Referral Criteria for Genetic Screening for APC**
- To confirm the diagnosis of FAP (in patients with ≥100 colorectal adenomas)
- To provide pre-symptomatic testing for individuals at risk for FAP (1st degree relatives who are ≥10 yr)
- To confirm the diagnosis of attenuated FAP (in patients with ≥20 colorectal adenomas)

### Investigations
- genetic testing (80-95% sensitive, 99-100% specific)
- if no polyposis found: annual flexible sigmoidoscopy from puberty to age 50, then routine screening
- if polyposis or APC gene mutation found: annual colonoscopy and consider surgery; consider upper endoscopy to evaluate for periampullary tumours

**Revised Bethesda Criteria for HNPCC and Microsatellite Instability (MSI)**
Tumours from individuals should be tested for MSI in the following situations:
- Colorectal cancer diagnosed in a patient who is <50 yr
- Presence of synchronous, metachronous, colorectal, or other HNPCC-associated tumours, regardless of age
- Colorectal cancer with the MSI-H histology diagnosed in a patient who is <60 yr
- Colorectal cancer diagnosed in one or more first-degree relatives with an HNPCC-related tumour, with one of the cancers being diagnosed <50 yr
- Colorectal cancer diagnosed in two or more first- or second-degree relatives with HNPCC-related tumours, regardless of age

### Treatment
- surgery indicated by age 17-20
- total proctocolectomy with ileostomy or total colectomy with ileorectal anastomosis
- doxorubicin-based chemotherapy
- NSAIDs for intra-abdominal desmoids

## HEREDITARY NON-POLYPOSIS COLORECTAL CANCER – LYNCH SYNDROME

### Pathogenesis
- autosomal dominant inheritance, mutation in a DNA mismatch repair gene (MSH2, MSH6, MLH1, PMS2) resulting in microsatellite genomic instability and subsequent mutations
- microsatellite instability account for approximately 15% of all colorectal cancers

### Clinical Features
- early age of onset, right > left colon, synchronous and metachronous lesions
- mean age of cancer presentation is 44 yr, lifetime risk 70-80% (M>F)
  - HNPCC I: hereditary site-specific colon cancer
  - HNPCC II: cancer family syndrome – high rates of extracolonic tumours (endometrial, ovarian, hepatobiliary, small bowel)

Elderly persons who present with iron-deficiency anemia should be investigated for colon cancer

### Diagnosis
- Amsterdam Criteria ("3-2-1 rule")
  - 3 or more relatives with verified Lynch syndrome associated cancers, and 1 must be 1st degree relative of the other 2
  - 2 or more generations involved
  - 1 case must be diagnosed before 50 yr
  - FAP is excluded
- genetic testing (80% sensitive) – colonoscopy mandatory even if negative
  - refer for genetic screening individuals who fulfill either the Amsterdam Criteria or the revised Bethesda Criteria
- colonoscopy (starting age 20) annually
- surveillance for extracolonic lesions

### Treatment
- total colectomy and ileorectal anastomosis with annual proctoscopy

# Colorectal Carcinoma

### Epidemiology
- 3rd most common cancer (lung>breast>colon), 2nd most common cause of cancer death

### Risk Factors
- most patients have no specific risk factors
- age >50 (dominant risk factor in sporadic cases), mean age is 70
- genetic: FAP, HNPCC, or family history of CRC
- colonic conditions
  - adenomatous polyps (especially if >1 cm, villous, multiple)
  - IBD (especially UC: risk is 1-2%/yr if UC >10 yr)
  - previous colorectal cancer (also gonadal or breast)
- diet (increased fat, red meat, and decreased fibre) and smoking
- DM and acromegaly (insulin and IGF-1 are growth factors for colonic mucosal cells)

**APR** removes distal sigmoid colon, rectum, and anus; permanent end colostomy required
**LAR** removes distal sigmoid and rectum with anastomosis of distal colon to anus

## Pathogenesis
- adenoma-carcinoma sequence; rarely arise *de novo*

## Clinical Features
- often asymptomatic
- hematochezia/melena, abdominal pain, and change in bowel habits
- others: weakness, anemia, weight loss, palpable mass, and obstruction
- 20% patients have distant metastatic disease at time of presentation
- spread
  - direct extension, lymphatic, and hematogenous (liver most common, lung, bone, and brain; tumour of distal rectum → IVC → lungs)
  - peritoneal seeding: ovary and Blumer's shelf (pelvic cul-de-sac)

**Table 21. Clinical Feature of CRC**

| | Right Colon | Left Colon | Rectum |
|---|---|---|---|
| **Frequency** | 25% | 35% | 30% |
| **Pathology** | Exophytic lesions with occult bleeding | Annular, invasive lesions | Ulcerating |
| **Symptoms** | Weight loss, weakness, rarely obstruction | Constipation ± overflow (alternating bowel patterns), abdominal pain, decreased stool calibre, rectal bleeding | Obstruction, tenesmus, rectal bleeding |
| **Signs** | Fe-deficiency anemia, RLQ mass (10%) | BRBPR, LBO | Palpable mass on DRE, BRBPR |

## Investigations
- colonoscopy (best), look for synchronous lesions (3-5% of patients); alternative: air contrast barium enema ("apple core" lesion) + sigmoidoscopy
- if a patient is FOBT +ve, has microcytic anemia, or has a change in bowel habits, do colonoscopy
- laboratory: CBC, urinalysis, liver enzymes, liver function tests, CEA (pre-operative for baseline, >5 ng/mL have worse prognosis)
- staging: CT chest/abdomen/pelvis; bone scan, CT head only if lesions suspected
- rectal cancer: pelvic MRI or endorectal U/S to determine T and N stage

**Table 22. TNM Classification System for Staging of Colorectal Carcinoma (AJCC/UICC 8th edition)**

| Primary Tumour (T) | | Regional Lymph Nodes (N) | | Distant Metastasis (M) | |
|---|---|---|---|---|---|
| **Tx** | Primary tumour cannot be assessed | **Nx** | Regional nodes cannot be assessed | **M0** | No distant metastasis |
| **T0** | No primary tumour found | **N0** | No regional node metastasis and no tumour deposits | **M1a** | Distant metastasis to 1 organ or site and no peritoneal metastasis |
| **Tis** | Carcinoma *in situ*, limited to intraepithelial or invasive lamina propria | **N1a** | Metastasis in 1 regional node | **M1b** | Distant metastasis to >1 (2 or more organs sites) and no peritoneal metastasis |
| **T1** | Invasion into submucosa | **N1b** | Metastasis in 2-3 regional nodes | **M1c** | Metastasis to peritoneal surface |
| **T2** | Invasion into muscularis propria | **N1c** | No regional node metastasis; tumour deposits were submucosal, mesangial or peritoneum-covered para-colorectal tissue | | |
| **T3** | Invasion through muscularis propria and into pericolorectal tissues | **N2a** | Metastasis in 4-6 regional nodes | | |
| **T4a** | Invasion through visceral peritoneum | **N2b** | Metastasis in ≥7 regional nodes | | |
| **T4b** | Invasion or adherent to other organs or structures | | | | |

## Treatment
- colon cancer
  - wide surgical resection of lesion and regional lymphatic drainage; usually colectomy with primary anastomosis
- curative: wide resection of lesion (5 cm margins) with nodes (>12) and mesentery
- metastatic lesions confined to the liver can be resected with curative intent
- palliative: if distant spread, local control for hemorrhage or obstruction
- care is taken to not spread tumour by unnecessary palpation
- cancer-bearing portion of colon is removed according to vascular distribution of segment
  - adjuvant chemotherapy (oxaliplatin-based ± capecitabine, fluorouracil) for stage III and is considered in select stage II patients

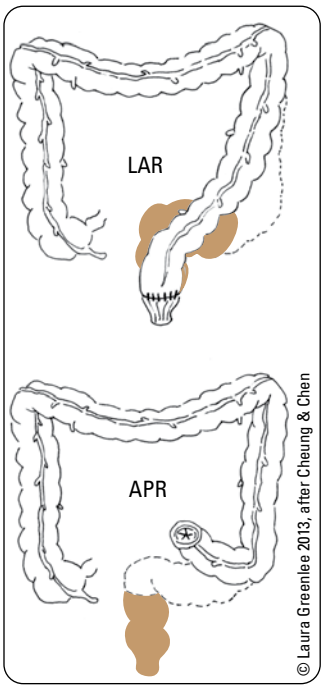

**Figure 16. APR vs. LAR**

**5 Year Survival Rates for CRC**

| Stage | 20-64 yr | ≥65 yr |
|---|---|---|
| I | 95.2% | 89.1% |
| IIA | 89.6% | 84.4% |
| IIB | 67.6% | 55% |
| IIIA | 91.3% | 85.1% |
| IIIB | 76.9% | 64.6% |
| IIIC | 61.8% | 45.5% |
| IV | 14.2% | 7.4% |

**Pre-Operative vs. Post-Operative Chemoradiotherapy for Locally Advanced Rectal Cancer: Results of the German CAO/ARO/AIO-94 Randomized Phase III Trial after a Median Follow-Up of 11 Yr**

J Clin Oncol 2012;30:1926-33

**Background**: The CAO/ARO/AIO-94 trial (published 2004) recommended pre-operative chemoradiotherapy (CRT) as standard treatment for locally advanced rectal cancer. However, no survival benefit was shown after median follow-up of 46 mo, and this study reports long-term effects.

**Methods**: Patients with stage II to III rectal cancer (n=799) were randomly assigned to pre-operative (n=404) or post-operative CRT (n=395) with fluorouracil (FU), radiation, and adjuvant FU chemotherapy, in addition to total mesorectal excision surgery. Follow-up was designed to assess long-term overall survival as the primary end point and cumulative incidence of local and distant relapses as well as disease-free survival as secondary end points.

**Results**: 10 yr incidence of local relapse was significantly lower in the pre-operative CRT group than in the post-operative group (7.1% vs. 10.1%, p=0.048). Overall survival at 10 yr was similar at ~60% for patients treated with pre-operative or post-operative CRT (p=0.85). Disease-free survival rates at 10 yr was similar at ~68% for patients treated with pre-operative or post-operative CRT (p=0.54). No significant difference was detected for 10 yr incidence of distant metastases (pre-operative CRT 29.8% vs. post-operative CRT 29.6%, p=0.9).

**Conclusion**: There is long-term reduction in local recurrence of stage II to III rectal cancer with pre-operative chemotherapy, but no improvement in overall survival or distant recurrence of disease.

- rectal cancer
  - choice of operation depends on individual case; types of operations
- low anterior resection of rectum (LAR): curative procedure of choice if adequate distal margins (~2 cm); uses technique of total mesorectal excision
- abdominoperineal resection of rectum (APR): if adequate distal margins cannot be obtained; involves the removal of distal sigmoid colon, rectum, and anus – permanent end colostomy required
- transanal minimally invasive surgery (TAMIS)- local excision for select T1 lesions only
- palliative procedures involve proximal diversion with an ostomy for obstruction and radiation for bleeding or pain
  - adjuvant therapy
- combined neoadjuvant chemoradiation therapy followed by post-operative adjuvant chemotherapy for stages II and III

### Follow-Up
- stage I: mixed recommendations; either routine colonoscopy or screening like stage II & III
- stage II & III: regular follow-up q3-6mo for 3 yr, then q6mo until 5 yr, with regular measurement of serum CEA for at least 3 yr; annual CT chest/abdo/pelvis for at least 3 yr; colonoscopy at 1, 3 and 5 yr
- stage IV: no data on surveillance strategy

# Other Conditions of the Large Intestine

## Angiodysplasia

### Definition
- vascular malformation: focal submucosal venous dilatation and tortuosity

### Clinical Features
- most frequently in right colon of patients >60 yr
- predisposition in end-stage renal disease and von Willebrand disease
- bleeding typically intermittent, rarely massive, and not usually hypotensive (melena, anemia, and occult blood positive stools)

### Investigations
- colonoscopy: cherry red spots, branching pattern from central vessel
- angiography: early-filling vein, vascular tuft, and delayed emptying vein; rarely active bleeding
- RBC technetium-99 scan
- barium enema is contraindicated (obscures other x-rays, i.e. angiogram)

### Treatment
- none if asymptomatic
- cautery, right hemicolectomy, embolization, vasopressin infusion, sclerotherapy, band ligation, laser, octreotide, and rarely segmental resection if other treatments fail

## Volvulus

### Definition
- rotation of segment of bowel about its mesenteric axis
- sigmoid (65%), cecum (30%), transverse colon (3%), and splenic flexure (2%)
- 5-10% of large bowel obstruction; 25% of intestinal obstruction during pregnancy

**Cecal Volvulus**
AXR: Central cleft of "coffee bean" sign points to RLQ

**Sigmoid Volvulus**
**AXR:** Central cleft of "coffee bean" sign points to LLQ
**Barium enema:** "ace of spades" or "bird's beak" sign

### Risk Factors
- age (50% of patients >70 yr: stretching/elongation of bowel with age is a predisposing factor)
- high fibre diet (can cause elongated/redundant colon), chronic constipation, laxative abuse, pregnancy, bedridden, and institutionalization (less frequent evacuation of bowels)

### Clinical Features
- symptoms due to bowel obstruction (see *Large Bowel Obstruction*, GS34) or intestinal ischemia (see *Intestinal Ischemia*, GS28)
- colicky abdominal pain, persistence of pain between spasms, abdominal distention, and vomiting

### Investigations
- AXR (classic findings): "omega", "bent inner-tube", "coffee-bean" signs
- barium/Gastrografin® enema: "ace of spades" (or "bird's beak") appearance due to funnel-like luminal tapering of lower segment towards volvulus
- sigmoidoscopy or colonoscopy as appropriate
- CT: "whirl pattern" of mesenteric vessels twisting about the volvulus axis

### Treatment
- initial supportive management same as initial management for bowel obstruction (see *Large Bowel Obstruction*, GS34)

- cecum
  - nonsurgical
    - may attempt colonoscopic detorsion and decompression; successful 15-20% of cases
  - surgical
    - right colectomy + ileotransverse colonic anastomosis
- sigmoid
  - nonsurgical
    - decompression by flexible sigmoidoscopy and insertion of rectal tube past obstruction
    - subsequent elective surgery recommended (50-70% recurrence)
  - surgical
    - surgical resection with or without primary anastomosis
    - indications: strangulation, perforation, or unsuccessful endoscopic decompression

# Toxic Megacolon

### Pathogenesis
- extension of inflammation into smooth muscle layer causing paralysis
- damage to myenteric plexus and electrolyte abnormalities are not consistently found

### Etiology
- inflammatory bowel disease (ulcerative colitis > Crohn's disease)
- infectious colitis: bacterial (*C. difficile, Salmonella, Shigella*, and *Campylobacter*), viral (cytomegalovirus), and parasitic (*E. histolytica*)

### Clinical Features
- infectious colitis usually presents for >1 wk before colonic dilatation
- diarrhea ± blood (sudden improvement of diarrhea may signify onset of megacolon)
- abdominal distention, tenderness, ± local/general peritoneal signs (suggests perforation)
- triggers: hypokalemia, constipating agents (opioids, antidepressants, loperamide, and anticholinergics), barium enema, and colonoscopy

### Diagnostic Criteria
- must have both colitis and systemic manifestations for diagnosis
- radiologic evidence of dilated colon
- three of: fever, HR >120, WBC >10.5, and anemia
- one of: fluid and electrolyte disturbances, hypotension, or altered LOC

### Investigations
- CBC (leukocytosis with left shift and anemia from bloody diarrhea), electrolytes, elevated CRP, and ESR
- metabolic alkalosis (volume contraction and hypokalemia) and hypoalbuminemia are late findings
- AXR: dilated colon >6 cm (right > transverse > left), loss of haustra
- CT: useful to assess underlying disease

### Treatment
- NPO, NGT, stop constipating agents, correct fluid and electrolyte abnormalities, and transfusion
- serial AXRs
- broad-spectrum antibiotics (reduce sepsis and anticipate perforation)
- aggressive treatment of underlying disease (e.g. steroids in IBD and metronidazole for *C. difficile*)
- indications for surgery (50% improve on medical management)
  - worsening or persisting toxicity or dilation after 48-72 h
  - severe hemorrhage, perforation
  - high lactate and WBC, especially for *C. difficile*
- procedure: subtotal colectomy + end ileostomy (may be temporary with second operation for re-anastomosis later)

Use caution when giving antidiarrheal agents, especially with bloody diarrhea

### Prognosis
- 25-30% mortality

# Fistula

### Definition
- abnormal communication between two epithelialized surfaces (e.g. enterocutaneous, colovesical, aortoenteric, and entero-enteric)

### Etiology
- foreign object erosion (e.g. gallstone, graft)
- inflammatory states (e.g. infection, IBD [Crohn's > UC], and diverticular disease)
- iatrogenic/surgery (e.g. post-operative anastomotic leak and radiation)
- congenital, trauma
- neoplastic

**Why Fistulae Stay Open**

**FRIENDO**
**F**oreign body
**R**adiation
**I**nfection
**E**pithelialization
**N**eoplasm
**D**istal obstruction (most common)
**O**thers: increased flow; steroids (may inhibit closure, usually will not maintain fistula)

### Investigations
- U/S, CT scan, fistulogram
- measure amount of drainage from fistula

### Treatment
- decrease secretion: octreotide/somatostatin/omeprazole
- surgical intervention: dependent upon etiology (for non-closing fistulas); uncertainty of diagnosis

## Stomas

### Definition
- an opening of the GI tract onto the surface of the abdomen wall
  - stomas can be constructed as either end stomas: the proximal end of the GI tract forms the stoma and the distal end of the GI tract is not part of the stoma
  - loop stomas: a loop of the GI tract is brought up to the skin and the anti-mesenteric surface of the bowel is matured as a stoma
- the proximal and distal GI tract remain in continuity

**Colostomy/Ileostomy**
- Connection of proximal limb of colon or ileum to abdominal wall skin

**Mucous Fistula**
- Connection of distal limb of colon to abdominal wall skin

**Ileal Conduit**
- Connection of bowel to ureter proximally and abdominal wall distally to drain urine

### Ileostomy
- usually positioned in RLQ; ileum is brought through rectus abdominus muscles
- indications: after protocolectomy for ulcerative colitis, in some cases of Crohn's disease or familial polyposis
- conventional ileostomy: discharges small quantities of liquid material continuously, appliance (plastic bag attached to a sheet of protective material) required at all times
- continent ileostomy: reservoir is constructed from distal ileum, emptied by inserting catheter into stoma several times a day; rarely used, has mostly been replaced by ileal pouch anal anastomosis

### Colostomy
- indications: to decompress an obstructed colon, to protect a distal anastomosis after resection, or to evacuate stool after distal colon or rectum is removed
- colostomies can be done by making an opening in a loop of colon (loop colostomy) or by dividing the colon and bringing out one end (end colostomy)
- most common permanent colostomy is a sigmoid colostomy – expels stool 1/d, no appliance required
- chronic paracolostomy hernia is a common complication

### Complications (10%)
- obstruction: herniation, stenosis (skin and abdominal wall), adhesive bands, volvulus
- peri-ileostomy abscess and fistula
- skin irritation
- prolapse or retraction
- diarrhea (excessive output), which may lead to fluid, electrolyte, and nutritional imbalances

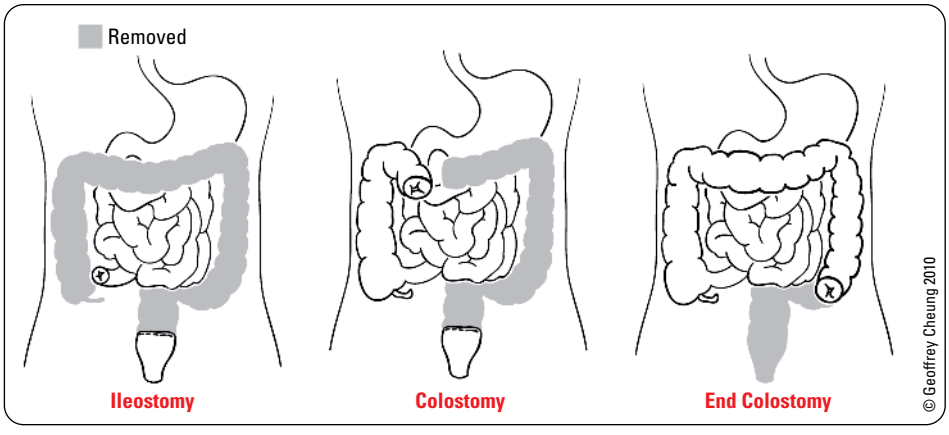

Figure 18. Ostomies

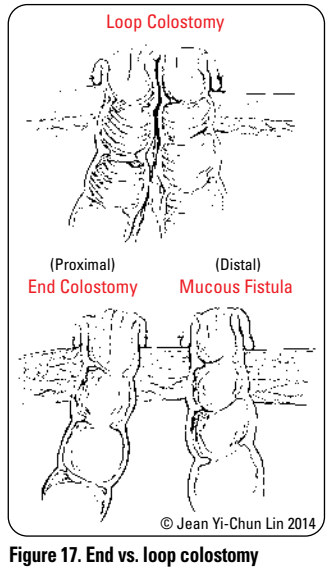

Figure 17. End vs. loop colostomy

# Anorectum

## Hemorrhoids

### Etiology
- vascular and connective tissue complexes form a plexus of dilated veins (cushion)
- internal: superior hemorrhoidal veins, above dentate line, portal circulation
- external: inferior hemorrhoidal veins, below dentate line, systemic circulation

