- proximal humerus and femur most common
- symptoms: asymptomatic, or local pain; complete pathological fracture (50% of presentations) or incidental detection
- radiographic findings: lytic translucent area on metaphyseal side of growth plate, cortex thinned/expanded; well-defined lesion
- treatment: aspiration followed by steroid injection; curettage ± bone graft indicated if re-fracture likely

## Benign Aggressive Bone Tumours

### Giant Cell Tumours/Aneurysmal Bone Cyst/Osteoblastoma
- affects patients of skeletal maturity, peak 3rd decade
- osteoblastoma: found in the distal femur, proximal tibia, distal radius, sacrum, tarsal bones, spine
- giant cell tumour: pulmonary metastases in 3%
- aneurysmal bone cysts: either solid with fibrous/granular tissue, or blood-filled
- radiographic findings
  - giant cell tumour: eccentric lytic lesions in epiphyses adjacent to subchondral bone; may break through cortex; T2 MRI enhances fluid within lesion (hyper-intense signal)
  - aneurysmal bone cyst: expanded with honeycomb shape
  - osteoblastoma: often nonspecific; calcified central nidus (>2 cm) with radiolucent halo and sclerosis
- symptoms: local tenderness and swelling, pain may be progressive (giant cell tumours), ± symptoms of nerve root compression (osteoblastoma)
- 15% recur within 2 yr of surgery

**Figure 58. X-ray of aneurysmal bone cyst**
Note the aggressive destruction of bone

### Treatment
- intralesional curettage + bone graft or cement
- wide local excision of expendable bones

## Malignant Bone Tumours

**Table 26. Most Common Malignant Tumour Types for Age**

| Age | Tumour |
|---|---|
| <1 | Neuroblastoma |
| 1-10 | Ewing's of tubular bones |
| 10-30 | Osteosarcoma, Ewing's of flat bones |
| 30-40 | Reticulum cell sarcoma, fibrosarcoma, periosteal osteosarcoma, malignant giant cell tumour, lymphoma |
| >40 | Metastatic carcinoma, multiple myeloma, chondrosarcoma |

### Osteosarcoma
- malignant bone tumour
- most frequently diagnosed in 2nd decade of life (60%), 2nd most common primary malignancy in adults
- history of Paget's disease (elderly patients), previous radiation treatment
- predilection for sites of rapid growth: distal femur (45% - Figure 59), proximal tibia (20%), and proximal humerus (15%)
  - invasive, variable histology; frequent metastases without treatment (lung most common)
- painful symptoms: progressive pain, night pain, poorly defined swelling, decreased ROM

**Figure 59. X-ray of osteosarcoma of distal femur**

- radiographic findings
  - characteristic periosteal reaction: Codman's triangle (Figure 56) or "sunburst" spicule formation (tumour extension into periosteum)
  - destructive lesion in metaphysis may cross epiphyseal plate
- management: complete resection (limb salvage, rarely amputation), neo-adjuvant chemo; bone scan – rule out skeletal metastases, CT chest – rule out pulmonary metastases
- prognosis: 90% survival for low-grade; 70% survival for high-grade

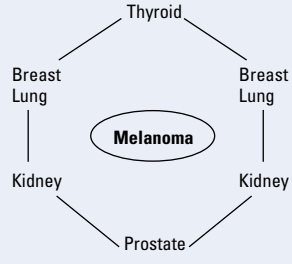
### Chondrosarcoma
- malignant chondrogenic tumour
- primary (2/3 cases)
  - previous normal bone, patient >40 yr; expands into cortex to cause pain, pathological fracture
- secondary (1/3 cases)
  - malignant degeneration of pre-existing cartilage tumour such as enchondroma or osteochondroma
  - age range 25-45 yr, better prognosis than primary chondrosarcoma
- symptoms: progressive pain, uncommonly palpable mass
- radiographic findings: in medullary cavity, irregular "popcorn" calcification
- treatment: unresponsive to chemotherapy, treat with aggressive surgical resection + reconstruction; regular follow-up X-rays of resection site and chest
- prognosis: 90% survival for low-grade (10yr survival); 20-40% survival for high-grade

### Ewing's Sarcoma
- malignant, small round cell sarcoma
- most occur between 5-25 yr old
- florid periosteal reaction in metaphyses of long bone with diaphyseal extension
- metastases frequent without treatment
- signs/symptoms: presents with pain, mild fever, erythema, and swelling; anemia, increased WBC, ESR, LDH (mimics an infection)
- radiographic findings: moth-eaten appearance with periosteal lamellated pattern ("onion-skinning")
- treatment: resection, chemotherapy, radiation
- prognosis: 70% survival, worst prognostic factor is distant metastases

### Multiple Myeloma
- proliferation of neoplastic plasma cells
- most common primary malignant tumour of bone in adults (~43%)
- 90% occur in people >40 yr old, M:F = 2:1; twice as common in African-Americans
- signs/symptoms: localized bone pain (cardinal early symptom), compression/pathological fractures, renal failure, nephritis, high incidence of infections (e.g. pyelonephritis/pneumonia), systemic (weakness, weight loss, anorexia)
- labs: anemia, thrombocytopenia, increased ESR, hypercalcemia, increased Cr
- radiographic findings: multiple, "punched-out" well-demarcated lesions, no surrounding sclerosis, marked bone expansion
- diagnosis
  - serum/urine immunoelectrophoresis (monoclonal gammopathy)
  - CT-guided biopsy of lytic lesions at multiple bony sites
- treatment: chemotherapy, bisphosphonates, radiation, surgery for symptomatic lesions or impending fractures – debulking, internal fixation
- prognosis: 5 yr survival 30%; 10 yr survival 11%
- see Hematology, H49

### Bone Metastases
- most common cause of bone lesions in adults; typically age >40
- 2/3 from breast or prostate; also consider thyroid, lung, kidney
- usually osteolytic; prostate occasionally osteoblastic
- may present with mechanical pain and/or night pain, pathological fracture, hypercalcemia
- bone scan for MSK involvement, MRI for spinal involvement may be helpful
- treatment: pain control, bisphosphonates, stabilization of impending fractures if Mirel's Critera >8 (ORIF, IM rod, bone cement)

**Table 27. Mirel's Criteria for Impending Fracture Risk and Prophylactic Internal Fixation**



| Variable | Number Assigned | | |
|---|---|---|---|
| | 1 | 2 | 3 |
| **Site** | Upper arm | Lower extremity | Peritrochanteric |
| **Pain** | Mild | Moderate | Severe |
| **Lesion** | Blastic | Mixed | Lytic |
| **Size** | <1/3 bone diameter | 1/3-2/3 diameter | >2/3 diameter |

**Figure 60. X-ray of femur chondrosarcoma**

**Signs of Hypercalcemia**
"Bones, Stones, Moans, Groans, Psychiatric overtones"
CNS: headache, confusion, irritability, blurred vision
GI: N/V, abdominal pain, constipation, weight loss
MSK: fatigue, weakness, unsteady gait, bone and joint pain
GU: nocturia, polydipsia, polyuria, UTIs

**Most Common Tumours Metastatic to Bone**

**BLT with a Kosher Pickle**
**B**reast
**L**ung
**T**hyroid
**K**idney
**P**rostate

# Common Medications

**Table 28. Common Medications**

| Drug Name | Dosing Schedule | Indications | Comments |
|---|---|---|---|
| **cefazolin (Ancef®)** | 1-2 g IV q8h | Pre-operative antibiotic prophylaxis | First generation cephalosporin; do not use with penicillin allergy |
| **heparin** | 5000 IU SC q12h | DVT prophylaxis | Monitor platelets, follow PTT which should rise 1.5-2x |
| **LMWH**<br>dalteparin (Fragmin®)<br>enoxaparin (Lovenox®)<br>fondaparinux (Arixtra®) | 5000 IU SC OD<br>30-40 mg SC bid<br>2.5 mg SC OD | DVT prophylaxis | Fixed dose, no monitoring, improved bioavailability, increased bleeding rates |
| **oral anticoagulants**<br>dabigatran (Pradaxa®)<br>rivaroxaban (Xarelto®)<br>apixaban | 110 mg PO x1 then 220 mg PO OD<br>10 mg PO OD<br>2.5 mg PO bid | DVT prophylaxis | Predictable, no monitoring, oral administration; no antidote |
| **tranexamic acid (TXA)** | 10-20 mg/kg IV<br>Topical application to wound | Reduce perioperative blood loss and transfusion | No evidence for increase in thromboembolic events |
| **midazolam (Versed®)** | 0.02-0.04 mg/kg IV | Conscious sedation for short procedures | Medication used during fracture reduction – monitor for respiratory depression |
| **fentanyl (Sublimaze®)** | 0.5-3 µg/kg IV | IV anesthetic | Short acting anesthetic used in conjunction with midazolam (Versed®) |
| **propofol (Diprivan®)** | 1-2 mg/kg IV<br>Maintenance 0.5 mg/kg | IV anesthetic | Short acting anesthetic often used in conjunction with fentanyl (Sublimaze®) |
| **ibuprofen (Advil®, Motrin®)** | 200-400 mg tid | Analgesia for inflammatory pain (arthritis) | NSAID, may cause gastric erosion and bleeding |
| **triamcinolone (Aristocort®) – an injectable steroid** | 0.5-1 mL of 25 mg/mL | Suspension (injected into inflamed joint or bursa); amount varies by joint size | Potent anti-inflammatory effect;increased pain for 24 h, rarely causes fat necrosis and skin depigmentation |
| **naproxen (Aleve®, Naprosyn®)** | 250-500 mg bid | Analgesia for pain due to inflammation, arthritis, soft tissue injury | NSAID, may cause gastric erosion and bleeding |
| **celecoxib (Celebrex®)** | 200 mg PO bid | Component of multimodal pain control and prophylaxis of HO after THA | NSAID (COX-2 inbibitor), cardiotoxic |
| **misoprostol (Cytotec®)** | 200 µg qid | Prophylaxis of HO after THA | Use with indomethacin |
| **indomethacin (Indocid®)** | 25 mg PO tid | Prophylaxis of HO after THA | Use with misoprostol |

# Anatomical Triangles of the Neck

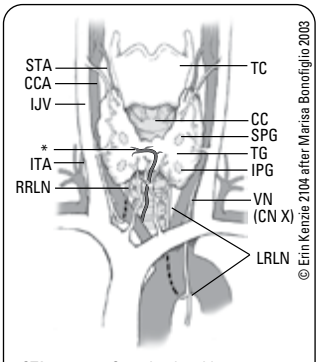
**Anterior triangle**
- bounded by anterior border of SCM, midline of neck, and lower border of mandible
- divided into:
  - **submental triangle**: bounded by both anterior belly of digastric and hyoid bone
  - **digastric triangle**: bounded by anterior and posterior bellies of digastric and inferior border of mandible
  - **carotid triangle**: bounded by SCM, anterior belly of omohyoid, and posterior belly of digastric
    - contains: tail of parotid, submandibular gland, hypoglossal nerve, carotid bifurcation, and lymph nodes

**Posterior triangle**
- bounded by posterior border of SCM, anterior border of trapezius, and middle third of clavicle
- divided into:
  - **occipital triangle**: superior to posterior belly of the omohyoid
  - **subclavian triangle**: inferior to posterior belly of omohyoid
- contains: spinal accessory nerve and lymph nodes

**Table 1. Lymphatic Drainage of Nodal Groups and Anatomical Triangles of Neck**

| Nodal Group/Level | Location | Drainage |
|---|---|---|
| **1. Suboccipital (S)** | Base of skull, posterior | Posterior scalp |
| **2. Retroauricular (R)** | Superficial to mastoid process | Scalp, temporal region, external auditory meatus, posterior pinna |
| **3. Parotid-preauricular (P)** | Anterior to ear | External auditory meatus, anterior pinna, soft tissue of frontal and temporal regions, root of nose, eyelids, palpebral conjunctiva |
| **4. Submental (Level IA)** | Anterior bellies (midline) of digastric muscles, tip of mandible, and hyoid bone | Floor of mouth, anterior tongue, anterior mandibular alveolar ridge, lower lip |
| **5. Submandibular (Level IB)** | Anterior belly of digastric muscle, stylohyoid muscle, body of mandible | Oral cavity, anterior nasal cavity, soft tissues of the mid-face, submandibular gland |
| **6. Upper jugular (Levels IIA and IIB)** | Skull base to inferior border of hyoid bone along SCM muscle | Oral cavity, nasal cavity, naso/oro/hypopharynx, larynx, parotid glands |
| **7. Middle jugular (Level III)** | Inferior border of hyoid bone to inferior border of cricoid cartilage along SCM muscle | Oral cavity, naso/oro/hypopharynx, larynx |
| **8. Lower jugular* (Level IV)** | Inferior border of cricoid cartilage to clavicle along SCM muscle | Hypopharynx, thyroid, cervical esophagus, larynx |
| **9. Posterior triangle** (Levels VA and VB)** | Posterior border of SCM, anterior border of trapezius, from skull base to clavicle | Nasopharynx and oropharynx, cutaneous structures of the posterior scalp and neck |
| **10. Anterior compartment*** (Level VI)** | Hyoid bone (midline) to suprasternal notch between the common carotid arteries | Thyroid gland, glottic and subglottic larynx, apex of piriform sinus, cervical esophagus |

*Virchow node: left lower jugular (level IV) supraclavicular node
**Includes some supraclavicular nodes
***Includes pretracheal, precricoid, paratracheal, and perithyroidal nodes



**Paired Parasympathetic Ganglia of the Head and Neck**
- **Ciliary:** pupillary constriction
- **Pterygopalatine:** lacrimal gland, nasal mucosa
- **Submandibular:** submandibular, sublingual glands
- **Otic:** parotid gland

**Function of Facial Nerve**

**"Ears, Tears, Face, Taste"**
**Ears:** stapedius muscle
**Tears:** lacrimation (lacrimal gland) and salivation
**Face:** muscles of facial expression
**Taste:** sensory anterior 2/3 of tongue (via chorda tympani)

- **Left-sided** enlargement of a supraclavicular node (Virchow's node) may indicate an abdominal malignancy or malignancy below the clavicle
- **Right-sided** enlargement may indicate malignancy of the mediastinum, lungs, or esophagus
- **Occipital and/or posterior auricular node** enlargement may indicate rubella

**4 Strap Muscles of the Neck**
- Thyrohyoid
- Omohyoid
- Sternohyoid
- Sternothyroid

STA – Superior thyroid artery
CCA – Common carotid artery
IJV – Internal jugular vein
ITA – Inferior thyroid artery
RRLN – Right recurrent laryngeal nerve
TC – Thyroid cartilage
CC – Cricoid cartilage
SPG – Superior parathyroid gland
TG – Thyroid gland
IPG – Inferior parathyroid gland
VN (CN X) – Vagus nerve (CN X)
LRLN – Left recurrent laryngeal nerve

*Thyroidea ima artery: present in 3% of population, arises from aortic arch or innominate artery

**Figure 10. Anatomy of the thyroid gland**

# Differential Diagnoses of Common Presentations

## Dizziness

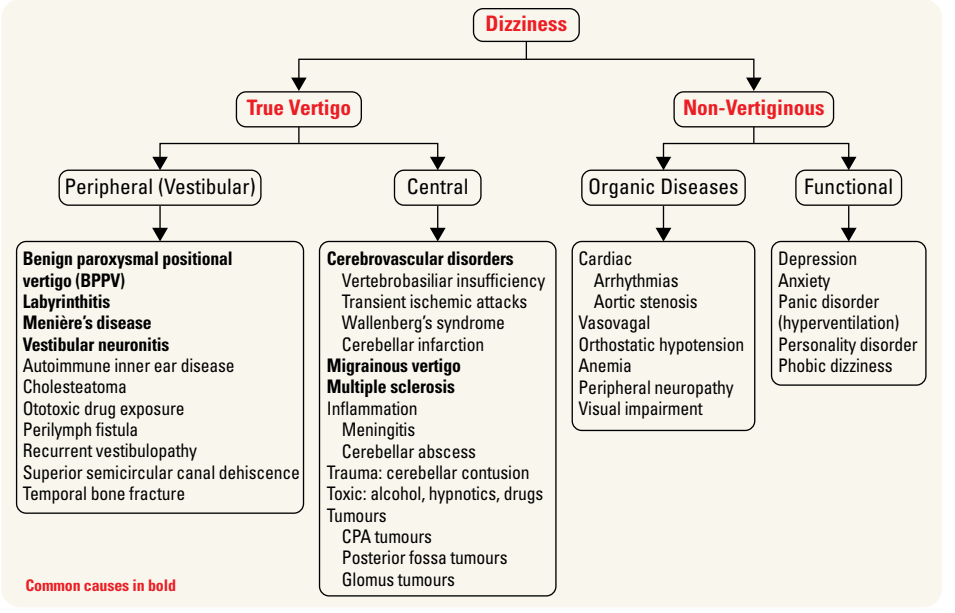


**Figure 11. Differential diagnosis of dizziness**

True nystagmus and vertigo caused by a peripheral lesion will never last longer than a few weeks, due to compensation from the cerebellum (unless there is a history of cerebellar ischemia/stroke). Central lesions do not compensate, therefore nystagmus and vertigo will persist

**5 "D"s of Vertebrobasilar Insufficiency**
**D**rop attacks
**D**iplopia
**D**ysarthria
**D**izziness
**D**ysphagia

## Otalgia

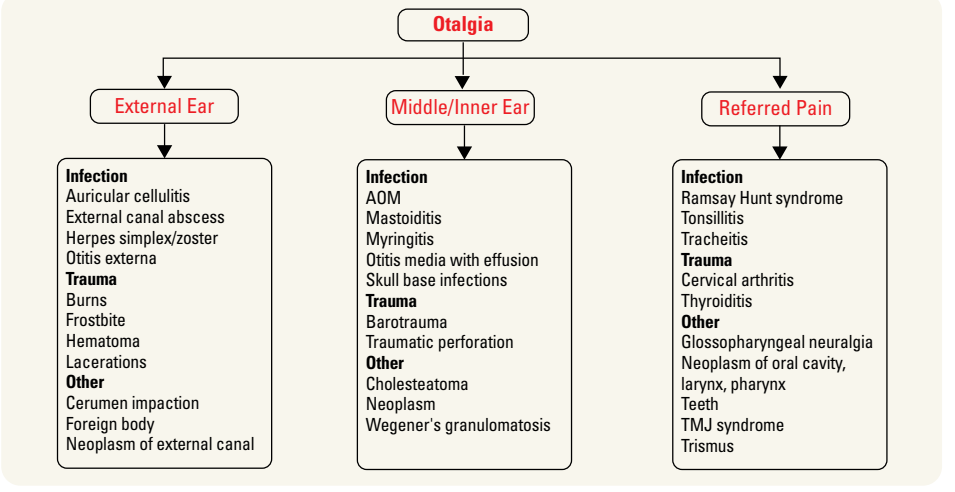

**Figure 12. Differential diagnosis of otalgia**

# Hearing Loss

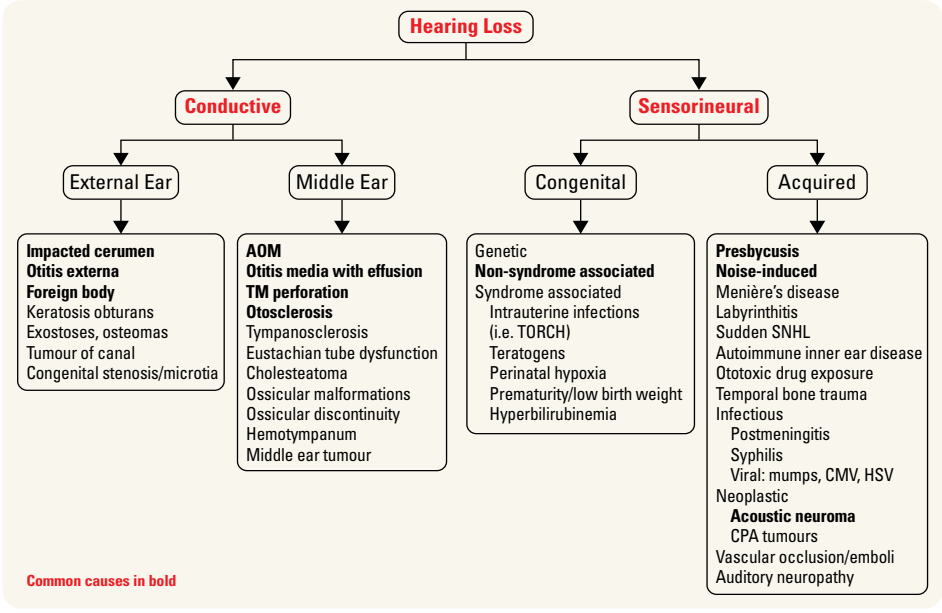

**Figure 13. Differential diagnosis of hearing loss**

# Tinnitus

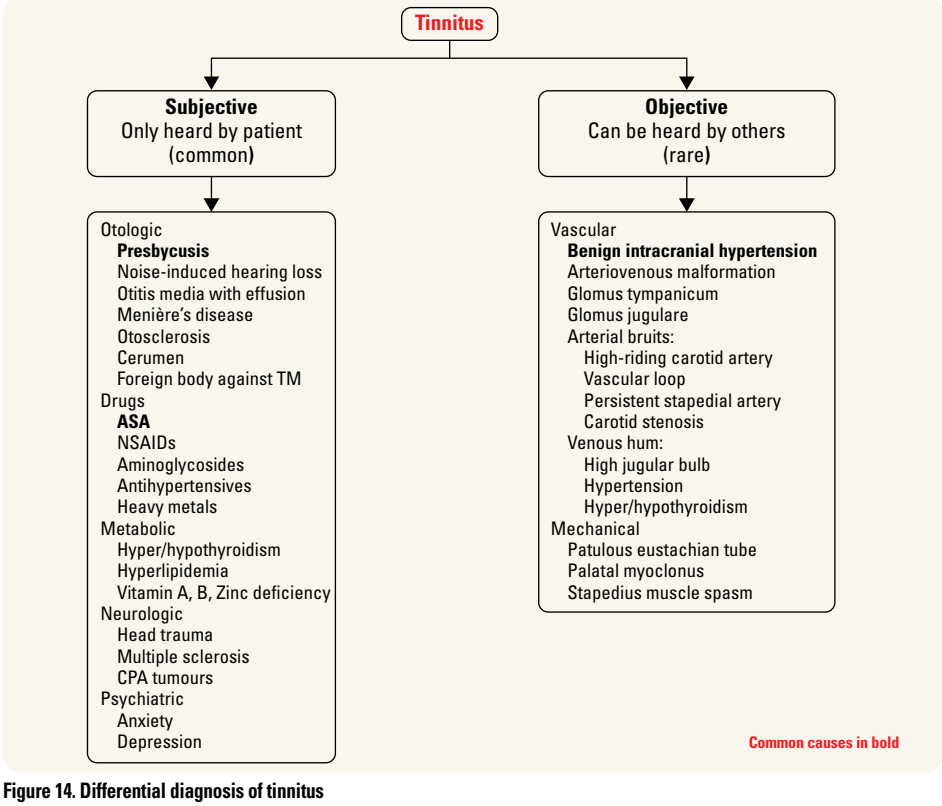

**Figure 14. Differential diagnosis of tinnitus**

Tinnitus is most commonly associated with SNHL

**Glomus Tympanicum/Jugulare Tumour Signs and Symptoms**

- Pulsatile tinnitus
- Hearing loss
- Blue mass behind TM
- Brown's sign (blanching of the TM with pneumatic otoscopy)

# Nasal Obstruction

**Table 2. Differential Diagnosis of Nasal Obstruction**

| Acquired | Congenital |
|---|---|
| **Nasal Cavity**<br>Rhinitis<br>Acute/chronic<br>Vasomotor<br>Allergic<br>Rhinosinusitis<br>Foreign bodies<br>Enlarged turbinates<br>Tumour<br>Benign: polyps, inverting papilloma<br>Malignant<br>SCC<br>Esthesioneuroblastoma (olfactory neuroblastoma)<br>Adenocarcinoma | **Nasal Cavity**<br>Nasal dermoid cyst<br>Encephalocele<br>Glioma<br>Choanal atresia |
| **Nasal Septum**<br>Septal deviation<br>Septal hematoma/abscess<br>Dislocated septum | **Nasal Septum**<br>Septal deviation<br>Septal hematoma/abscess<br>Dislocated septum |
| **Nasopharynx**<br>Adenoid hypertrophy<br>Tumour<br>Benign: juvenile nasopharyngeal angiofibroma (JNA), polyps<br>Malignant: nasopharyngeal carcinoma | |
| **Systemic** | |
| Granulomatous diseases, diabetes, vasculitis | |

# Hoarseness

**Table 3. Differential Diagnosis of Hoarseness**

| | | |
|---|---|---|
| **Infectious** | Acute/chronic laryngitis<br>Laryngotracheobronchitis (croup) | |
| **Inflammatory** | GERD<br>Vocal cord polyps/nodules<br>Lifestyle: smoking, chronic EtOH use | |
| **Trauma** | External laryngeal trauma<br>Endoscopy and endotracheal tube (e.g. intubation granuloma) | |
| **Neoplasia** | Benign tumour<br>Papillomas (HPV infection)<br>Minor salivary gland tumours<br>Other | Malignant tumours (e.g. thyroid)<br>SCC<br>Other |
| **Cysts** | Retention cysts | |
| **Systemic** | Endocrine<br>Hypothyroidism<br>Virilization | Connective tissue disease<br>RA<br>SLE |
| **Neurologic** (vocal cord paralysis due to superior ± recurrent laryngeal nerve injury) | Central lesions<br>Cerebrovascular accident (CVA)<br>Head injury<br>Multiple sclerosis (MS)<br>Skull base tumours<br>Arnold-Chiari malformation<br>Peripheral lesions<br>Unilateral<br>Lung malignancy | Iatrogenic injury: thyroid, parathyroid surgery, carotid endarterectomy, patent ductus arteriosus (PDA) ligation<br>Bilateral<br>Iatrogenic injury: bilateral thyroid surgery, forceps delivery<br>Neuromuscular<br>Myasthenia gravis |
| **Functional** | Psychogenic aphonia (hysterical aphonia) | |
| **Congenital** | Laryngomalacia<br>Laryngeal web<br>Laryngeal atresia | |

Lung malignancy is the most common cause of extralaryngeal vocal cord paralysis

# Neck Mass

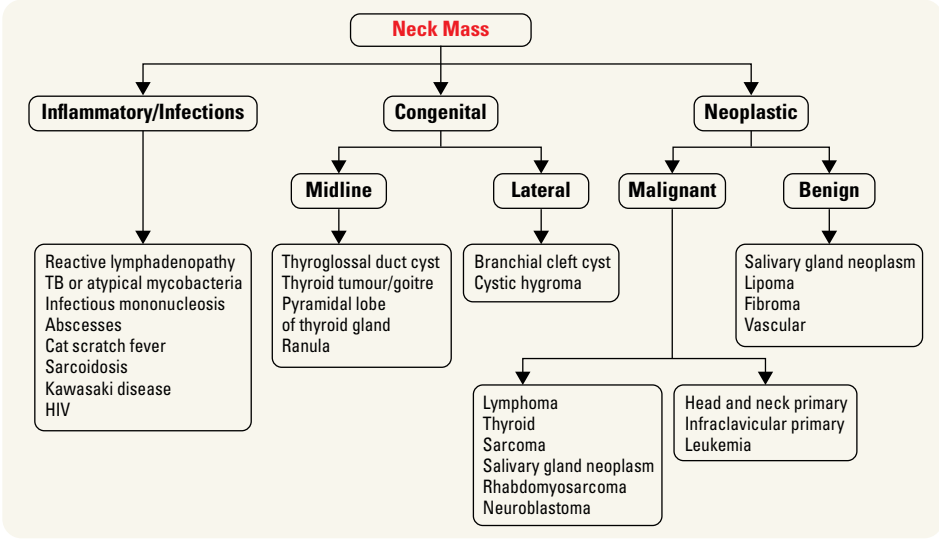

**Figure 15. Differential diagnosis of a neck mass**

# Hearing

## Normal Hearing Physiology

- **conductive pathway** (EAC to cochlea): air conduction of sound down the EAC → vibration of TM → sequential vibration of middle ear ossicles (malleus, incus, stapes) → transmission of amplified vibrations from stapes footplate to the oval window of the cochlea → transmitted vibrations via cochlear fluid create movement along the basilar membrane within the cochlea
- **neural pathway** (nerve to brain): basilar membrane vibration stimulates overlying hair cells in the organ of Corti → stimulation of bipolar neurons in the spiral ganglion of the cochlear division of CN VIII → cochlear nucleus → superior olivary nucleus → lateral lemniscus → inferior colliculus → Sylvian fissure of temporal lobe

**Order of the Neural Pathway (with corresponding waves on ABR)**

**E COLI**
**E**ighth cranial nerve (I – II)
**C**ochlear nucleus (III)
Superior **O**livary nucleus
**L**ateral leminiscus (IV – V)
**I**nferior colliculus

## Types of Hearing Loss

### 1. Conductive Hearing Loss
- conduction of sound to the cochlea is impaired
- can be caused by external and middle ear disease

### 2. Sensorineural Hearing Loss
- defect in the conversion of sound into neural signals or in the transmission of those signals to the cortex
- can be caused by disease of the inner ear (cochlea), acoustic nerve (CN VIII), brainstem, or cortex

### 3. Mixed Hearing Loss
- combination of CHL and SNHL

### Auditory Acuity
- whispered-voice test: mask one ear and whisper into the other
- tuning fork tests (see Table 4; audiogram is of greater utility)
  - Rinne test
    - 512 Hz tuning fork is struck and held firmly on mastoid process to test bone conduction (BC); the tuning fork is then placed beside the pinna to test air conduction (AC)
    - if AC > BC → positive Rinne (normal)
  - Weber test
    - 512 Hz tuning fork is held on vertex of head and patient states whether it is heard centrally (Weber negative) or is lateralized to one side (Weber right, Weber left)
    - can place vibrating fork on patient's chin while they clench their teeth, or directly on teeth to elicit more reliable response
    - will only lateralize if difference in hearing loss between ears is >6 dB

Weber Test lateralization = ipsilateral conductive hearing loss or contralateral sensorineural hearing loss

The Weber test is more sensitive in detecting CHL than the Rinne test

**Table 4. The Interpretation of Tuning Fork Tests**

| Examples | Weber | Rinne |
|---|---|---|
| Normal or bilateral SNHL | Central | AC>BC (+) bilaterally |
| Right-sided CHL, normal left ear | Lateralizes to right | BC>AC (–) right |
| Right-sided SNHL, normal left ear | Lateralizes to left | AC>BC (+) bilaterally |
| Right-sided severe SNHL or dead right ear, normal left ear | Lateralizes to left | BC>AC (–) right* |

*A vibrating tuning fork on the mastoid stimulates the cochlea bilaterally, therefore in this case the left cochlea is stimulated by the Rinne test on the right (e.g. a false negative test). These tests are not valid if the ear canals are obstructed with cerumen (e.g. will create conductive loss)

| Frequency of Tuning Fork (Hz) | Minimum Hearing Loss for Rinne to Reverse (BC>AC, NEGATIVE Rinne) (dB) |
|---|---|
| 256 | 15 |
| 512 | 30 |
| 1024 | 45 |

# Pure Tone Audiometry

- a threshold is the lowest intensity level at which a patient can hear the tone 50% of the time
- thresholds are obtained for each ear at frequencies of 250, 500, 1000, 2000, 4000, and 8000 Hz
- air conduction thresholds are obtained with headphones and measure outer, middle, inner ear, and auditory nerve function
- bone conduction thresholds are obtained with bone conduction oscillators which bypass the outer and middle ear

**Range of Frequencies Audible to Human Ear**
- 20 to 20000 Hz
- Most sensitive frequencies: 1000 to 4000 Hz
- Range of human speech: 500 to 2000 Hz

## Degree of Hearing Loss

- determined on basis of the pure tone average (PTA) at 500, 1000, and 2000 Hz

Hearing loss most often occurs at higher frequencies. Noise-induced (occupational) HL is classically seen at 4000 Hz (Boilermaker's notch). HL associated with otosclerosis is seen at 2000 Hz (Carhart's notch)

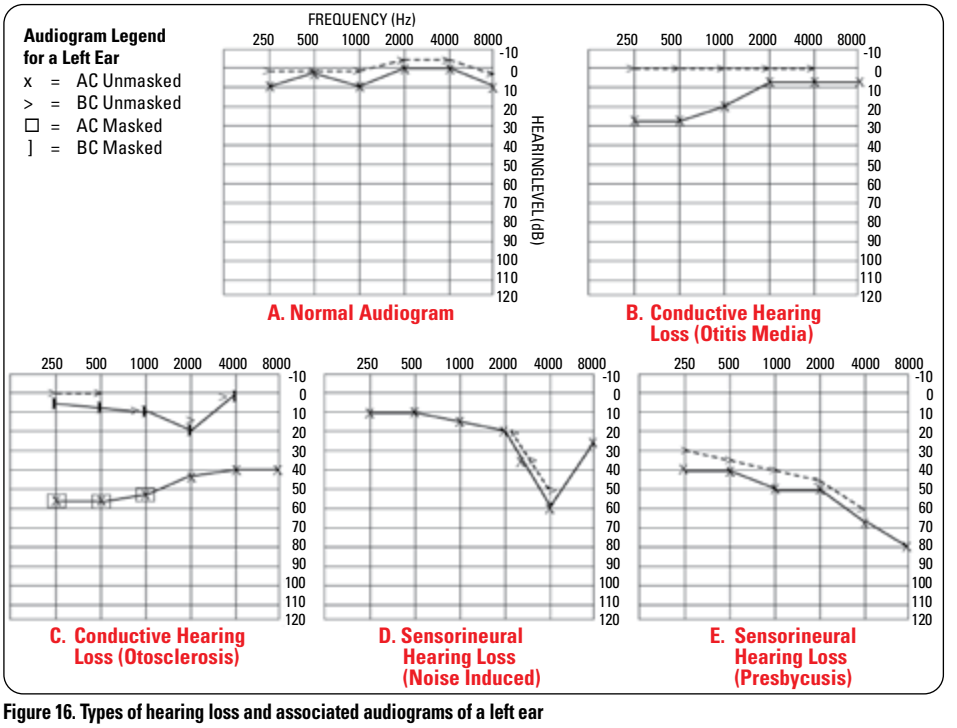

**Figure 16. Types of hearing loss and associated audiograms of a left ear**

## PURE TONE PATTERNS

### 1. Conductive Hearing Loss (Figure 16B and 16C)
- BC in normal range
- AC outside of normal range
- gap between AC and BC thresholds >10 dB (an air-bone gap)