### Risk Factors
- increased intra-abdominal pressure: chronic constipation, pregnancy, obesity, portal HTN, heavy lifting

### Clinical Features and Treatment
- internal hemorrhoids
  - engorged vascular cushions usually at 3, 7, 11 o'clock positions (patient in lithotomy position)
  - painless rectal bleeding, anemia, prolapse, mucus discharge, pruritus, burning pain, and rectal fullness
    - **1st degree**: bleed but do not prolapse through the anus
      - treatment: high fibre/bulk diet, sitz baths, steroid cream (short course), pramoxine (Anusol®), phlebotonics, rubber band ligation, sclerotherapy, and photocoagulation
    - **2nd degree**: bleed, prolapse with straining, and spontaneous reduction
      - treatment: rubber band ligation, and photocoagulation
    - **3rd degree**: bleed, prolapse, and require manual reduction
      - treatment: same as 2nd degree, but may require closed hemorrhoidectomy
    - **4th degree**: bleed, permanently prolapsed, and cannot be manually reduced
      - treatment: closed hemorrhoidectomy
- external hemorrhoids
  - dilated venules usually mildly symptomatic
    - pain after bowel movement, associated with poor hygiene
    - medical treatment: dietary fibre, stool softeners, steroid cream (short course), pramoxine (Anusol®), phlebotonics, and avoid prolonged straining
  - thrombosed hemorrhoids are very painful
    - resolve within 2 wk, may leave excess skin = perianal skin tag
    - treatment: consider surgical decompression within first 48 h of thrombosis, otherwise medical treatment

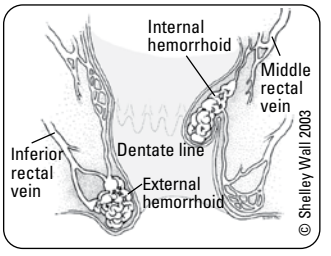

**Figure 19. Hemorrhoids**

Always rule out more serious causes (e.g. colon cancer or anal canal cancer) in a person with hemorrhoids and rectal bleeding

Band ligation can be done as outpatient

External hemorrhoids will often recur

**Table 23. Signs and Symptoms of Internal vs. External Hemorrhoids**

| Internal Hemorrhoids | External Hemorrhoids |
|---|---|
| Painless BRBPR | Sudden severe perianal pain |
| Rectal fullness or discomfort | Perianal mass |
| Mucus discharge | |

## Anal Fissures

### Definition
- tear of anal canal below dentate line (very sensitive squamous epithelium)
- 90% posterior midline, 10% anterior midline
- if off midline: consider other possible causes such as IBD, STIs, TB, leukemia, or anal carcinoma
- repetitive injury cycle after first tear
  - sphincter spasm occurs preventing edges from healing and leads to further tearing
  - ischemia may ensue and contribute to chronicity

### Etiology
- local trauma: constipation, irritation, diarrhea, vaginal delivery, anal intercourse
- secondary to: Crohn's disease, granulomatous diseases, malignancy, communicable diseases
- further tearing by internal anal sphincter spasm and hypertonicity

### Clinical Features
- acute fissure
  - very painful bright red bleeding especially after bowel movement, sphincter spasm on limited DRE
  - treatment is conservative: stool softeners, bulking agents, and sitz baths (heals 90%)
- chronic fissure (anal ulcer)
  - triad: fissure, sentinel skin tags, and hypertrophied papillae
  - treatment
    - stool softeners, increased fibre intake, and sitz baths
    - topical nitroglycerin or calcium channel blocker (nifedipine or diltiazam): increases local blood flow, promotes healing, and relieves sphincter spasm
    - lateral internal anal sphincterotomy (most effective): relieves sphincter spasm to increase blood flow and promote healing; reserved for medically-refractory cases due to 5% chance of fecal incontinence
    - alternative treatment: botulinum toxin A; inhibits release of acetylcholine (ACh), reducing sphincter spasm

# Anorectal Abscess

## Definition
- infection typically originating within an obstructed anal crypt which forms an abscess
- common bacterial: *E. coli, Proteus, Streptococci, Staphylococci, Bacteroides*, and anaerobes

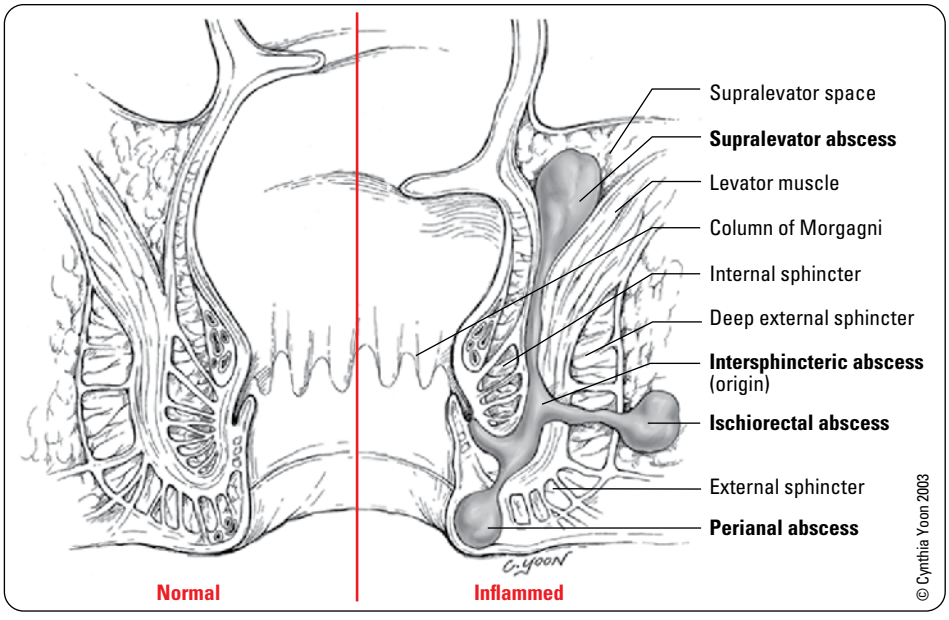

**Figure 20. Different types of perianal abscesses**

## Clinical Features
- throbbing pain that may worsen with straining and ambulation
- abscess can spread vertically downward (perianal), vertically upward (supralevator), or horizontally (ischiorectal)
- tender perianal/rectal mass on exam

## Treatment
- I&D
  - curative in 50% of cases
  - 50% develop anorectal fistulas
- may require antibiotics if diabetic, heart murmur, or cellulitis

Recurrent perianal abscesses is associated with Crohn's disease

Antibiotics are not typically helpful in the treatment of perianal abscesses

# Fistula-In-Ano

## Definition
- fistula from anal canal to perianal skin
- an inflammatory tract with internal os at dentate line, external os on skin

## Etiology
- see *Fistula*, GS42
- same processes that lead to the formation of an anal abscess
- other causes: post-operative, trauma, anal fissure, malignancy, and radiation proctitis

## Clinical Features
- intermittent or constant purulent discharge from perianal opening
- pain
- palpable cord-like tract

## Treatment
- identification
  - internal opening
    - Goodsall's rule
      - fistulas originating anterior to a transverse line through the anus will have a straight course and exit anteriorly, whereas those originating posterior to the transverse line will begin in the midline and have a curved tract
  - fistulous tract
    - probing or fistulography under anesthesia

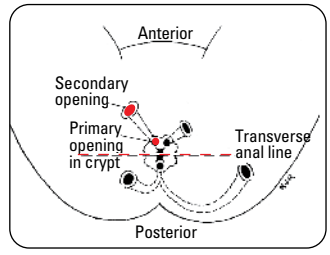

**Figure 21. Goodsall's rule**

- surgery
  - fistulotomy: unroof tract from external to internal opening, allow drainage, heals by secondary intention
  - low lying fistula (does not involve external sphincter) → primary fistulotomy
  - high lying fistula (involves external sphincter) → staged fistulotomy with Seton suture placed through tract
    - promotes drainage
    - promotes fibrosis and decreases incidence of incontinence
    - delineates anatomy
    - usually done to spare muscle
  - alternative for high lying fistula → ligation of intersphicteric fistula tract (LIFT) procedure
    - access fistula between sphincter muscles, sparring them

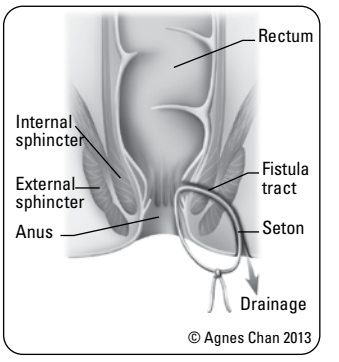

**Figure 22. Fistulotomy**

### Post-Operative
- sitz baths, irrigation, and packing to ensure healing proceeds from inside to outside

### Complications
- recurrence
- rarely fecal incontinence

## Pilonidal Disease

### Definition
- pilo = hair, nidal = nest; cyst or abscess near or on the intergluteal cleft of the sacrococcygeal area containing hair and skin debris

### Epidemiology
- occurs most frequently in young men age 15-35 yr; rare in >50 yr

### Etiology
- obstruction of the hair follicles in this area → formation of cysts, sinuses, or abscesses
- associated with occupations that require prolonged sitting, obesity, and high amounts of body hair

### Clinical Features
- asymptomatic or chronically itchy until acutely infected, then pain/tenderness, purulent discharge, and increased moisture near the tailbone

### Treatment
- acute abscess
  - I&D (often performed by primary care doctors)
  - wound packed open
  - 40% develop chronic pilonidal sinuses
- surgery
  - indication: failure of healing after I&D, recurrent disease, or complex disease
  - pilonidal cystotomy: excision of sinus tract and cyst; wound closed by secondary intention, primary closure with tissue flap, or marsupialization (cyst edge sewn to surrounding tissue to leave sinus tract open)

## Rectal Prolapse

### Definition
- protrusion of some or all of rectal mucosa through external anal sphincter

### Epidemiology
- extremes of ages: <5 yr and >50 yr
- 85% women

### Etiology
- lengthened attachment of rectum secondary to constant straining
- 2 types
  1. false/partial/mucosal: protrusion of mucosa only, radial furrows at junction with anal skin; most common type of rectal prolapse in childhood
  2. true/complete (most common): full thickness extrusion of rectal wall, concentric folds in:
     - first degree: prolapse includes mucocutaneous junction
     - second degree: without involvement of mucocutaneous junction
     - third degree (internal intussusception): prolapse is internal, concealed, or occult

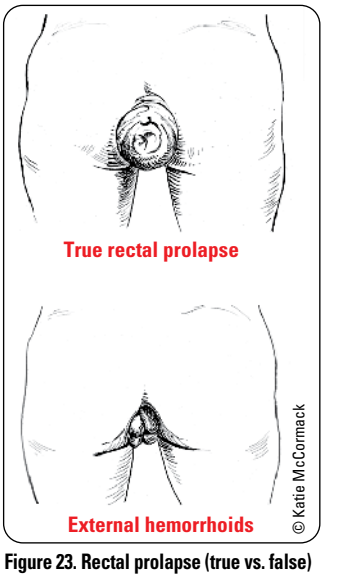

**Figure 23. Rectal prolapse (true vs. false)**

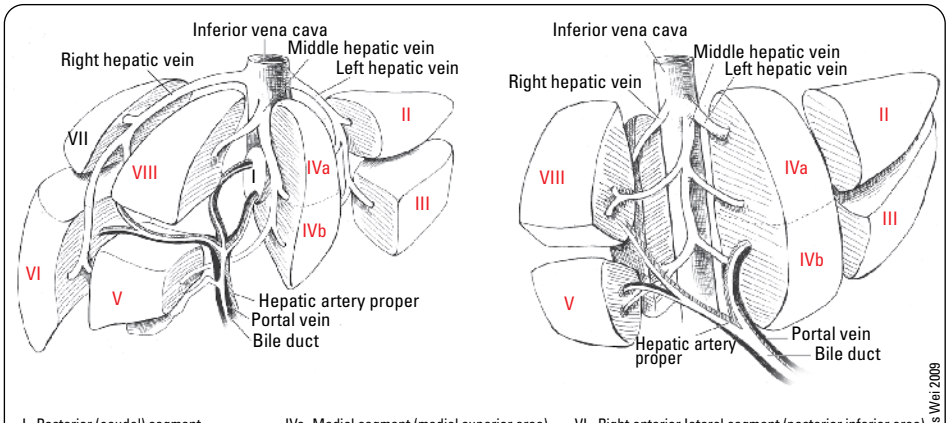
### Risk Factors
- gynecological surgery
- chronic neurologic/psychiatric disorders affecting motility

### Clinical Features
- extrusion of mass with increased intra-abdominal pressure
- difficulty in bowel regulation
  - tenesmus, constipation, fecal incontinence
- permanently extruded rectum with excoriation, ulceration, and constant soiling
- may be associated with urinary incontinence or uterine prolapse

### Treatment
- Type I
  - conservative: gentle manual reduction of prolapsed area, especially in children
  - mucosectomy with excision of redundant mucosa, mostly in adults
- Type II
  - conservative: reduce if possible
  - surgery: abdominal, perineal, and transsacral approaches

# Anal Neoplasms



## ANAL CANAL

### Squamous Cell Carcinoma of Anal Canal (Above Dentate Line)
- most common tumour of anal canal (75%)
- anus prone to human papillomavirus (HPV) infection, therefore at risk for anal squamous intra-epithelial lesions (ASIL)
  - high grade squamous intra-epithelial lesion (HSIL) and low grade squamous intra-epithelial lesion (LSIL) terminology used
- clinical features: anal bleeding, pain, mass, ulceration, and pruritus; 25% asymptomatic
- treatment: chemotherapy ± radiation ± surgery
- prognosis: 80% 5-yr survival

### Malignant Melanoma of Anal Canal
- 3rd most common site for primary malignant melanoma after skin, eyes
- aggressive, distant metastases common at time of diagnosis
- treatment: wide excision or abdominal perineal resection (APR) ± chemoradiation
- prognosis: <5% 5 yr survival

## ANAL MARGIN
- clinical features and treatment as for skin tumours elsewhere
- squamous and basal cell carcinoma, Bowen's disease (SCC in situ), and Paget's disease

# Liver

I. Posterior (caudal) segment
II. Lateral segment (lateral superior area)
III. Left anterior lateral segment (lateral inferior area)

# Liver Cysts

**Table 24. Characteristics of Liver Cysts**

| | Simple Cysts | Polycystic Liver Disease | Choledochal Cysts | Hydatid (Cystic Echinococcosis) | Cystadenoma (Premalignant)/ Cystadenocarcinoma |
|---|---|---|---|---|---|
| **Description** | Contain clear fluid that do not communicate with the intrahepatic biliary tree<br>Most common<br>May have multiple cysts<br>Always benign | Several cysts that replace much of the liver | Congenital malformations of pancreaticobiliary tree<br>High risk of malignancy<br>Majority present before age 10 | Infection with parasite *Echinococcus granulosus*<br>Associated with exposure to dogs, sheep, and cattle in Southern Europe, Middle East, Australasia, South America | Rare cystic tumours that occur in the liver parenchyma or the extrahepatic bile ducts<br>Cystadenocarcinoma is an invasive carcinoma |
| **Clinical Features** | Usually asymptomatic<br>Dull RUQ pain, bloating, and/or early satiety when symptomatic | Progressive<br>50% associated with polycystic kidney disease (if over age 60) | Recurrent abdominal pain<br>Intermittent jaundice<br>RUQ mass<br>Cholangitis<br>Pancreatitis | Usually asymptomatic<br>May have palpable RUQ mass<br>Chronic RUQ pain when symptomatic | Upper abdominal mass<br>Abdominal pain<br>Anorexia |
| **Investigations** | U/S: Used for diagnosis and follow-up<br>CT: well demarcated lesion that does not enhance with contrast | U/S | U/S<br>CT<br>Transhepatic cholangiography<br>LFTs | Anti-Echinococcus Ab (IgG)<br>U/S<br>CT: calcified mass<br>Needle biopsy | Appear as complex cysts: internal septae, papillary projections, irregular lining<br>Need histology for definite diagnosis |
| **Treatment** | Not required unless very large and/or symptomatic<br>Monitor if >4 cm<br>Laparoscopic or open cyst wall removal (unroofing) is established treatment and is usually curative<br>Percutaneous drainage and ethanol sclerotherapy also an option, but not curative | Only if symptomatic<br>partial liver resection<br>drainage | Complete excision of cysts<br>liver transplant if cyst involves intrahepatic bile ducts (Caroli's disease) | Albendazole (anti-helminthic drug) – cure up to 30%<br>Surgical: radical (total pericystectomy or partial hepatectomy) vs. conservative (open endocystectomy)<br>Percutaneous: PAIR (puncture, aspiration, injection, reaspiration) | All complex, multiloculated cysts (except echinococcal) should be excised because of malignancy risk |
| **Complications** | Intracystic hemorrhage<br>Cyst rupture which can lead to secondary infection | | Biliary cirrhosis, portal HTN, cyst rupture, or cholangiocarcinoma<br>Abnormal pancreaticobiliary junction is associated with increased risk of malignancy | Inferior vena cava compression<br>Cyst rupture which can cause biliary colic, jaundice, cholangitis, pancreatitis, or anaphylactic reaction | Cystadenocarcinoma can invade adjacent tissues and metastasize |

# Liver Abscesses

## Etiology

- types
  - pyogenic (bacterial): most common etiology; most often polymicrobial – *E. coli, Klebsiella, Proteus, Strep. milleri*
  - parasitic (amoebic): *Entamoeba histolytica, Echinococcal* cyst
  - fungal: *Candida*
  - sources: direct spread from biliary tract infection, portal spread from GI infection, systemic infection (e.g. endocarditis)

## Clinical Features

- fever, malaise, chills, anorexia, weight loss, abdominal pain, and nausea
- RUQ tenderness, hepatomegaly, and jaundice

## Investigations

- CBC (leukocytosis, anemia), LFTs (elevated ALP and hypoalbuminemia common; elevated transaminases and bilirubin variable), blood cultures, INR/PTT, stool cultures, and serology (*E. histolytica* and echinoccocus)
- U/S, CXR (right basilar atelectasis/effusion), CT, cyst aspiration with C&S, and MRI

## Treatment

- treat underlying cause
- pyogenic abscesses generally treated with antibiotic therapy (e.g. ceftriaxone and metronidazole or piperacillin-tazobactam) and U/S- or CT-guided percutaneous drainage or surgical drainage
- consider potential source of sepsis (e.g. biliary source, infected tumour)

## Prognosis

- overall mortality 15% – higher rate if delay in diagnosis, multiple abscesses, and malnutrition

# Neoplasms

## BENIGN LIVER NEOPLASMS

### Hemangioma (cavernous)
- pathogenesis: most common benign hepatic tumour; results from malformation of angioblastic fetal tissue
- risk factors: F:M = 3:1
- clinical features
  - usually small and asymptomatic
  - consumptive coagulopathy if giant (in children)
- investigations
  - contrast CT (well-demarcated hypodense mass with peripheral enhancement on arterial phase with centripetal filling on delayed phases), U/S (homogenous hyperechoic mass), MRI
  - avoid biopsy: may result in hemorrhage
- treatment
  - usually none

### Focal Nodular Hyperplasia
- pathogenesis: unclear, may be regenerative response to hyperperfusion from anomalous arteries at centre of nodule
- risk factors: female, age 20-50
- clinical features: asymptomatic, rarely grows or bleeds, and no malignant potential
- investigations: central stellate scar on CT scan; MRI, biopsy may be required
- treatment: may be difficult to distinguish from adenoma/fibrolamellar HCC (malignant potential)
  - if confirmed to be FNH → no treatment required

### Adenoma
- pathogenesis: benign abnormal growth of glandular epithelium
- risk factors: female, age 20-50, estrogen (OCP, pregnancy), obesity, and type 1 glycogen storage disease
- clinical features: asymptomatic, 25% present with RUQ pain or mass, may present with bleeding
- investigations: CT (well-demarcated masses, often heterogeneous enhancement on arterial phase, isodense on venous phase without washout of contrast), U/S, MRI, biopsy can be considered, with bleeding risk taken into account
- treatment
  - stop anabolic steroids or OCP
  - excise, especially if large (>5 cm), due to risk of transformation to HCC and spontaneous rupture/hemorrhage

## MALIGNANT LIVER NEOPLASMS

### Primary
- most commonly hepatocellular carcinoma (HCC) and cholangiocarinomas
- others include angiosarcoma, hepatoblastoma, and hemangioendothelioma
- epidemiology: 4th leading cause of cancer death worldwide, 9th in United States; highest in sub-Saharan Africa and Southeast Asia
- risk factors
  - chronic liver inflammation: cirrhosis from any cause, chronic hepatitis B (inherently oncogenic) and hepatitis C, hemochromatosis, α1-antitrypsin deficiency, and non-alcoholic steatohepatitis
  - medications: OCPs (3x increased risk), steroids
  - smoking, alcohol, betel nuts
  - chemical carcinogens: aflatoxin, microcystin, and vinyl chloride (associated with angiosarcoma)
- clinical features
  - RUQ discomfort and right shoulder pain
  - jaundice, weakness, weight loss, and ± fever (if central tumour necrosis)
  - hepatomegaly, bruit, and hepatic friction rub
  - ascites with blood (sudden intra-abdominal hemorrhage)
  - paraneoplastic syndromes: hypoglycemia, hypercalcemia, erythrocytosis, and watery diarrhea
  - metastasis: lung, bone, brain, and peritoneal seeding
- investigations
  - elevated ALP, bilirubin, and α-fetoprotein (80% of patients)
  - U/S (poorly-defined margins with internal echos), triphasic CT (enhancement on arterial phase and washout on portal venous phase), and MRI
  - liver enzyme and liver function tests: AST, ALT, ALP, bilirubin, albumin, and INR
- treatment
  - cirrhosis is a relative contraindication to tumour resection due to decreased hepatic reserve
  - surgical: resection (10% of patients have resectable tumours)
  - liver transplant; may use bridging therapy while awaiting transplant
    - absolute contraindications: extrahepatic disease and vascular invasion
    - relative contraindications: dependent on liver transplant protocol based on staging criteria followed by transplant centre
  - non-surgical: radiofrequency ablation, percutaneous ethanol injection, transcatheter arterial chemoembolization (TACE), chemotherapy (consider sorafenib for HCC; pre-operative chemotherapy for hepatoblastoma is standard of care), and radiotherapy

**Differential Diagnosis of Metastatic Liver Mass**

**S**ome **GU** **C**ancers **P**roduce **B**umpy **L**umps
**S**tomach
**G**enito**U**rinary cancers (kidney, ovary, uterus)
**C**olon
**P**ancreas
**B**reast
**L**ung

**Staging Criteria for Hepatocellular Carcinoma**

| | |
|---|---|
| **Milan Criteria*** | 1 tumour ≤5 cm<br>Up to 3 tumours each ≤3 cm |
| **UCSF Criteria*** | 1 tumour ≤6.5 cm<br>Up to 3 tumours each ≤4.5 cm, total diameter ≤8 cm |
| **Toronto Criteria*** | No tumour size or number restrictions<br>No systemic symptoms<br>Not poorly differentiated |

*Each criteria assumes no extrahepatic and no macrovascular invasion

**Child-Turcotte-Pugh Score (Prognosis of Chronic Liver Disease/Cirrhosis, including Post-Operatively)**

| | 1 Point | 2 Points | 3 Points |
|---|---|---|---|
| **Albumin (g/L)** | >35 | 28-35 | <28 |
| **Ascites** | Absent | Easily controlled | Poorly controlled |
| **Bilirubin (μmol/L)** | <34 | 34-51 | >51 |
| **(mg/dL)** | <2.0 | 2.0-3.0 | >3.0 |
| **Coagulation (INR)** | <1.7 | 1.7-2.3 | >2.3 |
| **Hepatic Encephalopathy** | None | Minimal (Grade I-II) | Advanced (Grade III-IV) |

| Points | Class | One Yr Survival | Two Yr Survival |
|---|---|---|---|
| **5-6** | A | 100% | 85% |
| **7-9** | B | 81% | 57% |
| **10-15** | C | 45% | 35% |

- prognosis
  - 5 yr survival: 18% of all patients; 40-70% of patients undergoing complete resection

### Secondary
- metastases to the liver are the most common malignant tumours found in the liver
- etiology
  - GI (colorectal most common), lung, breast, pancreas, ovary, uterus, kidney, gallbladder, and prostate
- treatment
  - depends on the primary cancer site and prognosis
    - often liver metastases are a manifestation of Stage IV disease and chemotherapy is indicated
  - metastasectomy may be appropriate for some cancers
    - hepatic resection of metastatic colorectal liver metastases is standard of care as part of multi-modality treatment that includes chemotherapy if complete resection of the primary cancer and metastases is possible
    - prognosis following liver resection for colorectal metastases is an overall survival of 30-60% at 5 yr

Secondary liver metastases are common in many cancers, with some studies showing a prevalence of 40-50% amongst patients with extrahepatic cancers. They commonly arise from breast, lung, and colorectal cancers. For metastases secondary to colorectal cancer, surgical resection offers the greatest likelihood of cure

## Liver Transplantation

**Table 25. Conditions Leading to Transplantation**

| Parenchymal Disease | Cholestatic Disease | Inborn Errors | Tumours |
|---|---|---|---|
| Chronic hepatitis B or C*<br>Alcoholic cirrhosis<br>Acute liver failure<br>Budd-Chiari syndrome<br>Congenital hepatic fibrosis<br>CF<br>Autoimmune hepatitis<br>Cryptogenic cirrhosis<br>Drug induced hepatotoxicity<br>Non-alcoholic steatohepatitis | Biliary atresia**<br>Primary biliary cirrhosis<br>Sclerosing cholangitis | α1-antitrypsin deficiency<br>Wilson's disease<br>Hemochromatosis | Hepatocellular carcinoma |

*leading cause in adults; **leading cause in children

**Living Liver Donors vs. Deceased Liver Donors**
The right lobe of a living donor liver is transplanted into the recipient, whereas whole livers from deceased donors are transplanted orthotopically into the recipient

### Clinical Indications
- early referral for transplant should be considered for all patients with progressive liver disease not responsive to medical therapy, especially:
  - decompensated cirrhosis (ascites, esophageal variceal hemorrhage, spontaneous hepatic encephalopathy, coagulopathy, progressive jaundice, severe fatigue)
  - unresectable primary liver cancers
  - fulminant hepatic failure
- end-stage liver disease with life expectancy <1 yr and if no other therapy is appropriate
  - suitable HCC not amenable to liver resection

**Which Matters Most: Number of Tumours, Size of the Largest Tumour, or Total Tumour Volume?**
Liver Transplant 2011;17:S58-66
**Purpose**: To determine if the size and/or number of hepatocellular carcinoma (HCC) nodules predict disease recurrence and survival after liver transplantation.
**Methods**: Systematic review and meta-analysis.
**Results**: 74 studies were included for analysis. Patients beyond the Milan criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the UCSF criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the Milan criteria but within the UCSF criteria had reduced overall and disease-free survivals. Overall and disease-free survivals were reduced for patients with larger total tumour diameter, ≥10 cm vs. <10 cm and ≥9 cm vs. <9 cm, respectively. Similarly, patients with higher diameter of largest tumour nodule (≥3 cm vs. <3 cm) had reduced overall survival and higher recurrence. Overall and disease-free survivals were reduced and recurrence higher for patients with tumour size ≥5 cm vs. <5 cm. Mixed results were found regarding number of tumour nodules.
**Conclusion**: Tumour size and volume are important factors in survival after liver transplantation.

### Criteria for Transplantation
- Model for End-Stage Liver Disease (MELD): prognostic model to estimate 3 mo survival following transjugular intrahepatic portosystemic shunt (TIPS) procedure and to prioritize patients awaiting liver transplant; based on creatinine, bilirubin, INR; MELD scores from 6-40 used to prioritize liver allocation
- Child-Turcotte-Pugh Score: classification system to assess the prognosis and the abdominal surgery peri-operative mortality of chronic liver disease and cirrhosis; patient must have ≥7 points (Class B) for transplant evaluation

### Contraindications
- active alcohol/substance abuse
- extrahepatic malignancy within 5 yr
- advanced cardiopulmonary disease
- active uncontrolled infection

**Living Donor Liver Transplantation vs. Deceased Donor Liver Transplantation for Hepatocellular Carcinoma: Comparable Survival and Recurrence**
Liver Transplant 2012;18:315-322
**Purpose**: To compare the overall survival and hepatocellular carcinoma (HCC) recurrence rates after living donor liver transplantation (LDLT) versus deceased donor liver transplantation (DDLT) in a series of patients with HCC.
**Methods**: Study conducted between 1996 and 2009 at a single centre. 345 patients with HCC undergoing liver transplantation included.
**Results**: The overall survival rates at 1, 3, and 5 yr did not significantly differ between the LDLT and DDLT groups (p=0.62). Disease free survival at 1, 3, and 5 yr did not differ between the groups (p=0.82). The recurrence rates at 1, 3, and 5 yr also did not differ between the two group (p=0.54).
**Conclusion**: LDLT and DDLT lead to similar survival and recurrence rates.

### Post-Operative Complications
- primary non-function (graft failure): urgent re-transplantation is indicated
- acute and chronic rejection, ischemia-reperfusion injury
- vascular: hepatic artery or portal vein thrombosis, IVC obstruction
- biliary complications: fever, increasing bilirubin and ALP
- complications related to immunosuppression: HTN, renal disease, DM, obesity, hyperlipidemia, osteoporosis, malignancy, neurologic complications, infection (leading cause of mortality following transplant)

### Prognosis
- patient survival at 1 yr: 85%
- graft survival at 1 yr: >80%, at 5 yr: 60-70%

# Biliary Tract

## Cholelithiasis

### Definition
- the presence of stones in the gallbladder

### Pathogenesis
- imbalance of cholesterol and its solubilizing agents (bile salts and lecithin)
- excess hepatic cholesterol secretion relative to bile salts and lecithin → supersaturated cholesterol which precipitates as gallstones
- North America: cholesterol stones (80%), pigment stones (20%)

### Risk Factors
- cholesterol stones
  - obesity
  - age <50
  - estrogens: female, multiparity, OCPs
  - ethnicity: First Nations heritage (especially Pima Indians) > Caucasian > Black
  - terminal ileal resection or disease (e.g. Crohn's disease)
  - impaired gallbladder emptying: starvation, TPN, DM
  - rapid weight loss: rapid cholesterol mobilization and biliary stasis
- pigment stones (contain calcium bilirubinate)
  - cirrhosis
  - chronic hemolysis
  - biliary stasis (strictures, dilation, biliary infection)
  - protective factors: statins, vitamin C, coffee, exercise

**Risk Factors for Cholesterol Stones**

**4Fs**
**F**at
**F**emale
**F**ertile
**F**orties

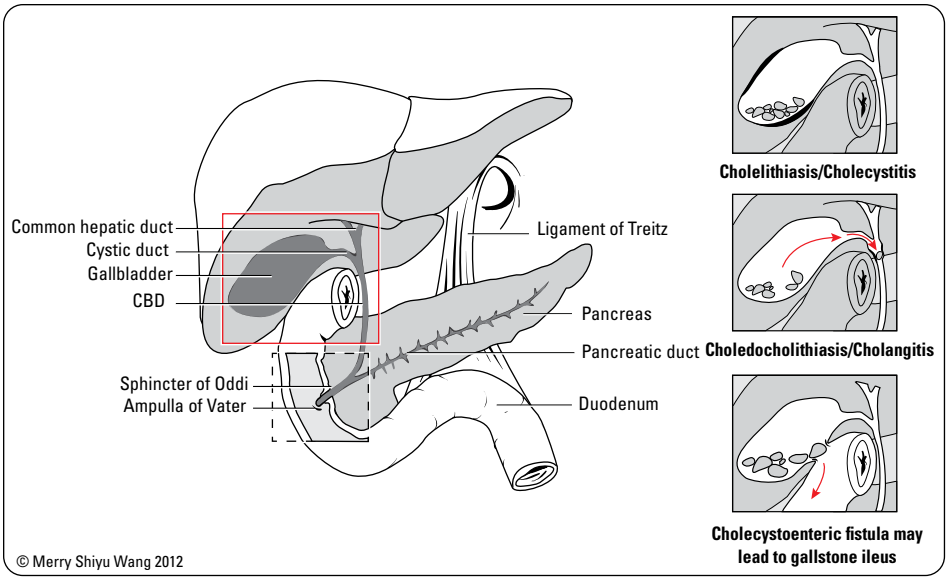

**Figure 25. Gallstone disease**

### Clinical Feature
- asymptomatic (80%): found incidentally
  - 18% risk of progression to symptomatic gallstone disease within 20 yr
  - most do NOT require treatment
  - consider cholecystectomy if: increased risk of malignancy (choledochal cysts, Caroli's disease, porcelain or calcified gallbladder), sickle cell disease, pediatric patient, bariatric surgery, and immunosuppression
- biliary colic (10-25%)

### Investigations
- normal bloodwork: CBC, LFTs, liver enzymes, amylase, lipase
- U/S: diagnostic procedure of choice
  - image for signs of inflammation, obstruction, and localization of stones
  - 95% specific for detecting stones
- HIDA scan (cholescintography)
  - used less commonly
  - IV technetium-99 radioisotope is excreted into bile, allowing visualization of the biliary tree
  - does not visualize stones; diagnosis based on occluded cystic duct or CBD

**Summary of Biliary Tract Conditions**

| Gall Bladder | Asymptomatic | Pain Only | Infection + Pain |
|---|---|---|---|
| Cholelithiasis | ✓ (majority) | | |
| Biliary Colic | | ✓ | |
| Cholecystitis | | | ✓ |
| **Common Bile Duct** | **Asymptomatic** | **Pain Only** | **Infection + Pain** |
| Choledocholithiasis | ✓ (majority) | ✓ | |
| Cholangitis | | | ✓ (majority) |

# Biliary Colic

### Pathogenesis
- gallstone transiently impacted in cystic duct, no infection

### Clinical Features
- an episode of steady, severe dull pain in the epigastrium or RUQ lasting minutes to hours (<6 h), crescendo-decrescendo pattern
- can present with chest pain, right shoulder tip pain, scapular pain
- N/V
- frequently occurs at night or after fatty meal, not after fasting
- no peritoneal findings, no systemic signs

### Investigations
- normal blood work: CBC, electrolytes, liver enzymes, LFTs, bilirubin, amylase
- U/S shows cholelithiasis, may show stone in cystic duct

### Treatment
- analgesia, rehydration during colic episode
- elective cholecystectomy (95% success)
  - complications: CBD injury (0.3-0.5%), hollow viscus injury, bile peritonitis, and vessel injury
  - laparoscopic cholecystectomy is the standard of care, no benefit to delaying surgery
  - risk of open cholecystectomy higher in emergency situations

# Acute Cholecystitis

### Pathogenesis
- inflammation of gallbladder resulting from sustained gallstone impaction in cystic duct or Hartmann's pouch
- no cholelithiasis in 5-10% (see *Acalculous Cholecystitis*, GS53)

### Clinical Features
- often have history of biliary colic
- severe constant (>6 h) epigastric or RUQ pain, anorexia, N/V, and low grade fever (<38.5°C)
- focal peritoneal findings: Murphy's sign, palpable, and tender gallbladder (in 33%)
- Boas' sign: right subscapular pain

### Investigations
- blood work: elevated WBC and left shift, mildly elevated bilirubin, AST, ALT, and ALP
- U/S: 98% sensitive, consider HIDA scan if U/S negative
  - signs: gallbladder wall thickening >4 mm, edema (double-wall sign), gallbladder sludge, pericholecystic fluid, and sonographic Murphy's sign

### Complications
- Mirizzi syndrome: extra-luminal compression of CBD/CHD due to large stone in cystic duct
- empyema of gallbladder: suppurative cholecystitis, pus in gallbladder, and sick patient
- emphysematous cholecystitis: bacterial gas present in gallbladder lumen, wall, or pericholecystic space (risk in diabetic patient); organisms involved in secondary infection: *E. coli, Klebsiella, Enterococcus*
- gangrenous gallbladder (20%), perforation (2%): result in abscess formation or peritonitis
- cholecystoenteric fistula (from repeated attacks of cholecystitis) can lead to gallstone ileus

### Treatment
- admit, hydrate, NPO, NGT (if persistent vomiting from associated ileus), analgesics
- antibiotics
  - cefazolin if uncomplicated cholecystitis
- ERCP prior to surgery if CBD stones are present on US
  - MRCP ± ERCP if CBD is markedly dilated or CBD stones suspected
- cholecystectomy
  - early (within 72 h) vs. delayed (after 6 wk)
    - equal morbidity and mortality
    - early cholecystectomy preferred: shorter hospitalization and recovery time, no benefit to delaying surgery
    - emergent OR indicated if high risk, e.g. emphysematous
  - laparoscopic is standard of care (convert to open for complications or difficult case)
    - laparoscopic: reduced risk of wound infections, shorter hospital stay, reduced post-operative pain, and increased risk of bile duct injury
- intra-operative cholangiography (IOC)
  - indications: clarify bile duct anatomy, history of biliary pancreatitis, small stones in gallbladder with a wide cystic duct (>15 mm), and jaundice
- percutaneous cholecystostomy tube: critically ill or if general anesthetic contraindicated

Biliary colic is a **constant pain**, not colicky

**2 Most Important Lab Tests for Biliary Pain**
- Lipase
- Bilirubin

Biliary colic is treated with analgesia and elective cholecystectomy
Acute cholecystitis is treated with antibiotics and early cholecystectomy

**Early vs. Delayed Laparoscopic Cholecystectomy for Uncomplicated Biliary Colic**
Cochrane DB Syst Rev 2013;6:CD007196
**Study**: To assess the benefits and harms of early vs. delayed laparoscopic cholecystectomy for patients with uncomplicated biliary colic due to gallstones.
**Results**: One trial with 75 participants, average age 43 yr. Early laparoscopic cholecystectomy (<24 h) vs. delayed (mean wait period 4.2 mo). The proportion of serious adverse events was lower in the early vs. delayed group (0% vs. 22.5%, respectively). There was a shorter hospital stay in the early group (MD -1.25 d, 95% CI -2.05 to -0.45) and a shorter operating time in the early group (MD -14.80 min, 95% CI -18.02 to -11.58). There was no difference in the proportion of patients requiring conversion to open cholecystectomy in the two groups.
**Conclusion**: Early laparoscopic cholecystectomy (<24 h of diagnosis of biliary colic) decreased morbidity during the waiting period for elective laparoscopic cholecystectomy, hospital stay, and operating time.

# Acalculous Cholecystitis

## Definition
- acute or chronic cholecystitis in the absence of stones

## Pathogenesis
- typically due to gallbladder ischemia and stasis

## Risk Factors
- DM, immunosuppression, ICU admission, trauma patient, TPN, and sepsis

## Clinical Features
- see *Acute Cholecystitis*, GS52
- occurs in 10% of cases of acute cholecystitis

## Investigations
- bloodwork: CBC, electrolytes, LFTs, liver enzymes, amylase, and lipase
- U/S: shows sludge in gallbladder, other U/S features of cholecystitis (see *Acute Cholecystitis*, GS52)
- CT or HIDA scan

## Treatment
- IV fluids, pain management
- broad-spectrum antibiotics, cholecystectomy
- if patient unstable → cholecystostomy

# Choledocholithiasis

## Definition
- stones in CBD

## Clinical Features
- 50% asymptomatic
- often have history of biliary colic
- tenderness in RUQ or epigastrium
- acholic stool, dark urine, and fluctuating jaundice
- primary vs. secondary stones
  - primary: formed in bile duct, indicates bile duct pathology (e.g. benign biliary stricture, sclerosing cholangitis, choledochal cyst, and CF)
  - secondary: formed in gallbladder (85% of cases in U.S.)