### 2. Sensorineural Hearing Loss (Figure 16D and 16E)
- both air and bone conduction thresholds below normal
- gap between AC and BC <10 dB (no air-bone gap)

### 3. Mixed Hearing Loss
- both air and bone conduction thresholds below normal
- gap between AC and BC thresholds >10 dB (an air-bone gap)

# Speech Audiometry

### Speech Reception Threshold
- lowest hearing level at which patient is able to repeat 50% of two syllable words which have equal emphasis on each syllable (spondee words)
- speech reception threshold (SRT) and best pure tone threshold in the 500 to 2000 Hz range (frequency range of human speech) usually agree within 5 dB; if not, suspect a retrocochlear lesion or functional hearing loss
- used to assess the reliability of the pure tone audiometry

### Speech Discrimination Test
- percentage of words the patient correctly repeats from a list of 50 monosyllabic words
- tested at 40 dB above the patient's SRT, therefore degree of hearing loss is taken into account
- patients with normal hearing or CHL score >90%
- rollover effect: a decrease in discrimination as sound intensity increases; typical of a retrocochlear lesion (e.g. acoustic neuroma)
- investigate further if scores differ more than 20% between ears, as asymmetry may indicate a retrocochlear lesion
- best predictor of hearing aid response: a poor discrimination score indicates significant neural degeneration and hearing aids may not be the best option for the patient

# Impedance Audiometry

### Tympanogram
- the Eustachian tube equalizes the pressure between the external and middle ear
- tympanograms graph the compliance of the middle ear system against a pressure gradient ranging from −400 to +200 mm$H_2O$
- tympanogram peak occurs at the point of maximum compliance: where the pressure in the external canal is equivalent to the pressure in the middle ear
- normal range: −100 to +50 mm$H_2O$

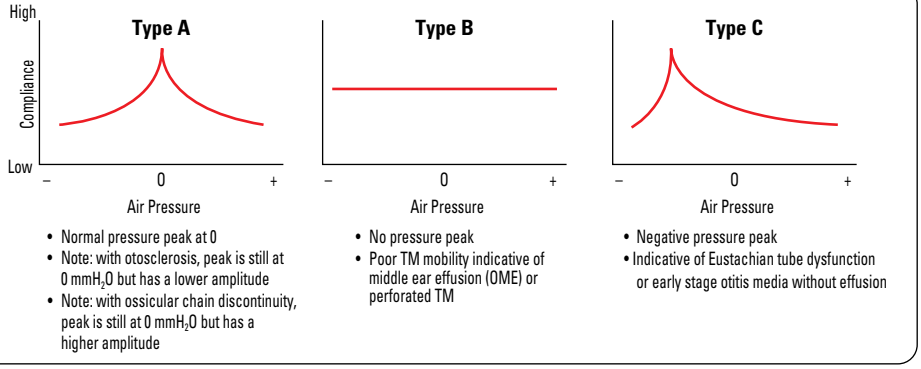

**Figure 17. Tympanograms**

### Static Compliance
- volume measurement reflecting overall stiffness of the middle ear system
- normal range: 0.3-1.6 cc
- negative middle ear pressure and abnormal compliance indicate middle ear pathology
- in a type B curve, ear canal volumes of >2 cc in children and >2.5 cc in adults indicate TM perforation or presence of a patent ventilation tube

### Acoustic Stapedial Reflexes
- stapedius muscle contracts in response to loud sound
- acoustic reflex threshold = 70-100 dB greater than hearing threshold; if hearing threshold >85 dB, reflex likely absent
  - stimulating either ear causes bilateral and symmetrical reflexes
  - for reflex to be present, CN VII must be intact with no CHL in monitored ear
  - if reflex is absent without CHL or severe SNHL, suspect CN VII lesion
- **acoustic reflex decay test** = ability of stapedius muscle to sustain contraction for 10 s at 10 dB
  - normally, little reflex decay occurs at 500 and 1000 Hz
- with cochlear hearing loss, acoustic reflex thresholds are 25-60 dB
- with retrocochlear hearing loss (acoustic neuroma), absent acoustic reflexes or marked reflex decay (>50%) within 5 s

## Auditory Brainstem Response

- measures neuroelectric potentials (waves) in response to a stimulus in five different anatomic sites (see Order of Neural Pathway sidebar on OT9; this test can be used to determine the site of lesion)
- delay in brainstem response suggests cochlear or retrocochlear abnormalities
- does not require volition or co-operation of patient (therefore, of value in children and malingerers)

## Otoacoustic Emissions

- objective test of hearing where a series of clicks is presented to the ear and the cochlea generates an echo which can be measured
- often used in newborn screening
- can be used to uncover normal hearing in malingering patients
- absence of emissions can be due to hearing loss or fluid in the middle ear

Pre-lingually deaf infants are the best candidates for aural rehabilitation because they have maximal benefit from ongoing developmental plasticity

## Aural Rehabilitation

- dependent on degree of hearing loss, communicative requirements, motivation, expectations, and physical and mental abilities
- negative prognostic factors
  - poor speech discrimination
  - narrow dynamic range (recruitment)
  - unrealistic expectations
- types of hearing aids
  - BTE: behind-the-ear (with occlusive mould or open fit which allows natural sound to pass – for milder hearing losses)
  - ITE: in-the-ear, placed in concha
  - ITC: in-the-canal, placed entirely in ear canal
  - CIC: contained-in-canal, placed deeply in ear canal
  - bone conduction: bone-anchored hearing aid (BAHA): attached to the skull → BAHA: bone-anchored hearing aid: attached to skull (bone conduction)
  - CROS: contralateral routing of signals
- assistive listening devices
  - direct/indirect audio output
  - infrared, FM radio, or induction loop systems
  - telephone, television, or alerting devices
- cochlear implants
  - electrode is inserted into the cochlea to allow direct stimulation of the auditory nerve
  - for profound bilateral SNHL not rehabilitated with conventional hearing aids
  - established indication: post-lingually deafened adults, pre-and post-lingually deaf children

**Bone Anchored Hearing Aids (BAHA)**
BAHAs function based on bone conduction and are indicated primarily for patients with CHL, unilateral hearing loss, and mixed hearing loss who cannot wear conventional hearing aids. BAHAs consist of a titanium implant, an external abutment, and a sound processor. The sound processor transmits vibrations through the external abutment to the titanium implant and then directly to the cochlea

**Pre-lingual deafness**: deafness occurring before speech and language are acquired
**Post-lingual deafness**: deafness occurring after speech and language are acquired

# Vertigo

## Evaluation of the Dizzy Patient

- vertigo: illusion of rotational, linear, or tilting movement of self or environment
- vertigo is produced by peripheral (inner ear) or central (brainstem-cerebellum) stimulation
- it is important to distinguish vertigo from other potential causes of "dizziness" (see Figure 11, OT6)

**Table 5. Peripheral vs. Central Vertigo**

| Symptoms | Peripheral | Central |
|---|---|---|
| **Imbalance** | Moderate-severe | Mild-moderate |
| **Nausea and Vomiting** | Severe | Variable |
| **Auditory Symptoms** | Common | Rare |
| **Neurologic Symptoms** | Rare | Common |
| **Compensation** | Rapid | Slow |
| **Nystagmus** | Unidirectional<br>Horizontal or rotatory | Bidirectional<br>Horizontal or vertical |

**Table 6. Differential Diagnosis of Vertigo Based on History**

| Condition | Duration | Hearing Loss | Tinnitus | Aural Fullness | Other Features |
|---|---|---|---|---|---|
| **Benign Paroxysmal Positional Vertigo** (BPPV) | Seconds | – | – | – | |
| **Ménière's Disease** | Minutes to hours<br>Precedes attack | Uni/bilateral, fluctuating | + | Pressure/warmth | |
| **Labyrinthitis/Vestibular Neuronitis** | Hours to days | Unilateral | ±Whistling | – | May have recent AOM |
| **Acoustic Neuroma** | Chronic | Progressive | + | – | Ataxia<br>CN VII palsy |

**Table 7. Differential Diagnosis of Vertigo Based on Time Course**

| Time Course | Condition |
|---|---|
| Recurrent, lasting | BPPV |
| Single episode, lasting minutes to hours | Migraine, transient ischemia of the labyrinth or brainstem |
| Recurrent to hours | Ménière's |
| Prolonged | Vestibular neuritis, MS, brainstem/cerebellum infarct |
| Chronic | Acoustic neuroma |

# Benign Paroxysmal Positional Vertigo (BPPV)

BPPV is the most common cause of episodic vertigo; patients are often symptomatic when rolling over in bed or moving their head to a position of extreme posterior extension (such as looking up at a tall building or getting their hair washed at the hairdresser)

## Definition
- acute attacks of transient rotatory vertigo lasting seconds to minutes, initiated by certain head positions, accompanied by torsional (i.e. rotatory) nystagmus (geotropic = fast phase towards the floor)
- most common form of positional vertigo (50% of patients with peripheral vestibular dysfunction)

## Etiology
- due to canalithiasis (migration of free floating otoliths within the endolymph of the semicircular canal) or cupulolithiasis (otolith attached to the cupula of the semicircular canal)
  - can affect each of the 3 semicircular canals, although the posterior canal is affected in >90% of cases
  - causes: head injury, viral infection (URTI), degenerative disease, idiopathic
  - results in slightly different signals being received by the brain from the two balance organs, resulting in sensation of movement

## Diagnosis
- history (time course, provoking factors, associative symptoms)
- positive Dix-Hallpike maneuver (sensitivity 82%, specificity 71%)

**Signs of BPPV seen with Dix-Hallpike Maneuver**
- Latency of ~20 s
- Crescendo/decrescendo vertigo lasting 20 s
- Geotropic rotatory nystagmus (nystagmus MUST be present for a positive test)
- Reversal of nystagmus upon sitting up
- Fatigability with repeated stimulation

## Dix-Hallpike Positional Testing (see website for video and illustrations)
- the patient is rapidly moved from a sitting position to a supine position with the head hanging over the end of the table, turned to one side at 45°, and neck extended 20° holding the position for 20 s
- onset of vertigo and rotary nystagmus indicate a positive test for the dependent side
- other diagnostic testing is not indicated in posterior canal BPPV

## Treatment
- reassure patient that process resolves spontaneously
- particle repositioning maneuvers
  - Epley maneuver (performed by MD or by patient with the help of devices such as the DizzyFIX™)
  - Brandt-Daroff exercises (performed by patient)
- anti-emetics for N/V
- surgery for refractory cases
- drugs to suppress the vestibular system delay eventual recovery and are therefore not used

# Ménière's Disease (Endolymphatic Hydrops)

## Definition
- episodic attacks of tinnitus, hearing loss, aural fullness, and vertigo lasting min to hr

**Diagnostic Criteria for Ménière's Disease (must have all three)**
- Two spontaneous episodes of rotational vertigo ≥20 min
- Audiometric confirmation of SNHL (often low frequency)
- Tinnitus and/or aural fullness

## Proposed Etiology
- inadequate absorption of endolymph leads to endolymphatic hydrops (over accumulation) that distorts the membranous labyrinth

## Epidemiology
- peak incidence 40-60 yr
- bilateral in 35% of cases

### Clinical Features
- episodic vertigo, fluctuating low frequency SNHL, tinnitus, and aural fullness
- ± drop attacks (Tumarkin crisis), ± N/V
- vertigo disappears with time (min to h), but hearing loss remains
- early in the disease: fluctuating SNHL
- later stages: persistent tinnitus and progressive hearing loss
- attacks come in clusters and can be debilitating to the patient
- triggers: high salt intake, caffeine, stress, nicotine, and alcohol

### Treatment
- acute management may consist of bed rest, antiemetics, antivertiginous drugs (e.g. betahistine [Serc®], meclizine, dimenhydramine), and anticholinergics (e.g. scopolamine)
- long-term management may include
  - medical
    - low salt diet, diuretics (e.g. hydrochlorothiazide, triamterene, amiloride)
    - Serc® prophylactically to decrease intensity of attacks
    - intratympanic gentamicin to destroy vestibular end-organ, results in complete SNHL
    - intratympanic glucocorticoids (e.g. dexamethasone) may improve vertigo symptoms
  - surgical
    - selective vestibular neurectomy or labyrinthectomy
    - potential benefit for endolymphatic sac decompression or sacculotomy
    - must monitor opposite ear, as bilaterality occurs in 35% of cases

## Vestibular Neuronitis (Labyrinthitis)

### Definition
- acute onset of disabling vertigo often accompanied by N/V and imbalance without hearing loss that resolves over days, leaving a residual imbalance that lasts days to weeks
- vestibular neuronitis: inflammation of the vestibular portion of CN VIII
- labyrinthitis: inflammation of both vestibular and cochlear portions

### Etiology
- thought to be due to a viral infection (e.g. measles, mumps, herpes zoster) or post-viral syndrome
- only ~30% of cases have associated URTI symptoms
- labyrinthitis may occur as a complication of acute and chronic otitis media, bacterial meningitis, cholesteatoma, and temporal bone fractures

### Clinical Features
- acute phase
  - severe vertigo with N/V and imbalance lasting 1-5 d
  - irritative nystagmus (fast phase towards the offending ear)
  - ataxia: patient tends to veer towards affected side
  - tinnitus and hearing loss in labyrinthitis
- convalescent phase
  - imbalance and motion sickness lasting d-wk
  - spontaneous nystagmus away from affected side
  - gradual vestibular adaptation requires wk-mo

**Drop Attacks (Tumarkin's Otolithic Crisis)** are sudden falls occurring without warning and without loss of consciousness, where patient experiences feeling of being pushed down into the ground

### Treatment
- acute phase
  - bed rest, antivertiginous drugs
  - corticosteroids (methylprednisolone) ± antivirals
  - bacterial infection: treat with IV antibiotics, drainage of middle ear, ± mastoidectomy
- convalescent phase
  - progressive ambulation, especially in the elderly
  - vestibular exercises: involve eye and head movements, sitting, standing, and walking

Before proceeding with gentamicin treatment, perform a gadolinium-enhanced MRI to rule out CPA tumour as the cause of symptoms

## Acoustic Neuroma (Vestibular Schwannoma)

### Definition
- schwannoma of the vestibular portion of CN VIII

### Pathogenesis
- starts in the internal auditory canal and expands into CPA, compressing cerebellum and brainstem
- when associated with type 2 neurofibromatosis (NF2): bilateral acoustic neuromas, juvenile cataracts, meningiomas, and ependymomas

### Clinical Features
- usually presents with unilateral SNHL (chronic) or tinnitus
- dizziness and unsteadiness may be present, but true vertigo is rare as tumour growth occurs slowly, and thus compensation occurs

Acoustic neuroma is the most common intracranial tumour causing SNHL and the most common CPA tumour

In the elderly, unilateral tinnitus or SNHL is acoustic neuroma until proven otherwise

- facial nerve palsy and trigeminal (V1) sensory deficit (corneal reflex) are late complications
- risk factors: exposure to loud noise, childhood exposure to low-dose radiation, history of parathyroid adenoma

### Diagnosis
- MRI with gadolinium contrast (gold standard)
- audiogram (to assess SNHL)
- poor speech discrimination relative to the hearing loss
- stapedial reflex absent or significant reflex decay
- ABR: increase in latency of the 5th wave
- vestibular tests: normal or asymmetric caloric weakness (an early sign)

### Treatment
- expectant management if tumour is very small, or in elderly
- definitive management is surgical excision
- other options: gamma knife, radiation

# Tinnitus

### Definition
- an auditory perception in the absence of an acoustic stimuli, likely related to loss of input to neurons in central auditory pathways and resulting in abnormal firing

### History
- subjective vs. objective (see Figure 14, OT7)
- continuous vs. pulsatile (vascular in origin)
- unilateral vs. bilateral
- associated symptoms: hearing loss, vertigo, aural fullness, otalgia, otorrhea

### Investigations
- audiology
- if unilateral
  - ABR, gadolinium-enhanced MRI to exclude a retrocochlear lesion
  - CT to diagnose glomus tympanicum (rare)
  - MRI or angiogram to diagnose arteriovenous malformation
- if suspect metabolic abnormality: lipid profile, TSH, zinc levels

### Treatment
- if a cause is found, treat the cause (e.g. drainage of middle ear effusion, embolization or excision of arteriovenous malformation)
- with no treatable cause: 50% will improve, 25% worsen, 25% remain the same
- avoid loud noise, ototoxic meds, caffeine, smoking
- tinnitus clinics
- identify situations where tinnitus is most bothersome (e.g. quiet times), mask tinnitus with soft music or "white noise"
- hearing aid if coexistent hearing loss
- tinnitus instrument: combines hearing aid with white noise masker
- trial of tocainamide

Cerumen impaction is the most common cause of CHL for those aged 15-50 yr

# Diseases of the External Ear

## Cerumen Impaction

### Etiology
- ear wax: a mixture of secretions from ceruminous and pilosebaceous glands, squames of epithelium, dust, and debris

### Risk Factors
- hairy or narrow ear canals, in-the-ear hearing aids, cotton swab usage, osteomata

### Clinical Features
- hearing loss (conductive)
- ± tinnitus, vertigo, otalgia, aural fullness

### Treatment
- water or ceruminolytic drops (bicarbonate solution, olive oil, glycerine, Cerumenol®, Cerumenex®)
- manual debridement (by MD)

**Syringing**

**Indications**
- Totally occlusive cerumen with pain, decreased hearing, or tinnitus

**Contraindications**
- Active infection
- Previous ear surgery
- Only hearing ear
- TM perforation

**Complications**
- Otitis externa
- TM perforation
- Trauma
- Pain
- Vertigo
- Tinnitus
- Otitis media

**Method**
- Establish that TM is intact
- Gently pull the pinna superiorly and posteriorly
- Using lukewarm water, aim the syringe nozzle upwards and posteriorly to irrigate the ear canal

# Exostoses

### Definition
- bony protuberances in the external auditory canal composed of lamellar bone

### Etiology
- possible association with swimming in cold water

### Clinical Features
- usually an incidental finding
- if large, they can cause cerumen impaction or otitis externa

### Treatment
- no treatment required unless symptomatic

# Otitis Externa

### Definition
- inflammation of external auditory canal or auricle

### Etiology
- bacterial (90% of OE): *Pseudomonas aeruginosa, Pseudomonas vulgaris, E. coli, S. aureus*
- fungal: *Candida albicans, Aspergillus niger*

### Risk Factors
- associated with swimming ("swimmer's ear")
- mechanical cleaning (Q-tips®), skin dermatitis, aggressive scratching
- devices that occlude the ear canal: hearing aids, headphones, etc.
- allergic contact dermatitis, dermatologic conditions (psoriasis, atopic dermatitis)

### Clinical Features
- acute
  - pain aggravated by movement of auricle (traction of pinna or pressure over tragus)
  - otorrhea (sticky, yellow purulent discharge)
  - CHL ± aural fullness secondary to obstruction of external canal by swelling and purulent debris
  - posterior auricular lymphadenopathy
  - complicated OE exists if the pinna and/or the periauricular soft tissues are erythematous and swollen
- chronic
  - pruritus of external ear ± excoriation of ear canal
  - atrophic and scaly epidermal lining, ± otorrhea, ± hearing loss
  - wide meatus but no pain with movement of auricle
  - TM appears normal

Pulling on the pinna is extremely painful in OE, but is usually well tolerated in otitis media

### Treatment
- clean ear under magnification with irrigation, suction, dry swabbing, and C&S
- bacterial etiology
  - antipseudomonal otic drops (e.g. ciprofloxacin) or a combination of antibiotic and steroid (e.g. Cipro HC®)
  - do not use aminoglycoside if the TM is perforated, because of the risk of ototoxicity
  - introduction of fine gauze wick (pope wick) if external canal edematous
  - ± 3% acetic acid solution to acidify ear canal (low pH is bacteriostatic)
  - systemic antibiotics if either cervical lymphadenopathy or cellulitis is present
- fungal etiology
  - repeated debridement and topical antifungals (gentian violet, Mycostatin® powder, boric acid, Locacorten®, Vioform® drops)
- ± analgesics
- chronic otitis externa (pruritus without obvious infection) → corticosteroid alone (e.g. diprosalic acid)

# Malignant (Necrotizing) Otitis Externa (Skull Base Osteomyelitis)

### Definition
- osteomyelitis of the temporal bone

### Epidemiology
- occurs in elderly diabetics and immunocompromised patients

### Etiology
- rare complication of otitis externa
- *Pseudomonas* infection in 99% of cases

### Clinical Features
- otalgia and purulent otorrhea that is refractory to medical therapy
- granulation tissue on the floor of the auditory canal

### Complications
- cranial nerve palsy (most commonly CN VII>CN X>CN XI)
- systemic infection, death

### Management
- imaging: high resolution temporal bone CT scan, gadolinium-enhanced MRI, technetium scan
- requires hospital admission, debridement, IV antibiotics, hyperbaric $O_2$
- may require OR for debridement of necrotic tissue/bone

**Gallium and Technetium Scans**
Gallium scans are used to show sites of active infection. Gallium is taken up by polymorphonuclear leukocytes, and therefore only lights up when active infection is present. It will not show the extent of osteomyelitis. Technetium scans provide information about osteoblastic activity and, as a result, are used to demonstrate sites of osteomyelitis. Technetium scans help with diagnosis, whereas gallium scans are useful in follow-up

# Diseases of the Middle Ear

## Acute Otitis Media and Otitis Media with Effusion

- see *Pediatric Otolaryngology*, OT38

## Chronic Otitis Media

### Definition
- an ear with TM perforation in the setting of recurrent or chronic ear infections

### Benign
- dry TM perforation without active infection

### Chronic Serous Otitis Media
- continuous serous drainage (straw-coloured)

### Chronic Suppurative Otitis Media
- persistent purulent drainage through a perforated TM

## Cholesteatoma

### Definition
- a cyst composed of keratinized desquamated epithelial cells occurring in the middle ear, mastoid, and temporal bone
- two types: congenital and acquired

### Congenital
- presents as a "small white pearl" behind an intact TM (anterior and medial to the malleus) or as CHL
- believed to be due to aberrant migration of external canal ectoderm during development
- not associated with otitis media/Eustachian tube dysfunction

### Acquired (more common)
- primary cholesteatoma
  - frequently associated with retraction pockets in the pars flaccida (may lead to attic cholesteatomas, which are difficult to visualize)
  - often has crusting or desquamated debris on lateral surface
- secondary cholesteatoma
  - pearly mass evident behind TM, frequently associated with marginal perforation
  - may appear as skin that have replaced the mucosa of the middle ear
- the associated chronic inflammatory process causes progressive destruction of surrounding bony structures

**Mechanisms of Cholesteatoma Formation**
- Epithelial migration through TM perforation (2° acquired)
- Invagination of TM (1° acquired)
- Metaplasia of middle ear epithelium or basal cell hyperplasia (congenital)

### Clinical Features
- history of otitis media (especially if unilateral), ventilation tubes, ear surgery
- symptoms
  - progressive hearing loss (predominantly conductive, although may get SNHL in late stage)
  - otalgia, aural fullness, fever
- signs
  - retraction pocket in TM, may contain keratin debris
  - TM perforation
  - granulation tissue, polyp visible on otoscopy
  - malodourous, unilateral otorrhea

### Complications

**Table 8. Complications of Cholesteatoma**

| Local | Intracranial |
|---|---|
| Ossicular erosion: CHL | Meningitis |
| Inner ear erosion: SNHL, dizziness, and/or labyrinthitis | Sigmoid sinus thrombosis |
| Temporal bone infection: mastoiditis, petrositis | Intracranial abscess (subdural, epidural, cerebellar) |
| Facial paralysis | |

### Investigations
- audiogram and CT scan

### Treatment
- there is no conservative therapy for cholesteatoma
- surgical: mastoidectomy ± tympanoplasty ± ossicular reconstruction

## Mastoiditis

### Definition
- infection (usually subperiosteal) of mastoid air cells, most commonly seen approximately two wk after onset of untreated or inadequately treated AOM (suppurative)
- more common in children than adults

### Etiology
- acute mastoiditis is caused by the same organisms as AOM: *S. pneumoniae, H. influenzae, M. catarrhalis, S. pyogenes, S. aureus, P. aeruginosa,* etc.

### Clinical Features
- otorrhea
- tenderness to pressure over the mastoid
- retroauricular swelling with protruding ear
- fever, hearing loss, ± TM perforation (late)
- CT radiologic findings: opacification of mastoid air cells by fluid and interruption of normal trabeculations of cells (coalescence)

**Classic Triad**
- Otorrhea
- Tenderness to pressure over the mastoid
- Retroauricular swelling with protruding ear

### Treatment
- IV antibiotics with myringotomy and ventilation tubes – usually all that is required in acute cases
- cortical mastoidectomy
  - debridement of infected tissue allowing aeration and drainage
- indications for surgery
  - failure of medical treatment after 48 h
  - symptoms of intracranial complications
  - aural discharge persisting for 4 wk and resistant to antibiotics

Complications of AOM are rare due to rapid and effective treatment of AOM with antibiotics

## Otosclerosis

### Definition
- fusion of stapes footplate to oval window so that it cannot vibrate

### Etiology
- autosomal dominant, variable penetrance approximately 40%
- F>M, progresses during pregnancy (hormone responsive)

Otosclerosis is the 2nd most common cause of CHL in 15-50 yr old (after cerumen impaction)

### Clinical Features
- progressive CHL first noticed in teens and 20s (may progress to SNHL if cochlea involved)
- ± pulsatile tinnitus
- TM normal ± pink blush (Schwartz's sign) associated with the neovascularization of otosclerotic bone
- characteristic dip at 2000 Hz (Carhart's notch) on audiogram (see Figure 16C, OT10)

### Treatment
- monitor with serial audiograms if coping with loss
- hearing aid (air conduction, bone conduction, BAHA)
- AC and BC instead of air conduction, bone conduction
- stapedectomy or stapedotomy (with laser or drill) with prosthesis is definitive treatment

# Diseases of the Inner Ear

## Congenital Sensorineural Hearing Loss

### Hereditary Defects
- non-syndrome associated (70%)
  - often idiopathic, autosomal recessive
  - connexin 26 (GJB2) most common
- syndrome associated (30%)
  - Waardenburg: white forelock, heterochromia iridis (each eye different colour), wide nasal bridge, and increased distance between medial canthi
  - Pendred: deafness associated with thyroid gland disorders, SLC26A4 gene, enlarged vestibular aqueducts
  - Treacher-Collins: first and second branchial cleft anomalies
  - Alport: hereditary nephritis

### Prenatal Infections
- TORCH: toxoplasmosis, others (e.g. HIV, syphilis), rubella, CMV, HSV
- Zika

### Perinatal
- Rh incompatibility
- anoxia
- hyperbilirubinemia
- birth trauma (hemorrhage into inner ear)

### Postnatal
- meningitis, mumps, measles

### High Risk Factors (for hearing loss in newborns)
- low birth weight/prematurity
- perinatal anoxia (low APGARs)
- kernicterus: bilirubin >25 mg/dL
- craniofacial abnormality
- family history of deafness in childhood
- 1st trimester illness: TORCH infections
- neonatal sepsis
- ototoxic drugs
- perinatal infection, including post-natal meningitis
- consanguinity
- 50-75% of newborns with SNHL have at least one of the above risk factors and 90% of these have spent time in the NICU

### Treatment
- presence of any risk factor: ABR study performed before leaving NICU and at 3 mo adjusted age
- early rehabilitation improves speech and school performance

## Presbycusis

Presbycusis is the most common cause of SNHL

### Definition
- SNHL associated with aging (starting in 5th and 6th decades)

### Etiology
- hair cell degeneration
- age related degeneration of basilar membrane, possibly genetic etiology
- cochlear neuron damage
- ischemia of inner ear

### Clinical Features
- progressive, bilateral hearing loss initially at high frequencies, then middle frequencies
- loss of discrimination of speech, especially with background noise present – patients describe people as mumbling
- recruitment phenomenon: inability to tolerate loud sounds
- tinnitus

### Treatment
- hearing aid if patient has difficulty functioning, hearing loss >30-35 dB, and good speech discrimination
- ± lip reading, auditory training, auditory aids (doorbell and phone lights)

# Sudden Sensorineural Hearing Loss

### Clinical Features
- presents as a sudden onset of significant SNHL (usually unilateral) ± tinnitus, aural fullness
- usually idiopathic; rule out other causes
  - autoimmune causes (e.g. ESR, rheumatoid factor, ANA)
  - MRI to rule out tumour and/or CT to rule out ischemic/hemorrhagic stroke if associated with any other focal neurological signs (e.g. vertigo, ataxia, abnormality of CN V or VII, weakness)

### Treatment
- intratympanic or oral corticosteroids within 3 d of onset: prednisone 1 mg/kg/d for 10-14 d

### Prognosis
- depends on degree of hearing loss
- 70% resolve within 10-14 d
- 20% experience partial resolution
- 10% experience permanent hearing loss

Sudden SNHL may easily be confused with ischemic brain events. It is important to keep a high index of suspicion especially with elderly patients presenting with sudden SNHL as well as vertigo

**Steroids for Treatment of Sudden Sensorineural Hearing Loss: A Meta-Analysis of RCTs**
Laryngoscope 2015;125(1):209-17
**Summary**: A meta-analysis of randomized controlled trials does not support the use of steroids over placebo in this condition, a finding consistent with previous analyses.