## Investigations
- CBC: usually normal; leukocytosis suggests cholangitis
- LFTs: increased AST, ALT early in disease, increased bilirubin (more sensitive), alkaline phosphatase (ALP), gamma glutamyltransferase (GGT) later
- amylase/lipase: to rule out gallstone pancreatitis
- U/S: intra-/extra-hepatic duct dilatation; differential diagnosis is choledochal cyst
- MRCP (90% sensitive)
  - visualization of ampullary region, biliary and pancreatic anatomy
  - non-invasive diagnostic test of choice
- ERCP
  - CBD stones in periampullary region
  - diagnostic and therapeutic; removal of stones and sphincterotomy possible
  - complications: retained stones, ERCP pancreatitis (1-2%), pancreatic or biliary sepsis

## Percutaneous Transhepatic Cholangiography
- percutaneous approach to the proximal biliary tree (i.e. intra-hepatic biliary system) via the hepatic parenchyma
- useful for proximal bile duct obstruction or when ERCP fails or not available
- requires prophylactic antibiotics
- contraindications: coagulopathy, ascites, peri/intrahepatic sepsis, and disease of right lower lung or pleura
- complications: bile peritonitis, chylothorax, pneumothorax, biliary sepsis, and hemobilia

## Complications
- cholangitis, pancreatitis, biliary stricture, and biliary cirrhosis

## Treatment
- treat with ERCP for CBD stone extraction possibly followed by elective cholecystectomy in 25% of patients

**Mirizzi Syndrome**
Extrinsic compression of the common hepatic duct by a gallstone in the cystic duct or Hartmann's pouch. Impacted gallstone may erode into the CHD or CBD, creating a cholecystohepatic or cholecystocholedochal fistula; Mirizzi syndrome has an association with gallbladder cancer

**Rouviere's Sulcus**
Fissure between right lobe and caudate process of liver; keeping dissection anterior to this landmark prevents bile duct injury

**Critical View of Safety**
Decreases risk of injury to CBD during laparoscopic cholecystectomy
Hepatocystic triangle (space between the gallbladder and liver) cleared of any structures other than the cystic artery

**Laparoscopic vs. Open Cholecystectomy**
**Laparoscopic Cholecystectomy**
- Shorter operating time
- Shorter length of stay
- Shorter sick leave
- Shorter time to return to daily activities
- Less post-operative pain
- Decreased use of post-operative analgesia
- Decreased reduction in pulmonary function*
- Fewer pulmonary complications
- Decreased acute phase response
- Less impairment in intestinal motility*

**Open Cholecystectomy**
- Lower conversion rates to open surgery (for mini-laparotomies)

*NOTE:
Pulmonary function = $O_2$ consumption, spirometric parameters, ABG, and acid-base balance
Intestinal motility = auscultating intestinal peristalsis, abdominal circumference measurement, and time interval to restitution of defecation

**American Society of Gastrointestinal Endoscopy 2010 Predictors for Risk of CBD Stones**
**Very strong**
- CBD stone on U/S
- Clinical ascending cholangitis
- Bilirubin >68 µmol/L

**Strong**
- CBD dilated >6 mm on U/S
- Bilirubin 31-68 µmol/L

**Moderate**
- Abnormal liver test (besides bilirubin)
- Age >55 yr
- Clinical gallstone pancreatitis

# Acute Cholangitis

### Pathogenesis
- obstruction of CBD leading to biliary stasis, bacterial overgrowth, suppuration, and biliary sepsis – may be life-threatening, especially in elderly

### Etiology
- choledocholithiasis (60%), stricture, neoplasm (pancreatic or biliary), extrinsic compression (pancreatic pseudocyst or pancreatitis), instrumentation of bile ducts (PTC, ERCP), and biliary stent
- organisms: *E. coli, Klebsiella, Pseudomonas, Enterococcus, B. fragilis, and Proteus*

### Clinical Features
- Charcot's triad: fever, RUQ pain, and jaundice
- Reynold's pentad: fever, RUQ pain, jaundice, shock, and confusion
- may have N/V, abdominal distention, ileus, acholic stools, and tea-coloured urine (elevated direct bilirubin)

### Investigations
- CBC: elevated WBC + left shift
- may have positive blood cultures
- LFTs: obstructive picture (elevated ALP, GGT, and conjugated bilirubin, mild increase in AST, ALT)
- amylase/lipase: rule out pancreatitis
- U/S: intra-/extra-hepatic duct dilatation

### Treatment
- initial: NPO, fluid and electrolyte resuscitation, ± NGT, IV antibiotics (treats 80%)
- biliary decompression
  - ERCP + sphincterotomy: diagnostic and therapeutic
  - PTC with catheter drainage: if ERCP not available or unsuccessful
  - laparotomy with CBD exploration and T-tube placement if above fails
- all patients should also have a cholecystectomy, unless contraindicated

### Prognosis
- suppurative cholangitis mortality rate: 20-30%

**Charcot's Triad**
Fever, RUQ pain, jaundice

**Reynolds' Pentad**
Fever, RUQ pain, jaundice, shock, confusion

**Common Bacteria in Biliary Tract**

**KEEPS**
***K****lebsiella*
***E****nterococcus*
***E****. coli,* ***E****nterobacter*
***P****roteus,* ***P****seudomonas*
***S****erratia*

# Gallstone Ileus

### Pathogenesis
- repeated inflammation causes a cholecystoenteric fistula (usually duodenal) → large gallstone enters the GI tract (impacting near the ileocecal valve) causing a mechanical bowel obstruction (note: ileus is a misnomer in this context)

### Clinical Features
- crampy abdominal pain, N/V, constipation/obstipation (see *Large Bowel Obstruction*, GS34)

### Investigations
- AXR: dilated small intestine, air fluid levels, may reveal radiopaque gallstone, and air in biliary tree (pneumobilia) (40%)
- CT: biliary tract air, obstruction, and gallstone in intestine
- Rigler's triad: pneumobilia, small bowel obstruction (partial or complete), and gallstone (usually in right iliac fossa)

### Treatment
- fluid resuscitation, NGT decompression
- surgery: enterolithotomy and removal of stone, inspect small and large bowel for additional proximal stones
- may close fistula surgically or manage expectantly (can resolve spontaneously)
- cholecystectomy is generally not performed

**Rigler's Triad of Gallstone Ileus**
Pneumobilia
Small bowel obstruction
Gallstone

**Bouveret's Syndrome**
Gastric outlet/duodenal obstruction caused by a large gallstone passing through a cholecystogastric or cholecystoduodenal fistula

# Carcinoma of the Gallbladder

### Risk Factors
- chronic symptomatic gallstones (70% of cases), old age, female, gallbladder polyps, porcelain gallbladder, chronic infection (*Salmonella, Helicobacter*), and abnormal pancreaticobiliary duct junction

### Clinical Features
- majority are adenocarcinoma
- may be incidental finding on elective cholecystectomy (~1% of open cholecystectomies OR 0.1% in laparoscopic cholecystectomies)
- many patients are asymptomatic until late
- local: non-specific RUQ pain, ± palpable RUQ mass
- Courvoisier's gallbladder sign: enlarged gallbladder and painless jaundice due to obstruction of CBD, suggestive of gallbladder or pancreatitic malignancy
- systemic: jaundice (50%) due to invasion of CBD or compression of CBD by pericholedochal nodes, weight loss, malaise, anorexia
- early local extension to liver, may extend to stomach, duodenum
- early metastasis common to liver, lung, bone

### Investigations
- U/S: mural thickening, calcification, loss of interface between gallbladder and liver, and fixed mass
- endoscopic U/S (EUS): good for distinguishing carcinomas from other diagnoses such as polyps, staging, allows sampling of bile for cytology
- abdominal CT: polypoid mass, mural thickening, liver invasion, nodal involvement, and distant metastases
- MRI/MRCP: good for distinguishing benign and malignant polyps

### Treatment
- if carcinoma of the gallbladder is suspected pre-operatively, an open cholecystectomy should be considered to avoid tumour seeding of the peritoneal cavity
- confined to mucosa (rare): cholecystectomy
- beyond mucosa: cholecystectomy, en bloc wedge resection of 3-5 cm underlying liver, and dissection of hepatoduodenal lymph nodes

### Prognosis
- poor 5 yr survival (20%) as gallbladder carcinoma is often detected late
- better outcomes when detected incidentally following cholecystectomy

**Efficacy of Neoadjuvant Chemoradiation, Followed by Liver Transplantation, for Perihilar Cholangiocarcinoma at 12 US Centres**
Gastroenterology 2012;143:88-98
**Purpose**: To determine the effectiveness of neoadjuvant chemoradiation and liver transplantation for unresectable perihilar cholangiocarcinoma and to determine the appropriateness of the United Network of Organ Sharing/ Organ Procurement and Transplantation Network (UNOS/ OPTN) criteria for model of end-stage liver disease (MELD) exception for patients with this disease.
**Methods**: Study conducted from 1993-2010 in 12 transplant centres. 287 patients included.
**Results**: Median follow-up was 2.5 yr. 43% of patients (n=122) died after a median of 1.2 yr from presentation, and of these, 60 died pretransplant. Post-transplant, 43 patients had recurrences and 62 died. Recurrence-free survival at 2, 5, and 10 yr were 78%, 65%, and 59%, respectively. Intention-to-treat survival rates at 2 and 5 yr were 68% and 53%, respectively. 25% of patients left the waiting list after a median of 4.6 mo. The waiting list drop-out rate increased by an average of 11.5% every 3 mo. Patients who received transplantation outside of the criteria for MELD exception or who had a malignancy within 5 yr had significantly worse recurrence-free survival compared to those who met the criteria (HR=2.98, 95% CI 1.79, 4.95). Recurrence-free survival at 5 yr was shorter for patients with tumours >3 cm vs. ≤3 cm ($p<0.001$).
**Conclusions**: Neoadjuvant chemoradiation and liver transplantation are effective treatments for unresectable perihilar cholangiocarcinoma. Furthermore, the UNOS/ OPTN criteria for MELD exception appear to be appropriate.

Obstructive jaundice is the most common presenting symptom for cholangiocarcinoma

# Cholangiocarcinoma

### Definition
- malignancy of extra- or intrahepatic bile ducts

### Risk Factors
- age 50-70, gallstones, ulcerative colitis, primary sclerosing cholangitis, choledochal cyst, *Clonorchis sinensis* infection (liver fluke), chronic intrahepatic stones (hepatolithiasis)

### Clinical Features
- majority are adenocarcinomas
- gradual signs of biliary obstruction: jaundice, pruritus, dark urine, and pale stools
- anorexia, weight loss, RUQ pain, Courvoisier's sign (if CBD obstructed), hepatomegaly
- early metastases are uncommon, but commonly tumour grows into portal vein or hepatic artery
- Klatskin tumour: cholangiocarcinoma located at bifurcation of common hepatic duct

### Investigations
- LFTs show obstructive picture
- U/S, CT: bile ducts usually dilated, but not necessarily
- ERCP or PTC: to determine resectability, for biopsies
- CXR, bone scan: for metastatic workup

### Treatment
- if resectable: biliary drainage and wide excision margin
- intra-hepatic lesions: liver resection
  - upper third lesions: duct resection + Roux-en-Y hepaticojejunostomy, ± liver resection
  - middle third lesions (uncommon): duct resection + Roux-en-Y hepaticojejunostomy
  - lower third lesions: Whipple procedure
- unresectable lesions: stent or choledochojejunostomy (surgical bypass)
- chemotherapy ± radiotherapy
- role for transplantation in selected patients with Klatskin tumours

### Prognosis
- overall 5 yr survival: localized 30%, regional 24%, distant 2%

# Pancreas

## Acute Pancreatitis

- see Gastroenterology, G46

### GALLSTONE PANCREATITIS (45% of Acute Pancreatitis)

#### Pathogenesis
- obstruction of pancreatic duct by large or small gallstones and biliary sludge
- backup of pancreatic enzymes can cause autodigestion of the pancreas

#### Clinical Features (Pancreatitis of Any Etiology)
- pain (epigastric pain radiating to back), N/V, ileus, peritoneal signs, jaundice, and fever
- Inglefinger's sign: pain worse when supine, and better when sitting forward
- may have coexistent cholangitis or pancreatic necrosis
- Ranson's criteria for determining prognosis of acute pancreatitis (see sidebar)
  - APACHE II score for determining prognosis of severe acute pancreatitis
- physical exam may show: tachypnea, tachycardia, hypotension, abdominal distention and tenderness, Cullen's sign, and Grey Turner's sign

#### Investigations
- lipase (most Sn and Sp), elevated amylase (higher than alcoholic pancreatitis), and leukocytosis
- elevated ALT (>150 IU/L), AST strongly suggest gallstone etiology of pancreatitis
- U/S may show multiple stones (may have passed spontaneously), and edematous pancreas
- CXR, AXR, and CT (if severe to evaluate for complications)

#### Treatment
- supportive: e.g. NPO, hydration, analgesia, and early enteric nutrition
- antibiotics for severe cases of necrotizing pancreatitis or signs of sepsis
- stone often passes spontaneously (~90%); usually no surgical management in uncomplicated acute pancreatitis
- cholecystectomy during same admission (25-60% recurrence if no surgery)
- may need urgent ERCP + sphincterotomy if CBD stone impacted or cholangitis
- surgical indications in acute pancreatitis (rare):
  - drain placement and debridement for necrotizing pancreatitis if refractory to medical management, if septic, or in ICU without other sources of sepsis

#### Complications
- local complications
  - acute fluid collections
  - walled-off pancreatic fluid collection/pseudocyst (>4 wk old)
  - abscess/infection, necrosis
- systemic complications
  - splenic/mesenteric/portal vessel thrombosis
  - pancreatic ascites/pancreatic pleural effusion
  - DM (b/c pancreatic & insulin insufficiency)
  - ARDS/sepsis/multiorgan failure
  - coagulopathy/DIC
  - severe hypocalcemia

**Ranson's Criteria**
**A. At admission**
1. Age >55 yr
2. WBC >16 x $10^9$/L
3. Glucose >11 mmol/L
4. LDH ≥350 IU/L
5. AST >250 IU/L

**B. During initial 48 h**
1. Hct drop >10%
2. BUN rise >1.8 mmol/L
3. Arterial $PO_2$ <60 mmHg
4. Base deficit >4 mmol/L
5. Calcium <2 mmol/L
6. Fluid sequestration >6 L

**C. Interpretation**
≥2 = difficult course
≥3 = high mortality (≥15%)

## Chronic Pancreatitis

- see Gastroenterology, G48

The hallmark of chronic pancreatitis is epigastric pain radiating to the back

#### Surgical Treatment
- treatment is generally medical
- indications for surgery
  - failure of medical treatment
  - debilitating abdominal pain
  - pseudocyst complications: persistence, hemorrhage, infection, and rupture
  - CBD obstruction (e.g. strictures), and duodenal obstruction
  - pancreatic fistula, variceal hemorrhage secondary to splenic vein obstruction
  - rule out pancreatic cancer (present in 15% of chronic pancreatitis treated surgically)
  - anatomical abnormality causing recurrent pancreatitis
- pre-operative CT and/or ERCP are mandatory to delineate anatomy
- minimally invasive options
  - endoscopic pancreatic duct decompression: less effective than surgery
  - extracorporeal shockwave lithotripsy: if pancreatic duct stones
  - celiac plexus block: lasting benefit in 30% patients, less effective in those <45 yr or with prior pancreatic surgery

- surgical options
  - drainage procedures: only effective if ductal system is dilated
  - Puestow procedure (lateral pancreaticojejunostomy): improves pain in 80% of patients
  - pancreatectomy: best option in absence of dilated duct
  - Whipple procedure (pancreaticoduodenectomy): proximal disease
  - distal pancreatectomy ± Roux-en-Y pancreaticojejunostomy: distal disease
  - total pancreatectomy: refractory disease
- islet cells autotransplantation can be used to control insulin-related morbidity
  - denervation of celiac ganglion and splanchnic nerves

### WALLED-OFF PANCREATIC FLUID COLLECTIONS (PSEUDOCYST)

- localized fluid collections rich in pancreatic enzymes, with a non-epithelialized wall consisting of fibrous and granulation tissue
- complication of chronic and/or acute pancreatitis
- up to 40% resolve spontaneously
- cyst wall must be mature prior to drainage (4-6 wk)
- pseudoaneurysm an absolute contraindication to endoscopic drainage, must embolize first

#### Treatment

- if asymptomatic: expectant management
- if symptomatic: choice of drainage procedure depends on location of fluid collection
  - endoscopic drainage: transmural vs. transpapillary
  - surgical drainage: cystogastrostomy vs. cystoduodenostomy vs. cystojejunostomy
  - percutaneous catheter drainage
  - resection
  - consider biopsy of cyst wall to rule out cystadenocarcinoma

**Total Pancreatectomy and Islet Autotransplantation: A Decade Nationwide Analysis**
World J Transplant 2016;6(1):233-38
**Aim**: To investigate outcomes and predictors of in-hospital morbidity and mortality after total pancreatectomy (TP) and islet autotransplantation.
**Results**: We evaluated a total of 923 patients who underwent IAT after pancreatectomy during 2002-2012. The most common indication of surgery was chronic pancreatitis (86%) followed by acute pancreatitis (12%). Overall mortality and morbidity of patients were 0% and 57.8 %, respectively. Post-surgical hypoinsulinemia was reported in 42.3% of patients, indicating that 57.7% of patients were insulin independent during hospitalization. Predictors of in-hospital morbidity were obesity, fluid and electrolyte disorders, alcohol abuse, and weight loss.
**Conclusion**: Total pancreatectomy + islet autotransplantation is a safe procedure with no mortality, acceptable morbidity, and achieved high rate of early insulin independence. Obesity is the most significant predictor of in-hospital morbidity.

## Pancreatic Cancer

### Epidemiology

- fourth most common cause of cancer-related mortality in both men and women in Canada
- M:F = 1.3:1, average age: 50-70 yr

### Risk Factors

- increased age
- smoking: 2-5x increased risk, most clearly established risk factor
- high fat/low fibre diets
- heavy alcohol use
- obesity
- DM, chronic pancreatitis
- partial gastrectomy
- cholecystectomy
- chemicals: β-naphthylamine, benzidine
- African descent

**Trousseau's Sign**
Spontaneous peripheral venous thrombosis, often associated with pancreatic and other cancers

Vague abdominal pain with weight loss ± jaundice in a patient over 50 yr is pancreatic cancer until proven otherwise

### Clinical Features

- head of the pancreas (70%)
  - weight loss, obstructive jaundice, steatorrhea, and vague constant mid-epigastric pain (often worse at night, may radiate to back)
  - painless jaundice, pruritis, dark urine, pale stools, and Courvoisier's sign
- body or tail of pancreas (30%)
  - tends to present later and usually inoperable (80% are unresectable at diagnosis)
  - weight loss, vague mid-epigastric pain
  - <10% jaundiced
  - sudden onset DM

**Courvoisier's Sign**
Palpable, nontender, distended gallbladder due to CBD obstruction. Present in 33% of patients with pancreatic carcinoma. The distended gallbladder could not be due to acute cholecystitis or stone disease because the gallbladder would actually be scarred and smaller, not larger

### Investigations

- serum chemistry is non-specific, can have elevated ALP and high bilirubin
- carbohydrate antigen 19-9 (most useful serum marker of pancreatic cancer)
- U/S, CT (also evaluates metastasis and resectability) ± ERCP, MRI, EUS

### Pathology

- ductal adenocarcinoma: most common type (75-80%); exocrine pancreas
- intraductal papillary mucinous neoplasm (IPMN)
- other: pancreatic neuroendocrine tumours (non-functional, insulinoma, gastrinoma, VIPoma, glucagonoma, somatostatinoma), mucinous cystic neoplasm (MCN), acinar cell carcinoma
- see *Surgical Endocrinology*, GS65 for functional pancreatic neuroendocrine tumours

### Treatment

- resectable (10-20% of pancreatic cancer)
  - no involvement of liver, peritoneum, or vasculature (hepatic artery, SMA, SMV, portal vein, IVC, aorta), no distant metastasis
  - Whipple procedure (pancreaticoduodenectomy) for cure <5% mortality

  - distal pancreatectomy ± splenectomy, lymphadenectomy if carcinoma of midbody and tail of pancreas
  - adjuvant chemotherapy recommended (gemcitabine ± capecitabine, 5-FU/leucovorin)
- locally advanced, borderline resectable
  - tumours that abut the SMA, SMV, portal vein, hepatic artery, or celiac artery
- locally advanced, non-resectable (palliative → relieve pain, obstruction)
  - encasement of major vascular structures including arteries
  - most body/tail tumours are not resectable (due to late presentation)
  - relieve biliary/duodenal obstruction with endoscopic stenting or double bypass procedure (choledochoenterostomy + gastroenterostomy)
  - palliative chemotherapy (gemcitabine + nab-paclitaxel, FOLFIRNOX) ± radiotherapy

## Prognosis

- most important poor prognostic indicators are lymph node status, margin status, size >3 cm, perineural invasion (invasion of tumour into microscopic nerves of pancreas)
- overall 5 yr survival for all patients with pancreas cancer is 1%; following surgical resection 5 yr survival is 20%
- median survival for unresectable disease: 3-6 mo if metastatic, 8-12 mo if locally advanced at presentation

**Steps of a Whipple Resection (Pancreaticoduodenectomy)**

1. Assessment of metastatic disease (all peritoneal surfaces)
2. Mobilization of the duodenum and head of the pancreas
3. Identification of the superior mesenteric vein and mobilization of the pancreatic neck
4. Mobilization of the stomach; dissection of the hepatoduodenal ligament and cholecystectomy
5. Division of the stomach, proximal jejunum, and CBD
6. Transection of the pancreatic neck and dissection of the uncinate process from the retroperitoneum
7. Restoration of gastrointestinal continuity: construction of a pancreaticojejunostomy, hepaticojejunostomy, gastrojejunostomy using a neoduodenum

**Remove**

- CBD
- Gallbladder
- Duodenum
- Pancreatic head
- Distal stomach (sometimes)

**Table 26. TNM Classification System for Exocrine Tumours of the Pancreas (AJCC 8th edition)**

| Primary Tumour (T) | | Regional Lymph Nodes (N) | | Distant Metastasis (M) | |
|---|---|---|---|---|---|
| **TX** | Primary tumour cannot be assessed | **NX** | Regional lymph nodes cannot be assessed | **M0** | No distant metastasis |
| **T0** | No evidence of primary tumour | **N0** | No regional lymph node metastasis | **M1** | Distant metastasis |
| **Tis** | Carcinoma *in situ* | **N1** | Metastasis in one to three regional lymph nodes | | |
| **T1** | Tumour ≥2 cm in greatest dimension<br>T1a: <0.5 cm<br>T1b: 0.5-1.0 cm<br>T1c: 1.0-2.0cm | **N2** | Metastasis in four or more regional lymph nodes | | |
| **T2** | Tumour >2 cm and ≤4 cm in greatest dimension | | | | |
| **T3** | Tumour >4 cm in greatest dimension | | | | |
| **T4** | Tumour involves celiac axis, SMA, or common hepatic artery | | | | |

**Table 27. Staging and Treatment of Pancreatic Cancer**

| Stage | Classification | 5 Yr Survival | Treatment |
|---|---|---|---|
| **0** | Tis, N0, M0 | | Surgical resection ± chemotherapy |
| **IA** | T1, N0, M0 | 14% | Same as above |
| **IB** | T2, N0, M0 | 12% | Same as above |
| **IIA** | T3, N0, M0 | 7% | Same as above |
| **IIB** | T1-3, N1, M0 | 5% | Same as above |
| **III** | T1-3, N2, M0<br>T4, any N, M0 | 3% | Borderline resectable, trial of chemotherapy and radiation |
| **IV** | any T, any N, M1 | 1% | Non-resectable, palliative treatments |

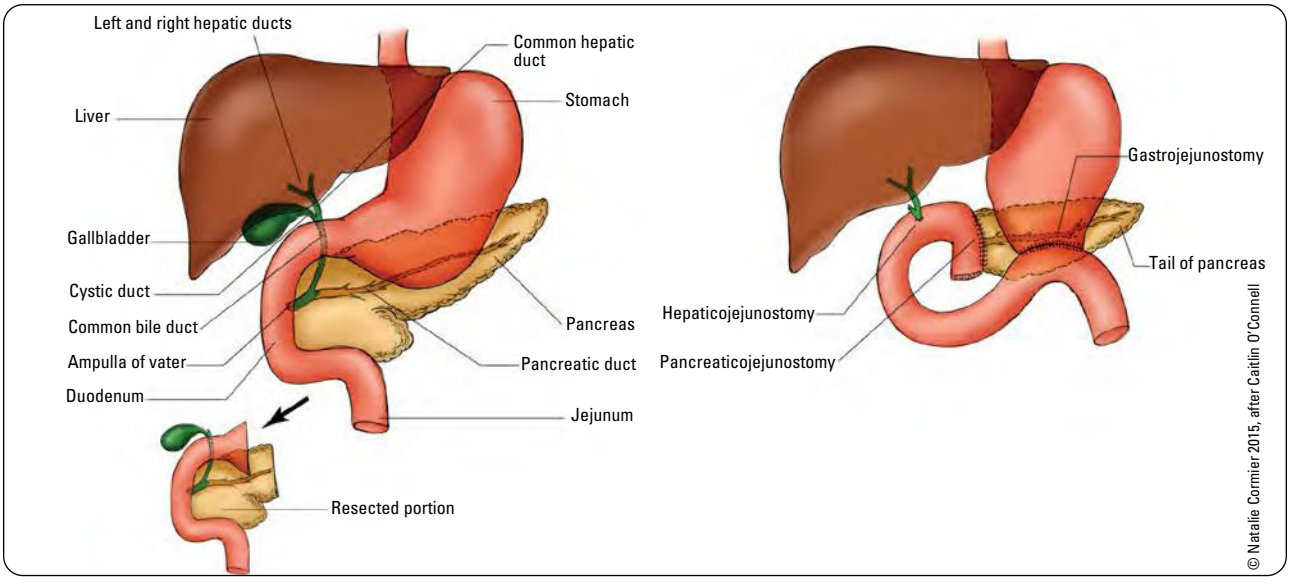

**Figure 26. Schematic of Whipple resection showing the resected components**

# Spleen

## Splenic Trauma

- typically from blunt trauma (especially in people with splenomegaly)
- most common intra-abdominal organ injury in blunt trauma
- may have Kehr's sign

**Kehr's Sign**
Left shoulder pain due to diaphragmatic irritation from splenic rupture, worsens with inspiration

### Treatment

- non-operative
  - in stable patients: extended bed rest with serial hematocrit levels, close monitoring for 3-5 d; pediatric guidelines for days of bed rest is grade plus 1 (i.e. grade 3 splenic laceration requires 4 d of bed rest)
  - hemostatic control
  - splenic artery embolization if patient stable and one of: active contrast extravasation, splenic pseudoaneurysm, hemoperitoneum
- operative
  - hemodynamically unstable patients with positive FAST will undergo operative surgical exploration
  - splenorrhaphy (suture of spleen) ± splenic wrapping with hemostatic mesh – if patient hemodynamically stable, patient has stopped bleeding and laceration does not involve hilum
  - partial splenectomy, rarely performed due to risk of recurrent hemorrhage
  - total splenectomy if patient unstable or high-grade injury

## Splenectomy

### Indications

- splenic trauma (most common reason for splenectomy), hereditary spherocytosis, primary hypersplenism, chronic immune thrombocytopenic purpura (ITP), splenic vein thrombosis causing esophageal varices, splenic abscess, thrombotic thrombocytopenic purpura (TTP), and sickle cell disease
- does not benefit all thrombocytopenic states (e.g. infection, most malignancies involving the bone marrow, drugs/toxins)
- probability of cure of ITP by splenectomy is 60-70%, may be predicted by response to IVIG

**Indication of Splenectomy**

**SHIRTS**
**S**plenic abscess/splenomegaly
**H**ereditary spherocytosis
**I**mmune thrombocytopenic purpura
**R**upture of spleen
**T**hrombotic thrombocytopenic purpura
**S**plenic vein thrombosis

### Complications

- short-term
  - injury to surrounding structures (e.g. gastric wall, tail of pancreas) and their vascular supply
  - post-operative thrombocytosis, leukocytosis
  - thrombosis of portal, splenic, or mesenteric veins
  - subphrenic abscess
- long-term
  - post-splenectomy sepsis (encapsulated organisms): 4% of splenectomized patients (highest risk in those <16 yr)
- 50% mortality
- prophylaxis with vaccinations, ideally 2 wk pre- or post-operative (*pneumococcal, H. influenzae*, and *meningococcus*)
- liberal use of penicillin especially in children <6 yr
  - splenosis: intra-abdominal "seeding" of splenic tissue during removal
  - increased risk of malignancy, DVT, and PE compared to non-splenectomized patients

## Splenic Infarct

### Pathophysiology

- splenic artery occlusion or oxygen-delivery insufficiency leading to parenchymal ischemia and necrosis
- can occur in sickle cell disease, thromboembolism, myelofibrosis, CML, hypercoagulable states
- patient can be asymptomatic or can have LUQ pain (70%), N/V, fever, chills, and Kehr sign

### Treatment

- non-operative: close follow-up, analgesia
- indications for splenectomy: complications such as rupture, abscess, persistent pseudocyst, bleeding, or sepsis

# Breast

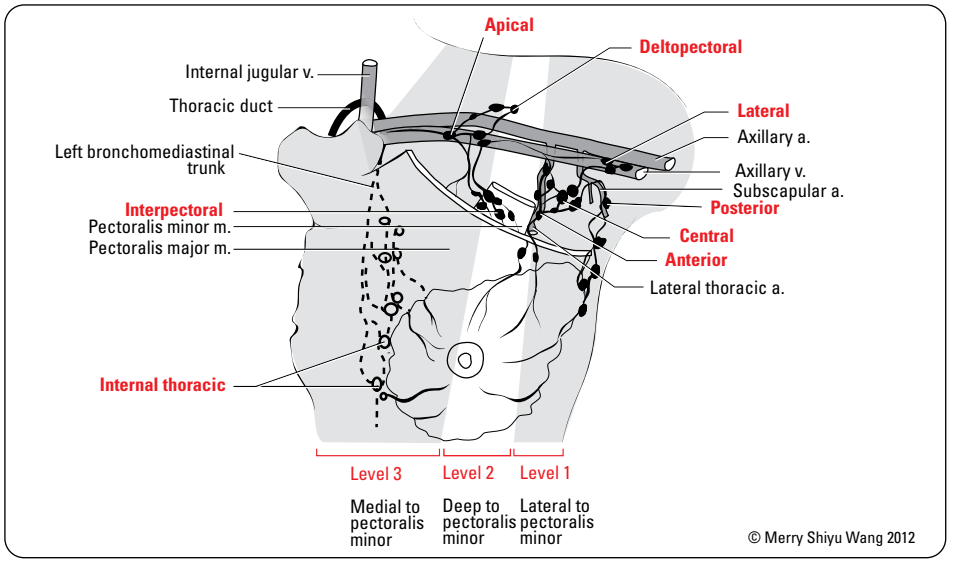

**Figure 27. Anatomy of the breast**

**Levels of Axillary Lymph Nodes**
**Level I:** lateral to pectoralis minor
**Level II:** deep to pectoralis minor
**Level III:** medial to pectoralis minor
(higher level of nodal involvement = worse prognosis)

# Benign Breast Lesions

## Three Categories

1. nonproliferative
2. proliferative without atypia
3. atypical hyperplasia

## NONPROLIFERATIVE LESIONS

- benign breast condition characterized by fibrous and cystic changes in the breast (fibrocystic changes/disease)
- most common: breast cysts
- other lesions include papillary apocrine change, epithelial-related calcifications and mild hyperplasia of the usual type
- no increased risk of breast cancer
- age 30 to menopause (and after if hormone replacement therapy (HRT) used)
- clinical features
  - breast pain, focal areas of nodularity or cysts often in the upper outer quadrant, frequently bilateral, mobile, varies with menstrual cycle, and nipple discharge (straw-like, brown, or green)
- treatment
  - evaluation of breast mass (U/S, mammography as indicated) and reassurance
  - analgesia (ibuprofen, ASA)
  - for severe symptoms: OCP, danazol, bromocriptine

**DDx for Breast Mass**
**Benign**
- Fibrocystic changes
- Fibroepithelial lesions (fibroadenoma most common; benign phyllodes)
- Fat necrosis
- Papilloma/papillomatosis
- Galactocele
- Duct ectasia
- Ductal/lobular hyperplasia
- Sclerosing adenosis
- Lipoma
- Neurofibroma
- Granulomatous mastitis (e.g. TB, granulomatosis with polyangiitis, sarcoidosis)
- Abscess
- Silicone implant

**Malignant**
- Breast cancer (likely invasive, DCIS rarely forms a breast mass)
- Malignant phyllodes
- Angiosarcoma (rare)

## PROLIFERATIVE LESIONS – WITHOUT ATYPIA

**Table 28. Proliferative Lesions - Without Atypia**

| | | Clinical Features | Diagnosis | Treatment | Risk of Breast Cancer |
|---|---|---|---|---|---|
| **Fibroadenoma** | Most common breast tumour in women <30 yr | Nodules: firm, rubbery, discrete, well-circumscribed, non-tender, mobile, hormone-dependent (unlike cysts), needle aspiration yields no fluid | Core or excisional biopsy sometimes required if concerned about malignancy U/S and FNA alone cannot differentiate fibroadenoma from phyllodes tumour | Generally conservative serial observation Consider excision if size 2-3 cm and growing on serial U/S (q6mo x 2 yr is usual follow-up), if symptomatic, formed after age 35, patient preference or features on core biopsy suggestive of a phyllodes tumour | Increased if complex, adjacent atypia or strong family history of breast cancer |
| **Intraductal Papilloma** | Solitary intraductal benign polyp | Can present as nipple discharge (most common cause of spontaneous, unilateral, bloody nipple discharge = pathologic nipple discharge), breast mass, nodule on U/S | | Surgical excision of involved duct to ensure no atypia | Can harbour areas of atypia or DCIS |
| **Usual Ductal Hyperplasia** | Increased number of cells within the ductal space | Incidental finding on biopsy of mammographic abnormalities or breast masses | | None required | Generally low risk, slightly increased if moderate or florid hyperplasia |
| **Sclerosing Adenosis** | Lobular lesion with increased fibrous tissue and glandular cells | Mass or mammographic abnormality | | None required | Low risk |

### ATYPICAL HYPERPLASIA
- can involve ducts (atypical ductal hyperplasia) or lobules (atypical lobular hyperplasia)
- cells lose apical-basal orientation
- increased risk of breast cancer
- diagnosis: core or excisional biopsy
- treatment: complete resection, risk modification (avoid exogenous hormones), close follow-up

### OTHER LESIONS

#### Fat Necrosis
- uncommon, result of trauma (may be minor, positive history in only 50%), after breast surgery (i.e. reduction)
- firm, ill-defined mass with skin or nipple retraction, ± tenderness
- regress spontaneously, but complete imaging ± biopsy to rule out carcinoma

#### Mammary Duct Ectasia
- obstruction of a subareolar duct (see Obstetrics, OB47)

#### Abscess
- lactational vs. non-lactational (periductal/subareolar) (see Obstetrics, OB47)

## Breast Cancer

#### Epidemiology
- leading cancer diagnosis in women in North America, 2nd leading cause of cancer mortality in women
- 1 in 8 (12.9% life time risk) women in Canada will be diagnosed with breast cancer in their lifetime
- 1 in 31 women in Canada will die from breast cancer
- all age relative survival is 87%

Gender followed by age are the two greatest risk factors for breast cancer

#### Risk Factors
- gender (99% female)
- age (83% >50 yr)
- personal history of breast cancer and/or prior breast biopsy (regardless of pathology)
- family history of breast cancer (greater risk if relative was first degree and premenopausal)
- high breast density, nulliparity, first pregnancy >30 yr, menarche <12 yr, or menopause >55 yr
- decreased risk with lactation, early menopause, and early childbirth
- radiation exposure (e.g. mantle radiation for Hodgkin's disease)
- >5 yr HRT use, >10 yr OCP use
- BRCA1 and BRCA2 gene mutations
- alcohol use, obesity, and sedentary lifestyle

Any palpable dominant breast mass requires further investigation

#### Male Breast Cancer (<1%)
- most commonly invasive ductal carcinoma
- often diagnosed at later stages
- stage-for-stage similar prognosis to breast cancer in females
- consider genetic testing: most often hormone receptor positive

#### Investigations
- mammography
  - indications: screening guidelines (see Family Medicine, FM3)
  - findings indicative of higher risk of malignancy
    - mass that is poorly defined, spiculated border
    - microcalcifications
    - architectural distortion
    - interval mammographic changes
  - normal mammogram does not rule out suspicion of cancer based on clinical findings
- other radiographic studies
  - U/S: differentiate between cystic and solid
  - MRI: high sensitivity, low specificity. Use annual MRI and mammography for patients with 25% lifetime risk of breast cancer
  - galactogram/ductogram (for nipple discharge): identifies lesions in ducts
  - metastatic workup indicated in Stage II-IV disease: bone scan, abdominal U/S, CXR (or CT chest/abdomen/pelvis), CT head (if specific neurological symptoms)

## Diagnostic Procedures

- "triple test" for diagnosis of breast cancer: clinical breast exam, imaging (U/S for <30 yr, mammography + U/S for >30 yr), pathology (biopsy)
- needle aspiration: for palpable cystic lesions; send fluid for cytology if blood or cyst does not completely resolve
- U/S or mammography guided core needle biopsy (most common)
- excisional biopsy: only performed as second choice to core needle biopsy; should not be done for diagnosis if possible

Diagnostic mammography is indicated in all patients, even in women <50 yr

## Genetic Screening

- consider testing for BRCA1/2 if:
  - young patient (<35 yr)
  - bilateral breast cancer in patients <50 yr
  - patient diagnosed with breast AND ovarian cancer
  - strong family history of breast/ovarian cancer
  - family history of male breast cancer

Phyllodes tumours are rare fibroepithelial breast tumours that can be benign or malignant that mostly affect women from 35-55 yr

## Staging

- patients are assigned a clinical stage pre-operatively (cTNM); following surgery the pathologic stage is determined (pTNM)
- clinical
  - tumour size by palpation, mammogram, U/S and/or MRI
  - nodal involvement by palpation, imaging
  - metastasis by physical exam, CXR, and abdominal U/S (or CT chest/abdomen/pelvis), bone scan (usually done post-operative if node-positive disease)
- pathological
  - tumour size and type
  - grade: modified Bloom and Richardson score (I to III) – histologic, nuclear, and mitotic grade
  - number of axillary nodes positive for malignancy out of total nodes resected, extranodal extension, and sentinel lymph node biopsy (SLNB) positive/negative
  - tumour biology: estrogen receptor (ER), progesterone receptor (PR), and HER2/neu oncogene status
  - margins: for invasive breast cancer negative margin is sufficient, for DCIS prefer 2 mm margin
  - lymphovascular invasion (LVI)
  - extensive *in situ* component (EIC): DCIS in surrounding tissue
  - involvement of dermal lymphatics (inflammatory) – automatically Stage IIIb

**Table 29. TNM Classification System for Staging of Breast Cancer (AJCC 2017)**

| Primary Tumour (T) | | Regional Lymph Nodes (N) | | Distant Metastasis (M) | |
|---|---|---|---|---|---|
| **TX** | Primary tumour cannot be assessed | **NX** | Regional lymph nodes cannot be assessed | **M0** | No distant metastasis |
| **T0** | No evidence of primary tumour | **N0** | No regional lymph node metastasis | **M1** | Distant metastasis |
| **Tis** | Ductal carcinoma *in situ* | **N1** | Involvement of 1-3 axillary lymph nodes and/or clinically negative internal mammary nodes on sentinel node biopsy | | |
| **T1** | Tumour ≤2 cm in greatest dimension | **N2** | Involvement of 4-9 axillary lymph nodes or clinically positive ipsilateral internal mammary lymph node | | |
| **T2** | Tumour >2 cm but ≤5 cm in greatest dimension | | | | |
| **T3** | Tumour >5 cm in greatest dimention | | | | |
| **T4** | Tumour of any size with direct extension to chest wall and/or skin | | | | |

| Favourable Features | Unfavourable Features |
|---|---|
| • <2 cm<br>• Grade I (low grade)<br>• Node negative<br>• ER positive<br>• Mucinous pattern | • >5 cm<br>• Grade III (high grade)<br>• Node positive<br>• ER negative<br>• Inflammatory cancer<br>• Her2Neu positive<br>• Positive margins<br>• Lymphovascular invasion<br>• Epidermal inclusion cyst<br>• Dermal lymphatics involved |

## Pathology

## NON-INVASIVE

### Ductal Carcinoma *in situ* (DCIS)

- proliferation of malignant ductal epithelial cells completely contained within breast ducts, often multifocal
- 80% non-palpable, detected by screening mammogram
- risk of invasive ductal carcinoma in same breast up to 35% in 10 yr
- treatment
  - lumpectomy with wide excision margins + radiation (5-10% risk of invasive cancer)
  - mastectomy if large area of disease, high grade, or multifocal (risk of invasive cancer reduced to 1%)
  - possibly tamoxifen as an adjuvant treatment
  - 99% 5 yr survival

### Lobular Carcinoma *in situ* (LCIS)
- neoplastic cells completely contained within breast lobule
- no palpable mass and no mammographic findings; usually incidental finding on breast biopsy for another indication
- LCIS is a risk factor for invasive carcinoma (approximately 1%/yr)
- treatment
  - if diagnosed on core biopsy, excisional biopsy necessary to rule out malignancy
  - if diagnosed on excisional biopsy, wide excision not needed since LCIS if often multicentric and not managed as precursor lesion
  - clinical follow-up and surveillance; consider chemoprevention (e.g. tamoxifen)