# Autoimmune Inner Ear Disease

### Etiology
- idiopathic
- may be associated with systemic autoimmune diseases (e.g. rheumatoid arthritis, SLE), vasculitides (e.g. GPA, polyarteritis nodosa), and allergies

### Epidemiology
- most common between ages 20-50

### Clinical Features
- rapidly progressive or fluctuating bilateral SNHL
- ± tinnitus, aural fullness, vestibular symptoms (e.g. ataxia, disequilibrium, vertigo)

### Investigations
- autoimmune workup: CBC, ESR, ANA, rheumatoid factor

### Treatment
- high-dose corticosteroids: treat early for at least 30 d
- consider cytotoxic medication for steroid non-responders

# Drug Ototoxicity

### Aminoglycosides
- streptomycin and gentamicin (vestibulotoxic), kanamycin, and tobramycin (cochleotoxic)
- toxic to hair cells by any route: oral, IV, and topical (if the TM is perforated)
- destroys sensory hair cells: outer first, inner second (therefore, otoacoustic emissions are lost first)
- high frequency hearing loss develops earliest
- ototoxicity occurs d-wk post-treatment
- must monitor with peak and trough levels when prescribed, especially if patient has neutropenia and/or history of ear or renal problems
- q24h dosing recommended (with amount determined by creatinine clearance)
- aminoglycoside toxicity displays saturable kinetics, therefore, once daily dosing presents less risk than divided daily doses
- duration of treatment is the most important predictor of ototoxicity
  - treatment: immediately stop aminoglycosides

### Salicylates
- hearing loss with tinnitus, reversible if discontinued

### Antimalarials (Quinines)
- hearing loss with tinnitus
- reversible if discontinued, but can lead to permanent loss

### Others
- many antineoplastic agents are ototoxic (weigh risks vs. benefits)
- loop diuretics

# Noise-Induced Sensorineural Hearing Loss

## Pathogenesis
- 85-90 dB over months or years or single sound impulses >135 dB can cause cochlear damage
- bilateral SNHL initially and most prominently at 4000 Hz (resonant frequency of the temporal bone), known as "boilermaker's notch" on audiogram, extends to higher and lower frequencies with time (see Figure 16D, OT10)
- speech reception not altered until hearing loss >30 dB at speech frequency, therefore considerable damage may occur before patient complains of hearing loss
- difficulty with speech discrimination, especially in situations with competing noise

## Phases of Hearing Loss
- dependent on: intensity of sound and duration of exposure
  - temporary threshold shift
    - when exposed to loud sound, decreased sensitivity or increased threshold for sound
    - may have associated aural fullness and tinnitus
    - with removal of noise, hearing returns to normal
  - permanent threshold shift
- hearing does not return to previous state

## Treatment
- hearing aid
- prevention
  - ear protectors: muffs, plugs
  - limit exposure to noise with frequent rest periods
  - regular audiologic follow-up

# Temporal Bone Fractures

**Table 9. Features of Temporal Bone Fractures**

| | Transverse (1) | Longitudinal (2) |
|---|---|---|
| **Extension** | Into bony labyrinth and internal auditory meatus | Into middle ear |
| **Incidence** | 10-20% | 70-90% |
| **Etiology** | Frontal/occipital trauma | Lateral skull trauma |
| **CN Pathology** | CN VII palsy (50%) | CN VII palsy (10-20%) |
| **Hearing Loss** | SNHL due to direct cochlear injury | CHL 2° to ossicular injury |
| **Vestibular Symptoms** | Sudden onset vestibular symptoms due to direct semicircular canal injury (vertigo, spontaneous nystagmus) | Rare |
| **Other Features** | Intact external auditory meatus, TM ± hemotympanum<br>Spontaneous nystagmus<br>CSF leak in Eustachian tube to nasopharynx<br>± rhinorrhea (risk of meningitis) | Torn TM or hemotympanum<br>Bleeding from external auditory canal<br>Step formation in external auditory canal<br>CSF otorrhea<br>Battle's sign = mastoid ecchymoses<br>Raccoon eyes = periorbital ecchymoses |

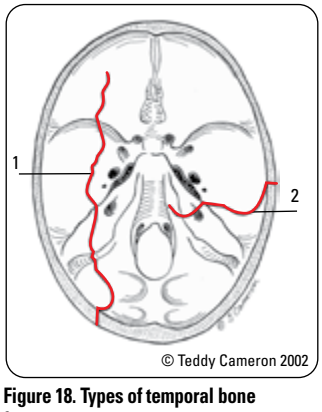

**Figure 18. Types of temporal bone fractures**

- characterized as longitudinal or transverse relative to the long axis of the petrous temporal bone
- temporal bone fractures are rarely purely transverse or longitudinal (often a mixed picture)

## Diagnosis
- otoscopy
- do not syringe or manipulate external auditory meatus due to risk of inducing meningitis via TM perforation
- CT head
- audiology, facial nerve tests (for transverse fractures), Schirmer's test (of lacrimation), stapedial reflexes if CN VII palsy
- if suspecting CSF leak: look for halo sign, send fluid for β-2 transferrin or β trace protein (prostaglandin D synthase)

## Treatment
- ABCs
- medical: expectant, prevent otogenic meningitis
- surgical: explore temporal bone; indications:
  - CN VII palsy (immediate and complete)
  - gunshot wound
  - depressed fracture of external auditory meatus
  - early meningitis (mastoidectomy)
  - bleeding intracranially from sinus
  - CSF otorrhea (may resolve spontaneously)

Hemotympanum can be indicative of temporal bone trauma

**Signs of Basilar Skull Fracture**
- Battle's Sign
- Racoon Eyes
- CSF Rhinorrhea/Otorrhea
- Cranial Nerve Involvement:
  facial palsy → CN VII,
  nystagmus → CN VI,
  facial numbness → CN V

### Complications
- AOM ± labyrinthitis ± mastoiditis
- meningitis/epidural abscess/brain abscess
- post-traumatic cholesteatoma

# Facial Nerve (CN VII) Paralysis

### Peripheral Facial Paralysis (PFP)
- mononeuropathy of the facial nerve where there is weakening in the facial muscles, which alters facial symmetry and functions
- can have a detectable cause (secondary facial nerve palsy) or may be idiopathic (primary)

### Etiology
- supranuclear and nuclear (MS, poliomyelitis, cerebral tumours)
- infranuclear

### Treatment
- treat according to etiology, plus provide corneal protection with artificial tears, nocturnal lid taping, tarsorrhaphy, gold weighting of upper lid
- facial paralysis that does not resolve with time or with medical treatment will often be referred for possible reanimation techniques to restore function
  - common reanimation techniques include:
    - direct facial nerve anastomosis
    - interpositional grafts
    - anastomosis to other motor nerves
    - muscle transpositions

**Table 10. Differential Diagnosis of Peripheral Facial Paralysis (PFP)**

| Etiology | Incidence | Findings | Investigations | Treatment, Follow-up, and Prognosis (Px) |
|---|---|---|---|---|
| **Bell's Palsy**<br>Idiopathic, (HSV) infection of the facial nerve<br>Diagnosis of exclusion | 80-90% of PFP<br>**Risk Factors:**<br>DM<br>Pregnancy<br>Viral prodrome (50%) | **Hx**<br>Acute onset<br>Numbness of ear<br>Schirmer's test<br>Recurrence (12%)<br>+ FHx (14%)<br>Hyperacusis (30%)<br>**P/E**<br>Paralysis or paresis of all muscle groups on one side of the face<br>Absence of signs of CNS disease<br>Absence of signs of ear or CPA diseases | Stapedial reflex absent<br>Audiology normal (or baseline)<br>EMG – best measure for prognosis<br>Topognostic testing<br>MRI with gadolinium – enhancement of CN VII and VIII<br>High resolution CT | **Rx**<br>Protect the eye to prevent exposure keratitis with patching or tarsorraphy<br>Systemic steroids may lessen degeneration and hasten recovery<br>Consider antiviral (acyclovir)<br>**F/U**<br>Spontaneous remission should begin within 3 wk of onset<br>Delayed (3-6 mo) recovery portends at least some functional loss<br>**Px**<br>electroneuronography (ENoG) testing between day 3-14 of onset:<br><90% degeneration = high likelihood of recovery<br>>90% + no voluntary EMG motor unit potentials = surgical decompression<br>Poorer if hyperacusis, >60 yr, DM, HTN, severe pain |
| **Ramsay Hunt Syndrome** (Herpes Zoster Oticus)<br>Varicella zoster infection of CN VII/VIII | 4.5-9% of PFP<br>**Risk Factors:**<br>>60 yr<br>Impaired immunity<br>Cancer<br>Radiotherapy<br>Chemotherapy | **Hx**<br>Hyperacusis<br>SNHL<br>Severe pain of pinna, mouth, or face<br>**P/E**<br>Vesicles on pinna, external canal (errupt 3-7 d after onset of pain)<br>Associated herpes zoster ophthalmicus (uveitis, keratoconjunctivitis, optic neuritis, or glaucoma) | Stapedial reflex absent<br>Audiology – SNHL<br>Viral ELISA studies to confirm<br>MRI with gadolinium (86% of facial nerves enhance) | **Rx**<br>Avoid touching lesions to prevent spread of infection<br>Systemic steroids can relieve pain, vertigo, avoid postherpetic neuralgia<br>Acyclovir may lessen pain, aid healing of vesicles<br>**F/U:** 2-4 wk<br>**Px**<br>Poorer prognosis than Bell's palsy; 22% recover completely, 66% incomplete paralysis, 10% complete paralysis |
| **TEMPORAL BONE FRACTURE** *rarely a patient has a single type of fracture | | | | |
| **Longitudinal** (90%) | 20% have PFP | **Hx**<br>Blow to side of head<br>**P/E**<br>Trauma to side of head<br>Neuro findings consistent with epidural/subdural bleed | Skull X-rays<br>CT head | **Px**<br>Injury usually due to stretch or impingement; may recover with time |
| **Transverse** (10%) | 40% have PFP | **Hx**<br>Blow to frontal or occipital area<br>**P/E**<br>Trauma to front or back of head | Skull X-rays<br>CT head | **Px**<br>Nerve transection more likely |
| **Iatrogenic** | | Variable (depending on level of injury) | Wait for lidocaine to wear off<br>EMG | **Rx**<br>Exploration if complete nerve paralysis<br>No exploration if any movement present |

Source: Paul Warrick, MD

# Rhinitis

## Definition
- inflammation of the lining (mucosa) of the nasal cavity

**Table 11. Classification of Rhinitis**

| Inflammatory | Non-Inflammatory |
|---|---|
| Perennial non-allergic<br>Asthma, ASA sensitivity<br>Allergic<br>Seasonal<br>Perennial<br>Atrophic<br>Primary: *Klebsiella ozena* (especially in elderly)<br>Acquired: post-surgery if too much mucosa or turbinate has been resected<br>Infectious<br>Viral: e.g. rhinovirus, influenza, parainfluenza, etc.<br>Bacterial: e.g. *S. aureus*<br>Fungal<br>Granulomatous: TB, syphilis, leprosy<br>Non-infectious<br>Sarcoidosis<br>GPA<br>Irritant<br>Dust<br>Chemicals<br>Pollution | Rhinitis medicamentosa<br>Topical decongestants<br>Hormonal<br>Pregnancy<br>Estrogens<br>Thyroid<br>Idiopathic vasomotor |

**Rhinitis medicamentosa:** rebound congestion due to the overuse of intranasal vasoconstrictors; for prevention, use of these medications for only 5-7 d is recommended

**Table 12. Nasal Discharge: Character and Associated Conditions**

| Character | Associated Conditions |
|---|---|
| **Watery/Mucoid** | Allergic, viral, vasomotor, CSF leak (halo sign) |
| **Mucopurulent** | Bacterial, foreign body |
| **Serosanguinous** | Neoplasia |
| **Bloody** | Trauma, neoplasia, bleeding disorder, HTN/vascular disease |

# Allergic Rhinitis (i.e. Hay Fever)

## Definition
- rhinitis characterized by an IgE-mediated hypersensitivity to foreign allergens
- acute-and-seasonal or chronic-and-perennial
- perennial allergic rhinitis often confused with recurrent colds

Congestion reduces nasal airflow and allows the nose to repair itself (i.e. washes away the irritants). Treatment should focus on the initial insult rather than target this defense mechanism

## Etiology
- when allergens contact the respiratory mucosa, specific IgE antibody is produced in susceptible hosts
- concentration of allergen in the ambient air correlates directly with the rhinitis symptoms

## Epidemiology
- age at onset usually <20 yr
- more common in those with a personal or family history of allergies/atopy

## Clinical Features
- nasal: obstruction with pruritus, sneezing
- clear rhinorrhea (containing increased eosinophils)
- itching of eyes with tearing
- frontal headache and pressure
- mucosa: swollen, pale, "boggy"
- seasonal (summer, spring, early autumn)
  - pollens from trees
  - lasts several wk, disappears, and recurs the following year at same time
- perennial
  - inhaled: house dust, wool, feathers, foods, tobacco, hair, mould
  - ingested: wheat, eggs, milk, nuts
  - occurs intermittently for years with no pattern or may be constantly present

### Complications
- chronic sinusitis/polyps
- serous otitis media

### Diagnosis
- history
- direct exam
- allergy testing

### Treatment
- education: identification and avoidance of allergen
- nasal irrigation with saline
- antihistamines (e.g. diphenhydramine, fexofenadine)
- oral decongestants (e.g. pseudoephedrine, phenylpropanolamine)
- topical decongestant (may lead to rhinitis medicamentosa)
- other topicals: steroids (fluticasone), disodium cromoglycate, antihistamines, ipratropium bromide
- oral steroids if severe
- desensitization by allergen immunotherapy

## Vasomotor Rhinitis

### Definition
- neurovascular disorder of nasal parasympathetic system (vidian nerve) affecting mucosal blood vessels
- nonspecific reflex hypersensitivity of nasal mucosa

### Etiology
- temperature change
- alcohol, dust, smoke
- stress, anxiety, neurosis
- endocrine: hypothyroidism, pregnancy, menopause
- parasympathomimetic drugs
- beware of rhinitis medicamentosa: reactive vasodilation due to prolonged use (>5 d) of nasal drops and sprays (Dristan®, Otrivin®)

### Clinical Features
- chronic intermittent nasal obstruction, varies from side to side
- rhinorrhea: thin, watery
- mucosa and turbinates: swollen
- nasal allergy must be ruled out

### Treatment
- elimination of irritant factors
- parasympathetic blocker (Atrovent® nasal spray)
- steroids (e.g. beclomethasone, fluticasone)
- surgery (often of limited lasting benefit): electrocautery, cryosurgery, laser treatment, or removal of inferior or middle turbinates
- vidian neurectomy (rarely done)
- symptomatic relief with exercise (increased sympathetic tone)

## Rhinosinusitis

### Definition
- inflammation of the mucosal lining of the sinuses and nasal passages

### Pathogenesis of Rhinosinusitis
- ostial obstruction or dysfunctional cilia permit stagnant mucous and, consequently, infection
- all sinuses drain to a common prechamber under the middle meatus called the osteomeatal complex

### Classification
- acute: <4 wk
- subacute: 4-8 wk
- chronic: >8-12 wk

**Table 13. Etiologies of Rhinosinusitis**

| | | |
|---|---|---|
| **Ostial Obstruction** | Inflammation | URTI<br>Allergy |
| | Mechanical | Septal deviation<br>Turbinate hypertrophy<br>Polyps<br>Tumours<br>Adenoid hypertrophy<br>Foreign body<br>Congenital abnormalities (e.g. cleft palate) |
| | Immune | PA<br>Lymphoma, leukemia<br>Immunosuppressed patients (e.g. neutropenics, diabetics, HIV) |
| **Systemic** | | Cystic fibrosis<br>Immotile cilia (e.g. Kartagener's syndrome) |
| **Direct Extension** | Dental | Infection |
| | Trauma | Facial fractures |

# Acute Bacterial Rhinosinusitis

## Definition

- bacterial infection of the paranasal sinuses and nasal passages lasting >7 d
- clinical diagnosis requiring ≥2 major symptoms, and at least one of the symptoms is either nasal obstruction or purulent/discoloured nasal discharge

| | **Major Symptoms (at least 2 of PODS, 1 must be O or D)** | **Minor Symptoms** |
|---|---|---|
| **P** | Facial **P**ain/**P**ressure/fullness | Headache |
| **O** | Nasal **O**bstruction | Halitosis |
| **D** | Purulent/discoloured nasal **D**ischarge | Fatigue |
| **S** | Hyposmia/anosmia (**S**mell) | Dental pain |
| | | Cough |
| | | Ear pain/fullness |

## Etiology

- bacteria: *S. pneumoniae* (35%), *H. influenzae* (35%), *M. catarrhalis, S. aureus*, anaerobes (dental)
- children are more prone to a bacterial etiology, but viral is still more common
- maxillary sinus most commonly affected
- must rule out fungal causes (mucormycosis) in immunocompromised hosts (especially if painless black or pale mucosa on examination)

## Clinical Features

- sudden onset of:
  - nasal blockage/congestion and/or purulent nasal discharge/posterior nasal drip
  - ± facial pain or pressure, hyposmia, sore throat
- persistent/worsening symptoms >5-7 d or presence of purulence for 3-4 d with high fever
- speculum exam: erythematous mucosa, mucopurulent discharge, pus originating from the middle meatus
- predisposing factors: viral URTI, allergy, dental disease, anatomical defects
- differentiate from acute viral rhinosinusitis (course: <10 d, peaks by day 3)

## Diagnosis

- along with clinical criteria, can confirm radiographically and/or endoscopically using antral puncture for bacterial cultures

## Management

- depends on symptom severity (i.e. intensity/duration of symptoms, impact on quality of life)
- mild-moderate: INCS
  - if no response within 72 h, add antibiotics
- severe: INCS + antibiotics
- antibiotics
  - 1st line: amoxicillin x 10 d (TMP-SMX or macrolide if penicillin allergy)
- if no response to 1st line antibiotics within 72 h, switch to 2nd line
  - 2nd line: fluoroquinolones or amoxicillin-clavulanic acid
- adjuvant therapy (saline or hypochlorous acid (pediatric sinusitis) irrigation, analgesics, oral/topical decongestant) may provide symptomatic relief
- CT indicated only if complications are suspected

**Acute Rhinosinusitis Complications**
Consider hospitalization if any of the following are suspected
**Orbital (Chandler's classification)**
- Preseptal cellulitis
- Postseptal cellulitis
- Subperiosteal abscess
- Orbital abscess
- Cavernous sinus thrombosis

**Intracranial**
- Meningitis
- Abscess

**Bony**
- Subperiosteal frontal bone abscess ("Pott's Puffy tumour")
- Osteomyelitis

**Neurologic**
- Superior orbital fissure syndrome (CN III/IV/VI palsy, immobile globe, dilated pupils, ptosis, V1 hypoesthesia)
- Orbital apex syndrome (as above, plus neuritis, papilledema, decreased visual acuity)

**Systemic Corticosteroid Therapy for Acute Sinusitis**
JAMA 2015 Mar;313(12):1258-9
**Clinical Question**: Are oral or parenteral corticosteroids associated with improved clinical outcomes in patients with acute sinusitis compared with placebo or NSAIDs?
**Conclusion**: Oral corticosteroids combined with antibiotics may be associated with modest benefit for short-term relief of symptoms in adults with severe symptoms of acute sinusitis compared with antibiotics alone. Oral corticosteroids as monotherapy are not associated with improved clinical outcomes in adults with clinically diagnosed acute sinusitis.

# Chronic Rhinosinusitis

### Definition
- inflammation of the mucosa of paranasal sinuses and nasal passages >8-12 wk
- diagnosis requires ≥2 major symptoms for >8-12 wk and ≥1 objective finding of inflammation of the paranasal sinuses (CT/endoscopy)

### Etiology
- unclear etiology but the following may contribute or predispose
  - inadequate treatment of acute rhinosinusitis
  - bacterial colonization/biofilms
- *S. aureus, Enterobacteriaceae, Pseudomonas, S. pneumoniae, H. influenzae*, group A β-hemolytic *Streptococcus*
  - fungal infection (e.g. *Aspergillus, Zygomycetes, Candida*)
  - anatomic abnormality (e.g. lost ostia patency, deviated septum – predisposing factors)
  - allergy/allergic rhinitis
  - ciliary disorder (e.g. cystic fibrosis, Kartagener syndrome)
  - chronic inflammatory disorder (e.g. GPA)
  - untreated dental disease

**Allergic Fungal Rhinosinusitis**
- A chronic sinusitis affecting mostly young, immunocompetent, atopic individuals
- Treatment options include FESS ± intranasal topical steroids, antifungals, and immunotherapy

### Clinical Features (similar to acute, but less severe) - at least 2 of CPODS for >8-12 wk
- facial **C**ongestion/fullness
- facial **P**ain/**P**ressure
- chronic nasal **O**bstruction
- purulent anterior/posterior nasal **D**ischarge
- hyposmia/anosmia (**S**mell)
- others: halitosis, chronic cough, maxillary dental pain

### Management
- identify and address contributing or predisposing factors
- obtain CT or perform endoscopy
- if polyps present: INCS, oral steroids ± antibiotics (if signs of infection), refer to otolaryngologist/H&N surgeon
- if polyps absent: INCS, antibiotics, saline irrigation, oral steroids (severe cases)
- antibiotics for 3-6 wk
  - amoxillin-clavulanic acid, fluoroquinolone (moxifloxacin), macrolide (clarithromycin), clindamycin (metronidazole)
- surgery if medical therapy fails or fungal sinusitis: FESS, balloon sinoplasty

**FESS = Functional Endoscopic Sinus Surgery**
Opening of the entire osteomeatal complex in order to facilitate drainage while sparing the sinus mucosa

### Complications
- same as acute sinusitis, mucocele

# Epistaxis

### Blood Supply to the Nasal Septum (see Figure 4, OT3)
1. Superior posterior septum
   - internal carotid → ophthalmic → anterior/posterior ethmoidal
2. Posterior septum
   - external carotid → internal maxillary → sphenopalatine → nasopalatine
3. Lower anterior septum
   - external carotid → facial artery → superior labial artery → nasal branch
   - external carotid → internal maxillary → descending palatine → greater palatine
- these arteries all anastomose to form Kiesselbach's plexus, located at Little's area (anterior-inferior portion of the cartilaginous septum)
- bleeding from above middle turbinate is internal carotid, from below is external carotid

90% of nose bleeds occur in Little's area

**Table 14. Etiology of Epistaxis**

| Type | Causes | |
|---|---|---|
| **Local** | Trauma (most common)<br>Fractures: facial, nasal<br>Self-induced: digital, foreign body | Tumours<br>Benign: polyps, inverting papilloma, angiofibroma<br>Malignant: SCC, esthesioneuroblastoma (olfactory neuroblastoma) |
| | Iatrogenic: nasal, sinus, orbit surgery | Inflammation<br>Rhinitis: allergic, non-allergic |
| | Barometric changes | Infections: bacterial, viral, fungal |
| | Nasal dryness: dry air ± septal deformities | Idiopathic |
| | Structural abnormalities:<br>septal deviation, chronic septal perforation | |
| | Chemical: cocaine, nasal sprays, ammonia, etc. | |
| **Systemic** | Coagulopathies<br>Meds: anticoagulants, NSAIDs<br>Hemophilias, von Willebrand disease<br>Hematological malignancies<br>Liver failure, uremia | |
| | Vascular: HTN, atherosclerosis, Osler-Weber-Rendu disease (hereditary hemorrhagic telangectasia) | |
| | Others: GPA, SLE | |

**Special Cases**
- Adolescent male with unilateral recurrent epistaxis: consider juvenile nasopharyngeal angiofibroma (JNA); this is the most common benign tumour of the nasopharynx
- Thrombocytopenic patients: use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack

## Investigations
- CBC, PT/PTT (if indicated)
- X-ray, CT as needed

## Treatment
- locate bleeding and achieve hemostasis

## 1. ABCs
- lean patient forward to minimize swallowing blood and avoid airway obstruction
- apply constant firm pressure for 20 min on cartilaginous part of nose (not bony pyramid)
- if significant bleeding, assess vitals for signs of hemorrhagic shock ± IV NS, cross-match blood

## 2. Determine Site of Bleeding
- anterior/posterior hemorrhage defined by location in relationship to bony septum
- visualize nasal cavity with speculum
- use cotton pledget with topical lidocaine ± topical decongestant (i.e. Otrivin®) to help identify area of bleeding (often anterior septum)
- if suspicious of bleeding disorder: coagulation workup (i.e. platelet number and platelet function assay)

## 3. Control the Bleeding
- first-line: topical vasoconstrictors (Otrivin®)
- if first-line fails and bleeding adequately visualized, cauterize with silver nitrate
- **do not cauterize both sides of the septum** at one time due to risk of septal perforation from loss of septal blood supply

**A. Anterior hemorrhage treatment**
- if failure to achieve hemostasis with cauterization
  - place anterior pack* with half inch Vaseline®-soaked ribbon gauze strips layered from nasal floor toward nasal roof and extending to posterior choanae, or lubricated absorbable packing (i.e. Gelfoam wrapped in Surgicel®) for 2-3 d
  - can also attempt packing with Merocel® or nasal tampons of different shapes
  - can also apply Floseal® (hemostatic matrix consisting of topical human thrombin and cross-linked gelatin) if other methods fail

**B. Posterior hemorrhage treatment**
- if unable to visualize bleeding source, then usually posterior source
  - place posterior pack* using a Foley catheter, gauze pack, or Epistat® balloon
  - subsequently, layer anterior packing bilaterally
  - admit to hospital with packs in for 3-5 d
  - watch for complications: hypoxemia (naso-pulmonic reflex), toxic shock syndrome (Rx: remove packs immediately), pharyngeal fibrosis/stenosis, alar/septal necrosis, aspiration

**C. If anterior/posterior packs fail to control epistaxis**
- ligation or embolization of culprit arterial supply by interventional radiology
- ± septoplasty

*antibiotics for any posterior pack or any pack left for >48 h due to risk of toxic shock syndrome

## 4. Prevention
- prevent drying of nasal mucosa with humidifiers, saline spray, or topical ointments
- avoidance of irritants
- medical management of HTN and coagulopathies

# Hoarseness

### Definitions
- hoarseness: change in voice quality, ranging from voice harshness to voice weakness; reflects abnormalities anywhere along the vocal tract from oral cavity to lungs
- dysphonia: a general alteration in voice quality
- aphonia: no sound emanates from vocal folds

If hoarseness present for >2 wk in a smoker, laryngoscopy must be done to rule out malignancy

## Acute Laryngitis

### Definition
- <2 wk inflammatory changes in laryngeal mucosa

### Etiology
- viral: influenza, adenovirus, HSV
- bacterial: Group A *Streptococcus*
- mechanical: acute voice strain → submucosal hemorrhage → vocal cord edema → hoarseness
- environmental: toxic fume inhalation

### Clinical Features
- URTI symptoms, hoarseness, aphonia, cough attacks, ± dyspnea
- true vocal cords erythematous/edematous with vascular injection and normal mobility

### Treatment
- usually self-limited, resolves within ~1 wk
- voice rest
- humidification
- hydration
- avoid irritants (e.g. smoking)
- treat with antibiotics if there is evidence of coexistent bacterial pharyngitis

**Vocal Cord Paralysis**
**Unilateral**: Affected cord lies in the paramedian position, inadequate glottic closure during phonation → weak, breathy voice. Usually medializes with time, whereby phonation and aspiration improve. Treatment options include voice therapy, injection laryngoplasty (Radiesse), medialization using silastic block

**Bilateral**: Cords rest in midline, therefore voice remains good but respiratory function is compromised and may present as stridor. If no respiratory issues, may monitor closely and wait for improvement. If respiratory issues, intubate and will likely require vocal cord lateralization, arytenoidectomy, posterior costal cartilage graft, or tracheotomy

## Chronic Laryngitis

### Definition
- >2 wk inflammatory changes in laryngeal mucosa

### Etiology
- repeated attacks of acute laryngitis
- chronic irritants (dust, smoke, chemical fumes)
- chronic voice strain
- chronic rhinosinusitis with postnasal drip
- chronic EtOH use
- esophageal disorders: GERD, Zenker's diverticulum, hiatus hernia
- systemic: allergy, hypothyroidism, Addison's disease

### Clinical Features
- chronic dysphonia: rule out malignancy
- cough, globus sensation, frequent throat clearing 2° to GERD
- laryngoscopy: erythematous and thickened cords with ulceration/granuloma formation and normal mobility

### Treatment
- remove offending irritants
- treat related disorders (e.g. antisecretory therapy for GERD)
- speech therapy with voice rest
- ± antibiotics ± steroids to decrease inflammation
- laryngoscopy to rule out malignancy

## Vocal Cord Polyps

### Definition
- structural manifestation of vocal cord irritation
- acutely, polyp forms 2° to capillary damage in the subepithelial space during extreme voice exertion

### Etiology
- most common benign tumour of vocal cords
- voice strain (i.e. muscle tension dysphonia)
- laryngeal irritants (i.e. GERD, allergies, tobacco)

### Epidemiology
- 30-50 yr of age
- M>F

### Clinical Features
- hoarseness, aphonia, cough attacks ± dyspnea
- pedicled or sessile polyp on free edge of vocal cord
- typically, polyp is asymmetrical, soft, and smooth
- more common on the anterior 1/3 of the vocal cord
- intermittent respiratory distress with large polyps

### Treatment
- avoid irritants
- endoscopic laryngeal microsurgical removal if persistent or if high risk of malignancy

## Vocal Cord Nodules

### Definition
- vocal cord callus
- i.e. "screamer's" or "singer's" nodules

### Etiology
- early nodules occur 2° to submucosal hemorrhage
- mature nodules result from hyalinization, which occurs with long-term voice abuse
- chronic voice strain
- frequent URTI, smoking, EtOH consumption

### Epidemiology
- frequently in singers, children, bartenders, and school teachers
- F>M

### Clinical Features
- hoarseness worst at end of day
- on laryngoscopy
  - often bilateral
  - at the junction of the anterior 1/3 and posterior 2/3 of the vocal cords – point of maximal cord vibration
- chronic nodules may become fibrotic, hard, and white

### Treatment
- voice rest
- hydration
- speech therapy
- avoid irritants
- surgery rarely indicated for refractory nodules

**Vocal Cords: Polyps vs. Nodules**

| Polyps | Nodule |
|---|---|
| Unilateral, asymmetric | Bilateral |
| Acute onset | Gradual onset |
| May resolve spontaneously | Often follow a chronic course |
| Subepithelial capillary breakage | Acute: submucosal hemorrhage or edema<br>Chronic: hyalinization within submucosal lesion |
| Soft, smooth, fusiform, pedunculated mass | Acute: small, discrete nodules<br>Chronic: hard, white, thickened fibrosed nodules |
| Proton pump inhibitor | Voice rest but no whispering, hydration, speech therapy if refractory to therapy |
| Surgical excision if persistent or in the presence of risk factors for laryngeal cancer | Surgical excision as last resort |

## Benign Laryngeal Papillomas

### Etiology
- HPV types 6, 11
- possible hormonal influence, possibly acquired during delivery

### Epidemiology
- biphasic distribution: 1) birth to puberty (most common laryngeal tumour) and 2) adulthood

### Clinical Features
- hoarseness and airway obstruction
- can seed into tracheobronchial tree
- highly resistant to complete removal
- some juvenile papillomas resolve spontaneously at puberty
- may undergo malignant transformation
- laryngoscopy shows wart-like lesions in supraglottic larynx and trachea

### Treatment
- microdebridement or $CO_2$ laser
- adjuvants under investigation: interferon, cidofovir, acyclovir
- HPV vaccine may prevent/decrease the incidence, but more research is needed

## Laryngeal Carcinoma

- see *Neoplasms of the Head and Neck*, OT34

# Salivary Glands

## Sialadenitis

### Definition
- inflammation of salivary glands

### Etiology
- viral most common (mumps)
- bacterial causes: *S. aureus, S. pneumoniae, H. influenzae*
- obstructive vs. non-obstructive
  - obstructive infection involves salivary stasis and bacterial retrograde flow

### Predisposing Factors
- HIV
- anorexia/bulimia
- Sjögren's syndrome
- Cushing's syndrome, hypothyroidism, DM
- hepatic/renal failure
- meds that increase stasis: diuretics, tricyclic antidepressants, β-blockers, anticholinergics, antibiotics
- sialolithiasis (can cause chronic sialadenitis)

Bilateral enlargement of the parotid glands may be a manifestation of a systemic disease, such as mumps, HIV, Sjögren's, or an eating disorder (i.e. anorexia, bulimia)

### Clinical Features
- acute onset of pain and edema of parotid or submandibular gland that may lead to marked swelling
- ± fever
- ± leukocytosis
- ± suppurative drainage from punctum of the gland

Mumps usually presents with bilateral parotid enlargement ± SNHL ± orchitis

### Investigations
- U/S imaging to differentiate obstructive vs. non-obstructive sialadenitis

### Treatment
- bacterial: treat with cloxacillin ± abscess drainage, sialogogues
- viral: no treatment

## Sialolithiasis

### Definition
- ductal stone (mainly hydroxyapatite in adults, sand/sludge in children), leading to chronic sialadenitis
- 80% in submandibular gland, <20% in parotid gland, ~1% in sublingual gland

### Risk Factors
- any condition causing duct stenosis or a change in salivary secretions (e.g. dehydration, diabetes, EtOH, hypercalcemia, psychiatric medications)

### Clinical Features
- pain and tenderness over involved gland
- intermittent swelling related to meals
- digital palpation reveals presence of calculus

### Investigations
- U/S ± sialogram

### Treatment
- may resolve spontaneously
- encourage salivation to clear calculus
- massage, analgesia, antibiotics, sialogogues (e.g. lemon wedges, sour lemon candies), warm compresses
- remove calculi endoscopically, by dilating duct or orifice, or by excision through floor of the mouth
- gland-preserving surgery has long-term symptom improvement and favourable gland retention rates

## Salivary Gland Neoplasms

### Etiology
- anatomic distribution
  - parotid gland: 70-85%
  - submandibular gland: 8-15%
  - sublingual gland: 1%
  - minor salivary glands, most concentrated in hard palate: 5-8%

- malignant (see Table 15 and Table 16, OT35)
- benign
  - benign mixed (pleomorphic adenoma): 80%
  - Warthin's tumour (5-10% bilateral, M>F): 10%
  - cysts, lymph nodes, and adenomas: 10%
  - oncocytoma: <1%

### Epidemiology
- 3-6% of all head and neck neoplasms in adults
- mean age at presentation: 55-65
- M=F

A mass sitting above an imaginary line drawn between the mastoid process and angle of the mandible is a parotid neoplasm until proven otherwise

## Parotid Gland Neoplasms

### Clinical Features
- 80% benign (most common: pleomorphic adenoma), 20% malignant (most common: mucoepidermoid)
- if bilateral, suggests benign process (e.g. Warthin's tumour, Sjögren's, bulimia, mumps) or possible lymphoma
- facial nerve involvement (e.g. facial paralysis) increases risk of malignancy

**DDx Parotid Tumour**

**Benign**
- Pleomorphic adenoma
- Warthin's tumour (more common in men)
- Benign lymphoepithelial cysts (viral eitiology e.g. HIV)
- Oncocytoma

**Malignant**
- Mucoepidermoid carcinoma
- Adenoid cystic carcinoma
- Acinic cell carcinoma

### Investigations
- FNA biopsy
- CT, U/S, or MRI to determine extent of tumour

### Treatment
- treatment of choice is surgery for all salivary gland neoplasms – benign and malignant
- pleomorphic adenomas are excised due to risk of malignant transformation (5% risk over prolonged period of time)
- superficial tumour
  - superficial parotidectomy above plane of CN VII ± radiation
  - incisional biopsy contraindicated
- deep lesion
  - near-total parotidectomy sparing as much of CN VII as possible
  - if CN VII involved, then it is removed and cable grafted
- complications of parotid surgery
  - hematoma, infection, salivary fistula, temporary facial paresis, Frey's syndrome (gustatory sweating)

Frey's syndrome is a post-operative complication characterized by gustatory sweating. It is due to aberrant innervation of cutaneous sweat glands by parasympathetic nerve fibres that are divided during surgery

### Prognosis
- benign: excellent, <5% of pleomorphic adenomas recur
- malignant: dependent on stage and type of malignancy (see Table 16, OT35)

# Neck Masses

## Approach to a Neck Mass

- ensure that the neck mass is not a normal neck structure (e.g. hyoid, transverse process of C1 vertebra, prominent carotid bulb)
- any neck mass persisting for >2 wk should be investigated for possible neoplastic causes