## INVASIVE

### Invasive Ductal Carcinoma (most common 80%)
- originates from ductal epithelium and infiltrates supporting stroma
- characteristics: hard, scirrhous, infiltrating tentacles, and gritty on cross-section
  - divided into three grades based on cytologic and architectural features: well differentiated (grade 1), moderately differentiated (grade 2), poorly differentiated (grade 3)

### Invasive Lobular Carcinoma (8-10%)
- originates from lobular epithelium, 20% bilateral
- subtle thickening originating from lobes/lobules; usually positive for estrogen and progesterone receptors
- harder to detect on mammography due to lack of microcalcifications (may benefit from MRI)

### Paget's Disease (1-3%)
- ductal carcinoma that invades nipple with scaling, and eczematoid lesion

### Inflammatory Carcinoma (1-3%)
- most aggressive form of breast cancer
- ductal carcinoma that grows in nests (vs. solid tumour); invades and blocks dermal lymphatics
- clinical features: erythema, skin edema, warm, swollen, and tender breast ± lump, nipple changes
- peau d'orange indicates advanced disease (IIIb-IV)

### Sarcomas: rare
- most commonly phyllodes tumour, a variant of fibroadenoma with potential for malignancy
- can also be angiosarcomas – after previous radiation

### Lymphoma: rare

### Other
- papillary, medullary, mucinous, and tubular cancers
- generally better prognosis

### Treatment

**Table 30. Breast Cancer Treatment by Stage**

| Stage | Primary Treatment Options | Adjuvant Systemic Therapy |
|---|---|---|
| **0 (*in situ*)**<br>Tis, N0, M0 | BCS + radiotherapy<br>BCS alone if margins >1 cm and low nuclear grade<br>Mastectomy* ± SLNB | Consider post-operative tamoxifen for ER+, trastuzumab for HER2+ |
| **I**<br>IA: T1, N0, M0<br>IB: T1, N1mi, M0 | BCS + axillary node dissection + radiotherapy<br>Mastectomy* + axillary node dissection/SLNB | May not be needed; discuss risks/benefits of chemotherapy and tamoxifen |
| **II**<br>A: T0, N1, M0<br>T1, N1, M0<br>T2, N0, M0<br>B: T2, N1, M0<br>T3, N0, M0 | BCS + axillary node dissection + radiotherapy<br>Mastectomy* + axillary node dissection/SLNB | Chemotherapy for premenopausal women or postmenopausal and ER negative, followed by tamoxifen if ER+ |
| **III**<br>A: T0, N2, M0<br>T1, N2, M0<br>T2, N2, M0<br>T3, N1, M0<br>T3, N2, M0<br>B: T4, N0, M0<br>T4, N1, M0<br>T4, N2, M0 | Likely mastectomy + axillary node dissection + radiotherapy after chemotherapy (neoadjuvant) | Neoadjuvant therapy should be considered (i.e. pre-operative) especially if not resectable chemotherapy and/or hormone therapy. Adjuvant radiation and chemotherapy may also be appropriate (i.e. post-operative) |
| **Inflammatory** | Mastectomy + axillary node dissection + radiotherapy | Neoadjuvant therapy |
| **IV**<br>any T, any N, M1 | Surgery as appropriate for local control | Primary treatment is systemic therapy (i.e. chemotherapy) and/or hormone therapy |

BCS = breast conserving surgery; SLNB = sentinel lymph node biopsy
*If no reason to select mastectomy, the choice between BCS + radiotherapy and mastectomy can be made according to patient's preference since choice of local treatment does not significantly affect survival if local control is achieved

**Diagnosis of Breast Lesions: Fine-Needle Aspiration Cytology (FNAC) or Core Needle Biopsy? A Review**
J Clin Pathol 2012;65:287-92
**CNB**
- High sensitivity (85%-100%) and specificity (86%-100%)
- High success rates for diagnosis of malignancy for palpable lesions (97%), non-palpable lesions (94%), and lesions <10 mm (90%)
- More accurate for histologic and immunohistochemistry examinations, and differentiation between *in situ* and invasive malignancies
- Reliable for testing of ER, PR, and HER2 status and proliferation assessment
- More painful procedure

**FNAC**
- Variable sensitivity (35%-95%) and specificity (48%-100%)
- Quality correlates with skill of aspirator
- Lower success rates for diagnosis of malignancy for palpable lesions (75-90%), non-palpable lesions (34-58%), and lesions <10 mm (50%)
- High rates of insufficient sampling for lesions >40 mm or calcified lesions
- Quick to perform
- Low technical costs

**Conclusions**: FNAC is preferable for palpable, low malignancy-risk lesions. However, for potential malignancies, CNB is advantageous with respect to prognostication and prediction and is likely cost-effective in the long-term

**Analysis of Circulating Tumour DNA to Monitor Metastatic Breast Cancer**
NEJM 2013;368:1199-1209
**Study**: The quantification of circulating tumour DNA, cancer antigen 15-3 (CA 15-3), and circulating tumour cells in 30 women with metastatic breast cancer receiving systemic therapy. The results were compared with radiographic imaging of tumours.
**Results/Conclusions**: Circulating tumour DNA was detected in 97% of women and showed greater correlation with changes in tumour burden than did CA 15-3 or circulating tumour cells, providing the earliest measure of treatment response in 53% of women. CA 15-3 and circulating tumour cells were detected in 78% and 87% of women, respectively. Circulating tumour DNA may therefore be an informative biomarker for metastatic breast cancer.

**10 Year Survival after Breast-Conserving Surgery Plus Radiotherapy Compared with Mastectomy in Early Breast Cancer in The Netherlands: A Population-Based Study**
Lancet Oncol 2016;17(8):1158
**Results/Interpretation**: Breast-conserving surgery plus radiotherapy showed improved 10 yr overall and relative survival compared with mastectomy in early breast cancer, but 10 yr distant metastasis-free survival was improved with breast-conserving surgery plus radiotherapy compared with mastectomy in the T1N0 subgroup only, indicating a possible role of confounding by severity. These results suggest that breast-conserving surgery plus radiotherapy is at least equivalent to mastectomy with respect to overall survival and may influence treatment decision making for patients with early breast cancer.

## PRIMARY SURGICAL TREATMENT

### Breast Conservation Surgery (BCS)
- lumpectomy must be combined with radiation for survival equivalent to mastectomy
- contraindications include
  - high risk of local recurrence (e.g. extensive malignant-type calcifications on mammogram), and multifocal primary tumours
  - failure to obtain tumour-free margins after re-excision
  - not suitable for radiation therapy (pregnancy, previous radiation, and collagen vascular disease)
  - large tumour size relative to breast

### Mastectomy
- radical mastectomy (rare): removes all breast tissue, skin, pectoralis muscle, and axillary nodes
- modified radical mastectomy (MRM): removes all breast tissue, skin, and axillary nodes
- simple mastectomy: removes all breast tissue and skin
- see Plastic Surgery PL37 for breast reconstruction

### Sentinel Lymph Node Biopsy (SLNB)
- performed in women with clinically node-negative invasive breast cancer and those with extensive DCIS who are undergoing mastectomy
- patients with clinically suspicious nodes should get U/S + FNA prior to decision to proceed with SLNB
- technetium-99 ± blue dye injected at tumour site prior to surgery to identify sentinel node(s)
- intra-operative frozen section evaluated can be considered
- proceed with ALND if >3 positive nodes, with 1-3 nodes whole breast radiation therapy may be alternative
- 5% false negative rate

### Axillary Lymph Node Dissection (ALND)
- perform in all patients with pathologic confirmation of nodal involvement (including positive SLNB as above)
- side effects: risk of arm lymphedema (10-15%) especially if getting radiation therapy, decreased arm sensation, and shoulder pain

## ADJUVANT/NEOADJUVANT

### Radiation
- indications
  - decrease risk of local recurrence; almost always used after BCS, sometimes after mastectomy
  - inoperable locally advanced cancer
  - axillary nodal radiation may be added if nodal involvement

### Hormonal
- indications
  - ER positive plus node-positive or high-risk node-negative
  - selective estrogen receptor modulators (SERM) if premenopausal (e.g. tamoxifen) or aromatase inhibitors if postmenopausal (e.g. anastrozole); optimal duration 5-10 yr
  - other options include ovarian ablation (e.g. goserelin/GnRH agonist, oophorectomy), progestins (e.g. megestrol acetate), and androgens (e.g. fluoxymesterone)
  - palliation for metastatic disease

### Chemotherapy
- indications
  - ER negative plus node-positive or high-risk node-negative
  - triple-negative disease (ER/PR and HER2-negative) - more common in younger and African-American women
  - ER positive and young age
  - stage I disease at high risk of recurrence (high grade, lymphovascular invasion)
  - palliation for metastatic disease
  - for HER2 positive breast cancer, add trastuzumab ± pertuzumab to the chemotherapy regimen

## FOLLOW-UP

### Post-Treatment Follow-Up
- assessment and physical exam q3-6mo x 3 yr, q6-12mo x 2 yr, and annually thereafter
- following BCS mammography q6-12mo; can reduce to annual once stable, no other routine imaging unless clinically indicated
- women who receive tamoxifen should have regular gynecologic follow-up (increased risk of endometrial cancer)

Breast conserving surgery can be offered to most women with stage I/II disease

There is no survival benefit of mastectomy over lumpectomy plus radiation for stage I and II disease

**Effect of Radiotherapy After Mastectomy And Axillary Surgery on 10 Year Recurrence and 20 Year Breast Cancer Mortality: Meta-Analysis of Individual Patient Data for 8135 Women in 22 Randomised Trials**
EBCTCG (Early Breast Cancer Trialists' Collaborative Group)
Lancet 2014;383(9935):2127-35
**Study**: Assessed the effect of radiotherapy in women with one to three positive lymph node after mastectomy and axillary dissection in a meta-analysis of 8135 women in 22 trials.
**Results**: For 700 women with axillary dissection and no positive nodes, radiotherapy had no significant effect on local regional recurrence, overall recurrence, or breast cancer mortality. For 1314 women with axillary dissection and one to three positive nodes, radiotherapy reduced local regional, overall recurrence, and breast cancer mortality.1133 of these 1314 women were in trials in which systemic therapy (cyclophosphamide, methotrexate, and fluorouracil, or tamoxifen) was given in both trial groups and radiotherapy again reduced local regional recurrence, overall recurrence, and breast cancer mortality. For 1772 women with axillary dissection and four or more positive nodes, radiotherapy reduced local regional recurrence, overall recurrence, and breast cancer mortality.
**Conclusion**: Post mastectomy and axillary dissection, radiotherapy reduced both recurrence and breast cancer mortality in the women with one to three positive lymph nodes in these trials even when systemic therapy was given.

### Local/Regional Recurrence
- recurrence in treated breast or ipsilateral axilla
- 1% per yr up to maximum of 15% risk of developing contralateral malignancy
- 5x increased risk of developing metastases

### Metastasis
- bone > lungs > pleura > liver > brain
- treatment is palliative: hormone therapy, chemotherapy, radiation
- overall survival of metastatic breast cancer is 36-60 mo

# Surgical Endocrinology

## Thyroid and Parathyroid

- see Endocrinology, E21

### Thyroidectomy
- indications: thyroid cancer, large or symptomatic thyroid goitre, toxic nodules, or some patients with Graves' disease (not candidates for RAI)
- pre-operative workup: thyroid U/S for thyroid nodules, FNA for nodules ≥1 cm with suspicious U/S features or for most nodules ≥1.5 cm with low suspicion U/S features, and CT neck for preoperative staging when advanced disease is suspected
- complications
  - lobectomy: recurrent laryngeal nerve palsy (hoarseness or swallowing issues), neck hematoma
  - total thyroidectomy: same as above plus hypoparathyroidism/hypocalcemia, bilateral RLN palsy (requiring tracheostomy)
  - 20-60% of patients need thyroxine after lobectomy and 100% need thyroxine after total thyroidectomy

### Parathyroidectomy
- indications: symptomatic primary hyperparathyroidism due to effects of PTH on bone or kidneys, asymptomatic primary hyperparathyroidism with specific laboratory criteria (elevated serum $Ca^{2+}$, marked hypercalciuria, Cr clearance <30% normal, bone density reduction with T score <2.5, <50 yr)
- contraindications: familial hypocalciuric hypercalcemia
- pre-operative workup: 99mTc sestamibi scanning, ± SPECT or CT, U/S
- complications: recurrent/superior laryngeal nerve injury, post-operative hypocalcemia, infection, and bleeding

## Adrenal Gland

- see Endocrinology, E30
- functional anatomy
  - cortex: glomerulosa (mineralocorticoids), fasciculata (glucocorticoids), and reticularis (sex steroids)
  - medulla: catecholamines (epinephrine, norepinephrine)
- types of adrenal tumours: functional (e.g. Cushing's syndrome, Conn's syndrome, pheochromocytoma) or non-functional

### INCIDENTALOMA
- adrenal mass discovered by investigation of unrelated symptoms

### Epidemiology
- benign adenoma (38%) > metastases to adrenal (22%) >> cyst, carcinoma, pheochromocytoma, neuroblastoma
- metastasis to adrenal gland from: lung > breast, colon, lymphoma, melanoma, and kidney
- peak incidence of carcinoma: females age 50-60, risk decreases with increasing age and male gender

### Investigations
- MRI, CT: size >6 cm is best predictor of primary adrenal carcinoma (92% are >6 cm)
- functional studies
  - pheochromocytoma: plasma metanephrines (highly specific and sensitive). If not available, 24 h urine catecholamines
  - Cushing's: 24 h urine cortisol or 1 mg overnight dexamethasone suppression test
  - aldosteronoma: electrolytes, aldosterone, plasma renin activity level, saline suppression test if appropriate
  - adrenal androgens: 17-OH progesterone and dehydroepiandrosterone (DHEAS)
- FNA biopsy: usually not recommended. May be helpful in situations when diagnostic uncertainty for metastasis

### Treatment
- functional tumour: resect
- non-functional tumour
  - >4 cm: resect
  - <4 cm: follow-up imaging in 6-12 mo, resect if >1 cm enlargement

# Pancreas

## INSULINOMA
- tumour that secretes insulin
- most common pancreatic endocrine neoplasm; 10% associated with MEN1 syndrome

### Clinical Features
- Whipple's triad
- palpitations, trembling, diaphoresis, confusion, seizure, and personality changes

### Investigations
- blood work: decreased serum glucose and increased serum insulin and C-peptide, pro-insulin
- U/S, CT: insulinomas evenly distributed throughout head, body, tail of pancreas

### Treatment
- only 10% are malignant
- enucleation of solitary insulinomas may be done endoscopically
- tumours >2 cm located close to the pancreatic duct may require pancreatectomy or pancreaticoduodenectomy

**Whipple's Triad**
- Symptomatic fasting hypoglycemia
- Serum glucose <2.8 mmol/L
- Relief of symptoms when glucose is administered

## GASTRINOMA
- tumour secreting gastrin; cause of Zollinger-Ellison syndrome

### Clinical Features
- abdominal pain, PUD, severe esophagitis
- multiple ulcers in atypical locations refractory to antacid therapy

### Investigations
- blood work: serum gastrin levels (usually >1000 pg/mL), secretin stimulation test
- U/S, CT: 70-90% found in Passaro's triangle (head of pancreas medially, 2nd portion of duodenum inferiorly, and the confluence of the cystic and CBD superiorly)
- octreotide scintigraphy scan

### Treatment
- 50% are malignant
- surgical resection of tumour dependent on location
- non-surgical treatment: chemotherapy, somatostatin analogues, interferon, and chemoembolization
- if inoperable, vagotomy can be performed for symptomatic control

**Zollinger-Ellison Syndrome**
Occurs because of gastric acid hypersecretion; patient experiences diarrhea and abdominal pain, as well as peptic disease and reflux disease

## VASOACTIVE INTESTINAL PEPTIDE-SECRETING TUMOUR
- tumour secreting VIP; commonly located in the distal pancreas and most are malignant when diagnosed

### Clinical Features
- severe watery diarrhea causing dehydration, weakness, and electrolyte imbalance

### Investigations
- blood work: serum VIP levels
- U/S, CT

### Treatment
- somatostatin analogues
- surgical resection/palliative debulking

**Hypertrophic Pyloric Stenosis**
Non-bilious emesis in infants is the classic presentation

**Rule of 2s for Meckel's Diverticulum**
- **2**% of the population
- **2**:1 male-to-female ratio
- Symptomatic in **2**% of cases
- Found within **2** feet (10-90 cm) of the ileocecal (IC) valve
- **2** inches in length
- **2** inches in diameter
- **2** types of tissue (gastric, pancreatic)
- Often present by **2** yr of age

# Pediatric Surgery

| Condition | Epidemiology and Risk Factors | Pathophysiology | Clinical Features and History | Physical Exam | Investigations | Treatment | Prognosis |
|---|---|---|---|---|---|---|---|
| **Hydrocele** (see Urology, U31) | 1-2% of live births<br>Present at birth, majority close spontaneous by 1 yr<br>M:F = 6:1<br>Prematurity | **Communicating hydroceles**: processus vaginalis fails to close with small opening for fluid to move freely between peritoneal cavity through patent processus (if opening progresses to allow passage of intestine, it is a hernia)<br>**Noncommunicating hydroceles**: fluid trapped in tunica vaginalis; in older children, may be secondary to testicular pathology (reactive hydrocele) | Painless scrotal mass<br>Communicating hydroceles increase in size with standing or valsalva, may be absent in the morning and large in the evening | Transillumination suggests hydrocele<br>Silk glove sign: gently palpating hydrocele sac over pubic tubercle feels like rubbing silk on silk | U/S if suspect pathology | Most resolve spontaneously by 1 yr<br>Surgical repair if:<br>Persistence >2 yr<br>Pain<br>Fluctuating in size which suggests communication<br>Cosmetic reasons<br>Infection | <2% recurrence |
| **Hypertrophic Pyloric Stenosis** | 0.03-1.0% of live births<br>Can present at 1-20 wk, most commonly at 6-8 wk<br>M:F = 4:1<br>Early erythromycin exposure (<13 d old) | Acquired pyloric circular muscle hypertrophy results in gastric outlet obstruction<br>Hypovolemia caused by emesis of gastric contents causes hypochloremic, hypokalemic, metabolic alkalosis<br>Electrolyte exchange based volume retention in kidneys results in paradoxical aciduria | Projectile non-bilious vomiting<br>Vomiting 30-60 min after feeds<br>Hungry after vomiting<br>Dehydration (variable severity) | Smooth oblong 1-2 cm mass palpable above umbilicus, "olive" visible left-to-right gastric contraction "waves" after feeding | Electrolytes (assess hypochloremia, dehydration)<br>U/S shows pyloric length >14 mm, muscle thickness >4 mm<br>Upper GI series necessary only when U/S unavailable or non-diagnostic will show "string sign" | Fluid resuscitate with normal saline, correct electrolyte and acid/base abnormalities with D5, 1/2NS + 20 mEq/L KCl at maintenance rate<br>NGT decompression unnecessary<br>Pyloromyotomy, open (Ramstedt vs. transumbilical or laparoscopic approach)<br>Alternative therapies such as TPN/wait or atropine impractical due to long time course of effect | Pyloromyotomy curative |
| **Congenital Diaphragmatic Hernias**<br>3 types:<br>Posterolateral (Bochdalek)<br>Left-sided, 85%<br>Right-sided, 13%<br>Bilateral, rare, often fatal<br>Anterior (Morgagni)<br>Hiatus | 1 in 2000 to 5000 live births<br>Presents within hours of life although some cases of delayed presentation<br>M=F<br>>10% are associated with other congenital anomalies<br>Prenatal diagnosis common | **Left-sided**: small bowel, large bowel, stomach, and solid viscera (spleen, left lobe of liver) herniate into thorax<br>**Right-sided**: liver, large bowel herniate into thorax<br>Pulmonary hypoplasia<br>Pulmonary HTN | Early respiratory distress<br>Cyanosis<br>Scaphoid abdomen<br>Prenatal diagnosis | Decreased air entry ± bowel sounds in the chest<br>Displaced heart sounds | Prenatal US/MRI<br>ABG<br>CXR (bowel loops in hemithorax, shifted heart)<br>Echocardiography<br>Genetic consultation if warranted | Intubate<br>Orogastric suction<br>Period of respiratory stabilization due to associated pulmonary hypoplasia (may require extracorporeal membrane oxygenation)<br>Surgical repair after stable by hernia reduction and closure of diaphragmatic defect – open vs. thoracoscopic vs. laparoscopic with or without prosthetic or muscular patch depending on size of defect | Better outcomes in later presentations<br>Hearing deficit (40%)<br>Associated GERD<br>MSK defects – chest wall and scoliotic defects a potential complication of thoracotomy<br>Long-term surveillance for potential recurrence<br>Failure to thrive<br>Chronic lung disease if severe hypoplasia |
| **Meckel's Diverticulum**<br>Most common remnant of vitelline duct that connects yolk sac with primitive midgut | 1-3% of population<br>M:F = 3:1<br>Present most frequently during first 5 yr of life<br>Symptomatic in 2% of cases | Failure of vitelline duct to regress 5-7 wk in utero; 50% contain heterotopic tissue (e.g. gastric mucosa, ectopic pancreas); other associated anomalies include omphalomesenteric fistula, umbilical sinus, umbilical cyst, fibrous band | BRBPR (heterotopic gastric mucosa in Meckel's causing mucosal ulceration and bleeding in adjacent small bowel mucosa)<br>Abdominal sepsis (Meckel's diverticulitis ± perforation)<br>Small bowel volvulus around fibrous band | Tenderness (lower abdomen) near umbilicus | AXR<br>Meckel scan: scan for ectopic gastric mucosa with technetium Tc99m pertechnetate IV (sensitivity 85%, specificity 95%) | Stabilize, resection by laparotomy or laparoscopy ± incidental appendectomy | Resection curative |

| Condition | Epidemiology and Risk Factors | Pathophysiology | Clinical Features and History | Physical Exam | Investigations | Treatment | Prognosis |
|---|---|---|---|---|---|---|---|
| **Malrotation** | 1:500 live births<br>1/3 present by 1 wk of age, 3/4 by 1 mo of age, 90% by 1 yr of age<br>M:F = 1:1; higher incidence among patients with cardiac anomalies, heterotaxy syndromes | Failure of gut to normally rotate around SMA with associated abnormal intestinal attachments and anatomic positions<br>Represent a spectrum of rotational abnormalities including complete non-rotation (which is not at high risk for volvulus) | Bilious emesis is the cardinal sign, especially if abdomen nondistended<br>If bilious emesis in ill child with distended abdomen, consider surgical exploration to rule out volvulus<br>Rectal bleed (late/ominous signs)<br>Intermittent symptoms | Bilious drainage from NGT<br>Tachycardic, pale<br>Diaphoretic<br>Flat abdomen<br>Tenderness | AXR: obstruction of proximal SBO, double-bubble sign, intestinal wall thickened<br>Immediate UGI: dilated duodenum, duodenojejunal segment (Ligament of Treitz) right of midline and not fixed posteriorly over spinal column, "corkscrew" sign indicating volvulus<br>U/S: "whirlpool" sign, abnormal SMA/SMV relationship indicates<br>UGI to rule out rotational anomalies | IV antibiotics<br>Fluid resuscitation<br>EMERGENT LAPAROTOMY<br>Ladd procedure: counterclockwise reduction of midgut volvulus, division of Ladd's bands, division of peritoneal attachments between cecum and abdominal wall that obstruct duodenum, broadening of the mesentery (open folded mesentery like a book and divide congenital adhesions), ± appendectomy<br>Positioning the bowel into non-rotation (SBO in right abdomen, LBO in left abdomen) | Mortality related to length of bowel loss: 10% necrosis – 100% survival rate, 75% necrosis – 35% survival rate<br>Recurrence 2-6% |
| **Gastroschisis** | 1:2000 live births<br>Antenatal diagnosis common<br>Increases with younger maternal age and associated with IUGR<br>M:F = 1:1 | Defect of abdominal wall, with free extrusion of intestine into amniotic cavity<br>No specific environmental factor identified<br>Defect in embryogenesis unclear | Not associated with genetic syndromes<br>10% with intestinal atresia<br>Some cases associated with short bowel syndrome due to antenatal volvulus and necrosis of herniated bowel | Hollow viscera (stomach, small and large bowels)<br>Defect lateral to cord (usually right)<br>Bowel may be inflamed, thickened, matted, foreshortened<br>Defect size variable | Prenatal U/S<br>Elevated MS-AFP | NGT decompression<br>IV fluids<br>IV antibiotics<br>Keep viscera moist and protected until surgical reduction with primary abdominal closure or staged closure with silo<br>May have bowel dysmotility requiring motility medications | >90% survival rate |
| **Omphalocele** | 1:5000 live birth<br>Antenatal diagnosis common<br>Lower gestational age<br>Increased maternal age<br>M:F = 1.5:1 | Defect of abdominal wall and umbilical ring, with extrusion of sac covered viscera (amnion, Wharton's jelly, peritoneum)<br>Duhamel's theory – failure of body wall morphogenesis<br>Commonly associated with rotational abnormalities of the intestine | 30-70% associated with genetic syndromes (e.g. Pentalogy of Cantrell, congenital heart disease, Beckwith-Wiedemann syndrome, Trisomy 18)<br>Associated pulmonary hypoplasia | Hollow viscera (stomach, small and large bowels, often liver)<br>Sac present with cord attached | Prenatal U/S<br>Elevated MS-AFP | NGT decompression<br>IV fluids, IV antibiotics<br>Small defect (<2 cm): Primary closure<br>Medium (2-4 cm) and large (>4 cm) defects: silver sulfadiazine coupled with compression dressing (to allow epithelialization and gradual reduction) or Silon Silo Pouch, followed by future repair ±mesh | 40-70% survival rate<br>Higher survival rates most likely related to antenatal mortality of fetuses with giant omphaloceles |
| **Umbilical Hernias** | Incidence 2-14%<br>Increases with prematurity<br>Decreases with increasing age | Incomplete closure of peritoneal and fascial layers within umbilicus by 4 yr<br>Hernia is peritoneum-lined and skin-covered<br>Size of fascial defect determines chances of spontaneous closure | Majority asymptomatic<br>Majority (95%) spontaneously resolve by age 4<br>Incarceration prior to age 5 very rare<br>Most symptoms occur in late adolescence or adulthood | Protrusion from umbilicus<br>Different from less common abdominal wall hernias that do not spontaneously resolve (e.g. epigastric hernias)<br>Most defects >1.5 cm in infancy will not close spontaneously | None if uncomplicated | Repair if not spontaneously closed by age 5<br>Earlier repair of large "proboscoid" hernias with extensive skin stretching may be warranted for cosmetic reasons<br>Simple primary closure of fascial defect | Almost never become incarcerated<br>Low risk of recurrence |
| **Intestinal Atresia** | Incidence 2-14%<br>May be antenatally diagnosed by dilated bowel loops or "double-bubble" sign on x-ray for duodenal atresia<br>Decreased with increasing age | Duodenal – failure of bowel to recanalize after endodermal epithelium proliferation (wk 8-10)<br>Jejunal/ileal – acquired as a result of vascular disruption → ischemic necrosis → resorption of necrotic tissue → blind distal and proximal ends<br>Colonic – mechanism unknown, thought to be similar to small bowel atresia | Gastric distension and vomiting (usually bilious)<br>Duodenal – may be associated with other anomalies (tracheoesophageal fistula, cardiac, renal, and vertebral anomalies), 24-28% have Down syndrome<br>Jejunal/ileal – within 2 d of birth, may be associated with CF<br>Colonic – within 3 d of birth | Complete physical<br>Special attention to abdominal exam<br>Perineum and anus<br>Include evaluation of respiratory distress and signs of volume depletion<br>Congenital anomalies<br>Jaundice | Contrast enema ± UGI with small bowel follow through (SBFT)<br>Group and screen<br>INR and PTT if for surgery | NPO<br>NGT decompression<br>Fluid resuscitate<br>TPN<br>Broad spectrum antibiotics<br>Duodenal – duodenoduodenostomy or duodenojejunostomy<br>Jejunal/ileal – primary anastomosis; or if atresia associated with short bowel then may create end stoma or defer surgery for bowel lengthening procedures<br>Colonic – primary anastomosis | Long-term survival<br>Duodenal – 86%<br>Jejunal/ileal – 84%<br>Colonic – 100% |

| Condition | Epidemiology and Risk Factors | Pathophysiology | Clinical Features and History | Physical Exam | Investigations | Treatment | Prognosis |
|---|---|---|---|---|---|---|---|
| **Hirschsprung's Disease** | 1:5000 births<br>M:F = 3:1 to 4:1, approaches 1:1 when whole colon involved<br>Can have aganglionosis of small bowel as well<br>Familial Hirschsprung's in <5% of cases | Defect in migration of neurocrest cells to intestine resulting in aganglionic bowel that fails to peristalse and internal sphincter that fails to relax (internal anal sphincter achalasia) causing functional and partial mechanical obstruction, respectively;<br>always starts in the rectum and variable involvement proximally;<br>RET mutation | Failure to pass meconium spontaneously within 48 h of life is the classic history (95% pass meconium within 24 h, 5% within 48 h)<br>Symptoms of bowel obstruction: abdominal distension, constipation, bilious emesis<br>Enterocolitis/sepsis<br>Failure to thrive | ± abdominal distension<br>Squirt/blast sign | Rectal biopsy (gold standard) – look for aganglionosis and neural hypertrophy<br>AXR<br>Contrast enema to find narrow rectum and transition zone<br>Anal manometry unreliable in infants – classic finding is absence of rectoanal inhibitory reflex | Duhamel pull-through procedure: surgical resection of aganglionic intestinal segment and anastomosis of remaining intestine to anus<br>Either in newborn period or staged if extensive aganglionosis | Most have normal/near-normal anorectal function<br>Complications: fecal incontinence and constipation, post-operative enterocolitis (medical emergency if progresses to sepsis) |
| **Cryptorchidism** | 2-5% of term males – most of these descend spontaneously by 6 mo of age<br>1% of males do not spontaneously descend<br>Suspect in prematurity | Idiopathic<br>Descent is mediated by descendin which is created in response to testosterone<br>Descent usually begins at 28 wk | Palpable testicle within inguinal canal or testicle which can be milked down into the scrotum (called retractile testis)<br>Occasionally no palpable testis as it is intra-abdominal<br>Consider other congenital abnormalities | Scrotal asymmetry<br>Bi-annual testicular exam with palpation<br>Distinguish truly undescended testis from retractile testis (which is "high" testis due to hyperactive cremasteric muscles) | Depends on age of presentation<br>Older child: LH, FSH, Müllerian inhibiting substance, hCG stimulation test for gonadotropin production<br>Infant: U/S, FSH, LH, karyotype, MIS, 17-hydroxy-progesterone<br>If non-palpable: Exam under anesthesia, exploratory laparoscopy | hCG to stimulate testosterone production and descent<br>Orchidopexy – especially if undescended by age 6 mo-2 yr | Orchidopexy<br>Decreased risk of torsion and blunt trauma to testicle<br>No effect on malignant potential of testicle<br>Descent can preserve spermatogenesis if performed by 1 yr |
| **Intussusception** | Most common cause of bowel obstruction between 6-36 mo<br>26:100,000 newborns<br>M:F = 3:2<br>Pathologic lead points: enlarged Peyer's patches due to viral infections of the GI tract, polyps, Meckel's diverticulum CF, lymphoma, IBD may increase risk | Idiopathic is most common<br>Usually starts at ileocecal junction<br>Telescoping of bowel into itself causing an obstruction and vascular compromise | Acute onset of abdominal pain which is classic episodic "colicky" pain<br>Vomiting ± bilious<br>Abdominal mass<br>Currant-jelly stool suggests mucosal necrosis and sloughing | Abdominal exam<br>Palpate for masses (especially sausage shaped upper abdominal mass) and tenderness<br>Signs of bowel obstruction: distended abdomen<br>Look for localized peritonitis which suggests transmural ischemia | AXR for signs of bowel obstruction or perforation<br>U/S if suspect pathology | If peritonitis, then consider operative management<br>Non-operative management involves reduction via air contrast enema<br>Operative reduction can be done open or laparoscopically<br>Resection of involved colon if failure to reduce or bowel appears compromised | 10% recurrence rate<br>If recurrent = more likely non-idiopathic<br>If successfully reduced by enema in older children allow 2 wk resolution of edema then perform SBFT to rule out pathologic lead points |
| **Tracheoesophageal Fistula (TEF)** | 1:3000-1:4500 | Associated anomalies in 50%: VACTERL association | Varies with type of fistula<br>May have history of maternal polyhydramnios<br>May present after several months (if no associated esophageal atresia) of non-bilious vomiting, coughing, cyanosis with feeds, respiratory distress, recurrent pneumonia, frothy bubbles of mucus in mouth, and nose that return after suctioning | | X-ray: anatomic abnormalities, NGT curled in pouch | Investigate for other congenital anomalies, early repair by surgical ligation to prevent lung damage and maintain nutrition and growth | Complications: pneumonia, sepsis, reactive airways disease<br>Following repair: esophageal stenosis and strictures at repair site, GERD and poor swallowing (i.e. dysphagia, regurgitation) |
| **Inguinal Hernias** | 5% of all term newborns<br>2x risk and more likely bilateral if pre-term<br>M:F = 4:1<br>Low birth weight increases risk<br>1/5 inguinal hernias will become incarcerated if patient is <1 yr<br>Incarceration is more common in females<br>Associated with other conditions: androgen insensitivity, connective tissue diseases | All infant hernias are indirect: descent of intra-abdominal contents through the internal inguinal ring through a patent tunica vaginalis<br>Inguinal hernia can be reducible, incarcerated (unreducible), or strangulated | Most common presentation: painless intermittent mass in groin, may also note extension into scrotum (scrotal mass in absence of inguinal mass is a hydrocele)<br>If incarcerated: tender, vomiting, firm mass, erythema then cyanosis of mass may be noted | Palpate for "bag of worms" suggests possible testicular varicocele<br>Biannual testicular exam + palpation along inguinal canal to evaluate for any masses<br>"Silk sign" – palpable thickening of cord<br>Mass palpated at external inguinal ring and reducible through inguinal canal into abdomen<br>Must always try reduction to confirm that hernia is not incarcerated | Physical exam is gold standard<br>U/S only if physical exam uncertain (e.g. in small infants where exam can be difficult) | Manual reduction – in the ER to relieve acute symptoms (then repair)<br>For reducible hernia: repair within a few weeks (if <1 yr) vs. elective repair (if >1 yr)<br>For incarcerated hernia: repair immediately (emergency)<br>Herniorraphy – definitive treatment by reduction of herniated contents and high ligation of sac for indirect hernias<br>Laparoscopic or open techniques | Risk of recurrence after surgical reduction <3% but higher if repair done in premature infants or if hernia was incarcerated/strangulated at repair |

All inguinal hernias of infancy and childhood require repair at the earliest convenience; emergent repair if incarcerated/strangulated

# Common Medications

| | |
|---|---|
| **Antiemetics** | • dimenhydrinate (Gravol®) 25-50 mg PO/IV/IM q4-6h prn<br>• prochlorperazine (Stemetil®) 5-10 mg PO/IV/IM bid-tid prn<br>• metoclopramide (Maxeran®) 10 mg IV/IM q2-3h prn, 10-15 mg PO qid (30 min before meals and qhs)<br>• ondansetron (Zofran®) 4-8 mg PO q8h prn<br>• granisetron (Kytril®) 1 mg PO bid (for nausea from chemotherapy/radiation) |
| **Analgesics** | • acetaminophen ± codeine (Tylenol® #3/plain) 1-2 tabs q4-6h PO/PR prn<br>• hydromorphone 1-2 tabs PO q4h prn, 0.5-2 mg IV q3-4h prn<br>• ibuprofen 200-400 mg PO q4-6h prn<br>• morphine 2.5-10 mg IM/SC q4-6h prn + 1-2 mg IV q1h prn for breakthrough<br>• ketorolac (Toradol®) 30-60 mg IM/IV q6h prn<br>• acetominophen/oxycodone (Percocet® ) 325/5 mg, 1-2 tabs PO q4-6h prn |
| **DVT Prophylaxis** | • heparin 5000 units SC bid, if cancer patient then heparin 5000 units SC tid/bid<br>• dalteparin (Fragmin®) 5000 units SC daily<br>• enoxaparin (Lovenox®) 40 mg SC daily |
| **Antidiarrheals** | • loperamide (Imodium®) 4 mg PO initially, then 2 mg PO after each loose stool up to 16 mg/d<br>• diphenoxylate + atropine (Lomotil®) 2 tabs/10 mL PO qid |
| **Laxatives** | • sennosides (Senokot®) 1-2 tabs qhs<br>• docusate sodium (Colace®) 100 mg PO bid<br>• glycerine suppository 1 tab PR prn<br>• lactulose 15-30 mL PO qid prn<br>• milk of magnesia (MOM) 30-60 mL PO qid prn<br>• bisacodyl (Dulcolax®)10-15 mg PO prn |
| **Sedatives** | • zopiclone (Imovane®) 5-7.5 mg PO qhs prn<br>• lorazepam (Ativan®) 0.5-2 mg PO/SL qhs prn |
| **Antibiotics** | • cefazolin (Ancef®) 1 g IV/IM on call to OR or q8h – GP except *Enterococcus*, GN only *E. coli, Klebsiella*, and *Proteus*<br>• cefalexin (Keflex®) 250-500 mg PO qid – *Listeria*, GP except *Enterococcus*, GN only *E. coli, Klebsiella*, and *Proteus*<br>• ceftriaxone 1-2 g IM/IV q24h – broad coverage including *Pseudomonas*<br>• ampicillin 1-2 g IV q4-6h – *Listeria*, GP (*Enterococcus*) except *Streptococcus* and *E. coli*, oral anaerobes except *Bacteroides*<br>• gentamicin 3-5 mg/kg/d IM/IV divided q8h; monitor creatinine, gentamicin levels – GN including *Pseudomonas*<br>• ciprofloxacin 400 mg IV q12h, 500 mg PO bid – GN including *Pseudomonas*<br>• metronidazole (Flagyl®) 500 mg PO/IV bid (500 mg PO tid for *C. difficile*) – anaerobes<br>• clindamycin 600-900 mg IV q8h, 150-400 mg PO qid – GP except *Enterococcus*, anaerobes<br>• piperacillin/tazobactam 4.5 mg IV q6h – GP, GN, and anaerobes<br>• vancomycin 1g IV q12h – GP and MRSA<br>• sulfamethoxazole/trimethoprim DS (Septra®) PO bid – GP, GN including *Nocardia* |
| **Over-the-Counter Medications** | • bismuth subsalicylate (Pepto-Bismol®) 2 tabs or 30 mL PO q30min-1h up to 8 doses/d<br>side effects: black stools, risk of Reye's syndrome in children<br>• ASA + citrate + bicarbonate (Alka-Seltzer®) 2 tabs in 4 oz water PO q4h prn, max 8 tabs<br>• aluminum hydroxide + magnesium hydroxide (Maalox®) 10-20 mL or 1-4 tabs PO prn<br>• calcium carbonate (Tums®) 1-3 g PO q2h prn<br>• calcium carbonate and magnesium hydroxide (Rolaids®) 2-4 tabs PO q1h prn, max 12 tabs/d |

# Physiology and Pathology of Aging

## Definition

- major categories of impairment that develop with old age and affect the physical, mental, and social domains of the elderly, usually due to many predisposing and precipitating factors rather than a single cause

### Table 1. Changes Occurring Frequently with Aging

| System | Physiological Changes | Pathological Changes |
|---|---|---|
| **Neurologic** | Decreased brain mass, cerebral blood flow<br>Increased white matter changes | Increased insomnia, neurodegenerative disease, stroke<br>Decreased reflex response |
| **Senses** | Decreased lacrimal gland secretion, lens transparency, visual acuity, dark adaptation, sense of smell and taste, detection of higher frequency sounds, vestibular function, vestibulospinal reflexes | Increased glaucoma, cataracts, macular degeneration, presbycusis, presbyopia, tinnitus, vertigo, oral dryness |
| **Cardiovascular** | Increased sBP, decreased dBP, HR, CO<br>Decreased baroreflex and autonomic reflexes<br>Decreased vessel elasticity, cardiac myocyte size and number, β-adrenergic responsiveness | Increased atherosclerosis, CAD, MI, CHF, hypertension, arrhythmias, orthostatic hypotension, wide pulse pressure |
| **Respiratory** | Increased tracheal cartilage calcification, mucous gland hypertrophy<br>Decreased elastic recoil, mucociliary clearance, pulmonary function reserve | Increased COPD, pneumonia, pulmonary embolism |
| **Gastrointestinal** | Increased intestinal villous atrophy<br>Decreased esophageal peristalsis, gastric acid secretion, liver mass, hepatic blood flow, calcium and iron absorption | Increased cancer, diverticulitis, constipation, fecal incontinence, hemorrhoids, intestinal obstruction, malnutrition, weight loss |
| **Renal and Urologic** | Increased proteinuria, urinary frequency<br>Decreased renal mass, creatinine clearance, urine acidification, hydroxylation of vitamin D, bladder capacity | Increased urinary incontinence, nocturia, BPH, prostate cancer, pyelonephritis, nephrolithiasis, UTI |
| **Reproductive** | Decreased androgen, estrogen, sperm count, vaginal secretion<br>Decreased ovary, uterus, vagina, breast size | Increased breast and endometrial cancer, cystocele, rectocele, atrophic vaginitis |
| **Endocrine** | Increased NE, PTH, insulin, vasopressin<br>Decreased thyroid and adrenal corticosteroid secretion | Increased DM, hypothyroidism, impaired stress response |
| **Musculoskeletal** | Increased calcium loss from bone<br>Decreased muscle mass, cartilage | Increased arthritis, bursitis, osteoporosis, muscle weakness with gait abnormalities, polymyalgia rheumatica |
| **Integumentary** | Atrophy of sebaceous and sweat glands<br>Decreased epidermal and dermal thickness, dermal vascularity, melanocytes, collagen synthesis | Increased lentigo, cherry hemangiomas, pruritus, seborrheic keratosis, herpes zoster, decubitus ulcers, skin cancer, easy bruising |
| **Psychiatric** | Decreased processing speed, cognitive flexibility, visuospatial perception, working memory and divided attention<br>Loss of synaptic plasticity | Increased depression, dementia, delirium, suicidality, anxiety, sleep disruption |

**Functional Assessment (ADLs and IADLs)**

| ADLs: ABCDE-TT | IADLs: SHAFT-TT |
|---|---|
| **A**mbulating | **S**hopping |
| **B**athing | **H**ousework |
| **C**ontinence | **A**ccounting/Managing finances |
| **D**ressing | **F**ood preparation |
| **E**ating | **T**ransportation |
| **T**ransferring | **T**elephone |
| **T**oileting | **T**aking medications |

Can use formal assessment tools such as the Lawton-Brody Instrumental Activities of Daily Living Scale to assess functioning

**Comprehensive Geriatric Assessment for Older Adults Admitted to Hospital**
Cochrane DB Syst Rev 2017;CD006211
Inpatient comprehensive geriatric assessment increases likelihood that patients will be alive in their own homes at 3-12 mo follow-up (risk ratio (RR) 1.06, 95% confidence interval (CI) 1.01-1.10), decreases the likelihood that patients will be admitted to a nursing home at 3-12 mo (RR 0.80, 95% CI 0.72-0.89), and results in little or no difference in dependence (RR 0.97, 95% CI 0.89-1.04). Evidence for cost-effectiveness is of low-certainty due to imprecision and inconsistency among studies.