**Table 15. Prevalence of Acquired Causes of Neck Lumps According to Age**

| Age (yr) | Possible Causes of Neck Lump | | |
|---|---|---|---|
| <40 | 1. Inflammatory | 2. Congenital/Developmental | 3. Neoplastic |
| >40 | 1. Neoplastic | 2. Inflammatory | 3. Congenital |

### Differential Diagnosis
- congenital
  - lateral (branchial cleft cyst, laryngocele, plunging ranula, lymphatic/venous/venolymphatic malformation)
  - midline (thyroglossal duct cyst, dermoid cyst, teratoma, thyroid/thymus anomaly, vascular malformation)
- infectious/inflammatory
  - reactive lymphadenopathy (2° to tonsillitis, pharyngitis)
  - infectious mononucleosis
  - Kawasaki, Kikuchi-Fujimoto, Kimura, Cat-scratch, Castleman, Rosai-Dorfman disease
  - HIV
  - sialolithiasis, sialadenitis
  - thyroiditis

- granulomatous disease
  - mycobacterial infections
  - sarcoidosis
- neoplastic
  - lymphoma
  - salivary gland tumours
  - thyroid tumours
  - metastatic malignancy ("unknown primary")
  - lipoma, fibroma, hemangioma, nerve or nerve sheath tumour

## Evaluation

### Investigations

- history and physical (including nasopharynx and larynx)
- all other investigations and imaging are dependent upon clinical suspicion following history and physical
- laboratory investigations
  - WBC: infection vs. lymphoma
  - Mantoux TB test
  - thyroid function tests and scan
- imaging
  - neck U/S
  - CT scan
  - angiography: vascularity and blood supply to mass
- biopsy for histologic examination
  - FNA: least invasive
  - needle biopsy
  - open biopsy for lymphoma
- identification of possible primary tumour (rule out a metastatic lymph node from an unknown primary)
  - panendoscopy: nasopharyngoscopy, laryngoscopy, esophagoscopy, bronchoscopy with washings, and biopsy of suspicious lesions
  - biopsy of normal tissue of nasopharynx, tonsils, base of tongue, and hypopharynx
  - primary identified 95% of time → stage and treat
  - primary occult identified 5% of time: excisional biopsy of node for histologic diagnosis → manage with radiotherapy and/or neck dissection (squamous cell carcinoma)

**Inflammatory vs. Malignant Neck Masses**

| | Inflammatory | Neoplastic |
|---|---|---|
| **History** | | |
| Painful | Y | N |
| H&N infection | Y | N |
| Fever | Y | N |
| Weight loss | N | Y |
| CA risk factors | N | Y |
| Age | Younger | Older |
| **Physical** | | |
| Tender | Y | N |
| Rubbery | Y | Occipital |
| Rock hard | N | Y |
| Mobile | Y | ± fixed |

# Congenital Neck Masses

## Brachial Cleft Cysts/Sinuses/Fistulae

### Embryology

- at the 6th wk of development, the 2nd branchial arch grows over the 3rd and 4th arches and fuses with the neighbouring caudal pre-cardial swelling, forming the cervical sinus
- 3 types of malformations
  1. branchial fistula: persistent communication between skin and GI tract
  2. branchial sinus: blind-ended tract opening to skin
  3. branchial cyst: persistent cervical sinus with no external opening

### Clinical Features

- 2nd branchial cleft malformations most common
  - sinuses and fistulae present in infancy as a small opening anterior to the sternocleidomastoid muscle
  - cysts present as a smooth, painless, slowly enlarging lateral neck mass, often following a URTI
- 1st branchial cleft malformations present as sinus/fistula or cyst in preauricular area or on face over angle of mandible
- 3rd branchial cleft malformations present as recurrent thyroiditis or thyroid abscess and have a tract which usually leads to the left pyriform sinus. Air on CT scan in or near the thyroid gland is pathognomonic for this anomaly
- there is controversy whether 4th branchial cleft anomalies exist, as they may be remnants of the thyrothymic axis

### Treatment

- surgical removal of cyst or fistula tract
- if infected: allow infection to settle before removal (antibiotics may be required)

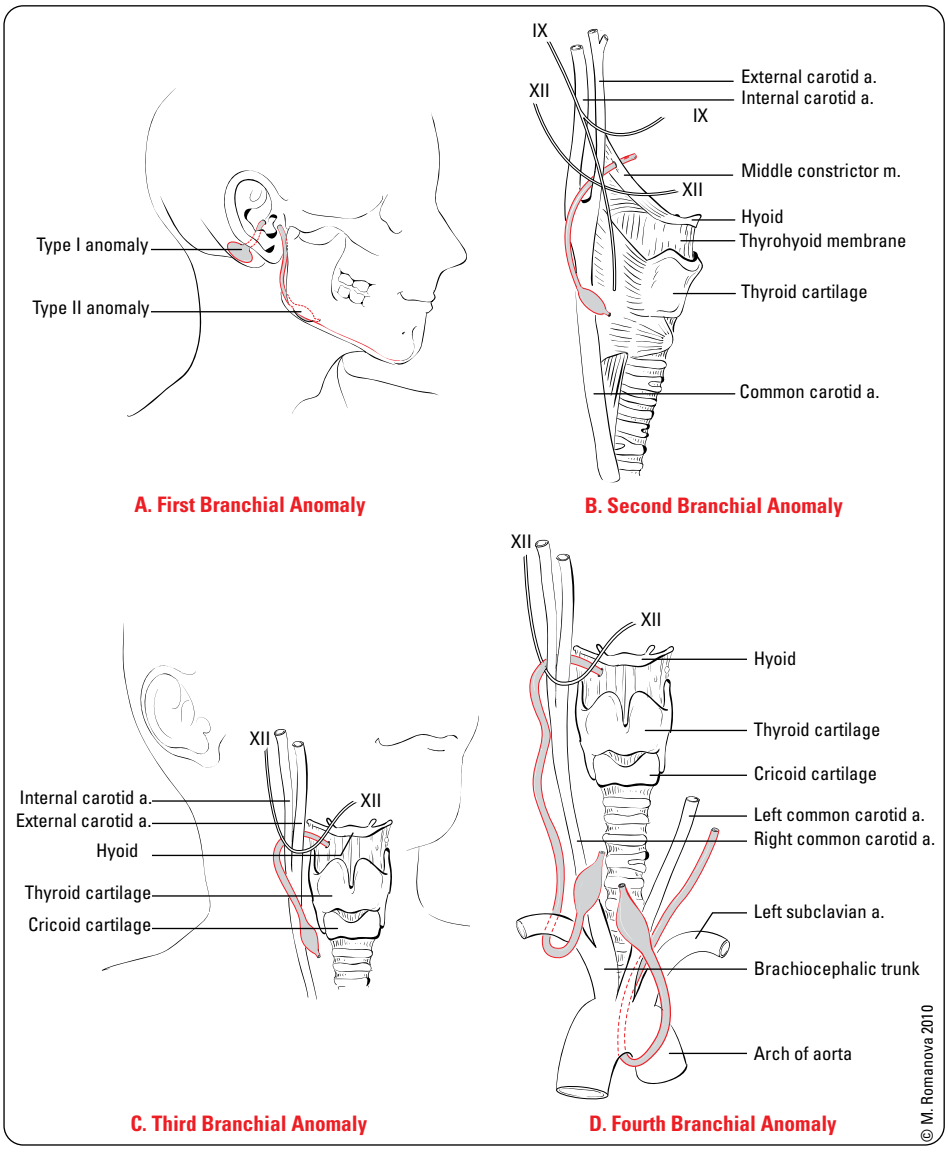

**Figure 19. Branchial cleft anomalies**

# Thyroglossal Duct Cysts

## Embryology

- thyroid originates as ventral midline diverticulum at base of tongue, caudal to junction of 3rd and 4th branchial arches (foramen cecum), and migrates down to inferior aspect of neck
- thyroglossal duct cysts are vestigial remnants of this tract

## Clinical Features

- usually presents in childhood or during 20-40 s as a midline cyst that enlarges with URTI and elevates with swallowing and tongue protrusion

## Treatment

- pre-operative antibiotics to reduce inflammation (infection before surgery is a well-described cause of recurrence)
- small potential for neoplastic transformation, so complete excision of cyst and tissue around tract up to foramen cecum at base of tongue, with removal of central portion of hyoid bone (Sistrunk procedure) recommended

# Lymphatic, Venous, or Mixed Venolymphatic Malformations

### Definition
- lymphatic malformation arising from vestigial lymph channels of neck

### Clinical Features
- commonly identified in many fetuses, but regress before birth and never cause a clinical problem
- usually present by age 2
- can be macrocystic (composed of large, thin-walled cysts, usually below level of mylohyoid muscle) or microcystic (composed of minute cysts, usually above level of mylohyoid muscle)
- usually painless, soft, compressible
- infection or trauma causes a sudden increase in size

### Treatment
- can regress spontaneously after bacterial infection, therefore do not plan surgical intervention until several months after infection
- macrocystic lesions can be treated by sclerotherapy or surgical excision
- microcystic lesions are difficult to treat, but can be debulked if it will not cause loss of function of normal structures, or injected with sclerotherapy in surrounding tissues

# Neoplasms of the Head and Neck

### Pre-Malignant Disease
- leukoplakia
  - hyperkeratosis of oral mucosa
  - risk of malignant transformation 5-20%
- erythroplakia
  - red superficial patches adjacent to normal mucosa
  - commonly associated with epithelial dysplasia
  - associated with carcinoma *in situ* or invasive tumour in 40% of cases
- dysplasia
  - histopathologic presence of mitoses and prominent nucleoli
  - involvement of entire mucosal thickness = carcinoma *in situ*
  - associated progression to invasive cancer in 15-30% of cases

### Investigations
- initial metastatic screen includes CXR
- scans of liver, brain, and bone only if clinically indicated
- CT scan is superior to MRI for the detection of pathologic nodal disease and bone cortex invasion
- MRI is superior to discriminate tumour from mucus and to detect bone marrow invasion
- ± PET scans
- endoscopy with biopsy

### Treatment
- treatment depends on:
  - histologic grade of tumour
  - stage
  - physical and psychological health of patient
  - facilities available
  - expertise and experience of the medical and surgical oncology team
- in general:
  - 1° surgery for malignant oral cavity tumours with radiotherapy reserved for salvage or poor prognostic indicators
  - 1° radiotherapy for nasopharynx, oropharynx, hypopharynx, and larynx malignancies with surgery reserved for salvage, although laser endoscopic surgery for early stage larynx cancer is an option and 1° surgery for advanced (T4) pharyngeal and laryngeal cancer is the standard of care
  - there is an emerging role for primary surgery (transoral robotic surgery [TORS]) for oropharyngeal cancer
  - palliative chemotherapy for metastatic or incurable disease
  - concomitant chemotherapy increases survival in advanced disease
  - chemotherapy has a role as induction therapy prior to surgery and radiation
  - panendoscopy to detect primary disease when lymph node metastasis is identified
  - anti-epidermal growth factor receptor treatment (cetuximab, panitumumab) has a role as concurrent therapy with radiation for SCC of the head and neck (for advanced local and regional disease)

### Prognosis
- synchronous tumours occur in 9-15% of patients
- late development of 2nd primary is most common cause of post-treatment failure after 36 mo

All patients presenting with a head and neck mass should be asked if they are experiencing the following obstructive, referred, or local symptoms
- Oropharyngeal: Odynophagia, dysphagia, non-healing oral ulcers
- Otologic: Otalgia, hearing loss
- Laryngeal: Dyspnea or stridor (position vs. non-positional), hoarseness, dysphonia → positional vs. non-positional
- Nasopharyngeal: Recurrent epistaxis, unilateral nasal obstruction, persistent rhinorrhea or sinusitis
- Hemoptysis, hematemesis

Detection of cervical lymph nodes on physical exam
- False negative rate: 15-30%
- False positive rate: 30-40%

Pathological lymphadenopathy defined radiographically as
- A jugulodigastric node >1.5 cm in diameter, or a retropharyngeal node >1 cm in diameter
- A node of any size which contains central necrosis

Common sites of distant metastases for head and neck neoplasms
lungs > liver > bones

**Risk Factors for Head and Neck Cancer**
- Smoking
- EtOH (synergistic with smoking)
- Radiation
- Occupational/environmental exposures
- Oral HPV infection (independent of smoking and EtOH exposure)
- Family history of cancer
- Previous cancer

The smaller the salivary gland, the greater the likelihood that a mass in the gland is malignant

**Table 16. Quick Look-Up Summary of Head and Neck Malignancies – Etiology and Epidemiology**

| Etiology | Epidemiology | Risk Factors |
|---|---|---|
| **Oral Cavity** | | |
| 95% SCC<br>Others: sarcoma, melanoma, minor salivary gland tumour | Mean age: 50-60 yr<br>M>F<br>Most common site of H&N cancers<br>50% on anterior 2/3 of tongue | Smoking/EtOH<br>Poor oral hygiene<br>Leukoplakia, erythroplakia<br>Lichen planus, chronic inflammation<br>Sun exposure – lip<br>HPV infection<br>Plummer-Vinson syndrome |
| **Nose and Paranasal Sinus** | | |
| 75-80% SCC<br>Adenocarcinoma (2nd most common) and mucoepidermoid<br>99% in maxillary/ethmoid sinus<br>10% of nose and paranasal sinus tumours arise from minor salivary glands | Mean age: 50-70 yr<br>Rare tumours<br>↓ incidence in last 5-10 yr | Wood/shoe/textile industry<br>Hardwood dust (nasal/ethmoid sinus)<br>Nickel, chromium (maxillary sinus)<br>Air pollution<br>Chronic rhinosinusitis |
| **Carcinoma of the Pharynx – Subtypes (Nasopharynx, Oropharynx, Hypopharynx, and Larynx)** | | |
| **Nasopharynx** | | |
| 90% SCC<br>~10% lymphoma | Mean age: 50-59 yr<br>M:F= 2.4:1<br>Incidence 0.8 per 100,000<br>100x increased incidence in Southern Chinese | Epstein-Barr virus (EBV)<br>Salted fish<br>Nickel exposure<br>Poor oral hygiene<br>Genetic – Southern Chinese |
| **Oropharynx** | | |
| 95% SCC – poorly differentiated<br>Up to 70% of oropharnyngeal cancer (OPC) attributable to HPV | Mean age: 50-70 yr<br>Patients with HPV+ OPC are approximately 10 yr younger<br>Prevalence of HPV+ OPC has increased by 225% from 1988 to 2004<br>M:F = 4:1 | Smoking/EtOH<br>HPV 16 infection: increased sexual encounters, specifically oral sex |
| **Hypopharynx** | | |
| 95% SCC<br>3 sites<br>1. pyriform sinus (60%)<br>2. postcricoid (30%)<br>3. posterior pharyngeal wall (10%) | Mean age: 50-70 yr<br>M>F<br>8-10% of all H&N cancer | Smoking/EtOH |
| **Larynx** | | |
| SCC most common<br>3 sites<br>1. supraglottic (30-35%)<br>2. glottic (60-65%)<br>3. subglottic (1%) | Mean age: 45-75 yr<br>M:F = 10:1<br>45% of all H&N cancer | Smoking/EtOH<br>HPV 16 infection strongly associated with the risk of laryngeal squamous cell cancers |
| **Salivary Gland** | | |
| 40% mucoepidermoid<br>30% adenoid cystic<br>5% acinic cell<br>5% malignant mixed<br>5% lymphoma | Mean age: 55-65 yr<br>M=F<br>3-6% of all H&N cancer<br>Percentage of malignant tumours in each gland:<br>Parotid 15-25%<br>Submandibular 37-43%<br>Minor salivary >80% | |
| **Thyroid (90% benign – 10% malignant)** | | |
| >80% papillary<br>5-15% follicular<br>5% medullary<br><5% anaplastic<br>1-5% Hürthle cell<br>1-2% metastatic | Children<br>Adults <30 or >60 yr<br>Nodules more common in females<br>Malignancy more common in males | Radiation exposure<br>Family history – papillary CA or multiple endocrine neoplasia (MEN II)<br>Older age<br>Male<br>Papillary – Gardner's syndrome, Cowden syndrome, familial adenomatous polyposis (FAP) |
| **Parathyroid** | Mean age: 44-55 yr<br>Rare tumour | |

**Survival Comparison between HPV Positive and HPV Negative Head and Neck Squamous Cell Carcinoma**
Int J Cancer 2007;121(8):1813-20
**Summary**: HPV positive oropharyngeal cancer has better prognosis vs. HPV negative oropharyngeal cancer. It may be a good idea to routinely test for HPV status for all adult patients presenting with oropharyngeal squamous cell carcinoma.
**Results**: Meta-analysis on relationship between HPV infection and overall survival and disease-free survival in head and neck squamous cell carcinoma. Site-specific analysis for oropharyngeal tumours show that HPV positive group has 28% reduced risk of death (HR 0.72, 95% CI: 0.5-1.0). Similar observations were made for disease-free status (HR: 0.51, 95% CI 0.4-0.7).

**Chemoradiotherapy for Advanced Head and Neck Squamous Cell Carcinoma (HNSCC)**
Radiother Oncol 2009;92(1):4-14
**Summary**: Cisplatin monochemotherapy or 5-fluorouracil (5-FU) plus cisplatin polychemotherapy should be used in treatment of HNSCC. Concomitant chemotherapy has higher benefit than neo-adjuvant chemotherapy.
**Results**: Meta-analysis including 87 trials (16,485 patients) comparing regional treatment vs. regional treatment plus chemotherapy in HNSCC patients. Cisplatin monochemotherapy or 5-FU plus cisplatin polychemotherapy had the highest effect of chemotherapy. Both direct and indirect comparisons showed a more pronounced benefit of concomitant chemotherapy (HR 0.81, absolute benefit 6.5% at 5 years) vs. neo-adjuvant chemotherapy (HR 0.88, absolute benefit 4.5% at 5 years). There is no good evidence for adjuvant chemotherapy (HR 1.06, p=0.32).

**Pembrolizumab versus methotrexate, docetaxel, or cetuximab for recurrent or metastatic head-and-neck squamous cell carcinoma (KEYNOTE-040): a randomised, open-label, phase 3 study**
Lancet 2019. 393(10167): 156-167
**Objective**: Compare the efficacy and safety of pembrolizumab versus standard-of-care therapy for the treatment of head-and-neck squamous cell carcinoma.
**Study**: Randomised, open-label, phase 3 clinical trial.
**Patients**: 495 patients randomized to either pembrolizumab or standard-of-care treatment groups.
**Results**: Median overall survival was 8.4 mo (95% CI 6.4–9.4) with pembrolizumab and 6.9 mo (5.9–8.0) with standard of care (HR 0.80, 0.65–0.98; p=0.0161). Fewer patients treated with pembrolizumab than with standard-of-care had grade 3 or worse treatment-related adverse events (33 [13%] of 246 vs. 85 [36%] of 234). Four treatment-related deaths with pembrolizumab vs. two for standard-of-care.
**Conclusion**: Pembrolizumab treatment prolongs overall survival and has a more favourable safety profile when compared to standard treatment for recurrent or metastatic head and neck squamous cell carcinoma.

**Nivolumab for Recurrent Squamous-Cell Carcinoma of the Head and Neck**
NEJM 2016;375:1856-1867
**Objective**: To assess whether overall survival would be longer with nivolumab therapy than with standard therapy in patients with platinum-refractory head and neck squamous-cell carcinoma.
**Study**: Randomized, open-label, phase 3 clinical trial.
**Patients**: 361 patients with recurrent head and neck squamous-cell carcinoma whose disease had progressed within 6 mo after platinum-based chemotherapy.
**Results**: The median overall survival was 7.5 mo in the nivolumab group vs. 5.1 mo in the standard therapy group. Overall survival was significantly longer with nivolumab. No difference in median progression-free survival, but the rate of progression-free survival at 6 mo was 19.7% with nivolumab vs. 9.9% with standard therapy. Treatment-related adverse events of grade 3 or 4 occurred in 13.1% of the patients in the nivolumab group vs. 35.1% of those in the standard-therapy group.
Conclusion: Treatment with nivolumab resulted in longer overall survival, overall progression-free survival, and fewer adverse events than treatment with standard therapy.

**Table 17. Quick Look-Up Summary of Head and Neck Malignancies – Diagnosis and Treatment**

| Clinical Features | Investigations | Treatment | Prognosis |
|---|---|---|---|
| **Oral Cavity** | | | |
| Asymptomatic neck mass (30%)<br>Non-healing ulcer ± bleeding<br>Dysphagia, sialorrhea, dysphonia<br>Oral fetor, otalgia, leukoplakia, or erythroplakia (pre-malignant changes or clinically isolated syndrome) | Biopsy<br>CT | 1° surgery<br>local resection<br>± neck dissection<br>± reconstruction<br>2° radiation | 5 yr overall survival<br>T1/T2: 75%<br>T3/T4: 30-35%<br>Poor prognostic indicators<br>Depth of invasion, close surgical margins location (tongue worse than floor of mouth)<br>Cervical nodes, extra-capsular spread |
| **Nose and Paranasal Sinus** | | | |

# Thyroid Carcinoma

### Table 18. Bethesda Classification of Thyroid Cytology

| Diagnostic Category | Risk of Malignancy if NIFTP is not considered Cancer | Risk of Malignancy if NIFTP is considered Cancer |
|---|---|---|
| Non-diagnostic or unsatisfactory | 5-10% | 5-10% |
| Benign | 0-3% | 0-3% |
| Follicular lesion of undetermined significance/Atypia of undetermined significance | 6-18% | 10-30% |
| Follicular neoplasm or suspicious for a follicular neoplasm | 10-40% | 25-40% |
| Suspicious for malignancy | 45-60% | 50-75% |
| Malignant | 94-96% | 97-99% |

The Bethesda System for Reporting Thyroid Cytopathology (TBSRTC) is a reporting system for thyroid FNA. The 2017 revision introduces the reclassification of noninvasive follicular variant of papillary thyroid carcinoma as noninvasive follicular thyroid neoplasm with papillary-like nuclear features (NIFTP).

### Table 19. Thyroid Carcinoma

| | Papillary | Follicular | Medullary | Anaplastic | Lymphoma |
|---|---|---|---|---|---|
| **Incidence (% of all thyroid cancers)** | 70-80% | 10-15% | 1 to 2%<br>(90% sporadic, 10% familial – test for RET germline mutation) | <2% | <1% |
| **Route of Spread** | Lymphatic | Hematogenous | Lymphatic and hematogenous | N/A | |
| **Histology** | Orphan Annie nuclei<br>Psammoma bodies<br>Papillary architecture | Capsular/vascular invasion<br>Invasion influences prognosis | Amyloid<br>May secrete calcitonin, prostaglandins, ACTH, serotonin, kallikrein, or bradykinin | Giant cells<br>Spindle cells | |
| **Other** | **P**s – **P**apillary cancer<br>**P**opular (most common)<br>**P**alpable lymph nodes<br>**P**ositive $I^{131}$ uptake<br>**P**ositive prognosis<br>**P**ost-operative $I^{131}$ scan to guide treatments | **F**s – **F**ollicular cancer<br>**F**ar away mets<br>**F**emale (3:1)<br>NOT FNA (cannot be diagnosed by **F**NA)<br>**F**avourable prognosis | **M**s – **M**edullary cancer<br>**M**ultiple endocrine neoplasia (**M**EN IIa or IIb)<br>a**M**yloid<br>**M**edian node dissection | More common in elderly<br>70% in women<br>20-30% have Hx of differentiated thyroid CA (mostly papillary) or nodular goitre mass<br>Rapidly enlarging neck<br>Rule out lymphoma | Usually non-Hodgkin's lymphoma<br>Rapidly enlarging thyroid mass<br>Hx of Hashimoto's thyroiditis increases risk 60x<br>4:1 female predominance<br>dysphagia, dyspnea, stridor, hoarseness, neck pain, facial edema, accompanied by "B" symptoms* |
| **Prognosis** | 98% at 10 yr | 92% at 10 yr | 50% at 10 yr<br>20% at 10 yr if detected when clinically palpable | 20-35% at 1 yr<br>13% at 10 yr | 5 yr survival<br>Stage IE: 55%-80%<br>Stage IIE: 20%-50%<br>Stage IIE/IV: 15%-35% |
| **Treatment** | Small tumours: Near total thyroidectomy or lobectomy<br>Diffuse/bilateral: Total thyroidectomy<br>± neck dissection ± post-operative $I^{131}$ treatment | Small tumours: Near total thyroidectomy/lobectomy/isthmectomy<br>Large/diffuse tumours: Total thyroidectomy | Total thyroidectomy<br>Median and/or lateral compartment node neck dissection (based on serum calcitonin)<br>Modified neck dissection<br>Post-operative thyroxine, radiotherapy<br>Tracheostomy<br>Screen relatives | Subtotal thryoidectomy, radiation, chemotherapy, palliative care<br>Small tumours:<br>Total thyroidectomy<br>± external beam | Non-surgical<br>Combined radiation<br>Chemotherapy (CHOP**) |

*B symptoms = fever, night sweats, chills, weight loss >10% in 6 mo ** CHOP = cyclophosphamide, adriamycin, vincristine, prednisone

## Approach to Thyroid Nodule

- all patients with thyroid nodules require evaluation of serum TSH and ultrasound
- intermediate-high suspicion nodule >1 cm and low suspicion nodule >1.5 cm should undergo FNA
- nodules <1 cm with clinical symptoms or lymphadenopathy may require further evaluation
- when performing repeat FNA on initially non-diagnostic nodules, U/S-guided FNA should be employed
- nuclear scanning has minimal value in the investigation of the thyroid nodule
- molecular testing is increasingly used to identify gene mutations associated with thyroid cancers to determine "high risk" from "low risk" thyroid nodules

### Table 20. Management of the Thyroid Nodule

| Treatment | Indications |
|---|---|
| Radioiodine therapy | Treatment of hyperthyroidism<br>After surgery as adjuvant treatment of intermediate-high risk papillary or follicular carcinoma |
| Chemotherapy and/or radiotherapy | Recurrent/residual medullary CA, anaplastic CA or thyroid lymphoma |
| Surgical excision | Nodule that is suspicious on FNA cytology<br>Malignancy other than anaplastic CA or thyroid lymphoma<br>Mass that is benign on FNA but increasing in size on serial imaging and/or >3-4 cm in size<br>Hyperthyroidism not amenable to medical therapy |

***U/S findings:** cystic: risk of malignancy <1%; solid: risk of malignancy ~10%; solid with cystic components: risk of malignancy same as if solid

**Indications for Post-Operative Radioactive Iodine Ablation – $I^{131}$**
Adjuvant therapy: decrease recurrent disease
Radioactive Iodine (RAI) therapy: treat persistent cancer

# Pediatric Otolaryngology

## Acute Otitis Media

### Definition
- all of: presence of middle ear effusion (MEE); presence of middle ear inflammation (MEI); acute onset of symptoms of MEE and MEI

### Epidemiology
- most frequent diagnosis in sick children visiting clinicians' offices and most common reason for antibiotic administration
- peak incidence between 6-15 mo: ~85% of children have >1 episode by 3 yr old
- seasonal variability: peaks in winter

### Etiology
- primary defect causing AOM: Eustachian tube dysfunction/obstruction → stasis/colonization by pathogens
- bacterial: *S. pneumoniae*, non-typable *H. influenzae, M. catarrhalis*, group A *Streptococcus*, *S. aureus*
- viral: RSV, influenza, parainfluenza, adenovirus
- commonly due to bacterial/viral co-infection

### Predisposing Factors
- Eustachian tube dysfunction/obstruction
  - swelling of tubal mucosa
    - upper respiratory tract infection (URTI)
    - allergic rhinitis
    - chronic rhinosinusitis
  - obstruction/infiltration of Eustachian tube ostium
    - tumour: nasopharyngeal carcinoma (adults)
    - adenoid hypertrophy (by maintaining a source of infection rather than obstruction)
    - barotrauma (sudden changes in air pressure)
  - inadequate tensor palati function: cleft palate (even after repair)
  - abnormal Eustachian tube
    - Down syndrome (horizontal position of Eustachian tube), Crouzon syndrome, cleft palate, and Apert syndrome
- disruption of action of:
  - cilia of Eustachian tube: Kartagener's syndrome
  - mucus secreting cells
  - capillary network that provides humoral factors, PMNs, phagocytic cells
- immunosuppression/deficiency due to chemotherapy, steroids, DM, hypogammaglobulinemia, cystic fibrosis

### Risk Factors
- non-modifiable: young age, family history of OM, prematurity, orofacial abnormalities, immunodeficiencies, Down syndrome, race, and ethnicity
- modifiable: lack of breastfeeding, daycare attendance, household crowding, exposure to cigarette smoke or air pollution, pacifier use

### Pathogenesis
- obstruction of Eustachian tube → air absorbed in middle ear → negative pressure (an irritant to middle ear mucosa) → edema of mucosa with exudate/effusion → infection of exudate from nasopharyngeal secretions

### Clinical Features
- triad of otalgia, fever (especially in younger children), and conductive hearing loss
- rarely tinnitus, vertigo, and/or facial nerve paralysis
- otorrhea if tympanic membrane perforated
- infants/toddlers
  - ear-tugging (this alone is not a good indicator of pathology)
  - hearing loss, balance disturbances (rare)
  - irritable, poor sleeping
  - vomiting and diarrhea
  - anorexia
- otoscopy of TM
  - hyperemia
  - bulging, pus may be seen behind TM
  - loss of landmarks: handle and long process of malleus not visible

**Clinical Assessment of AOM in Pediatrics**
JAMA 2010;304:2161-69
In assessment of AOM in pediatrics, ear pain is the most useful symptom with a likelihood ratio (LR) between 3.0-7.3. Useful otoscopic signs include erythematous (LR 8.4, 95% CI 7-11), cloudy (LR 34, 95% CI 28-42), bulging (LR 51, 95% CI 36-73), and immobile tympanic membrane (LR 31, 95% CI 26-37) on pneumatic otoscopy.

### Diagnosis
- history
  - acute onset of otalgia or ear tugging in a preverbal child, otorrhea, decreased hearing
  - unexplained irritability, fever, upper respiratory symptoms, poor sleeping, anorexia, N/V, and diarrhea
- physical
  - febrile
  - MEE on otoscopy: immobile tympanic membrane, acute otorrhea, loss of bony landmarks, opacification of TM, air-fluid level behind TM
  - MEI on otoscopy: bulging TM with marked discolouration (hemorrhagic, red, grey, or yellow)

### Management
- supportive care and symptom management: maintain hydration, analgesic, and antipyretic (acetaminophen, ibuprofen)
- watchful waiting: in a generally healthy child >6 mo of age with unilateral, non-severe, suspected AOM
  - without MEE or with MEE but non-bulging or mildly erythematous TM
- consider viral etiology
- reassess in 24-48 h if not clinically improved (or earlier if worsening)
  - mildly ill (alert, responsive, no rigors, mild otalgia, fever <39 °C, <48 h illness) with MEE present AND bulging TM
- recommend analgesia
- observe and follow-up in 24-48 h – if not improved or worsening, treat with antimicrobials
- antimicrobial indications: infants <6 mo of age or in a generally healthy child >6 mo of age with suspected AOM and the following features
  - moderately or severely ill (irritable, difficulty sleeping, poor antipyretic response, severe otalgia) OR fever ≥39 °C OR >48 h of symptoms
    - treat with antimicrobials: 10 d course if 6-24 mo, 5 d if ≥2 yr old
  - perforated TM with purulent drainage
    - treat with antimicrobials for 10 d
- referral to otolaryngology for myringotomy and tympanostomy tubes may be warranted for recurrent infections

### Treatment
- antimicrobial agents for AOM
  - 5 d course of appropriate dose antimicrobial recommended for most ≥ 2 yr old with uncomplicated AOM. 10 d course for 6-24 mo, perforated TM, or recurrent AOM
  - 1st line treatment (no penicillin allergy)
- amoxicillin: 5 d course of 45-60 mg/kg/d divided 3x/d, or 75-90 mg/kg/d divided 2x/d
  - 2nd line treatment
    - cefprozil: 30 mg/kg/d divided 2x/d
    - cefuroxime axetil: 30 mg/kg/d divided 2-3x/d (1st line for penicillin allergy)
    - ceftriaxone: 50 mg/kg IM (or IV) x 3 doses (1st line for penicillin allergy)
    - azithromycin: 10 mg/kg OD x 1 dose, then 5 mg/kg OD x 4 doses
    - clarithromycin: 15 mg/kg/d divided 2x/d
  - if initial therapy fails (i.e. no symptomatic improvement after 2-3 d)
    - amoxicillin-clavulanate: 45-60 mg/kg/d (7:1 formulation, 400 mg/5 mL suspension) for 10 d for child weighing ≤35 kg, or 500 mg tablets tid for 10 d for child weighing >35 kg
    - if AOM-related symptoms do not resolve with amoxicillin/clavulanate, a course of ceftriaxone 50 mg/kg/d IM (or IV) OD x 3 doses could be considered

### Complications
- extracranial
  - hearing loss and speech delay (secondary to persistent MEE), TM perforation, extension of suppurative process to adjacent structures (mastoiditis, petrositis, labyrinthitis), cholesteatoma, facial nerve palsy, middle ear atelectasis, ossicular necrosis, vestibular dysfunction, persistent effusion (often leading to hearing loss)
- intracranial
  - meningitis, epidural/brain abscess, subdural empyema, lateral and cavernous sinus thrombosis, carotid artery thrombosis, facial nerve paralysis
- other
  - mastoiditis, labyrinthitis, sigmoid sinus thrombophlebitis

**Antibiotics for Acute Otitis Media in Children**
Cochrane DB Syst Rev 2013;1:CD000219
**Study**: Meta-analysis of Randomized Controlled Trials (RCTs) on children (1-15 mo) with acute otitis media comparing any antibiotic regime to placebo and expectant observation.
**Data Sources**: Cochrane Central Register of Controlled Trials (2012 issue 10), MEDLINE (1966 to October 2012), OLDMEDLINE (1958 to 1965), EMBASE (January 1990 to November 2012), Current Contents (1966 to November 2012), CINAHL (2008 to November 2012) and LILACS (2008 to November 2012) without language restrictions.
**Main Outcomes**: 1) Pain at 24 h, 2-3 d, and 4-7 d; 2) Abnormal tympanometry findings; 3) TM perforation; 4) Contralateral otitis; 5) AOM recurrences; 6) Serious complications from AOM; 7) Adverse effects from antibiotics.
**Results**: Treatment with antibiotics had no significant impact on pain at 24 h. However, pain at 2-3 d and 4-7 d was lower in the antibiotic groups with a NNT of 20. Antibiotics had no significant effect on tympanometry findings, number of AOM recurrences, or severity of complications. Antibiotic treatment led to a significant reduction in TM perforations (NNT 33) and halved contralateral AOM (NNT 11). Adverse events (vomiting, diarrhea, or rash) occurred more often in children taking antibiotics.
**Conclusion**: The role of antibiotics is largely restricted to pain control at 2-7 d, but most (82%) settle without antibiotics. This can also be achieved by analgesics. However, antibiotic treatment can reduce risk of TM perforation and contralateral AOM episodes. These benefits must be weighed against risks of adverse events from antibiotics.