# Differential Diagnoses of Common Presentations

## Frailty

### Definition

- frailty: clinically-recognizable state of decreased reserve in older adults with increased vulnerability to acute stressors resulting from functional decline across multiple physiologic systems
- functional decline: progressive limitation in the ability to carry out basic functional activities

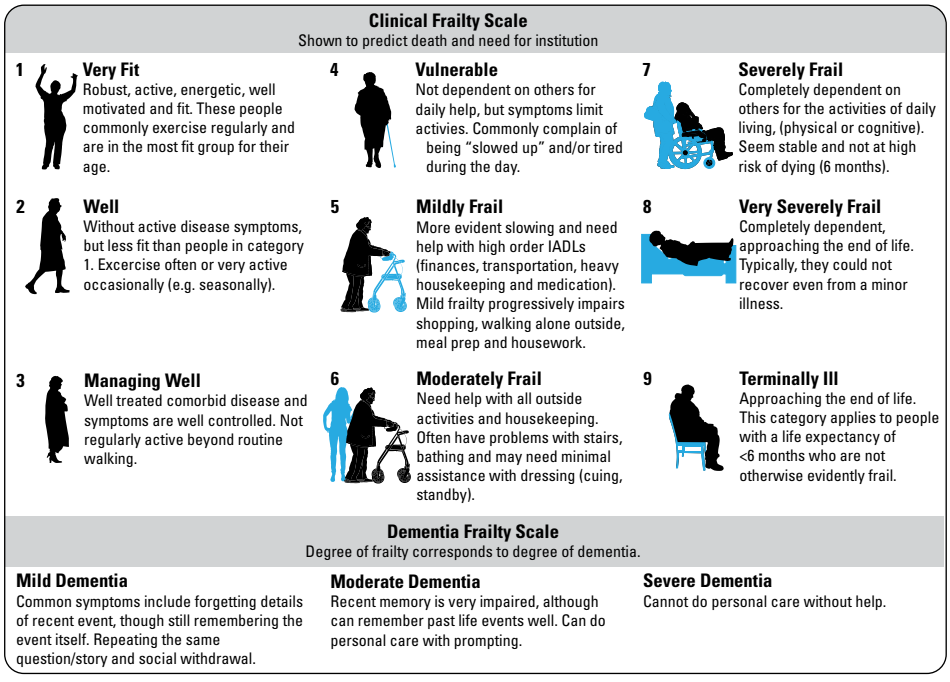

**Figure 1. Frailty scale**

Adapted from and reprinted with permission: Geriatric Medicine Research, Dalhousie University, Halifax, Canada. ©2007-2009 Version 1.2. All rights reserved.

### Models of Frailty

**Physical Frailty (PF) Phenotype (Fried et al.)**

- **Frail** = 3 or more criteria; at-risk or pre-frail = 1 or 2 criteria
  1. Shrinking: unintentional weight loss (baseline: >10 lbs or 5% total body weight lost in prior year)
  2. Weakness: grip strength in lowest 20% (by gender, BMI)
  3. Poor endurance: as indicated by self-report of exhaustion
  4. Slowness: walking time/15 feet in slowest 20% (by gender, height)
  5. Low activity: kcals/wk in lowest 20% (males: <383 kcals/wk, females: <270 kcals/wk)

**Cumulative Deficit Approach (Rockwood et al.)**

- balance between assets (e.g. health, attitudes, resources, caregiver) and deficits (e.g. illness, disability, dependence, caregiver burden) that determines whether a person can maintain independence in the community
- **Frailty Index** = number of deficits present/number of deficits possible

**Screening Tool for Frailty - FRAIL**
**F**atigue: "Are you fatigued?"
**R**esistance: "By yourself and without aids, do you have any difficulty walking up 10 steps without resting?"
**A**mbulation: "By yourself and without aids, do you have any difficulty walking several hundred yards?"
**I**llnesses: more than five
**L**oss of weight: greater than five percent
Frailty: "Yes" to 3 or more questions
Pre-frailty: "Yes" to 1-2 questions
FRAIL Questionnaire Screening Tool. J Am Med Dir Assoc 2017;18(12):1082-1086.

### Etiology

- multifactorial: dysregulated immune, endocrine, stress, and energy response systems lead to development of clinical frailty

**Table 2. Etiologies of Frailty**

| Etiology | Mechanism |
|---|---|
| **Physiologic Changes with Aging** | Sarcopenia (age-related loss of skeletal muscle and strength), decreased mass and increased stiffness of organs, decreased reserve capacity of systems |
| **Immune System** | Elevated levels of circulating interleukin-6, C-reactive protein, white blood cells, and monocytes associated with skeletal muscle decline<br>Elevated clotting markers (factor VIII, fibrinogen, D-dimer) upregulates clotting cascade<br>Chronic inflammation |
| **Endocrine System** | Decreased skeletal muscle mass via:<br>Decreased growth hormone and IGF-1<br>Increased cortisol levels<br>Decreased DHEA-S<br>Decreased 25 (OH) vitamin D |
| Dysregulated Stress Dysregulation of autonomic nervous system | |
| Age-related changes in renin-angiotensin system and mitochondria likely impact sarcopenia and inflammation | |

### Evidence-based Approach to the Frail Older Patient

- **Comprehensive Geriatric Assessment**
  - includes: Past Medical History, Medications, Allergies, Social History, Function, Physical Exam, and Geriatric Review of Systems (cognition, mood, sleep, pain, nutrition, falls, continence, vision/hearing, skin, and safety)
- interdisciplinary primary care
- pharmaceutical care and medication optimization
- management of geriatric syndromes (e.g. falls, cognitive impairment, incontinence)
- caregiver support

## Delirium

- see Psychiatry, PS22 and Neurology, N20

### Definition

- acute and potentially reversible disturbance in cognition, attention, or level of consciousness
- screened using the Confusion Assessment Method: delirium likely if 1 + 2 and either 3 or 4 are present
  - 1: acute onset and fluctuating course
  - 2: inattention
  - 3: disorganized thinking
  - 4: altered level of consciousness

### Differential Diagnosis

- 3Ds (dementia, delirium, depression) can present with overlapping cognitive changes

### Work-Up

- work-up is not universal, and depends on possible causes based on history and physical exam:
  - Drugs: medication review
  - Infection, Infarction, Inflammation: CBC, urinalysis, urine culture, blood culture, chest x-ray, ECG/troponin
  - Metabolic: basic and extended electrolytes, Vit B12, TSH, LFT, toxicology screen
  - Structural: neurologic exam, CT head

### Delirium Prevention in Elderly

- ensure optimal vision and hearing to support orientation (e.g. appropriate eyewear and hearing aids)
- provide adequate nutrition and hydration (up in chair to eat and drink whenever feasible)
- encourage regular mobilization to build and maintain strength, balance, and endurance
- avoid unnecessary medications and monitor for drug interactions
- avoid bladder catheterization
- ensure adequate sleep at night and wakefulness during the day

**Antipsychotics for Treatment of Delirium in Hospitalised non-ICU Patients**
Cochrane DB Syst Rev 2018;CD005594
**Objectives**: To compare the efficacy and incidence of adverse effects of antipsychotics in the treatment of delirium.
**Selection Criteria**: Types of studies included randomized trials with concealed allocation of subjects.
**Results**: Nine studies with 727 participants testing antipsychotics for delirium treatment; four trials compared an antipsychotic to another drug class or placebo and seven of the nine trials compared a typical antipsychotic to an atypical antipsychotic.
**Conclusions**: There is no evidence that antipsychotics shorten the course of delirium, reduce mortality risks, or improve quality of life in hospitalized patients.

**Table 3. Differentiating the Three Ds of Cognitive Impairment**

| | Dementia | Delirium | Depression |
|---|---|---|---|
| **Onset** | Gradual or step-wise decline | Acute (hours to days) | Subacute (weeks to months) |
| **Duration** | Months to years | Days to weeks | Variable |
| **Natural History** | Progressive, usually irreversible | Fluctuating, reversible<br>High mobidity/mortality in very old | Recurrent, usually reversible |
| **Level of Consciousness** | Normal | Fluctuating | Normal |
| **Attention** | Intact initially | Impaired, difficulty concentrating | |
| **Orientation** | Intact initially | Impaired, fluctuates | Intact |
| **Behaviour** | Disinhibition, loss of ADL/IADLs, personality change | Severe agitation/retardation | Importuning, self-harm/suicide |
| **Psychomotor** | Normal | Fluctuates between extremes | Slowing |
| **Sleep-Wake Cycle** | Fragmented sleep at night | Reversed sleep-wake cycle | Early morning awakening |
| **Mood and Affect** | Labile but not usually anxious | Anxious, irritable, fluctuating | Depressed, stable |
| **Cognition** | Decreased executive function, paucity of thought | Fluctuation preceded by mood changes | Concentration impaired |
| **Memory Loss** | Short-term | Marked short-term | Short-term |

# Falls

## Definition
- an event resulting in a person coming to rest inadvertently on a lower level, other than as a consequence of sudden paralysis, epileptic seizure, or overwhelming external force

## Epidemiology
- 30-40% of people >65 yr old and ~50% of people >80 yr old fall each year
  - equally common between men and women, but more likely to result in injury in women and death in men
  - falls are the leading cause of death from injury in persons ≥65 yr
  - 25% associated with serious injuries (e.g. hip fracture, head injury, bruises, laceration)
  - between 25-75% do not recover to previous level of ADL function after injurious falls

## Etiology
- intrinsic factors
  - age-related changes and diseases associated with aging: musculoskeletal (arthritis, muscle weakness), sensory (visual, proprioceptive, vestibular), cognitive (depression, dementia, delirium, anxiety), cardiovascular (CAD, arrhythmia, MI, low BP), neurologic (stroke, decreased LOC, gait disturbances/ataxia), metabolic (glucose, electrolytes)
  - orthostatic/syncopal
  - acute illness, exacerbation of chronic illness
- extrinsic factors
  - environmental (e.g. home layout, slippery surfaces, overcrowding, new environments)
  - side effects of medications, polypharmacy (>4 medications), and substance abuse (e.g. alcohol)
- situational factors
  - activities (e.g. rushing to the toilet, walking while distracted)

## History and Physical Exam
- history: previous falls and/or gait instability, inquire about intrinsic, extrinsic and situational factors, associated symptoms, loss of consciousness, medication and alcohol use, change in medications
- have a witness present if possible for interview
- physical exam: orthostatic blood pressure, cardiac, visual acuity, examination of feet and footwear, Performance-Oriented Assessment of Mobility, Timed Up-and-Go Test, MSK, neurologic

## Investigations
- comprehensive geriatric assessment to identify all potential causes
- CBC, electrolytes, BUN, creatinine, glucose, $Ca^{2+}$, TSH, B12, urinalysis, cardiac enzymes, ECG, CT head (as directed by history and physical), coagulation profile
- bone densitometry (DEXA) for osteoporosis screening in all women and men >65 yr old

## Interventions
- multidisciplinary, multifactorial, health, and environmental risk factor assessment and intervention programs in the community
- muscle strengthening, balance retraining (e.g. Tai Chi), and group exercise programs
- home hazard assessment and modification (e.g. remove loose rugs and tripping hazards, add shower bars and stair railing, improve lighting)
- prescription of vitamin D 1000 IU daily if vitamin D stores are low
- tapering or gradual discontinuation of psychotropic medication
- postural hypotension, heart rate, and rhythm abnormalities management
- eyesight (cataract surgery) and footwear optimization
- compression socks if venous stasis edema

**Key Clinical History Findings in Falls Evaluation - SPLATT:**
**S**ymptoms
**P**revious falls
**L**ocation of falls
**A**ctivity at the time of fall
**T**ime of fall
**T**rauma

**Will My Patient Fall?**
JAMA 2007;297:77-86
**Purpose**: To identify the prognostic value of risk factors for future falls among older patients.
**Study Selection**: Meta-analysis of prospective cohort studies of risk factors for falls.
**Results**: 18 studies were included. Clinically identifiable risk factors were identified across 6 domains: orthostatic hypotension, visual impairment, impairment of gait or balance, medication use, limitations in basic or instrumental activities of daily living, and cognitive impairment. The estimated pretest probability of falling at least once in any given yr for individuals 65 yr and older was 27% (95% CI 19-36%). Patients who have fallen in the past yr are more likely to fall again (LR2.3-2.8). Best predictors of future falls were disturbances in gait or balance (LR 1.7-2.4), while visual impairment, impaired cognition and medication were not reliable predictors.
**Conclusions**: Screening for risk of falling during the clinical examination begins with determining if the patient has fallen in the past yr. For patients who have not previously fallen, screening consists of an assessment of gait and balance. Patients who have fallen or who have a gait or balance problem are at higher risk of future falls.

**Comparisons of Interventions for Preventing Falls in Older Adults: A Systematic Review and Meta-analysis**
JAMA 2017;318(17):1687-99
**Objective**: To assess the potential effectiveness of interventions for preventing falls.
**Methods**: RCT of fall-prevention interventions for adults ≥65 yr.
**Results/Conclusions**: Exercise alone (OR 0.51, 95% CI 0.33-0.79), exercise + vision assessment/treatment (OR 0.17, 95% CI 0.07-0.38), exercise + vision assessment/treatment + environmental assessment/modification (OR 0.30, 95% 0.13-0.70), and comprehensive geriatric assessment + $Ca^{2+}$ and Vitamin D supplementation (OR 0.12, 95% CI 0.03-0.55) were each associated with lower risk of injurious falls.

**Impact of Medication Classes on Falls Risk in Geriatrics (Odds Ratios)**
- Antidepressants (1.68)
- Neuroleptics/Antipsychotics (1.59)
- Benzodiazepines (1.57)
- Sedatives/ Hypnotics (1.47)
- Antihypertensive agents (1.24)
- NSAIDs (1.21)
- Diuretics (1.07)
- β-blockers (1.01)

Meta-analysis of the impact of 9 medication classes on falls in elderly persons. Arch Intern Med 2009:169(21):1952-60

# Malnutrition

## Definition
- no uniformly accepted definition of malnutrition in older adults. Some commonly used definitions include the following:
  - involuntary weight loss (community: ≥2% over 1 mo, >10 lbs over 6 mo, or ≥4% over 1 yr; nursing home: ≥5% over 1 mo, ≥10% over 180 d)
  - hypoalbuminemia (community: ≤38 g/L; hospital: ≤35 g/L), hypocholesterolemia (<4.1 mmol/L)
  - other features include: insufficient energy intake, loss of muscle mass, fluid accumulation (e.g. edema), loss of subcutaneous fat, decreased hand-grip function

## Etiology
- nutritional
  - decreased assimilation: impaired transit, maldigestion, malabsorption
  - decreased intake: financial, psychiatric (depression), cognitive deficits, anorexia associated with chronic disease, functional deficits (e.g. difficulty shopping, preparing meals or feeding oneself due to functional impairment)

- stress: acute or chronic illness/infection, chronic inflammation, abdominal pain
- mechanical: dental problems, dysphagia
- age-related changes: appetite dysregulation, decreased thirst
- mixed: increased energy demands (e.g. hyperthyroidism), abnormal metabolism, protein-losing enteropathy

### Clinical Features
- history
  - weight loss in 6 mo prior to examination
  - recent or chronic illness
  - constitutional symptoms (e.g. recent weight loss)
  - dietary intake in relation to usual pattern
  - depression, GI symptoms (anorexia, nausea, vomiting, diarrhea)
  - functional disability: impaired ADLs and IADLs
  - social factors: economic barriers, dental problems, and living situation (e.g. living alone)
- physical exam
  - BMI <23.5 in males, <22 in females should raise concern
  - muscle wasting, temporal wasting, presence of triceps skin fold
  - loss of subcutaneous fat
  - ankle or sacral edema, ascites
  - assess cognition

### Investigations
- CBC, electrolytes, $Ca^{2+}$/albumin, $Mg^{2+}$, $PO_4^{3-}$, creatinine, LFTs (INR, bilirubin), B12, folate, TSH, lipid profile
- if indicated by assessment, can consider urinalysis, ESR, CXR

### Treatment
- direct treatment at underlying causes
- dietary modification: high calorie foods, oral nutritional supplementation: patient specific meal replacement products (e.g. Ensure™, Glucerna™, Nepro™), vitamins/minerals (e.g. B12, calcium, vitamin D)
- referral: speech language pathologist, nutritionist

**Etiology of Malnutrition in the Elderly**

**MEALS ON WHEELS**
**M**edications
**E**motional problems
**A**norexia
**L**ate-life paranoia
**S**wallowing disorders
**O**ral problems
**N**osocomial infections
**W**andering/dementia related activity
**H**yperthyroid/Hypercalcemia/Hypoadrenalism
**E**nteric disorders
**E**ating problems
**L**ow-salt/Low-fat diet
**S**tones

## Constipation

- see Gastroenterology, G27

### Definition
- Rome IV Diagnostic Criteria: straining, hard stools, sensation of incomplete evacuation, use of digital maneuvers, and/or sensation of anorectal obstruction/blockage with 25% of bowel movements and <3 bowel movements per wk. The criteria must be fulfilled for the last 3 mo with symptom onset ≥ 6 mo prior to diagnosis

### Epidemiology
- chronic constipation increases with age (up to 1/3 of patients >65 yr experience constipation and 1/2 of patients >80 yr)
- in the elderly, chronic constipation may present as fecal impaction

### Pathophysiology
- impaired rectal sensation (increased rectal distention required to stimulate the urge to defecate)
- colorectal dysmotility

### Treatment
- non-pharmacological
  - increase fibre intake (note: bulking agents, e.g. psyllium, Metamucil, may worsen constipation)
  - ensure adequate fluid intake
  - increase physical activity
- pharmacological
  - discourage chronic laxative use
  - review medication regime, reduce dosages or substitute
- see *Common Medications*, GM14

**Common Causes of Constipation in the Geriatric Population include:**
- Primary impaired colonic and anorectal function
- Drugs (see below)
- Diet (dehydration, low fibre "tea and toast" diet)