## Otitis Media with Effusion

### Definition
- presence of fluid in the middle ear without signs or symptoms of ear infection

### Epidemiology
- most common cause of pediatric hearing loss
- not exclusively a pediatric disease
- frequently follows AOM in children
- middle ear effusions have been shown to persist following an episode of AOM for 1 mo in 40% of children, 2 mo in 20%, and >3 mo in 10% (i.e. 90% of children clear the fluid within 3 mo – observe for 3 mo before considering myringotomy and tubes)

### Risk Factors
- same as AOM

### Clinical Features
- conductive hearing loss ± tinnitus
  - confirm with audiogram and tympanogram (flat) (see Figure 16B, OT10 and Figure 17B, OT11)
- fullness – blocked ear
- ± pain, low grade fever
- otoscopy of tympanic membrane
  - discolouration – amber or dull grey with "glue" ear
  - meniscus fluid level behind TM
  - air bubbles
  - retraction pockets/TM atelectasis
  - most reliable finding with pneumatic otoscopy is immobility with pneumatic otoscopy

### Treatment
- expectant: 90% resolve by 3 mo
  - watchful waiting for 3 mo from onset, or 3 mo from diagnosis if onset unknown
- document hearing loss with audiogram
- no clinical evidence that antihistamines, decongestants, or antibiotics clear disease faster
- recommend **against** intranasal or systemic steroids, systemic antibiotics, antihistamines, decongestants for OME treatment
- surgery: myringotomy ± ventilation tubes to equalize pressure and drain ear (tympanostomy tubes recommended) ± adenoidectomy (not recommended in <4 yr old unless nasal obstruction, chronic adenoiditis; recommended in ≥ 4 yr old)

### Complications of Otitis Media with Effusion
- hearing loss, speech delay, learning problems in young children
- chronic mastoiditis
- ossicular erosion
- cholesteatoma, especially when retraction pockets involve pars flaccida
- retraction of tympanic membrane, atelectasis, ossicular fixation

**Indications for Myringotomy and Tympanostomy Tubes in Recurrent AOM (RAOM) and OME***
- Chronic bilateral OME and documented hearing difficulties >3 mo
- Unilateral or bilateral OME >3 mo and symptoms likely attributable to OME (e.g. balance problems, poor school performance, ear discomfort, etc.)
- At-risk children (permanent hearing loss, speech/language delay, autism-spectrum disorder, craniofacial disorders, blindness, cleft palate, developmental delay) with unilateral or bilateral OME with type B tympanogram or persistent effusion >3 mo
- RAOM (>3 episodes in 6 mo or >4 in 12 mo) with unilateral or bilateral middle ear effusion

*Clinical practice guidelines: Tympanostomy tubes in children. Otolaryng Head Neck 2013;149:S1-S35

**Effectiveness of Tympanostomy Tubes for Otitis Media: A Meta-analysis**
Pediatrics 2017;139(6):e20170125
**Study**: Systematic review evaluating the effectiveness of tympanostomy tubes in children with chronic OM with effusion and recurrent AOM compared to watchful waiting.
**Data Sources**: MEDLINE, Cochrane Central Register of Controlled Trials, EMBASE, CINAHL.
**Results**: Children treated with tympanostomy tubes compared with watchful waiting had a net decrease (improvement) in mean hearing threshold of 9.1 dB at 1-3 mo and 0.0 by 12-24 mo. Children with recurrent AOM may have fewer episodes after tympanostomy tube.
**Conclusions**: Tympanostomy tubes improve hearing at 1-3 mo compared with watchful waiting, with no evidence of benefit by 12-24 mo. More evidence is needed for recurrent AOM. The benefits of tympanostomy tubes must be weighed against a variety of associated adverse events.

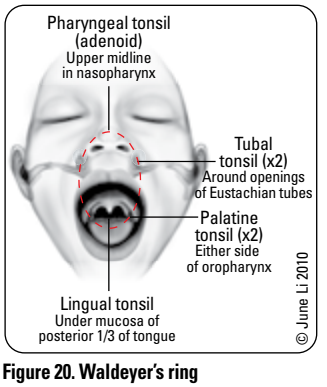

**Figure 20. Waldeyer's ring**
An interrupted circle of protective lymphoid tissue at the upper ends of the respiratory and alimentary tracts

## Adenoid Hypertrophy

### Definition
- size peaks at age 5 and resolves by age 12
- increase in size with repeated URTI and allergies

### Clinical Features
- nasal obstruction
  - adenoid facies (open mouth, high arched palate, narrow midface, malocclusion)
  - history of hypernasal voice and snoring
  - long-term mouth breather; minimal air escape through nose
- choanal obstruction
  - chronic rhinosinusitis/rhinitis
  - obstructive sleep apnea
- chronic inflammation
  - nasal discharge, post-nasal drip, and cough
  - cervical lymphadenopathy

### Diagnosis
- enlarged adenoids on nasopharyngeal exam (usually with flexible nasopharyngoscope)
- enlarged adenoid shadow on lateral soft tissue X-ray

### Complications
- Eustachian tube obstruction leading to serous otitis media
- interference with nasal breathing, necessitating mouth-breathing
- malocclusion
- sleep apnea/respiratory disturbance
- orofacial developmental abnormalities

## Adenoidectomy

### Indications for Adenoidectomy
- chronic upper airway obstruction with sleep disturbance/apnea ± cor pulmonale
- chronic nasopharyngitis resistant to medical treatment
- chronic serous otitis media and chronic suppurative otitis media (with 2nd set of tubes)
- recurrent acute otitis media resistant to antibiotics
- suspicion of nasopharyngeal malignancy
- persistent rhinorrhea secondary to nasal obstruction

### Contraindications
- uncontrollable coagulopathy
- recent pharyngeal infection
- conditions that predispose to velopharyngeal insufficiency (cleft palate, impaired palatal function, or enlarged pharynx)

### Complications
- bleeding, infection
- velopharyngeal insufficiency (hypernasal voice or nasal regurgitation)
- scarring of Eustachian tube orifice

## Sleep-Disordered Breathing in Children

### Definition
- spectrum of sleep-related breathing abnormalities ranging from snoring to OSA

### Epidemiology
- peak incidence between 2-8 yr when tonsils and adenoids are the largest relative to the pharyngeal airway

### Etiology
- due to a combination of anatomic and neuromuscular factors
  - adenotonsillar hypertrophy
  - craniofacial abnormalities
  - neuromuscular hypotonia (e.g. cerebral palsy, Down syndrome)
  - obesity

### Clinical Features
- heavy snoring, mouth breathing, pauses or apnea, enuresis, excessive daytime sleepiness, behavioural/learning problems, diagnosis of ADHD, morning headache, failure to thrive, sleeping with neck hyperextended, cyanosis

### Investigations
- flexible nasopharyngoscopy for assessment of nasopharynx and adenoids
- polysomnography (apnea-hypopnea index >1/h considered abnormal)
  - children: Mild OSA ≥1 to <5/h; Moderate OSA ≥5 to <10/h; Severe OSA ≥10/h
  - adults: Mild OSA 5.1-15/h; Moderate OSA 15.1-30/h; Severe OSA >30.1/h

### Treatment
- nonsurgical: CPAP, BiPAP, sleep hygiene, weight loss in overweight/obese child with OSA
- medication: topical nasal steroids and leukotriene-receptor antagonists for mild OSA or residual sleep-disordered breathing post-adenotonsillectomy
- surgical: bilateral tonsillectomy and adenoidectomy is first surgery of choice
  - if persistent obstructive sleep apnea following tonsillectomy and adenoidectomy, consider adenoid regrowth
  - if these fail and not tolerant of positive airway pressure (PAP) therapy, consider lingual tonsillectomy, midline glossectomy, or other surgeries targeting areas of resistance as required (STAR surgery); surgery may be guided by Drug-Induced Sleep Endoscopy (DISE) or cineradiography-MRI to localize site of resistance

## Acute Tonsillitis

- see Pediatrics, P55

## Peritonsillar Abscess (Quinsy)

**Quinsy Triad**
- Trismus
- Uvular deviation
- Dysphonia ("hot potato voice")

### Definition
- cellulitis of space behind tonsillar capsule extending onto soft palate, leading to abscess

### Etiology
- bacterial: group A *Streptococcus* (GAS) (50% of cases), *S. pyogenes, S. aureus, H. influenzae*, and anaerobes

### Epidemiology
- can develop from acute tonsillitis with infection spreading into plane of tonsillar bed
- unilateral
- most common in 15-30 yr age group

### Clinical Features
- trismus (due to irritation and reflex spasm of the medial pterygoid) is the most reliable indicator of peritonsillar abscess
- fever and dehydration
- sore throat, dysphagia, and odynophagia
- extensive peritonsillar swelling but tonsil may appear normal

- edema of soft palate
- uvular deviation
- dysphonia (edema → failure to elevate palate) 2° to CN X involvement
- unilateral referred otalgia
- cervical lymphadenitis

### Complications
- aspiration pneumonia 2° to spontaneous rupture of abscess
- airway obstruction
- lateral dissection into parapharyngeal and/or carotid space
- bacteremia
- retropharyngeal abscess

### Treatment
- secure airway
- surgical drainage (incision or needle aspiration) with C&S
- warm saline irrigation
- IV penicillin G x 10 d if cultures positive for GAS
- add PO/IV metronidazole or clindamycin x 10 d if culture positive for *Bacteroides*
- consider tonsillectomy after second episode

### Other Sources of Parapharyngeal Space Infections
- pharyngitis
- acute suppurative parotitis (see *Salivary Glands*, OT30)
- AOM
- mastoiditis (Bezold's abscess)
- odontogenic infection

## Tonsillectomy

### Absolute Indications
- most common indication: sleep-disordered breathing
- 2nd most common indication: recurrent throat infections
- tonsillar hypertrophy causing upper airway obstruction, obstructive sleep apnea, severe dysphagia, or cardiopulmonary complications such as cor pulmonale
- suspicion of malignancy (e.g. lymphoma, squamous cell carcinoma)
- orofacial/dental deformity
- hemorrhagic tonsillitis

### Relative Indications (To Reduce Disease Burden)
- recurrent throat infection with a frequency of at least 7 episodes in the past year, at least 5 episodes per year for 2 yr, or at least 3 episodes per year for 3 yr with documentation in the medical record for each episode of sore throat, and 1 or more of the following: temperature >38.3 °C, cervical adenopathy, tonsillar exudate, or positive test for group A β-hemolytic *Streptococcus* (Paradise Criteria)
- chronic tonsillitis with halitosis (bad breath) or sore throat ± tonsilloliths (clusters of material that form in the crevices of the tonsils)
- complications of tonsillitis: quinsy/peritonsillar abscess, parapharyngeal abscess, retropharyngeal abscess
- failure to thrive

### Relative Contraindications
- velopharyngeal insufficiency: overt or submucous/covert cleft of palate, impaired palatal function due to neurological or neuromuscular abnormalities
- hematologic: coagulopathy, anemia
- infectious: active local infection without urgent obstructive symptoms

### Complications
- hemorrhage: primary (within 24 h); secondary (within first 7-10 d)
- odynophagia and/or otalgia; dehydration 2° to odynophagia
- infection
- atlantoaxial subluxation (Grisel's syndrome) - rare

## Airway Problems in Children

### DIFFERENTIAL DIAGNOSIS BY AGE GROUP

### Neonates (Obligate Nose Breathers)
- extralaryngeal
  - choanal atresia (e.g. CHARGE syndrome)
  - nasopharyngeal dermoid, glioma, encephalocele
  - glossoptosis: Pierre-Robin sequence, Down syndrome, lymphatic malformation, hemangioma

- laryngeal
  - laryngomalacia: most common cause of stridor in children
  - vocal cord palsy (due to trauma or Arnold-Chiari malformation)
  - glottic web
  - subglottic stenosis
  - laryngeal cleft
  - laryngocele
- tracheal
  - tracheoesophageal fistula
  - tracheomalacia
  - vascular rings
  - complete tracheal rings

### 2-3 Months
- congenital
  - laryngomalacia
  - vascular: subglottic hemangioma (more common), innominate artery compression, double aortic arch
  - laryngeal papilloma
- acquired
  - subglottic stenosis: post-intubation
  - tracheal granulation: post-intubation
  - tracheomalacia: post-tracheotomy and TEF repair

### Infants – Sudden Onset
- foreign body aspiration
- croup
- bacterial tracheitis
- caustic ingestion
- epiglottitis

### Children and Adults
- infection
  - Ludwig's angina
  - peritonsillar/parapharyngeal abscess
  - retropharyngeal abscess
- neoplastic
  - squamous cell carcinoma (larynx, hypopharynx (adults))
  - retropharyngeal: lymphoma, neuroblastoma
  - nasopharyngeal: carcinoma, rhabdomyosarcoma
- allergic
  - angioneurotic edema
  - polyps (suspect cystic fibrosis in children)
- trauma
  - laryngeal fracture, facial fracture
  - burns and lacerations
  - post-intubation
  - caustic ingestion
- congenital
  - lingual thyroglossal duct cyst
  - lingual tonsil hypertrophy
  - lingual thyroid

## Signs of Airway Obstruction

### Stridor
- note quality, timing (inspiratory or expiratory)
- body position important
  - lying prone: double aortic arch
  - lying supine: laryngomalacia, glossoptosis
- site of stenosis
  - vocal cords or above: inspiratory stridor
  - subglottis and extrathoracic trachea: biphasic stridor
  - distal tracheobronchial tree: expiratory stridor

### Respiratory Distress
- nasal flaring
- supraclavicular and intercostal indrawing
- sternal retractions
- use of accessory muscles of respiration
- tachypnea
- cyanosis
- altered LOC

### Feeding Difficulty and Aspiration
- supraglottic lesion
- laryngomalacia
- vocal cord paralysis
- laryngeal cleft → aspiration pneumonia
- TEF

## Acute Laryngotracheobronchitis (Croup)

### Definition
- inflammation of tissues in subglottic space ± tracheobronchial tree
- swelling of mucosal lining associated with thick, viscous, mucopurulent exudate which compromises upper airway (subglottic space is narrowest portion of upper airway)
- normal function of ciliated mucous membrane impaired

### Etiology
- viral: parainfluenzae I (most common), II, III, influenza A B, RSV

### Clinical Features
- age: 4 mo-5 yr
- preceded by URTI symptoms
- generally occurs at night
- biphasic stridor and croupy cough (loud, sea-lion bark)
- appear less toxic than epiglottitis
- supraglottic area normal
- rule out foreign body and subglottic stenosis
- "steeple-sign" on AP X-ray of neck
- if recurrent croup, think subglottic stenosis

**Signs of Croup**

**The 3 Ss**
**S**tridor
**S**ubglottic swelling
**S**eal bark cough

### Treatment
- racemic epinephrine via metred-dose inhaler q1-2h prn (only if in respiratory distress)
- systemic corticosteroids (e.g. dexamethasone 0.5 mg/kg, prednisone)
- adequate hydration
- close observation for 3-4 h
- intubation if severe (use smaller endotracheal tube than expected for age)
- hospitalize if poor response to steroids after 4 h and persistent stridor at rest
- consider alternate diagnosis if poor response to therapy (e.g. bacterial tracheitis)
- if recurrent episodes of croup-like symptoms, perform high kV croup series X-ray (AP and lat) when well to rule out underlying subglottic stenosis and consider bronchoscopy for definitive diagnosis

## Acute Epiglottitis

Acute epiglottitis is a medical emergency

### Definition
- acute inflammation causing swelling of supraglottic structures of the larynx without involvement of vocal cords

### Etiology
- *H. influenzae* type b
- relatively uncommon condition due to HiB vaccine
- common causes now include *S. pneumoniae* and *S. aureus*

### Clinical Features
- any age, most commonly 1-4 yr
- rapid onset
- toxic-looking, fever, anorexia, restlessness
- cyanotic/pale, inspiratory stridor, slow breathing, lungs clear with decreased air entry
- prefers sitting up ("tripod" posture), open mouth, drooling, tongue protruding, sore throat, dysphagia

When managing epiglottitis, it is important not to agitate the child, as this may precipitate complete obstruction

### Investigations and Management
- examining the throat may lead to potential laryngospasm and airway compromise. Ensure an anesthesiologist/otolaryngologist is present and make preparations for intubation or tracheotomy prior to any manipulation
- WBC (elevated), blood and pharyngeal cultures after intubation
- lateral neck radiograph (only done if patient stable)

**Thumb sign:** cherry-shaped epiglottic swelling seen on lateral neck radiograph

### Treatment
- secure airway
- IV access with hydration
- antibiotics: IV cefuroxime, cefotaxime, or ceftriaxone
- moist air
- extubate when leak around tube occurs and afebrile
- watch for meningitis

# Subglottic Stenosis

### Congenital
- diameter of subglottis <4 mm in neonate (due to thickening of soft tissue of subglottic space or maldevelopment of cricoid cartilage)

### Acquired
- following prolonged, repeated, or traumatic intubation
  - most commonly due to endotracheal intubation; nasal intubation is less traumatic and preferred in long-term intubation, as it puts less pressure on the subglottis (tube sits at different orientation) and there is less movement
  - subglottic stenosis is related to duration of intubation and pressure of the endotracheal tube cuff
- can also be due to foreign body, infection (e.g. TB, diphtheria, syphilis), or chemical irritation

### Clinical Features
- biphasic stridor
- respiratory distress
- recurrent/prolonged croup

### Diagnosis
- rigid laryngoscopy and bronchoscopy

### Treatment
- if soft stenosis: divide tissue with knife or laser, dilate with balloon ± steroids
- if firm stenosis: laryngotracheoplasty

# Laryngomalacia

### Definition
- short aryepiglottic folds, omega-shaped epiglottis, pendulous mucosa
- caused by indrawing of supraglottis on inspiration, leading to laryngopharyngeal reflux of acid

Laryngomalacia is the most common cause of stridor in infants

### Clinical Features
- high-pitched inspiratory stridor at 1-2 wk
- stridor is constant or intermittent and more pronounced supine and following URTI
- usually mild, but can be associated with cyanosis or feeding difficulties when severe, leading to failure to thrive

### Treatment
- observation ± proton pump inhibitor (to break the acid reflux cycle that leads to edema and worse airway obstruction) is usually sufficient, as symptoms spontaneously subside by 12-18 mo in >90% of cases
- if severe, division of the aryepiglottic folds (supraglottoplasty) provides relief

# Foreign Body

### Ingested
- usually stuck at cricopharyngeus muscle
- coins, toys, batteries (emergency)
- presents with drooling, dysphagia, stridor if very large

Foreign body inhalation is the most common cause of accidental death in children

### Aspirated
- usually stuck at right main bronchus
- peanuts, carrot, apple core, popcorn, balloons
- presentation
  - stridor if lodged in trachea
  - unilateral "asthma" if bronchial, therefore often misdiagnosed as asthma
  - if totally occludes airway: cough, lobar pneumonia, atelectasis, mediastinal shift, pneumothorax, death

Batteries MUST be ruled out as a foreign body (vs. coins) as they are lethal and can erode through the esophagus. Batteries have a halo sign around the rim on AP X-ray and a step deformity on lateral x-ray

### Diagnosis and Treatment
- sudden onset, not necessarily febrile or elevated WBC
- any patient with suspected foreign body should be kept NPO immediately
- older patient: inspiratory-expiratory chest X-ray (if patient is stable)
- younger patient: right and left decubitus chest X-rays. Lack of lung deflation while resting on dependent side suggests foreign body blocking bronchus
- bronchoscopy or esophagoscopy with removal

# Deep Neck Space Infection

## Definition
- most commonly arise from an infection of mandibular teeth, tonsils, parotid gland, deep cervical lymph nodes, middle ear, or the sinuses
- often a rapid onset and may progress to fatal complications

## Etiology
- usually mixed aerobes and anaerobes that represent the flora of the oral cavity, upper respiratory tract, and certain parts of the ears and eyes

## Clinical Features
- sore throat or pain and trismus
- dysphagia and odynophagia
- stridor and dyspnea
- late findings may include dysphonia and hoarseness
- swelling of the face and neck, erythema
- asymmetry of the oropharynx with purulent oral discharge
- lymphadenopathy

## Diagnosis
- lateral cervical view plain radiograph
- CT
- MRI

## Treatment
- secure the airway
- surgical drainage
- maximum doses of IV systemic antimicrobials regimens according to the site of infection

These investigations should be obtained carefully and the surgeon should consider accompanying the patient, as the worst place to lose an airway is during imaging

Ludwig's angina is the prototypical infection of the submandibular and sublingual space

# Common Medications

**Table 21. Antibiotics**

| Generic Name (Brand Name) | Dose | Indications | Notes |
|---|---|---|---|
| amoxicillin (Amoxil®, Amoxi®, Amox®) | Adult: 500 mg PO tid<br>Children: 75-90 mg/kg/d in 2 divided doses | *Streptococcus, Pneumococcus, H. influenzae, Proteus* coverage | May cause rash in patients with infectious mononucleosis |
| piperacillin with tazobactam (Zosyn®) | 3 g PO q6h | Gram-positive and negative aerobes and anaerobes plus *Pseudomonas* coverage | May cause pseudomembranous colitis |
| ciprofloxacin (Cipro®, Ciloxan®) | 500 mg PO bid | *Pseudomonas*, streptococci, MRSA, and most Gram-negative; no anaerobic coverage | Animal studies suggest that systemic quinolones may cause cartilage necrosis in children |
| erythromycin (Erythrocin®, EryPed®, Staticin®, T-Stat®, Erybid®, Novorythro Encap®) | 500 mg PO qid | Alternative to penicillin | Ototoxic |

**Table 22. Otic Drops**

| Generic Name (Brand Name) | Dose | Indications | Notes |
|---|---|---|---|
| ciprofloxacin (Ciprodex®) | 4 gtt in affected ear bid | For otitis externa and complications of otitis media<br>*Pseudomonas*, streptococci, MRSA, and most Gram-negative; no anaerobic coverage | |
| neomycin, polymyxin B sulfate, and hydrocortisone (Cortisporin Otic®) | 5 gtt in affected ear tid | For otitis externa<br>Used for inflammatory conditions which are currently infected or at risk of bacterial infections | May cause hearing loss if placed in inner ear |
| hydrocortisone and acetic acid (VoSol HC®) | 5-10 gtt in affected ear tid | For otitis media | Bactericidal by lowering pH |
| tobramycin and dexamethasone (TobraDex®) | 5-10 gtt in affected ear bid | For chronic suppurative otitis media | Risk of vestibular or cochlear toxicity |

**Table 23. Nasal Sprays**

| Generic Name (Brand Name) | Indications | Notes |
|---|---|---|
| **Steroid** | | |
| flunisolide (Rhinalar®)<br>budesonide (Rhinocort®)<br>triamcinolonoe (Nasacort®)<br>beclomethasone (Beconase®)<br>mometasone furoate, monohydrate (Nasonex®)<br>fluticasone furoate (Avamys®) | Allergic rhinitis<br>Chronic sinusitis | Requires up to 4 wk of consistent use to have effect<br>Long-term use<br>Dries nasal mucosa; may cause minor bleeding<br>Patient should stop if epistaxis<br>May sting<br>Flonase® and Nasonex® not absorbed systemically |
| **Antihistamine** | | |
| levocarbastine (Livostin®) | Allergic rhinitis | Immediate effect<br>Discontinue if no effect by day 3<br>Use during allergy season |
| **Decongestant** | | |
| xylometazoline (Otrivin®)<br>oxymetazoline (Dristan®)<br>phenylephrine (Neosynephrine®) | Acute sinusitis<br>Rhinitis | Careful if patient has hypertension<br>Short-term use (<5 d)<br>If long-term use, can cause decongestant addiction (i.e. rhinitis medicamentosa) |
| **Antibiotic/Decongestant** | | |
| framycetin, gramicidin, phenylephrine (Soframycin®) | Acute sinusitis | |
| **Anticholinergic** | | |
| ipratropium bromide (Atrovent®) | Vasomotor rhinitis | Careful not to spray into eyes as can cause burning or precipitation of narrow angle glaucoma<br>Increased rate of epistaxis when combined with topical nasal steroids |
| **Lubricants** | | |
| saline, NeilMed®, Rhinaris®, Secaris®, Polysporin®, Vaseline® | Dry nasal mucosa | Use prn<br>Rhinaris® and Secaris® may cause stinging |

| ANA | antinuclear antibody |
| AOM | acute otitis media |
| ARB | angiotensin receptor blocker |
| ARBD | alcohol-related birth defects |
| ARND | alcohol-related neurodevelopmental disorder |
| ASD | atrial septal defect |
| ASOT | antistreptolysin-o titre |
| ATN | acute tubular necrosis |
| AVM | arteriovenous malformation |
| BRUE | brief resolved unexplained events |
| CAH | congenital adrenal hyperplasia |
| CAS | Children's Aid Society |
| CF | cystic fibrosis |
| CHD | congenital heart defect |
| CML | chronic myelogenous leukemia |
| CMV | cytomegalovirus |
| CP | cerebral palsy |
| CPAP | continuous positive airway pressure |
| CPS | Canadian Pediatric Society |
| DAT | direct antiglobulin test |
| DDAVP | 1-desamino-8-D-arginine vasopressin |
| DI | diabetes insipidus |
| DIC | disseminated intravascular coagulation |
| DKA | diabetic ketoacidosis |
| DMARD | disease modifying antirheumatic drug |
| DS | Down syndrome |
| DSD | disorder of sexual differentiation |
| EBV | Epstein-Barr virus |
| Echo | echocardiogram |
| EEG | electroencephalogram |
| EMG | electromyography |
| FAS | fetal alcohol syndrome |
| FASD | fetal alcohol spectrum disorder |
| FISH | fluorescent in situ hybridization |
| FSH | follicle stimulating hormone |
| FTT | failure to thrive |
| G6PD | glucose-6-phosphate dehydrogenase |
| GA | gestational age |
| GBM | glomerular basement membrane |
| GBS | group B Streptococcus |
| GERD | gastroesophageal reflux disease |
| GH | growth hormone |
| GN | glomerulonephritis |
| GSD | glycogen storage disease |
| HBsAg | hepatitis B surface antigen |
| HDNB | hemorrhagic disease of the newborn |
| Hib | Haemophilus influenzae type b |
| HIDA | hepatobiliary iminodiacetic acid |
| HIE | hypoxic ischemic encephalopathy |
| HIV | human immunodeficiency virus |
| HPA | human platelet antigen |
| HRV | human rotavirus |
| HSP | Henoch-Schönlein purpura |
| HUS | hemolytic uremic syndrome |
| IBW | ideal body weight |
| ICH | intracranial hemorrhage |
| ITP | immune thrombocytopenic purpura |
| IUGR | intra-uterine growth restriction |
| IVH | intraventricular hemorrhage |
| IVIg | intravenous immunoglobulin |
| JIA | juvenile idiopathic arthritis |
| LAH | left atrial hypertrophy |
| LBW | low birth weight |
| LGA | large for gestational age |
| LH | luteinizing hormone |
| LLSB | lower left sternal border |
| LMN | lower motor neuron |
| LOC | level of consciousness |
| LP | lumbar puncture |
| LRTI | lower respiratory tract infection |
| LVH | left ventricular hypertrophy |
| MAS | meconium aspiration syndrome |
| MCAD | medium-chain acyl-CoA dehydrogenase |
| MCD | minimal change disease |
| MDI | metred dose inhaler |
| MSUD | maple syrup urine disease |
| NCS | nerve conduction study |
| NEC | necrotizing enterocolitis |
| NF | neurofibromatosis |
| NICU | neonatal intensive care unit |
| NS | normal saline |
| N/V | nausea/vomiting |
| OCP | oral contraceptive pill |
| ORT | oral rehydration therapy |
| OSA | obstructive sleep apnea |
| PAC | premature atrial contraction |
| PDA | patent ductus arteriosus |
| PKU | phenylketonuria |
| PPHN | persistent pulmonary hypertension of newborn |
| PPV | positive pressure ventilation |
| PUVA | psoralen + UVA |
| RAD | right axis deviation |
| RAS | renal artery stenosis |
| RBBB | right bundle branch block |
| RDS | respiratory distress syndrome |
| RF | rheumatoid factor |
| Rh | Rhesus factor |
| RL | Ringer's lactate |
| RSV | respiratory syncytial virus |
| RUSB | right upper sternal border |
| RVH | right ventricular hypertrophy |
| RVOTO | right ventricular outflow tract obstruction |
| SEM | systolic ejection murmur |
| SGA | small for gestational age |
| SIADH | syndrome of inappropriate antidiuretic hormone |
| SIDS | sudden infant death syndrome |
| SVT | supraventricular tachycardia |
| TEF | tracheo-esophageal fistula |
| TM | tympanic membrane |
| TPN | total parenteral nutrition |
| TTN | transient tachypnea of the newborn |
| UMN | upper motor neuron |
| URTI | upper respiratory tract infection |
| UVA | ultraviolet A |
| VCUG | voiding cystourethrogram |
| VSD | ventricular septal defect |
| VUR | vesicoureteral reflux |
| WPW | Wolff-Parkinson-White |

# Pediatric Quick Reference Values

**Table 1. Average Vitals at Various Ages**

| Age (years) | Pulse (bpm) | Respiratory Rate (br/min) | sBP (mmHg) |
|---|---|---|---|
| <1 | 110-160 | 30-40 | 70-90 |
| 1-2 | 100-150 | 25-35 | 80-95 |
| 2-5 | 95-140 | 25-35 | 80-100 |
| 5-12 | 80-120 | 20-25 | 90-110 |
| >12 | 60-100 | 15-20 | 110-120 |

# Primary Care

## Visit Overview

- schedule
  - newborn (within 1 wk post-discharge), 1, 2, 4, 6, 9, 12, 15, 18, 24 mo
  - annually between age 2-5; every 1-2 yr between age 6-18
- content
  - history and physical exam including growth, development, and nutrition
  - routine immunizations
  - counselling and anticipatory guidance
  - see evidence based clinical tools such as Rourke baby record and Greig health record for more information

### Standard Pediatric History

- acronym: **BINDS**: **B**irth, **I**mmunization, **N**utritional, **D**evelopmental, **S**ocial
- ID: name, age, major chronic medical concerns
- CC/RFR (chief complaint/reason for referral):
- HPI:
  - OPQRSTU
  - recent travel, sick contacts
- obstetrical history
  - prenatal/pregnancy history
    - conception
    - screening: blood group, Rh, DAT, HBsAg, Rubella, Syphilis, HIV, GBS

        - genetic screening: MSS, FTS, IPS, amniocentesis, special tests
        - ultrasounds
        - complications: illnesses, infections, bleeding, gestational diabetes (GDM), gestational hypertension (GHTN),
        - medications, vitamins, iron, smoking, drinking, drug use
        - gestational age at birth, birth weight
    - labour and delivery or birth history
        - labour complications: prolonged rupture of membranes, maternal fever, fetal tachycardia, meconium
        - spontaneous vaginal delivery, interventions required: forceps, vacuum, caesarian section (C/S)
        - resuscitation: APGARs
- past medical history
    - hospitalizations
    - past surgeries
- medications
- allergies
- immunizations
- developmental history
    - meeting major milestones
    - behavioural concerns
- nutritional history
    - breast vs formula feeding
    - milk intake
    - solids, variety etc
- family history
    - consanguinity
- social history
    - Who lives at home? Siblings?
    - Does the child attend daycare? Primary care givers?
    - school adjustment, friends, activities, safety, stability, stressors
    - HEADDSS history for adolescents

# Routine Immunization

**Table 2. Publicly Funded Immunization Schedule for Ontario, December 2016**

| Age | DTaP-IPV-Hib | TdaP-IPV | Pneu-C-13 | Rot-1 | Men-C-C | MMR | Var | MMRV | Men-C-ACYW | HepB | HPV-4 | Tdap | Inf |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 2 mo | ✓IM | | ✓IM | ✓PO | | | | | | | | | |
| 4 mo | ✓IM | | ✓IM | ✓PO | | | | | | | | | |
| 6 mo | ✓IM | | | | | | | | | | | | |
| 12 mo | | | ✓IM | | ✓IM | ✓SC | | | | | | | |
| 15 mo | | | | | | | ✓SC | | | | | | |
| 18 mo | ✓IM | | | | | | | | | | | | |
| 4-6 yr* | | ✓IM | | | | | | ✓SC | | | | | |
| Grade 7 | | | | | | | | | ✓IM | ✓IM 3 doses (0,1,6 mo) | ✓IM 2 doses (0,6 mo) | | |
| 14-16 yr | | | | | | | | | | | | ✓IM | |
| Every autumn (beginning at age 6 mo) | | | | | | | | | | | | | ✓IM |

IM = intramuscular; PO = per oral; SC = subcutaneous  * Preferably given at 4 years of age
DTaP = diphtheria, tetanus, acellular pertussis vaccine; TdaP-IPV = diphtheria, tetanus, acellular pertussis, inactivated polio vaccine (i.e. Pentacel®, Pentavax®);
HepB = hepatitis B vaccine; Hib = *Haemophilus influenzae* type b conjugate vaccine; HPV-4 = human papillomavirus vaccine; Inf = influenza vaccine;
MMR = measles, mumps, rubella vaccine; Men-B = multicomponent meningococcal B vaccine; Men-C-C = meningococcal c conjugate vaccine; Men ACYW – meningococcal vaccine; MMRV = measles, mumps, rubella, varicella vaccine; Pneu-C-13 = pneumococcal 13-valent conjugate vaccine; Rot-1 = rotavirus oral vaccine; Var = varicella vaccine

**Table 3. Adverse Reactions and Contraindications of Routine Immunizations**

| Vaccine | Adverse Reaction | Contraindication |
|---|---|---|
| TdaP-IPV | Prolonged crying<br>Hypotonic unresponsive state (rare)<br>Seizure on day of vaccine (rare) | Evolving unstable neurologic disease<br>Hyporesponsive/hypotonic following previous vaccine<br>Anaphylactic reaction to neomycin or streptomycin |
| Rot-1 | Cough<br>Diarrhea, vomiting | History of intussusception<br>Immunocompromised<br>Abdominal disorder (e.g. Meckel's diverticulum)<br>Received blood products (e.g. immunoglobulin) within 42 d |
| MMR | Measle-like rash (7-14 d)<br>Lymphadenopathy, arthralgia, arthritis<br>Parotitis (rare)<br>Especially painful injection<br>Transient thrombocytopenia (1/30,000) | Pregnancy<br>Immunocompromised infants (except healthy HIV positive children)<br>Anaphylactic reaction to gelatin |

**Canadian Immunization Guide**
National Advisory Committee on Immunization. Canadian Immunization Guide (CIG). Last Modified 2014. Public Health Agency of Canada, 2006. Available at: http://www.phac-aspc.gc.ca/publicat/cig-gci/

According to the CDC, the weight of currently available scientific evidence does not support the hypothesis that MMR vaccine causes either autism or IBD. The landmark paper linking autism to the MMR vaccine (*Lancet* 1998;351:637-641) was retracted due to false claims in the article (*Lancet* 2010;375:445)

**Adverse Reactions Associated With Any Vaccine**
- **Local**: induration, tenderness, redness, swelling
- **Systemic**: fever, rash, irritability
- **Allergic**: urticaria, rhinitis, anaphylaxis
- **Contraindications**
    - Moderate/severe illness ± fever
    - Allergy to vaccine component
- No need to delay vaccination for mild URTI

**Vaccination in Cases of Asplenia or Hyposplenia (such as Sickle Cell Disease)**
- Should receive all routine immunizations, including the yearly influenza vaccine
- No vaccines are contraindicated
- Susceptible to infection by encapsulated bacteria ("SHiNE KISS" –*S. pneumoniae, H. influenzae, N. meningitidis, E. coli, Klebsiella, Salmonella*, Group B Strep), so must add:
- Quadrivalent conjugated Meningococcal C vaccine (Men-C-ACYW) and Meningococcal B vaccine (4CMenB) at time of diagnosis if ≥2 mo (2-3 doses given at least 8 wk apart) with booster at 12-23 mo, every 3-5 yr until 7 yr of age, and every 5 yr thereafter
- Can omit routine Meningococcal-C-Conjugate at 12 mo of age if received Men-C-ACYW and expected to receive a second dose within 8 wk
- Pneumococcal polysaccharide vaccine (Pneu-P-23) at age ≥2 yr and single booster ≥5 yr after first dose
- Consider single booster HiB at age >5 yr

**Injection site**
Infants (<12 mo): anterolateral thigh

**Table 3. Adverse Reactions and Contraindications of Routine Immunizations** (continued)

| Vaccine | Adverse Reaction | Contraindication |
|---|---|---|
| Var | Mild varicella-like papules or vesicles; 2 wk may get local or generalized rash | Pregnant or planning to get pregnant within 3 mo<br>Anaphylactic reaction to gelatin |
| HepB | | Anaphylactic reaction to Baker's yeast |
| MMRV | Same as MMR and Var vaccines | Same as MMR and Var vaccines |
| DTaP | | 1st trimester pregnancy |
| Inf | Malaise, myalgia<br>Febrile seizure when given with Pneu-C 13 or DTaP<br>Hypersensitivity reaction | <6 mo of age<br>Immunocompromised<br>Egg-allergic individuals – Live attenuated influenza vaccine is not recommended for those with an egg allergy. In these individuals, trivalent or quadrivalent vaccine can be given in environment where anaphylaxis can be managed |
| HPV-4 | Pruritis | |
| MenB* | | Anaphylactic reaction to MenB vaccine or its components in the past |

* Currently only publicly funded for select groups (asplenia, antibody/complement deficiencies, cochlear implant recipients, HIV, close contacts with infected individuals)

DTaP = diphtheria, tetanus, acellular pertussis vaccine; TdaP-IPV = diphtheria, tetanus, acellular pertussis, inactivated polio vaccine (i.e. Pentacel®, Pentavax®); HepB = hepatitis B vaccine; Hib = *Haemophilus influenzae* type b conjugate vaccine; HPV-4 = human papillomavirus vaccine; Inf = influenza vaccine; MMR = measles, mumps, rubella vaccine; Men-B = multicomponent meningococcal B vaccine; Men-C-C = meningococcal c conjugate vaccine; Men ACYW – meningococcal vaccine; MMRV = measles, mumps, rubella, varicella vaccine; Pneu-C-13 = pneumococcal 13-valent conjugate vaccine; Rot-1 = rotavirus oral vaccine; Var = varicella vaccine

**Safety and Efficacy of an Attenuated Vaccine Against Severe Rotavirus Gastroenteritis**
NEJM 2006;354:11-22
**Purpose:** To evaluate the safety and efficacy of an attenuated G1P[8] human rotavirus (HRV) vaccine.
**Methods:** Randomized, double-blind, phase 3 trial including healthy infants from Latin America and Finland, assigned to receive two oral doses of HRV vaccine versus placebo at 2 and 4 mo of age. Primary outcomes were episodes of gastroenteritis and severity.
**Results:** 63,225 healthy infants were enrolled. The vaccine was 85% efficacious against severe rotavirus gastroenteritis and hospitalizations associated with gastroenteritis (p<0.001) and 100% efficacious against more severe gastroenteritis. Hospitalization for diarrhea of any cause was reduced by 42% (95% CI 29-53%, p<0.001). Six vaccine recipients and seven placebo recipients had definite intussusception within 31 d after each dose (risk difference -0.32/10,000 infants; 95% CI -2.91 to 2.18, **p=0.78**).
**Conclusion:** Two oral doses of the live attenuated HRV vaccine were highly efficacious in decreasing incidence of severe rotavirus and all-cause gastroenteritis, and were not associated with an increased risk of intussusception.

# Growth and Development

## Growth

- growth is not linear
  - most rapid growth during first 2 yr and at puberty
- measurement of growth
  - premature infants (<37 wk) use corrected GA until age 2
  - body proportion = upper/lower segment ratio (use symphysis pubis as midpoint)
    - newborn = 1.7, adult male = 0.9, adult female = 1.0

## Average Growth Parameters

**Table 4. Parameters of Average Growth at Birth**

| | Normal | Growth | Comments |
|---|---|---|---|
| **Birth Weight** | 3.25 kg (7 lbs) | Gain 20-30 g/d (term neonate)<br>2 x birth wt by 4-5 mo<br>3 x birth wt by 1 yr<br>4 x birth wt by 2 yr | Weight loss (up to 10% of birth weight) in first 7 d of life is normal<br>Neonate should regain birth weight by ~10-14 d of age |
| **Length/Height** | 50 cm (20 in) | 25 cm in 1st yr<br>12 cm in 2nd yr<br>8 cm in 3rd yr then<br>4-7 cm/yr until puberty<br>1/2 adult height at 2 yr | Measure supine length until 2 yr of age, then measure standing height |
| **Head Circumference** | 35 cm (14 in) | 2 cm/mo for 1st 3 mo<br>1 cm/mo at 3-6 mo<br>0.5 cm/mo at 6-12 mo | Measure around occipital, parietal, and frontal prominences to obtain the greatest circumference |

## Reflexes

**Table 5. Developmental or Primitive Reflexes**

| Reflex | Maneuver to Elicit Reflex | Appropriate Reflex Response | Age of Disappearance |
|---|---|---|---|
| **Moro** | Infant placed semi-upright, head supported by examiner's hand, sudden withdrawal of supported head with immediate return of support | Abduction and extension of the arms, opening of the hands, followed by flexion and adduction of arms | 4-6 mo |
| **Galant** | Infant held in ventral suspension and one side of back is stroked along paravertebral line | Pelvis will move in the direction of stimulated side | 2-3 mo |
| **Grasp** | Placement of examiner's finger in infant's palm | Flexion of infant's fingers | 3-4 mo |
| **ATNR** | Turn infant's head to one side | "Fencing" posture (extension of ipsilateral arm and leg and flexion of contralateral arm and leg) | 4-6 mo |
| **Placing** | Dorsal surface of infant's foot placed touching edge of table | Flexion followed by extension of ipsilateral limb up onto table (resembles primitive walking) | variable |
| **Rooting** | Tactile stimulus near mouth | Infant turns head and opens mouth to suck on same side that cheek was stroked | 2-3 mo |
| **Parachute** | Tilt infant to side while in sitting position | Ipsilateral arm extension, present by 6-8 mo | Does not disappear |

ATNR = asymmetric tonic neck reflex

**Abnormal Reflex Response (primitive reflex response present in infancy; tendon reflex response always present)**
- Primitive reflex responses are abnormal if: absent during neonatal period; assymetric; or persistent after 4-6 mo (e.g. cerebral palsy)
- Tendon reflex responses: asymmetry suggests focal motor lesions (e.g. brachial plexus injury); and absence or hyper-reflexia may suggest CNS abnormality
- Upgoing plantar reflex (Babinski's sign) normal in infants up to age 2 yr

## Developmental Milestones

### Table 6. Developmental Milestones

| Age* | Gross Motor | Fine Motor | Speech and Language | Cognitive/Problem Solving | Social/Emotional |
|---|---|---|---|---|---|
| **Newborn** | Primitive reflexes: step, place, Moro, Babinski, asymmetrical tonic neck reflex | Primitive reflexes: grasp | Primitive reflexes: root, suck | Fix and follow slow horizontal arc | Bonding between parent and child |
| **2 mo** | Briefly raises head 45° when prone | Hands open half of time | Turns to voice, cooing | Prefers familiar caregiver | Social smile |
| **4 mo** | Rolls prone to supine | Palmar grasp, reaches and obtains items, brings objects to midline | Squeals, laughs | Purposeful sensory exploration of objects (eyes, hands, mouth) | Explores parent's face |
| **6 mo** | Tripod sit, rolls both ways | Transfers objects from hand to hand | Babbles (nonspecific) | Stranger anxiety | Expresses emotions: happy, sad, mad |
| **9 mo** | Sits well without support, crawls, pulls to stand | Inferior pincer grasp | "Mama, dada" Gestures "bye bye", "up" | Plays games (e.g. peek-a-boo) Object permanence | Separation anxiety |
| **12 mo** | Walks a few steps | Fine pincer (fingertips), finger-feeds cheerios | 1 word with meaning (besides mama, dada), responds to own name, follows 1-step command with gesture | Uses objects functionally, cause and effect | Points at wanted items |
| **15 mo** | Walks without support, crawls up stairs/steps | Stacks 2 blocks, uses spoon | 4-5 words, follows 1-step command without gesture | Looks for moved hidden object if saw it being moved | Shared attention: points at interesting items to show to parent |
| **18 mo** | Runs, stoops and recovers | Tower of 4 blocks, scribbling, fisted pencil grasp | 10-25 words 3 body parts | Symbolic play with doll or bear | Parallel play |
| **24 mo** | Jumps on two feet | Tower of 6 cubes, handedness established | 2-3 word phrases, uses "I, me, you", 50% intelligible, understands 2-step commands | New problem-solving strategies without rehearsal | Testing limits, tantrums |
| **3 yr** | Rides tricycle, climbs up 1 foot per step | Toilet trained, undresses, draws circle and cross (+) | 3-step commands, 3-4 word phrases, "W" questions ("why?"), 200 words, 75% intelligible | Identifies shapes, counts to 3 | Cooperative play, role play (pretend play) |
| **4 yr** | Hops on 1 foot, climbs down 1 foot per step | Uses scissors, buttons clothes | Speech 100% intelligible, uses past tense, tells a story | Identifies 4 colours, counts to 4 | Has a preferred friend |
| **5 yr** | Skips, rides bicycle | Prints name, ties shoelaces | Fluent speech, future tense | Counts to 10 accurately, recite ABC's | Has group of friends |

*Use corrected GA until 2 yr

**Developmental Red Flags**
- Gross motor: not walking at 18 mo rolling too early at <3 mo
- Fine motor: hand preference at <18 mo
- Speech: <10 words at 18 mo
- Social: not smiling at 3 mo; not pointing at 15-18 mo
- See the Nipissing District Developmental Screen for a checklist of important 18 mo milestones: www.ndds.ca

# Nutrition

## Dietary Requirements

| Weight | <10 kg | 10-20 kg | >20 kg |
|---|---|---|---|
| Needs | 100 kcal/kg/d | 1000 cal + 50 kcal/kg/d for each kg >10 | 1500 cal + 20 kcal/kg/d for each kg >20 |

## Dietary Recommendations

- 0-6 mo: breast milk or formula
  - exclusive breast milk during first 6 mo recommended over formula unless contraindicated
  - breastfed infants require supplements: vitamin D (400 IU/d), fluoride (after 6 mo if not sufficient in water), iron (6-12 mo, only if not receiving fortified cereals/meat/meat alternatives)
- >6 mo: solid food introduction – do not delay beyond 9 mo
  - 2-3 new foods per wk, wait at least 2 d in between each food to allow time for adverse reaction identification
    - common allergens: eggs, milk, mustard, peanuts, seafood, sesame, soy, tree nut, wheat
  - early introduction of highly allergenic foods is recommended
  - offer lumpy, soft-cooked, pureed, mashed textured foods
  - 9-24 mo: switch to homogenized (3.25%) milk, offer 16oz/d to non-breast feeding infant
  - offer vegetables, fruit, grains, and full-fat milk in any order after iron-rich foods are given
  - provide up to 3 large feedings (meals) with 1-2 smaller feedings (snacks), depending on child's hunger/satiety cues
  - encourage self-feeding and introduce open cup (should be done by 18 mo)
  - foods to avoid
    - honey until past 12 mo (risk of botulism)

**Peanut Allergies in Children**
NEJM 2015;372(9):803-813
**Study:** 640 children identified as "at risk to peanut allergy" due to severe eczema, egg allergy, or both were split into two cohorts depending on their pre-existing sensitivity to peanut extract on skin-prick test. These two cohorts were randomized to peanut consumption or avoidance up until 60 mo of age.
**Results:** In the cohort with negative skin-prick test at start of study, prevalence of peanut allergy at 60 mo of age was 13.7% in peanut avoidance and 1.9% in the peanut consumption group. In cohort with positive skin-prick test at start of study, prevalence of peanut allergy at 60 mo of age was 35.3% in peanut avoidance and 10.6% in peanut consumption group.
**Conclusion:** Early introduction of peanuts significantly decreased prevalence of peanut allergies in children deemed "at risk to peanut allergy".

**Dietary Exposures and Allergy Prevention in High-Risk Infants**
Paediatr Child Health 2013;18(10):545-549
There is no evidence that restriction of highly allergenic foods is beneficial in the first year of life. Later introduction of peanut, fish, or egg does not prevent, and may increase the risk of developing food allergy. There is also no evidence that dietary restrictions during pregnancy or breastfeeding are protective to the child.

- added sugar, salt
- excessive milk (i.e. no more than 750 mL or 24 oz/d after 1 yr)
- limit juice intake (not nutritious, too much sugar), maximum 4-6 oz (1/2 cup) daily
- anything that is a choking hazard (chunks, round foods like grapes)
- 2-6 yr: switch to 2% milk (500 mL/d)
- can maintain breastfeeding during this time complementary to solids

### Breastfeeding

- content of breast milk
  - colostrum (first few days): clear, rich in nutrients (i.e. high protein, low fat), immunoglobulin
  - mature milk: 70:30 whey:casein ratio, fat from dietary butterfat, carbohydrate from lactose
- advantages
  - easily digested, low renal solute load
  - immunologic
    - reduction of acute illnesses (i.e. diarrhea, respiratory tract illnesses, acute otitis media) and may have longer term benefits
    - contains IgA, macrophages, active lymphocytes, lysozymes, lactoferrin (which inhibits *E. coli* growth in intestine)
    - lower pH promotes growth of *Lactobacillus* in GI tract
  - parent-child bonding
  - economical, convenient
- maternal contraindications
  - chemotherapy, radioactive compounds, or medications known to cross to breast milk
  - HIV/AIDS, active untreated TB, herpes in breast region
  - >0.5 g/kg/d of alcohol or illicit drugs
  - OCPs are not a contraindication to breastfeeding (estrogen may decrease lactation, but is not dangerous to infant)
- if poor weight gain: consider dehydration or FTT and may consider formula supplementation if insufficient milk production or intake
- oral candidiasis (thrush): treat baby with antifungal such as nystatin; can occur in breast or bottle-fed infants

**Medications that Cross into Breast Milk**
- Antimetabolites
- Bromocriptine
- Chloramphenicol
- High dose diazepam
- Ergots
- Gold
- Metronidazole
- Tetracycline
- Lithium
- Cyclophosphamide

**Signs of Inadequate Intake**
- <6 wet diapers/d after first wk
- <7 feeds/d
- Sleepy or lethargic, sleeping throughout the night <6 wk
- Weight loss >10% of birth weight
- Jaundice

**Signs of Adequate Intake**
- 1 wet diaper per/d of age for first wk
- 1-2 black or dark green stools (meconium)/d on Day 1 & 2
- 3+ brown/green/yellow stools/d on Day 3 & 4
- 3+ yellow, seedy stools/d on Day 5+

**Table 7. Common Formulas Compared to Breast Milk**

| Type of Nutrition | Indications | Content (as compared to breast milk) |
|---|---|---|
| **Cow's Milk-Based** (Enfamil®, Similac®) | Prematurity<br>Transition to breastfeeding<br>Contraindication to breastfeeding | Lower whey:casein ratio<br>Plant fats instead of dietary butterfat |
| **Fortified Formula** | Low birth weight<br>Prematurity | Higher calories and vitamins A, C, D, K<br>May only be used in hospital due to risk of fat-soluble vitamin toxicity |
| **Soy Protein** (Isomil®, Prosobee®) | Galactosemia<br>Desire for vegetarian/vegan diet* | Corn syrup solids or sucrose in place of lactose |
| **Partially Hydrolyzed Proteins** (Good Start®) | Delayed gastric emptying<br>Risk of cow's milk protein allergy | Protein is 100% whey with no casein |
| **Protein Hydrolysate** (Nutramigen®, Alimentum®, Pregestimil®, Portagen®) | Malabsorption<br>Food allergy including cow's milk protein allergy | Protein is 100% casein with no whey<br>Corn syrup solids, sucrose, or tapioca starch instead of lactose<br>Expensive |
| **Amino Acid** (Neocate®, PurAmino™) | Food allergy<br>Short gut | Free amino acids (no protein)<br>Corn syrup solids instead of lactose<br>Very expensive |
| **Metabolic** | Inborn errors of metabolism | Various different compositions for children with galactosemia, propionic acidemia, etc. |

* 10-35% of children with cow's milk protein allergy also have reactions to soy-based formula

## Injury Prevention Counselling

- injuries are the leading cause of death in children >1 yr of age
- main causes: motor vehicle crashes, burns, drowning, falls, choking, infanticide

**Table 8. Injury Prevention Counselling**

| 0-6 mo | 6-12 mo | 1-2 yr | 2-5 yr |
|---|---|---|---|
| Do not leave alone on bed, on changing table, or in tub<br>Keep crib rails up<br>Check water temperature before bathing<br>Do not hold hot liquid and infant at the same time<br>Check milk temperature before feeding<br>Appropriate car seats are required before leaving hospital | Install stair barriers<br>Discourage use of walkers<br>Avoid play areas with sharp-edged tables and corners<br>Cover electrical outlets<br>Unplug appliances when not in use<br>Keep small objects, plastic bags, cleaning products, and medications out of reach<br>Supervise during feeding<br>Appropriate car seats | Never leave unattended<br>Keep pot handles turned to back of stove<br>Caution with whole grapes, nuts, raw carrots, hotdogs, etc. due to choking hazard<br>No running while eating<br>Appropriate car seats | Bicycle helmet<br>Never leave unsupervised at home, driveway, or pool<br>Teach bike safety, stranger safety, and street safety<br>Swimming lessons (>4 yr), sunscreen (from 6 mo), fences around pools<br>Appropriate car seats |

Note: This list is not exhaustive. For more details, see Rourke Baby Record (http://www.rourkebabyrecord.ca/pdf/RBR2011Ont_Eng.pdf)

## Circumcision

- elective procedure
  - CPS affirms that circumcision is not medically indicated, and does not recommend routine circumcision for every newborn male
  - often for religious or culture reasons
- benefits: prevention of phimosis and slightly reduced incidence of UTI, STI, balanitis, cancer of the penis
- complications (<1%): local infection, bleeding, urethral injury
- **contraindications**: presence of genital abnormalities (e.g. hypospadias) or known bleeding disorder

**Newborn Male Circumcision**
Pediatr Child Health 2015;20(6):311-20
Canadian Paediatric Society and the American Academy of Pediatrics have both previously indicated that circumcision of newborn males is not a medically indicated procedure. Some evidence has subsequently suggested decreased urinary tract infections and incidence of some sexually transmited infections, including HIV, with circumcision. While such a benefit may be present in some boys and high-risk populations where the procedure may be considered in the context of reduction or treatment, the Canadian Paediatric Society continues to not recommend routine circumcision for every newborn male.

# Common Complaints

## Breath Holding Spells

- **clinical feature**: types
  - cyanotic (more common), usually associated with anger/frustration
  - pallid, usually associated with pain/surprise
- **epidemiology**: 0.1-5% of healthy children 6 mo-4 yr of age, usually start during first year of life
- **etiology**: child is provoked (usually by anger, injury, or fear) → holds breath and becomes silent → spontaneously resolves or loses consciousness
- **management**
  - usually resolves spontaneously and rarely progresses to seizure
  - help child control response to frustration and avoid drawing attention to spell
  - may be associated with iron deficiency anemia, improves with supplemental iron

## Crying/Fussing Child

- common etiologies: functional (e.g. hungry, irritable), colic, trauma, illness
- history
  - description of baseline feeding, sleeping, crying patterns
  - infectious symptoms: fever, tachypnea, rhinorrhea, ill contacts
  - feeding intolerance: gastroesophageal reflux with esophagitis, N/V, diarrhea, constipation
  - trauma
  - recent immunizations (vaccine reaction) or medications (drug reactions), including maternal drugs taken during pregnancy (neonatal withdrawal syndrome) and drugs that may be transferred via breast milk
  - inconsistent history, pattern of numerous emergency department visits, high-risk social situations all raise concern of maltreatment
  - consider broad array of possible underlying causes such as meningitis, sepsis, respiratory distress, constipation, etc.

## Infantile Colic

- **clinical feature**: unexplained paroxysms of irritability and crying for >3 h/d, >3 d/wk for >3 wk in an otherwise healthy, well-fed baby (rule of 3s)
- **epidemiology**: 10% of infants; usual onset 10 d to 3 mo of age with peak at 6-8 wk
- **etiology**: unknown. Theories: alterations in fecal microflora, cow's milk intolerance, GI immaturity or inflammation, poor feeding, maternal smoking
- diagnosis of exclusion after thorough history and physical exam to rule out identifiable causes such as otits media, cow's milk intolerance, GI problem, fracture
- **management**
  - parental relief, rest, and reassurance
  - hold baby, soother, car ride, music, vacuum, check diaper
  - some evidence for probiotics
  - maintain breastfeeding but eliminate allergens (cow's milk protein, eggs, wheat, and nuts) from mother's diet
  - time-limited (2 wk) trial of protein hydrolysate formula (e.g. Nutramigen®)
  - time – all resolve, most in the first 3-6 mo of life, no long-term adverse effects

## Dentition and Caries

### Dentition

- primary dentition (20 teeth)
  - first tooth at 5-9 mo (lower incisor), then 1/mo
  - 6-8 central teeth by 1 yr
  - assessment by dentist 6 mo after eruption of first tooth and certainly by 1 yr of age (Grade B recommendation)
- secondary dentition (32 teeth)
  - first adult tooth is 1st molar at 6 yr, then lower incisors

### Caries
- **early childhood caries**: presence of one or more decayed, missing (due to caries), or filled tooth surfaces in any primary tooth in a preschool-aged child
- **etiology**: multifactorial with biomedical factors (e.g. diet, bacteria, host) and social determinants of health
  - inappropriate feeding practices (e.g. frequent, prolonged bottle feeding, putting to bed with bottle, prolonged breast feeding, and excessive juice consumption) are important factors
- **prevention**
  - no bottle at bedtime, clean teeth after last feed
  - minimize juice and sweetened pacifier
  - clean teeth with soft damp cloth or toothbrush and water
  - water fluoridation
  - ensure every child has a dentist by 1 year of age

## Enuresis

### Definition
- involuntary urinary incontinence by day and/or night in child >5 yr

### General Approach
- should be evaluated if: dysuria; change in colour, odour, or stream; secondary or diurnal; change in gait; or stool incontinence are present

### Primary Nocturnal Enuresis
- **clinical feature**: involuntary loss of urine at night, bladder control has never been attained
- **epidemiology**: boys > girls; 10% of 6 yr olds, 3% of 12 yr olds, 1% of 18 yr olds
- **etiology**: developmental disorder or maturational lag in bladder control while asleep
- **management**
  - time, reassurance (~20% resolve spontaneously each yr), and avoidance of punishment or humiliation to maintain self-esteem
  - behaviour modification (limiting fluids and avoid caffeine-containing food before bedtime, void prior to sleep, ensure access to toilet, take out of diapers)
  - conditioning: "wet" alarm wakes child upon voiding (70% success rate)
  - medications (for children >7 yr, considered second line therapy, may be used for sleepovers/camp): DDAVP oral tablets (similar success rate as "wet" alarm therapy but higher relapse rate), imipramine (Tofranil®) (rarely used, lethal if overdose, SE: cardiac toxicity, anticholinergic effects)

### Secondary Enuresis
- **clinical feature**: involuntary loss of urine at night, develops after child has sustained period of bladder control (>6 mo)
- **etiology**: inorganic regression due to stress or anxiety (e.g. birth of sibling, significant loss, family discord, sexual abuse), secondary to organic disease (UTI, DM, DI, sleep apnea, neurogenic bladder, CP, seizures, pinworms)
- **management**: treat underlying cause

### Diurnal Enuresis
- **clinical feature**: daytime wetting (60-80% also wet at night)
- **etiology**: micturition deferral (holding urine until last minute) due to psychosocial stressor (e.g. shy), structural anomalies (e.g. ectopic ureteral site, neurogenic bladder), UTI, constipation, CNS disorders, DM
- **management**: treat underlying cause, behavioural (scheduled toileting, double voiding, good bowel program, sitting backwards on toilet, charting/incentive system, relaxation/biofeedback), good constipation management, pharmacotherapy

Treatment for primary nocturnal enuresis should not be considered until 7 yr of age due to high rate of spontaneous cure

**Antidiuretic Hormone Regulation in Primary Nocturnal Enuresis**
Arch Dis Child 1995;73(6):508-11
**Purpose**: To evaluate the efficacy of DDAVP for the treatment of primary nocturnal enuresis.
**Methods**: Children with primary nocturnal enuresis were compared with a corresponding control group. Diurnal and nocturnal urine production, ADH secretion, and plasma osmolality were determined.
**Results**: Ten children (mean age 10.5 yr) with primary nocturnal enuresis were compared to a control group of eight patients. No differences in urine production, ADH levels during day and night, or plasma osmolality were found. However, the enuretic children required a markedly greater ADH output (2.87 pg/ml/mmol/kg vs. 0.56 in controls; $p<0.01$).
**Conclusion**: ADH secretion is a function of plasma osmolality. Urine production is not increased at night in individuals with primary nocturnal enuresis because of lower ADH secretion.

## Encopresis

- **clinical feature**: fecal incontinence in a child >4 yr old, at least once per mo for 3 mo
- **prevalence**: 1-1.5% of school-aged children (rare in adolescence); M:F = 6:1 in school-aged children
- **causes**: chronic constipation (retentive encopresis), Hirschsprung disease, hypothyroidism, hypercalcemia, spinal cord lesions, anorectal malformations, bowel obstruction

### Retentive Encopresis
- **definition**: child holds bowel movement, develops constipation, leading to fecal impaction and seepage of soft or liquid stool (overflow incontinence)
- **etiology**
  - physical: painful stooling often secondary to constipation
  - emotional: disturbed parent-child relationship, coercive toilet training, social stressors
- **clinical feature**
  - history
    - crosses legs or stands on toes to resist urge to defecate
    - distressed by symptoms, soiling of clothes
    - toilet training coercive or lacking in motivation
    - may show oppositional behaviour
    - abdominal pain

  - physical exam
    - digital rectal exam or abdo x-ray: large fecal mass in rectal vault
    - anal fissures (result from passage of hard stools)
    - palpable stool in LLQ
- **management**
  - complete clean-out of bowel: PEG 3350 given orally is most effective, enemas and suppositories may be second line therapies, but these are invasive and often less effective
  - maintenance of regular bowel movements (see *Constipation*, P39)
  - assessment and guidance regarding psychosocial stressors
  - behavioural modification
- **complications**: recurrence, toxic megacolon (requires >3-12 mo to treat), bowel perforation

# Toilet Training

- 90% of children attain bowel control before bladder control
- generally, females train earlier than males
- 25% by 2 yr (in North America), 98% by 3 yr have daytime bladder control
- signs of toilet readiness
  - ambulating independently, stable on potty, desire to be independent or to please caregivers (i.e. motivation), sufficient expressive and receptive language skills (2-step command level), can stay dry for several h (large enough bladder), can recognize need to go, able to remove clothing

# Failure to Thrive

- **definition**
  - weight <3rd percentile, falls across two major percentile curves, or <80% of expected weight for height and age
  - inadequate caloric intake most common factor in poor weight gain
  - may have other nutritional deficiencies (e.g. protein, iron, vitamin D)
  - factors affecting physical growth: genetics, intrauterine factors, nutrition, endocrine hormones, chronic infections/diseases, psychosocial factors
- **clinical feature**
  - history
    - nutritional intake
    - current symptoms
    - past illnesses
    - family history: growth, puberty, parental height and weight including mid-parental height
    - psychosocial history
  - physical exam
    - growth parameters, plotted: height, weight, head circumference (if ≤2 yr)
      - <2 yr: height, weight, head circumference
      - ≥2 yr: height, weight, BMI
    - vital signs
    - complete head to toe exam
    - dysmorphic features or evidence of chronic disease
    - upper to lower segment ratio
    - sexual maturity staging
    - signs of maltreatment or neglect
- **investigations** (as indicated by clinical feature)
  - CBC, blood smear, electrolytes, T4, TSH
  - bone age x-ray
  - chromosomes/karyotype
  - chronic illness: chest (CXR, sweat $Cl^-$), cardiac (CXR, ECG, Echo), GI (celiac screen, inflammatory markers, malabsorption), renal (urinalysis), liver (enzymes, albumin)

**Table 9. Failure to Thrive Patterns**

| Growth Parameters | | | Suggestive Abnormality | |
|---|---|---|---|---|
| Decreased Wt | Normal Ht | Normal HC | Caloric insufficiency<br>Decreased intake | Hypermetabolic state<br>Increased losses |
| Decreased Wt | Decreased Ht | Normal HC | Structural dystrophies<br>Endocrine disorder | Constitutional growth delay (BA < CA)<br>Familial short stature (BA = CA) |
| Decreased Wt | Decreased Ht | Decreased HC | Intrauterine insult | Genetic abnormality |

BA = bone age; CA = chronological age; HC = head circumference; Ht = height; Wt = weight

**Mid-Parental Height**
- Boys target height = (father ht + mother ht + 13) / 2
- Girls target height = (father ht + mother ht – 13) / 2

**Note:** height should be taken in cm

**Clinical Signs of FTT**

**SMALL KID**
**S**ubcutaneous fat loss
**M**uscle atrophy
**A**lopecia
**L**ethargy
**L**agging behind normal
**K**washiorkor
**I**nfection (recurrent)
**D**ermatitis

**Upper to Lower Segment Ratio**
- **Increased** in achondroplasia, short limb syndromes, hypothyroid, storage diseases
- **Decreased** in Marfan's, Klinefelter's, Kallman's syndromes, and testosterone deficiency
- **Calculation:** upper segment/lower segment
  - Upper segment: top of head to pubic symphysis
  - Lower segment: pubic symphysis to floor

### Etiology
- an interplay between pathophysiology and psychosocial influences
- investigations should assess:
  1. complex factors in the parent-child relationship
     - dietary intake, knowledge about feeding, improper mixing of formula
     - feeding environment
     - parent-child interaction, attachment
     - child behaviours, hunger/satiety cues
     - postpartum depression
     - social factors: stress, poverty, neglect, child/domestic abuse, parental substance abuse, restricted diets
  2. inadequate caloric intake: inadequate milk supply/latching, mechanical feeding difficulty (cleft palate), oromotor dysfunction, toxin-induced anorexia
  3. inadequate absorption: biliary atresia, celiac, IBD, CF, inborn errors of metabolism, milk protein allergy, pancreatic cholestatic conditions
  4. increased metabolism: chronic infection, CF, lung disease from prematurity, hyperthyroidism, asthma, IBD, malignancy, renal failure

### Management
- most as outpatient using multidisciplinary approach: primary care physician, occupational therapist, dietitian, psychologist, social work, CAS
- medical: oromotor problems, iron-deficiency anemia, gastro-esophageal reflux
- nutritional: educate about age-appropriate foods, calorie boosting, mealtime schedules, and environment; goal to reach 90-110% IBW, correct nutritional deficiencies, and promote catch-up growth/development
- behavioural: positive reinforcement, mealtime environment, no distractions (e.g. toys, books, or TV) during mealtime

### Energy Requirements
- see *Nutrition*, P6

## Obesity

- **definition**: overweight is BMI >85th percentile; obesity is BMI >95th percentile for age and height
- **risk factors**: genetic predisposition (e.g. both parents obese – 80% chance of obese child), psychosocial/environmental contributors
- **etiology**: organic causes are rare (<5%), but may include Prader-Willi, Carpenter, Turner, Cushing syndromes, hypothyroidism
- **complications**: association with HTN, dyslipidemia, slipped capital femoral epiphysis, type 2 DM, asthma, obstructive sleep apnea, gynecomastia, polycystic ovarian disease, early menarche, irregular menses, psychological trauma (e.g. bullying, decreased self-esteem, unhealthy coping mechanisms, depression)
- childhood obesity often persists into adulthood
- **investigations**: BP, pulse, screen for: dyslipidemia, fatty liver disease (ALT), type 2 DM (based on risk factors)
- **management**
  - encouragement and reassurance; engagement of entire family
  - diet: qualitative changes (do not encourage weight loss, but allow for linear growth to catch up with weight), special diets used by adults and very low calorie diets are not encouraged
  - behaviour modification: increase activity, change eating habits/meal patterns, limit juice/sugary drinks, ensure adequate sleep
  - education: multidisciplinary approach, dietitian, counselling
  - surgery and pharmacotherapy are rarely used in children
  - increase physical activity (1 h/d), reduce screen time (<2 h/d)
  - small changes in energy expenditure and intake (lose 1 lb/mo)
  - long term goal: maintain BMI <85th percentile

## Poison Prevention

- keep all types of medicines, vitamins, and chemicals locked up in a secure container
- potentially dangerous: medications, illicit drugs, drain cleaners, furniture polish, insecticides, cosmetics, nail polish remover, automotive products
- do not store any chemicals in juice, soft drink, or water bottles
- keep alcoholic beverages out of reach: 3 oz hard liquor can kill a 2 yr old
- always read labels before administering medicine to ensure correct medication drug and dose and/or speak with a pharmacist or healthcare provider

**Perinatal and Early Childhood Factors for Overweight and Obesity in Young Canadian Children**
Can J Public Health 2013;104(1):e69-74
**Purpose**: To assess potential early-life factors and their interrelationships with obesity among young Canadian children.
**Methods**: Data from a nationally representative sample of children aged 6-11 yr in the Canadian Health Measures Survey were analyzed. The associations of perinatal and early childhood behaviours and socioeconomic factors with overweight or obesity were evaluated using multivariate logistic regression models.
**Results**: Of 968 term-born children, 21% were overweight and another 13% were obese. Maternal smoking during pregnancy was positively associated with obesity. This association was mediated by birth weight and once controlled, the strength of the association between smoking and child obesity increased by 12%. Birth weight per 100 g (1.05; 1.005-1.09) was significantly associated with obesity. Exclusive breastfeeding for 6 mo, adequate sleep hours, and being physically active were found to be protective. Breastfeeding, whether exclusive or not, significantly reduced obesity risk among children whose mothers never smoked in pregnancy.
**Conclusion**: This study identified multiple perinatal and childhood factors associated with obesity in young Canadian children. Effective prevention strategies targeting four modifiable maternal and child risk factors may reduce childhood obesity by up to 54% in Canada.

**Screen Time Guidelines (Canadian Society for Exercise Physiology)**
- Screen time is not recommended for children under 2 yr
- <1 h/d screen time is appropriate for children aged 2-5 yr
- <2 h/d screen time is appropriate for children 5-17 yr

# Rashes

**Table 10. Common Pediatric Rashes**

| Type of Rash | Differential | Appearance | Management |
|---|---|---|---|
| **Diaper Dermatitis** | Irritant contact dermatitis | Shiny, red macules/patches, no skin fold involvement | Eliminate direct skin contact with urine and feces, allow periods of rest without a diaper, frequent diaper changes, topical barriers (petrolatum, zinc oxide or paste), short-term low-potency topical corticosteroids (severe cases) |
| | Seborrheic dermatitis | Yellow, greasy macules/ plaques on erythema, scales | Short-term, moisturisers, topical antifungal (ketoconazole), low-potency topical corticosteroids |
| | Candidal dermatits | Erythematous macerated papules/plaques, satellite lesions, involvement of skin folds | Antifungal agents (e.g. clotrimazole, nystatin) |
| **Other Dermatitis** | Atopic dermatitis | Erythematous, papules/ plaques, oozing, excoriation, lichenification, classic areas of involvement | Eliminate exacerbating factors, maintain skin hydration (daily baths and moisturisers), corticosteroids,, topical calcineurin inhibitor (2nd line) |
| | Nummular dermatitis | Annular erythematous plaques, oozing, crusting | Avoid irritant if identified, potent topical steroid in emollient base, short-term systemic steroids ± antibiotics (severe) |
| | Allergic contact dermatitis | Red papules/plaques/vesicles/ bullae, only in area of allergen | Mild: soothing lotion (e.g. calamine lotion)<br>Moderate: low-to-intermediate potency topical corticosteroids<br>Severe: systemic corticosteroids and antihistamine |
| | Irritant contact dermatitis | Morphology depends on irritant | Avoid skin contact |
| | Dyshidrotic dermatitis | Papulovesicular, cracking/ fissuring, hands and feet ("tapioca pudding") | Mild/moderate: medium/potent topical corticosteroids<br>Severe: systemic corticosteroids, local PUVA or UVA treatments |
| **Infectious** | Scabies | Polymorphic (red excoriated papules/nodules, burrows), in web spaces/folds, very pruritic Often affects multiple family members | Permethrin (Nix®) 5% cream for patient and family (2 applications, 1 wk apart) |
| | Impetigo | Honey-coloured crusts or superficial bullae | Topical antibiotics if mild: fucidic acid or mupirocin cream; Oral antibiotics if severe (e.g. cephalexin/erythromycin) |
| | Tinea corporis | Round erythematous plaques, central clearing and scaly border | Topical anti-fungal for skin, systemic anti-fungals for nails/head |
| Pediatric Exanthems (see *Infectious Pediatric Exanthems*, P53) | | | |
| Acne (see Dermatology, D11) | | | |

# Sleep Disturbances

## Types of Sleep Disturbances

- insufficient sleep quantity
  - difficulty falling asleep (e.g. limit setting sleep disorder)
    - preschool and older children
    - bedtime resistance
    - due to caregiver's inability to set consistent bedtime rules and routines
    - often exacerbated by child's oppositional behaviours
- poor sleep quality
  - frequent arousals (e.g. sleep-onset association disorder)
    - infants and toddlers
    - child learns to fall asleep only under certain conditions or associations (e.g. with parent, held, rocked or fed, with light on, in front of television), and loses ability to self-soothe
    - during the normal brief arousal periods of sleep (q90-120 min), child cannot fall back asleep because same conditions are not present
- obstructive sleep apnea
  - **definition**: partial or intermittent complete airway obstruction during sleep causing disrupted ventilation and sleep pattern
  - **epidemiology**: 1-5% of preschool aged children, more common in African American children
  - **clinical features**: snoring/gasping/noisy breathing during sleep and irritable/tired/hyperactive during the day
  - **complications**: cardiovascular (HTN/LV remodelling due to sympathetic activation), growth, cognitive, and behavioural deficitis
  - **etiology**: adenotonsillar hypertrophy, craniofacial abnormalities, obesity

**Daily Sleep Requirement**
- <6 mo 16 h
- 6 mo 14.5 h
- 12 mo 13.5 h
- 2 yr 13 h
- 4 yr 11.5 h
- 6 yr 9.5 h
- 12 yr 8.5 h
- 18 yr 8 h

**Nap Patterns**
- 2/d at 1 yr
- 1/d at 2 yr: 2-3 h
- 0.5/d at 5 yr: 1.7 h

  - **investigations**: polysomnography is gold standard for diagnosis but not required (expensive, inaccessible)
  - **management**: adenotonsillectomy and weight management are first-line tx, follow-up for residual OSA. Watchful waiting acceptable in mild-moderate cases
    - adenotonseillectomy does not improve executive function/attention but improves behaviour, QOL, polysymnographic findings
    - use CPAP if adenotonsillectomy is contraindicated (cleft palate/bleeding disorder/acute tonsillitis), OSA w/ minimal adenotonsillar tissue, residual OSA
    - avoid pollutants/tobacco smoke, allergens
    - avoid use of corticosteroids and antibiotics
- parasomnias
  - episodic nocturnal behaviours (e.g. sleepwalking, sleep terrors, nightmares)
  - often involves cognitive disorientation and autonomic/skeletal muscle disturbance

### Management of Sleep Disturbances
- set strict bedtimes and "wind-down" routines
- do not send child to bed hungry
- positive reinforcement for: limit setting sleep disorder
- always sleep in own bed, in a dark, quiet, and comfortable room
- avoid screens before bedtime and avoid caffeine-containing food
- do not use bedroom for timeouts
- systematic ignoring and gradual extinction for: sleep-onset association disorder

### Nightmares
- **epidemiology**: common in boys, 4-7 yr old
- associated with REM sleep (anytime during night)
- **clinical feature**: upon awakening, child is alert and clearly recalls frightening dream ± associated with daytime stress/anxiety
- **management**: reassurance

### Night Terrors
- **epidemiology**: 15% of children have occasional episodes
- usually in first one third of night; arousal from deep (slow wave) sleep
- **clinical feature**: abrupt sitting up, eyes open, screaming/vocalization, occurs in early hours of sleep, stage 4 of sleep; signs of autonomic arousal with no memory of event, disoriented if awakened, inconsolable, stress/anxiety can aggravate them
- **management**: reassurance from parents, ensure child is safe (e.g. if sleepwalks), often remits spontaneously at puberty

## Sudden Infant Death Syndrome

### Definition
- sudden and unexpected death of an infant <12 mo of age in which the cause of death cannot be found by history, examination, or a thorough postmortem and death scene investigation

### Epidemiology
- 0.5/1000 (leading cause of death between 1-12 mo of age); M:F = 3:2
- more common in children placed in prone position
- in full term infants, peak incidence is 2-4 mo, 95% of cases occur by 6 mo
- increase in deaths during peak RSV season
- most deaths occur between midnight and 8 AM

### Risk Factors
- prematurity (<37 wk), early bed sharing (<12 wk), alcohol use during pregnancy, soft bedding, low birthweight, Indigenous background, male, no prenatal care, smoking in household, prone sleep position, poverty
- risk of SIDS is increased 3-5x in siblings of infants who have died of SIDS
- bed sharing: sleeping on a sofa, adult sleeping with an infant after consumption of alcohol/street drugs or extreme fatigue, sleeping on a surface with a fixed wall (couch/sofa), infant sleeping with someone other than primary caregiver

### Prevention
- "Back to Sleep, Front to Play" (place infant on back when sleeping, daily supervised play/"tummy time" in prone position)
- avoid sharing bed with infant
- avoid overheating and overdressing
- appropriate infant bedding (firm mattress, avoid loose bedding, pillows, stuffed animals, and crib bumper pads)
- exclusive breastfeeding in first mo and no smoking
- pacifiers appear to have a protective effect; do not reinsert if falls out during sleep
- infant monitors do not reduce incidence

**Brief Resolved Unexplained Events (BRUE)**
These are sudden, brief and now resolved episodes in an infant with one or more of the following: cyanosis or pallor; absent, decreased or irregular breathing; change in tone; and/or altered level of consciousness. The observer fears the child may be dying. The child should be asyptomatic on presentation and there is no explanation after a history and physical for the cause. There is no clear connection between most BRUEs and SIDS. Evaluating for a cause of the BRUE (e.g. infection, cardiac, neurologic) is guided by history, physical exam, and period of observation

# Adolescent Medicine

## Adolescent History (HEEADSSS)

- tailor your history according to the clinical context

**Home:** Who do you live with? What kind of place do you live in? Do you get along with your parents and/or siblings?

**Education/Employment:** What grade are you in? What are your favourite subjects? What was your average on your last report card (ask for changes)? How much school have you missed this past year? Do you work (if so, how much)? Do you get along with teachers/employers?

**Eating:** Tell me about your meals/snacks in a typical day. Have you ever gone on a diet? What are your favourite and least favourite foods? (see Psychiatry, *Eating Disorders*, PS34)

**Activities:** What do you do after school? On the weekends? How much time do you spend on the computer/watching TV every day? Do you use social media (i.e. Facebook, Twitter, Instagram, etc.)? What do you do with your friends outside of school?

**Drugs:** Which seems to be more popular at your school, alcohol or drugs? How often do you drink/smoke marijuana or cigarettes/take other drugs? Have you ever passed out or not been able to remember what happened? Has anything bad ever happened to you while you were drunk or stoned?

- can organize as a CRAFFT screen:
  - Part A: during the last 12 mo, did you:
    1. Drink any alcohol?
    2. Smoke any marijuana or hashish?
    3. Use anything else to get high?
  - Part B:
    1. Have you ever ridden in a car driven by someone (including yourself) who was high or had been using drugs/alcohol?
    2. Do you ever use drugs/alcohol to relax, feel better about yourself, or fit in?
    3. Do you ever use drugs/alcohol when you are alone?
    4. Do you ever forget things you did while using drugs/alcohol?
    5. Do your family/friends ever tell you that you should cut down on your drinking or drug use?
    6. Have you ever gotten into trouble while you were using drugs/alcohol?
- see Psychiatry, *Substance Abuse*, PS25

**Sexuality:** Are you romantically interested in anyone? When you think about having sex with someone, do you think about females, males, or both? Have you ever had sex with anyone? Whether the answer is yes or no, the next question is: What activities would you include in the term 'having sex'? What do you do to prevent getting a STI/getting pregnant/getting someone pregnant? Has anyone ever given you money, drugs, or other stuff in exchange for sex? (see Gynecology, *Sexually Transmitted Infections*, GY26)

**Suicidality/Depression:** On a scale of 1 to 10, where 1 is so sad that you might kill yourself and 10 is the happiest you could be, where are you most days? Have you lost interest in activities that you used to enjoy? Do you often have trouble sleeping (Is there a difference between school days and the weekend?)? Have you ever thought seriously about suicide? Did you make a plan? (see Psychiatry, *Depression/Suicide*, PS12, PS5)

**Safety/Violence:** Do you ever get into a car with a driver who has been drinking? Do you always wear a seatbelt/bicycle helmet? Are you being bullied at school? Has anyone ever touched you in an unwanted way?

See *Disorders of Sexual Development*, P30

**Adolescent Psychosocial Assessment**

**HEEADSSS**
**H**ome
**E**ducation/Employment
**E**ating
**A**ctivities
**D**rugs
**S**exuality
**S**uicide and depression
**S**afety/violence

Rates of drug use in high school students who have used in the past year: alcohol (58.2%), cannabis (25.6%), tobacco (11.7%)

**Consent and Close Age Exceptions**

- The age of consent is 16
- A youth 16 or 17 cannot consent if: the partner is in a position of trust/authority (e.g. coach, teacher), young person is dependent on the partner (e.g. for care or support), the relationship is exploitative (e.g. prostitution or pornography)
- A 14 or 15-year old can consent as long as the partner is less than 5 years older and as long as there is no relationship of trust, authority, dependency, or exploitation
- A 12 or 13-year old can consent as long as the partner is less than 2 years older and as long as there is no relationship of trust, authority, dependency, or exploitation

Date rape comprises 80% of sexual assault in teenagers

Prevalence of depression: 1-2% in pre-pubertal children and 6-8% in adolescents

**Table 11. Developmental Stages of Adolescence**

| | Early Adolescence (10-13 yr) | Middle Adolescence (14-16 yr) | Late Adolescence (17-19 yr) |
|---|---|---|---|
| **Cognitive and moral** | Concrete<br>Unable to perceive long-term outcome of current decision-making | Emergence of abstract thought<br>Questioning mores | Future oriented with sense of perspective<br>Idealism<br>Ability to think things through independently |
| **Self-concept/identity formation** | Preoccupied with changing body<br>Self-consciousness about appearance and attractiveness | Concern with attractiveness<br>"Stereotypical adolescent" | More stable body image<br>Attractiveness may still be of concern<br>Firmer identity |
| **Family** | Increased need for privacy | Conflicts over control and independence<br>Struggle for acceptance of greater autonomy | Emotional and physical separation from family<br>Increased autonomy |
| **Peers** | Seeks same-sex peer affiliation to counter instability | Intense peer group involvement<br>Preoccupation with peer | Peer group and values recede in importance<br>Intimacy/possible commitment takes precedence |
| **Sexual** | Increased interest in sexual anatomy<br>Anxieties and questions about genital changes, size<br>Limited dating and intimacy | Testing ability to attract partner<br>Initiation of relationships and sexual activity<br>Questions of sexual orientation | Consolidation of sexual identity<br>Focus on intimacy and formation of stable relationships |

# Child Abuse and Neglect

### Definition
- an act of commission (physical, sexual, or psychological abuse) or omission (neglect) by a caregiver that harms a child

### Legal Duty to Report
- upon reasonable grounds to suspect abuse and/or neglect, physicians are required by legislation to contact the CAS to personally disclose all information relevant to the child's safety concern
- duty to report overrides patient confidentiality; physician is protected against liability

### Ongoing Duty to Report
- if there are additional reasonable grounds to suspect abuse and/or neglect, a further report to the CAS must be made

### Risk Factors
- environmental factors: social isolation, poverty, domestic violence
- caregiver factors: personal history of abuse, psychiatric illness, postpartum depression, substance abuse, single parent family, poor social and vocational skills, below average intelligence
- child factors: difficult temperament, disability, special needs (e.g. developmental delay), premature

### Management of Physical Abuse, Child Abuse, and Neglect
- do not take an abuse history from a young child; this must be done by trained personnel (e.g. during a forensic interview)
- report all suspicions to CAS; request emergency visit if imminent risk to child or any siblings in the home
- acute medical care: hospitalize for medical evaluation or treatment of injuries if indicated
- arrange consultation from social work and appropriate follow-up

# Physical Abuse

### History
- history that is not compatible with physical findings or with child's developmental capabilities
- history not reproducible or changes dramatically over time
- delay in seeking medical attention that is unexplained by other factors
- assess previous trauma or hospitalizations
- ask FHx: bleeding disorder, bone disorder, metabolic conditions
- ask developmental history

### Physical Exam
- physical findings not explained by underlying medical condition
- growth parameters including past recorded parameters (weight, height, head circumference)
- multiple injuries not explained by accidental injury or child's development level
- patterned skin injuries: linear, shapes, etc. that do not match provided history
- injury location:
  - bruises: on areas with abundant soft-tissue cushioning, such as abdomen, buttocks, genitalia, fleshy part of cheek or on ears, neck or feet, bruises that do not fit described cause
  - fractures: posterior rib/metaphyseal/scapular/vertebral/sternal fractures (more suspicious for non-accidental injuries)
  - immersion burns (e.g. hot water)
- altered mental status: head injury, poisoning
- eyes – retinal hemorrhages
- scalp – patchy hair loss from traumatic alopecia or severe malnutrition
- oral exam – check the frenula for tears
- head trauma is the leading cause of death in child maltreatment (e.g. acceleration-deceleration forces [shaking], direct force application [blow or impact])
- consider "red herrings" (e.g. slate grey macule/congenital dermal melanocytosis vs. bruises)

**Medical Assessment of Bruising in Suspected Child Maltreatment Cases**
Paediatr Child Health 2013;18(8):433-7
**CPS Position Statement**: While bruises are most often due to minor accidental injury, they may also signal underlying medical illness or inflicted injury. Knowing when to assess bruises in the context of maltreatment can be challenging. The following are red flags for inflicted injury in such bruising cases:
- Babies not yet cruising
- Present on ears, neck, feet, buttocks or torso
- Not on the front of the body and/or overlying bone
- Unusually large or numerous
- Clustered or patterned
- Not fitting with the described causal mechanism

### Investigations
- document all injuries on a body diagram: type, location, size, shape, colour, pattern
  - photography of skin injuries is ideal (police or hospital photography preferred; do not use physician's personal camera)
- rule out medical causes of bruising/fracture with appropriate investigations (e.g. blood disorders or rickets):
  - if fractures evident: $Ca^{2+}$, $Mg^{2+}$, $PO_4^{3-}$, ALP, PTH, Vitamin D, albumin
  - if bruising present: CBC, INR, PTT, von Willebrand factor, factors VIII/IX
- screen for abdominal trauma
  - transaminases and amylase if elevated: abdo CT recommended
  - renal function – electrolytes, urinalysis
    - toxicology screen – overdose or poisoning
- skeletal survey in children <2 yr; select imaging based on history in children >5 yr
  - neuroimaging: CT and/or MRI - dilated eye examination by pediatric ophthalmologist to rule out retinal hemorrhage if subdural hemorrhage detected on head imaging

# Sexual Abuse

### Epidemiology
- peak ages at 2-6 yr and 12-16 yr, most do not report until adulthood
- as adults: more likely to develop obesity, sexual problems, IBS, fibromyalgia, STI, substance use disorder
- more likely to experience intimate partner violence and sexual assault
  - in decreasing order: family member, non-relative known to victim, stranger

### History
- psychosocial: specific or generalized fears, depression, nightmares, social withdrawal, lack of trust, low self-esteem, school failure, sexually aggressive behaviour, advanced sexual knowledge, sexual preoccupation or play

### Physical Exam
- recurrent UTIs, pregnancy, STIs, vaginitis, vaginal bleeding, pain, genital injury, enuresis
  - anogenital exam performed along with head-to-toe physical for physical trauma
  - instrumentation not required for anogenital exam, speculum contraindicated in prepubertal girls
  - most victims have normal anogenital exam – cannot rule out sexual abuse if exam is negative

### Investigations
- depend on presentation, age, sex, and pubertal development of child
  - sexual assault examination kit within 24 h if prepubertal, within 72 h if pubertal
  - rule out STI, UTI, pregnancy (consider STI prophylaxis or emergency contraception)
  - rule out other injuries (vaginal/anal/oral penetration, fractures, head trauma)
  - investigations to rule out drug and alcohol screen e.g. Rohypnol, 'Liquid G,' etc.

# Neglect

### Definition
- omissions in care by parents or caregiver that leads to actual or potential harm

### History
- from child and each caregiver separately (if possible)

### Physical Exam
- head to toe (do not force), growth parameters, nutrition status
- dental care
- emotional state

### Investigations
- blood tests to rule out medical conditions or nutritional deficiencies (e.g. thrombocytopenia or coagulopathy)

**Presentation of Neglect**
- FTT, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents, no stranger anxiety

# Cardiology

## Congenital Heart Disease

### PRENATAL CIRCULATION

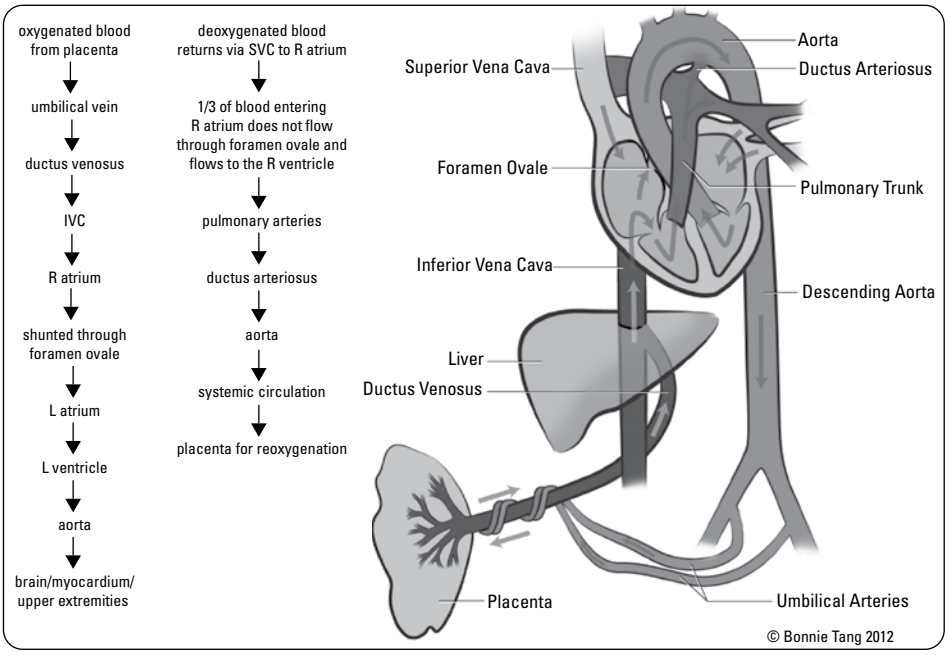

**Figure 1. Prenatal circulation**

Fetal circulation is designed so that oxygenated blood is preferentially delivered to the brain and myocardium

#### Before Birth

- shunting deoxygenated blood
  - ductus arteriosus: connection between pulmonary artery and aorta
- shunting oxygenated blood
  - foramen ovale: connection between right and left atria
  - ductus venosus: connection between umbilical vein and inferior vena cava

#### At Birth

- with first breath, lungs open up → pulmonary resistance decreases → pulmonic blood flow increases
- separation of low resistance placenta → systemic circulation becomes a high resistance system → ductus venosus closure
- increased pulmonic flow → increased left atrial pressures → foramen ovale closure
- increased oxygen concentration in blood after first breath → decreased prostaglandins → ductus arteriosus closure
- closure of fetal shunts and changes in vascular resistance → infant circulation assumes normal adult flow

#### Epidemiology

- 8/1000 live births have CHD, which may present as a heart murmur, heart failure, or cyanosis; VSD is the most common lesion

#### Investigations

- Echo, ECG, CXR
- pre and postductal oxygen saturations, 4 limb BPs, hyperoxia test

### CYANOTIC VS. ACYANOTIC CONGENITAL HEART DISEASE

- cyanosis: blue mucous membranes, nail beds, and skin secondary to an absolute concentration of deoxygenated hemoglobin of at least 30 g/dL
- acyanotic heart disease (i.e. L to R shunt, obstruction occurring beyond lungs): blood passes through pulmonic circulation → oxygenation takes place → low levels of deoxygenated blood in systemic circulation → no cyanosis
- cyanotic heart disease (i.e. R to L shunt): blood bypasses the lungs → no oxygenation occurs → high levels of deoxygenated hemoglobin enters the systemic circulation → cyanosis

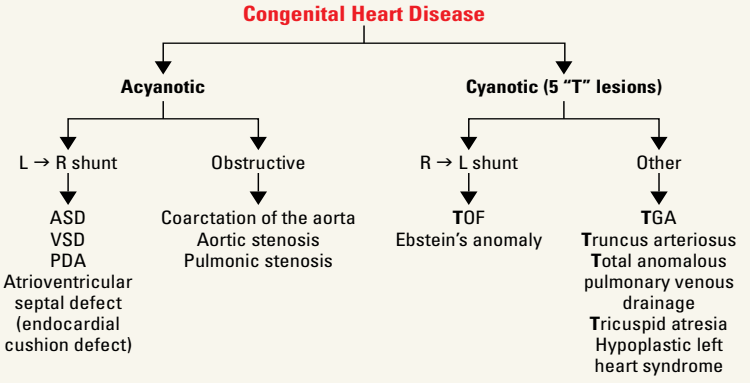

**Figure 2. Common congenital heart diseases**

**Characteristic CXR Findings in CHD**
- Boot-shaped heart: tetralogy of Fallot, tricuspid atresia
- Egg-shaped heart: transposition of great arteries
- "Snowman" heart: total anomalous pulmonary venous return

# Acyanotic Congenital Heart Disease

## 1. LEFT-TO-RIGHT SHUNT LESIONS

- extra blood is displaced through a communication from the left to the right side of the heart → increased pulmonary blood flow → increased pulmonary pressures
- shunt volume is dependent upon three factors: (1) size of defect, (2) pressure gradient between chambers or vessels, and (3) peripheral outflow resistance
- untreated shunts can result in pulmonary vascular disease, left ventricular dilatation and dysfunction, right ventricular HTN and RVH, and ultimately R to L shunts

### Atrial Septal Defect

- 3 types: *ostium primum* (common in DS, defect located at mitral or tricuspid valves), *ostium secundum* (most common type, 50-70%, defect located at septum between left and right atria), *sinus venosus* (defect located at entry of superior vena cava into right atrium)
- **epidemiology**: 6-8% of congenital heart lesions, common in patients with certain congenital disorders (e.g. Down's syndrome, fetal alcohol syndrome)
- **natural history**
  - 80-100% spontaneous closure rate if ASD diameter <8 mm
  - if remains patent, CHF and pulmonary HTN can develop in adult life
- **clinical feature**
  - history: often asymptomatic in childhood
  - physical exam: grade 2-3/6 pulmonic outflow murmur, widely split, and fixed S2
  - children with large ASDs may have signs of heart failure (tachypnea, FTT, hepatomegaly, pulmonary rales/retractions)
- **investigations**
  - ECG: RAD, mild RVH, RBBB (normal ECG does not rule out)
  - CXR: increased pulmonary vasculature, cardiac enlargement (normal ECG does not rule out)
  - Echo: diagnostic
- **management**
  - elective surgical or catheter closure between 2-5 yr of age, though majority require no surgery
  - size <8 mm will likely spontaneously close

### Ventricular Septal Defect

- most common congenital heart defect (30-50%)
- small VSD (majority)
  - **clinical feature**
    - history: asymptomatic, normal growth, and development
    - physical exam: early systolic to holosystolic murmur, best heard at LLSB, thrill
  - **investigations**: Echo to confirm diagnosis (ECG and CXR are normal)
  - **management**: most close spontaneously
- moderate-to-large VSD
  - **epidemiology**: CHF by 2 mo; late secondary pulmonary HTN if left untreated
  - **clinical feature**
    - history: delayed growth, decreased exercise tolerance, recurrent URTIs or "asthma" episodes
    - physical exam: holosystolic murmur at LLSB, mid-diastolic rumble at apex, size of VSD is inversely related to intensity of murmur, loss of splitting of second heart sound and a loud P2 suggests pulmonary hypertension
  - **investigations**
    - ECG: LVH, LAH, RVH (normal ECG does not rule out)
    - CXR: increased pulmonary vasculature, cardiomegaly, CHF (normal CXR does not rule out)
    - Echo: diagnostic
  - **management**: treatment of CHF and surgical closure by 1 yr old, if surgery required

Moderate-to-Large VSD
Size of VSD is inversely related to intensity of murmur

### Patent Ductus Arteriosus

- patent vessel between descending aorta and left pulmonary artery (normally, functional closure within first 15 h of life, anatomical closure within first days of life)
- **epidemiology**
  - 5-10% of all congenital heart defects
  - delayed closure of ductus is common in premature infants (1/3 of infants <1750 g); this is different from PDA in term infants
- **natural history**: spontaneous closure common in premature infants, less common in term infants
- **clinical feature**
  - history: asymptomatic, or have apneic or bradycardic spells, poor feeding, accessory muscle use, CHF
  - physical exam: tachycardia, bounding pulses, hyperactive precordium, wide pulse pressure, continuous "machinery" murmur best heard at left infraclavicular area
- **investigations**
  - ECG: may show left atrial enlargement, LVH, RVH
  - ECHO is diagnostic
  - CXR: may show normal to mildly enlarged heart, increased pulmonary vasculature, prominent pulmonary artery
- **management**
  - indomethacin (Indocid®): antagonizes prostaglandin E2, which maintains ductus arteriosus patency; only effective in premature infants
  - catheter or surgical closure if PDA causes respiratory compromise, FTT, or persists beyond 3rd mo of life

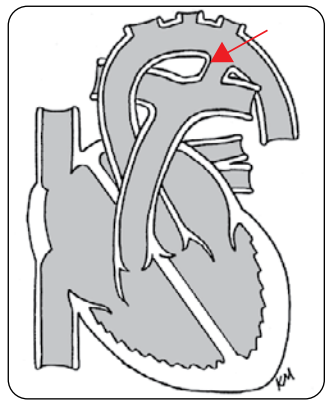

Figure 3. Patent duct arteriosus

**Physical Exam for PDA (in term infant)**
- Heavy "machinery" murmur
- High pulse rate
- Wide pulse pressure
- Hyperactive precordium
- Big bounding pulse

## 2. OBSTRUCTIVE LESIONS

- present with decreased urine output, pallor, cool extremities and poor pulses, shock, or sudden collapse

### Coarctation of the Aorta

- **definition**: narrowing of aorta (almost always at the level of the ductus arteriosus)
- **epidemiology**: commonly associated with bicuspid aortic valve (50%); Turner syndrome (35%)
- **clinical feature**
  - history: often asymptomatic
  - physical exam
    - blood pressure discrepancy between upper and lower extremities (increased suspicion/severity if >20 mmHg difference)
    - diminished or delayed femoral pulses relative to brachial (i.e. brachial-femoral delay)
    - possible systolic murmur with late peak at apex, left axilla, and left back
    - if severe, presents with shock in the neonatal period when the ductus arteriosis closes
- **investigations**: ECG shows RVH early in infancy, LVH later in childhood; Echo or MRI for diagnosis
- **prognosis**: can be complicated by HTN; if associated with other lesions (e.g. PDA, VSD) can lead to CHF
- **management**: give prostaglandins to keep ductus arteriosus patent for stabilization and perform surgical correction in neonates; for older infants and children balloon arterioplasty may be an alternative to surgical correction

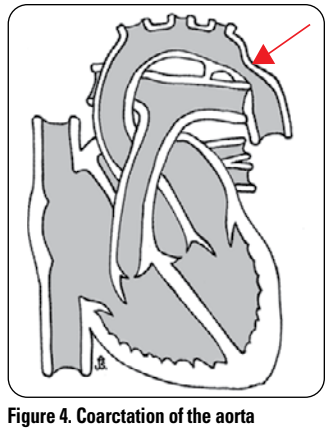

Figure 4. Coarctation of the aorta

### Aortic Stenosis

- 4 types: valvular (75%), subvalvular (20%), supravalvular, and idiopathic hypertrophic subaortic stenosis (5%)
- **clinical feature**
  - history: often asymptomatic, but may be associated with CHF, exertional chest pain, syncope, or sudden death
  - physical exam: SEM at RUSB with aortic ejection click at the apex (only for valvular stenosis)
- **investigations**: echo for diagnosis
- **management**: valvular stenosis is usually treated with balloon valvuloplasty, patients with subvalvular or supravalvular stenosis require surgical repair, exercise restriction required

### Pulmonary Stenosis

- 3 types: valvular (90%), subvalvular, or supravalvular
- **definition of critical pulmonary stenosis**: inadequate pulmonary blood flow, dependent on ductus for oxygenation, progressive hypoxia and cyanosis
- **natural history**: may be part of other congenital heart lesions (e.g. Tetralogy of Fallot) or in association with syndromes (e.g. congenital rubella, Noonan syndrome)
- **clinical feature**
  - history: spectrum from asymptomatic to CHF
  - physical exam: wide split S2 on expiration, SEM at LUSB, pulmonary ejection click (for valvular lesions)
- **investigations**
  - ECG findings: RVH
  - CXR: post-stenotic dilation of the main pulmonary artery (due to high velocity jet past stenotic valve)
  - Echo: diagnostic
- **management**: surgical repair if critically ill or if symptomatic in older infants/children

# Cyanotic Congenital Heart Disease

- systemic venous return re-enters systemic circulation directly
- most prominent feature is cyanosis ($O_2$ sat <75%)
- hyperoxic test differentiates between cardiac and other causes of cyanosis
  - obtain preductal, right radial ABG in room air, then repeat after the child inspires 100% $O_2$
  - if $PaO_2$ improves to > mmHg, cyanosis less likely cardiac in origin
- pre-ductal and post-ductal pulse oximetry
  - >5% difference suggests R to L shunt

**Causes of Cyanotic Heart Disease – 5T's**
**T**runcus arteriosus
**T**ransposition of the great vessels
**T**ricuspid atresia
**T**etralogy of Fallot
**T**otal anomalous pulmonary venous return

## 1. RIGHT-TO-LEFT SHUNT LESIONS

### Tetralogy of Fallot

- **epidemiology**: 10% of all CHD, most common cyanotic heart defect diagnosed beyond infancy with peak incidence at 2-4 mo of age
- **pathophysiology**
  - embryological defect due to anterior and superior deviation of the outlet septum leading to: VSD, RVOTO (i.e. pulmonary stenosis ± subpulmonary valve stenosis), over-riding aorta, and RVH
    - infants may initially have a L → R shunt (therefore no cyanosis); however, RVOTO is progressive, leading to increasing R → L shunting with hypoxemia and cyanosis
    - degree of RVOTO determines the direction and degree of shunt and, therefore, the extent of clinical cyanosis and degree of RVH
- **clinical feature**
  - history: hypoxic "tet" spells
    - during exertional states (crying, exercise) the increasing pulmonary vascular resistance and decrease in systemic resistance causes an increase in right-to-left shunting
    - clinical features include paroxysms of rapid and deep breathing, irritability and crying, increasing cyanosis, decreased intensity of murmur (decreased flow across RVOTO), patient squatting for relief (increased peripheral resistance, decreased R to L shunting)
    - if severe, can lead to decreased level of consciousness, seizures, death
  - physical exam
    - single loud S2 due to severe pulmonary stenosis (i.e. RVOTO), SEM at LSB
- **investigations**
  - ECG: RAD, RVH
  - CXR: boot-shaped heart, decreased pulmonary vasculature, right aortic arch (in 20%)
  - Echo: diagnostic
- **management of spells**: $O_2$, knee-chest position, fluid bolus, morphine sulfate, propranolol
- **treatment**: surgical repair at 4-6 mo of age; earlier if marked cyanosis or "tet" spells

**Tetralogy of Fallot**
1. VSD
2. RVOTO
3. Aortic root "overriding" VSD
4. RVH

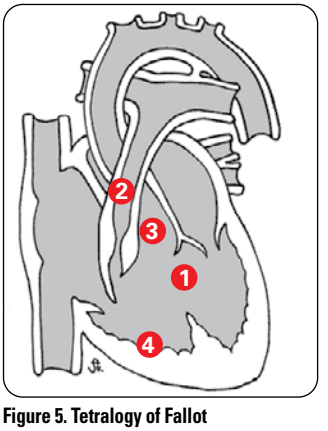

**Figure 5. Tetralogy of Fallot**

## 2. OTHER CYANOTIC CONGENITAL HEART DISEASES

### Transposition of the Great Arteries (TGA)

- **epidemiology**: 3-5% of all congenital cardiac lesions, most common cyanotic CHD in neonates
- **pathophysiology**: parallel pulmonary and systemic circulations
  - systemic: body → RA → RV → aorta → body
  - pulmonary: lungs → LA → LV → pulmonary artery → lungs
  - survival is dependent on mixing through PDA, ASD, or VSD
- **physical exam**
  - neonates: ductus arteriosus closure causes rapidly progressive severe hypoxemia unresponsive to oxygen therapy, acidosis, and death
  - VSD present: cyanosis is not prominent; CHF within first weeks of life
  - VSD absent: no murmur
- **investigations**
  - ECG: RAD, RVH, or may be normal
  - CXR: egg-shaped heart with narrow mediastinum ("egg on a string")
  - Echo: diagnostic
- **management**
  - symptomatic neonates: prostaglandin E1 infusion to keep ductus open until balloon atrial septostomy
  - surgical repair: arterial switch performed in the first two weeks in those without a VSD while LV muscle is still strong

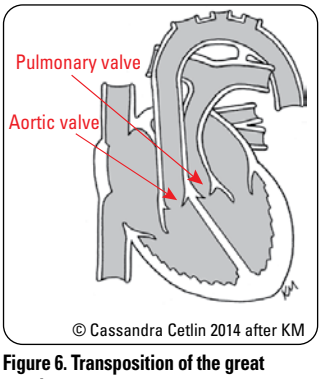

**Figure 6. Transposition of the great arteries**

### Total Anomalous Pulmonary Venous Return

- **epidemiology**: 1-2% of CHD
- **pathophysiology**
  - all pulmonary veins drain into right-sided circulation (systemic veins, RA)
  - no direct oxygenated pulmonary venous return to left atrium
  - often associated with obstruction at connection sites
  - ASD must be present for oxygenated blood to shunt into the LA and systemic circulation
- **management**: surgical repair in all cases and required urgently for severe cyanosis

**Ebstein's Anomaly**
- Septal and posterior leaflets of tricuspid valve are malformed and displaced into the RV
- Potential for RV dysfunction, tricuspid stenosis, tricuspid regurgitation, or functional pulmonary atresia if RV unable to open pulmonic valves
- Accessory conduction pathways (e.g. WPW) are often present

**Etiology**
- Unknown, associated with maternal lithium and benzodiazepine use in 1st trimester

**Treatment**
- Newborns: consider closure of tricuspid valve + aortopulmonary shunt, or transplantation
- Older children: tricuspid valve repair or valve replacement + ASD closure

### Truncus Arteriosus
- **pathophysiology**
  - single great vessel gives rise to the aorta, pulmonary, and coronary arteries
  - truncal valve overlies a large VSD
  - potential for coronary ischemia with fall in pulmonary vascular resistance
- **management**: surgical repair within first 6 wk of life

### Hypoplastic Left Heart Syndrome
- **epidemiology**: 1-3% of CHD; most common cause of death from CHD in first mo of life
- **pathophysiology**: LV hypoplasia may include atretic or stenotic mitral and/or aortic valve, small ascending aorta, and coarctation of the aorta with resultant systemic hypoperfusion
- systemic circulation is dependent on ductus patency; upon closure of the ductus, infant presents with circulatory shock and metabolic acidosis
- **management**
  - intubate and correct metabolic acidosis
  - IV infusion of prostaglandin E1 to keep ductus open
  - surgical palliation (overall survival 50% to late childhood) or heart transplant

**4 Features of Hypoplastic Left Heart Syndrome**
- Hypoplastic LV
- Narrow mitral/aortic valves
- Small ascending aorta
- Coarctation of the aorta

## Congestive Heart Failure

• see Cardiology and Cardiac Surgery, C34

### Etiology
- CHD
- cardiomyopathy (primary or secondary)
- high output circulatory states (e.g. anemia, AVMs, cor pulmonale, hyperthyroidism)
- non-cardiac (e.g. sepsis, renal failure)
- pressure overload (e.g. aortic stenosis/co-arctation, pulmonary stenosis, HTN)
- volume overload (e.g. L to R shunt, valve insufficiency)

### Clinical Features
- infant: weak cry, irritability, feeding difficulties, early fatigability, diaphoresis while sleeping or eating, respiratory distress, lethargy, FTT
- child: decreased exercise tolerance, fatigue, decreased appetite, respiratory distress, frequent URTIs or "asthma" episodes
- orthopnea, paroxysmal nocturnal dyspnea, pedal/dependent edema are all uncommon in children
- physical findings: 4 key features (tachycardia, tachypnea, cardiomegaly, hepatomegaly). Also FTT, alterations in peripheral pulses, four limb blood pressures (in some CHDs), dysmorphic features associated with congenital syndromes

**4 Key Features of CHF**

**2 Tachy's and 2 Megaly's**
- Tachycardia
- Tachypnea
- Cardiomegaly
- Hepatomegaly

### Investigations
- CXR: cardiomegaly, pulmonary venous congestion
- ECG: sinus tachycardia, signs of underlying cause (heart block, atrial enlargement, hypertrophy, ischemia/infarct)
- echo: structural and functional assessment
- blood work: CBC, electrolytes, BUN, Cr, LFTs

### Management
- general: sitting up, $O_2$, sodium and water restriction, increased caloric intake
- pharmacologic: diuretics, afterload reduction (e.g. ACEI), β-blockers; digoxin rarely used
- curative: correction of underlying cause

## Dysrhythmias

- can be transient or permanent, congenital (structurally normal or abnormal), or acquired (toxin, infection, infarction)

### Sinus Arrhythmia
- phasic variations with respiration (present in almost all normal children)

### Sinus Tachycardia
- rate of impulses arising from sinus node is elevated (>150 bpm in infants, >100 bpm in older children)
- characterized by: beat-to-beat heart rate variability with changes in activity, P waves present/normal, PR constant, QRS narrow
- etiology: HTN, fever, anxiety, sepsis, anemia/hypoxia, pain, PE, drugs, etc.
- differentiate from SVT by slowing the sinus rate (vagal massage, β-blockers) to identify sinus P waves

### Premature Atrial Contractions
- may be normal variant or can be caused by electrolyte disturbances, hyperthyroidism, cardiac surgery, digitalis toxicity

**Pediatric vs. Adult ECG**

Pediatric ECG findings that may be normal:
- HR >100 bpm
- Shorter PR and QT intervals and QRS duration
- Inferior and lateral small Q waves
- RV larger than LV in neonates, so normal to have:
  - RAD
  - Large precordial R waves
  - Upright T waves
  - Inverted T waves in the anterior precordial leads from early infancy to teen years

### Premature Ventricular Contractions
- common in adolescents
- benign if single, uniform, disappear with exercise, and no associated structural lesions
- if not benign, may degenerate into more severe dysrhythmias

### Supraventricular Tachycardia
- abnormally rapid heart rhythm originating above the ventricles – most frequent sustained dysrhythmia in children
- no beat-to-beat HR variability, >220 bpm (infants) or >180 bpm (children), P waves absent/abnormal, PR indeterminable, QRS usually narrow
- pre-excitation syndromes (subset of SVT): WPW syndrome, congenital defect (see Cardiology and Cardiac Surgery, C21)

### Complete Heart Block
- congenital heart block can be caused by maternal anti-Ro or anti-La (e.g. mother with SLE)
- often diagnosed *in utero* (may lead to development of fetal hydrops)
- clinical symptoms related to level of block (the lower the block, the slower the heart rate and greater the symptoms of inadequate cardiac output)
- symptomatic patients need a pacemaker

## Heart Murmurs

- 50-80% of children have audible heart murmurs at some point in their childhood
- most childhood murmurs are functional (e.g. "innocent") without associated structural abnormalities and have normal ECG and radiologic findings
- in general, murmurs can become audible or accentuated in high output states (e.g. fever, anemia)

**Table 12. Differentiating Heart Murmurs**

| | Innocent | Pathological |
|---|---|---|
| **History and Physical** | Asymptomatic | Symptoms and signs of cardiac disease (FTT, exercise intolerance) |
| **Timing** | SEM | All diastolic, pansystolic, or continuous (except venous hum) |
| **Grade/Quality** | <3/6; soft/blowing/vibratory | ≥3/6 (palpable thrill); harsh |
| **Splitting** | Physiologic S2 | May have fixed split or single S2 |
| **Extra Sounds/Clicks** | None | May be present |
| **Change of Position** | Murmur varies | Unchanged |

**Table 13. Five Innocent Heart Murmurs**

| Type | Etiology | Location | Description | Age | Differential Diagnosis |
|---|---|---|---|---|---|
| **Peripheral Pulmonic Stenosis** | Flow into pulmonary branch arteries from main, larger, artery | Left upper sternal border | Neonates, low-pitched, radiates to axilla and back | Neonates, usually disappears by 3-6 mo | PDA<br>Pulmonary stenosis |
| **Still's Murmur** | Flow across the pulmonic valve leaflets | Left lower sternal border | High-pitched, vibratory, LLSB or apex, SEM | 3-6 yr | Subaortic stenosis<br>Small VSD |
| **Venous Hum** | Altered flow in veins | Infraclavicular (R>L) | Infraclavicular hum, continuous, R>L | 3-6 yr | PDA |
| **Pulmonary Ejection** | Flow through the pulmonic valve | Left upper sternal border | Soft, blowing, LUSB, SEM | 8-14 yr | ASD<br>Pulmonary stenosis |
| **Supraclavicular Arterial Bruit** | Turbulent flow in the carotid arteries | Supraclavicular | Low intensity, above clavicles | Any age | Aortic stenosis<br>Bicuspid aortic valve |

## Infective Endocarditis

- see Infectious Diseases, ID13

# Development

## Approach to Global Developmental Delay

- also known as Early Developmental Impairment

### Definition
- significant delay (at least 2 SDs below the mean with standardized tests) in at least two developmental domains (gross motor, fine motor, speech/language, cognitive, social/personal, activities of daily living) in a child <5 yr of age
- predict a diagnosis of intellectual disability in the future
- after 5 years of age, intellectual and physical disabilities are described (no longer a development 'delay' as catch up is not expected

### Epidemiology
- 5-10% of children have neurodevelopmental delay
- careful evaluation can reveal a cause in 50-70% of cases

### Etiology

| Broad category | Possible causes | Upper limit of diagnostic yield* |
|---|---|---|
| **Prenatal Biological Factors** | Genetic mutations<br>Central nervous system deformities<br>Metabolic issues | 47%<br>28% |
| **Prenatal Environmental Factors** | Teratogens/toxins (substances of abuse, medications, etc.)<br>Infections | 21% |
| **Perinatal** | Asphyxia<br>Premature birth<br>Neonatal complications | 55% |
| **Postnatal** | Neglect/unhealthy psychosocial environment<br>Infections<br>Trauma<br>Toxins | 11% |

*Percentage of total cases of GDD or ID with an identified etiologic diagnosis who fall into this specific category

### Clinical Feature
- key questions in addition to standard pediatric history:
  - detailed developmental milestones: rate of acquisition, regression of skills
  - associated problems: feeding, seizures, behaviour, sleep
  - ototoxic antibiotics, frequent ear infections
- physical exam
  - micro/macrocephaly, dysmorphic features head-to-toe, hepatosplenomegaly, height and weight
  - **neurodevelopmental exam** (neurological exam, congenital abnormalities, dysmorphic features, current developmental level)
- investigations (guided by history and physical examination); see CPS step-wise algorithm
  - vision and hearing test
  - EEG if suspected seizures
  - chromosomal microarray, karyotype, Fragile X DNA testing,
  - brain MRI if abnormal neuro exams, micro/macroecephalopathy
  - MECP2 in girls with clinical course suggestive of Rett's Syndrome
  - metabolic screening (glucose, electrolytes, lactate, ammonia, liver function, pyruvate, albumin, trigylcerides, uric acid, amino acids, urine organic acids, acylcarnitine profile, carnitine (free and total), creatine phosphokinase, homocysteine, Biotinidase, copper, ceruloplasmin
  - lead, CBC, blood gas, urea, creatitine, electrolytes with anion gap, ferritin, B12, TSH, CK
  - OT, PT, and/or SLP assessments

### Management
- dependent on specific area of delay
- therapy services (e.g. speech and language therapy for language delay, OT and/or PT for motor delay), early intervention services (e.g. infant development services, Ontario Early Years Centres)

## Intellectual Disability

### Definition
- state of functioning that begins in childhood and is characterized by limitations in both intelligence and adaptive skills
- historically defined as an IQ <70
- often preceded by diagnosis of global developmental delay

### Epidemiology
- 1% of general population; M:F = 1.5:1

**Classification of Intellectual Disability**

| Severity | % Cases | IQ |
|---|---|---|
| Mild | 85 | 50-70 |
| Moderate | 10 | 35-49 |
| Severe | 3-4 | 20-34 |
| Profound | 1-2 | <20 |

### Clinical Feature
- history
  - earlier age of onset correlates with greater severity of ID
  - well below average general intellectual functioning
  - significant deficits in adaptive functioning in at least 2 of: communication, self-care, home-living, social skills, self-direction, academic skills, work, leisure, health, safety
- physical exam
  - check growth, dysmorphic features, complete physical exam
- investigations
  - standardized psychology assessment (includes IQ test and measure of adaptive functioning)
  - vision, hearing, and neurologic assessment
  - genetic and metabolic testing as indicated

### Management
- main objective: enhance adaptive functioning level
- requires an interprofessional team with strong case coordination
- emphasize community-based treatment and early intervention
- behaviour management services, therapy services (e.g. OT, SLP), medications for associated conditions
- education: life skills, vocational training, communication skills, family education
- psychosocial support for individual and family; respite care, individual/family therapy

### Prognosis
- higher rates of sensory deficits, motor impairment, behavioural/emotional disorders, seizures, psychiatric illness

## Language Delay

### Definition
- no universally accepted definition, but often identified around 18 mo of age with enhanced well baby visit
- if formally tested, at least one standard deviation below mean of age on standardized testing
- can be expressive (ability to produce or use language), receptive (ability to understand language), or both

### Epidemiology
- M>F
- ~10-15% of 2 yr old children have a language delay, but only 4-5% remain delayed after 3 yr of age
- ~6-8% of school-aged children have specific language impairment (many of whom were not identified before school entry)

### Etiology
- intellectual disability
- developmental disorders: cerebral palsy, autism spectrum disorder, constitutional language delay
  - constitutional language delay
- genetic/metabolic: DS, Fragile X syndrome, Williams syndrome, hypothyroidism, PKU, etc.
- mechanical problems: cleft palate, cranial nerve palsy, hearing impairment
- medical condition: seizure disorder (includes acquired epileptic aphasia), CP, TORCH infection, iron deficiency, lead poisoning, etc.
- psychosocial: neglect or abuse
- selective mutism
- language specific learning disorder
- isolated language delay

### Clinical Feature
- history
  - concerns about hearing, delay in language development or regression in previously normal language development
  - delayed language milestones, presence of red flags, regression (see Table 6, *Developmental Milestones*, P6)
  - must determine if language delay is expressive, receptive, or mixed
  - determine differences in behaviour at home, school, other social environments
  - risk factors: family history of speech and language delay, male, prematurity, low birth weight, hearing loss
- physical exam
  - guided by history: look for abnormal growth, dysmorphisms, unusual social interactions (lack of eye contact, not pointing)
  - include full exam of the external/internal ear (e.g. TM scarring), oral pharynx (e.g. cleft palate), and neurologic system (including tone)
- investigations
  - use of language specific screens in primary care setting: The Early Language Milestone
  - Clinical Adaptive Test/Clinical Linguistic and Auditory Milestone Scale (CAT/CLAMS), Modified Checklist for Autism in Toddlers (M-CHAT), etc.
  - developmental evaluation
  - hearing and vision screening (audiology and optometry referral)
  - CBC (to rule out anemia), venous blood lead levels, genetic/metabolic workup as indicated

**Risk Factors for Sensorineural Hearing Loss**
- Genetic syndromes/family history
- Congenital (TORCH) infections
- Craniofacial abnormalties
- <1500 g birthweight
- Hyperbilirubinemia/kernicterus
- Asphyxia/low APGAR scores
- Bacterial meningitis, viral encephalitis

Bilingual exposure generally does NOT explain a frank delay in language development

Primary care physicians should suspect a receptive language delay in any young child with an expressive language delay

### Management
- specific to etiology
- referrals to: SLP, Otolaryngology Head and Neck Surgery (OHNS), and dental professionals, general support services
- prevention: parents can read aloud to their child, engage in dialogic reading, avoid baby talk, narrate daily activities, etc.

### Prognosis
- depends on etiology – best prognosis for developmental speech delay
- if language delay persists beyond 5 yr old, more likely to have difficulties in adulthood
- persistent language delay is associated with poor academic performance, behavioural problems, social isolation

## Specific Learning Disorder

### Definition
- specific and persistent failure to acquire academic skills despite conventional instruction, adequate intelligence, and sociocultural opportunity
- a significant discrepancy between a child's intellectual ability and their academic performance
- types: reading (dyslexia), writing, mathematics (dyscalculia)

### Epidemiology
- prevalence: 10%
- high incidence of psychiatric comorbidity: anxiety, dysthymia, conduct disorder, major depressive disorder, oppositional defiant disorder, ADHD

### Etiology
- pathogenesis is unknown, likely genetic factors involved
- learning disabilities may be associated with a number of conditions:
  - genetic/metabolic: Turner syndrome, Klinefelter syndrome
  - perinatal: prematurity, low birth weight, birth trauma/hypoxia
  - postnatal: CNS damage, hypoxia, environmental toxins, FAS, psychosocial deprivation (understimulation), malnutrition
- poor visual acuity is NOT a cause

### Risk Factors
- positive family history, prematurity, other developmental and mental health conditions, neurologic disorders (e.g. seizure disorders, neurofibromatosis), history of CNS infection/irradiation/traumatic injury

### Clinical Feature
- history and physical exam
  - school difficulties (academic achievement, behaviour, attention, social interaction, over-reliance on teacher)
  - development of negative self-concept → reluctance to participate even in areas of strength
  - social issues: overt hostility towards parents/teachers; difficulties making friends, bullying, and anxiety
  - look for dysmorphisms, complete physical exam
- investigations
  - psychoeducational assessment, educational history from school staff
  - individual scores on achievement tests in reading, mathematics, or written expression (WISC III, WRAT) >2 SD below that expected for age, education, and IQ
  - evaluate attention, memory, expressive language, coordination skills

### Management
- provide quality instruction for specific learning disability
- support student by modifying the curriculum and/or providing accommodations (e.g. scribe for writing, extra time for tests, photocopied notes, etc.)
- consider grade retention in certain students (no guidelines exist, very rare in Ontario)
- specialized education placements that can provide educational remediation

### Prognosis
- limited information available about persistence of learning disabilities over time
- low self-esteem, poor social skills, 40% school drop-out rate

## Fetal Alcohol Spectrum Disorder

### Definition
- term describing the range of effects of prenatal exposure to alcohol, including physical, mental, behavioural, and learning disabilities
- abstinence from alcohol during pregnancy is recommended
- spectrum includes: FAS, partial FAS, ARBD (alcohol related brain damage) and ARND (alcohol related neurodevelopmental disorder)

### Epidemiology
- prevalence of FAS and FASD is 0.1% and 1.0%, respectively
- most common preventable cause of intellectual disability

### Pathogenesis
- specific mechanism of FASD is unknown, but hypotheses include nutritional deficits, toxic effects of acetaldehyde, alteration of placental transport, abnormal protein synthesis, and altered cerebral neurotransmission

### Diagnosis
- often misdiagnosed or missed entirely
- diagnosis of FAS, ARBD, and ARND all require evidence of maternal drinking during pregnancy
- criteria for diagnosis of FAS
  - **growth deficiency**: low birth weight and/or decelerating weight over time not due to nutrition
  - **characteristic pattern of facial anomalies**: short palpebral fissures (<2 SD below mean), flattened philtrum, thin upper lip (having all 3 features is highly specific for alcohol exposure, don't need maternal history to confirm)
  - **CNS dysfunction (need ≥3)**: motor skills; neuroanatomy/neurophysiology; cognition; language; academic achievement; memory; attention; executive function (impulse control and hyperactivity); affect regulation; adaptive behaviour, social skills or social communication OR microcephaly in infant and young children
- criteria for diagnosis of ARBD
  - congenital anomalies, including malformations and dysplasias of the cardiac, skeletal, renal, ocular, and auditory systems
- criteria for diagnosis of ARND
  - CNS dysfunction (similar to FAS)
  - complex pattern of behavioural or cognitive abnormalities inconsistent with developmental level that cannot be explained by familial background or environment alone

### Management
- early diagnosis is essential to prevent secondary disabilities
- no cure, but individuals with FASD and their families should be linked to community resources and services to improve outcome

### Prognosis
- secondary disabilities include unemployment, mental health problems, difficulties with the law, inappropriate sexual behaviour, disrupted school experience, peer problems

## Attention Deficit Hyperactivity Disorder

- see Psychiatry, *Neurodevelopmental Disorders*, PS40

## Autism Spectrum Disorder

- see Psychiatry, *Neurodevelopmental Disorders*, PS40

## Motor Delay

- see *Cerebral Palsy*, P77 and Medical Genetics, *Duchenne Muscular Dystrophy*, MG8

# Endocrinology

## Antidiuretic Hormone

### Diabetes Insipidus
- see Endocrinology, E19 and Nephrology, NP11

### Syndrome of Inappropriate Antidiuretic Hormone
- see Endocrinology, E19 and Nephrology, NP10

## Diabetes Mellitus

### DIABETES MELLITUS TYPE 1
- see Endocrinology, E7

## Epidemiology
- most common form of DM in children, M=F
- variable prevalence internationally, affects ~1:4000 children in Canada
- can present at any age, but bimodal peaks at 5-7 yr old and at puberty

## Clinical Feature
- can present as polyuria (often manifested as nocturia or secondary enuresis), polydipsia, weight loss (lack of insulin leading to a catabolic state), polyphagia, DKA (~20%)

## Management
- patients and families are best managed with a family-centred pediatric multidisciplinary team able to provide education, ongoing care, and psychosocial support surrounding survival skills, meal plans, and insulin injections as a cornerstone of treatment
  - diet with consistent levels of carbohydrates, avoiding foods with high glycemic index is advised
  - exercise recommended, extensive activity may cause prolonged hypoglycemia
  - administer influenza immunization yearly to avoid complications to management
- blood glucose monitoring is especially important in children as they are more susceptible to hypoglycemia
  - administer glucagon or dextrose for severe hypoglycemia
- if DKA present: ABCs, 100% $O_2$, admit, monitor, correct fluid losses, conduct ECG (assess for abnormal T waves), administer insulin and restore glucose gradually (first SC and then IV if no improvement), correct electrolyte disturbances, identify/treat precipitating event, avoid complications (i.e. cerebral edema)
  - low threshold to investigate (CT/MRI) and treat DKA, as cerebral edema is a major concern
    - signs of neurological deterioration – headache, bradycardia, irritability, decrease LOC, incontinence, specific neurological signs
    - administer mannitol for cerebral edema
  - frequent BG, fluid and electrolyte monitoring
  - see Endocrinology, E12
- screen for micro- and macrovascular complications (regular ophthalmology assessments, BP, microalbuminuria), concurrent autoimmune diseases (thyroiditis, celiac disease, etc.), and mental health issues (depression, eating disorders), hypertension, dyslipidemia

## Prognosis
- no cure currently
- short-term complications
  - hypoglycemia
    - due to missed/delayed meals, excess insulin or exercise, illness
    - can lead to seizures and/or coma
    - reversed with PO/IV glucose or IM glucagon
  - hyperglycemia
    - due to intercurrent illness, diet-to-insulin mismatch
    - risk of end-organ damage
  - DKA: due to missed insulin doses, infection; most common cause of death
- long-term complications
  - microvascular: retinopathy, nephropathy, neuropathy
  - macrovascular: metabolic syndrome, CVD, CAD, PVD
  - increased risk of other autoimmune diseases
  - hypertension, dyslipidemia

## DIABETES MELLITUS TYPE 2
- see Family Medicine, FM22, and Endocrinology, E7
- impaired glucose metabolism due to increased peripheral insulin resistance
- rare before 10 yr of age, but more common in older children/adolescents
- prevalence is rising mainly due to the increased incidence of childhood obesity
- risk factors: obesity, positive family history, female gender, PCOS, hyperglycemia exposure in utero, certain ethnic groups
  - risk reduced with breastfeeding
- clinical feature may be similar to that of type 1 DM, though most children are asymptomatic
- may present in DKA or hyperglycemic hyperosmotic nonketotic state
  - investigation – fasting plasma glucose recommended, oral glucose tolerance test for very obese children with multiple risk factors
- management
  - insulin used for severe metabolic decompensation at diagnosis (DKA, A1C >9%), can wean off
  - initiate lifestyle modification program, including diet, weight loss, physical activity (moderate-to-vigorous activity for at least 60 min/d; screen time less than 2 h/d)
  - glycemic target: HbA1c ≤7%
  - if glycemic targets not achieved within 3-6 mo from diagnosis with lifestyle intervention alone, either metformin (first line), glimepiride, or insulin should be initiated
    - metformin can be initiated at diagnosis if HbA1c >7%
  - monitor HbA1c every 3 mo
  - advise patient to monitor finger-stick blood glucose levels if on medication with risk of hypoglycemia, are changing medication regimen, have not met treatment goals, or have intercurrent illness
  - screening – same as T1D plus annual screening for polycystic ovary syndrome (PCOS) and nonalcoholic fatty liver disease (NAFLD)
- prognosis: includes microvascular and macrovascular complications similar to type 1 DM

**Diagnostic Criteria for DM (Types 1 and 2) in Children**

1. Symptoms (polyuria, polydipsia, weight loss, etc.) and hyperglycemia (Random glucose ≥11.1 mmol/L)

**OR**

2. Two of the following on one occasion:
- Fasting glucose ≥7.0 mmol/L
- 2 h plasma glucose during OGTT ≥11.1 mmol/L
- Random glucose ≥11.1 mmol/L (not appropriate for confirmatory testing)

**OR**

3. One of the following on two separate occasions*
- Fasting glucose ≥7.0 mmol/L
- 2 h plasma glucose during OGTT ≥11.1 mmol/L
- Random glucose ≥11.1 mmol/L (not appropriate for confirmatory testing)

*Random glucose is not appropriate for confirmatory (second) testing

**Blood Glucose Targets by Age**

| Age range | Pre-meal blood glucose target | HbA1c target |
|---|---|---|
| <6 | 6-10 | <8% |
| 6-12 | 6-10 | <7.5% |
| >12 | 4-7 | <7% |

**Management of Newly Diagnosed Type 2 DM in Children and Adolescents**

Pediatrics 2013;131(2):364-82

**Key Action Statements**

1. Clinicians should ensure that insulin therapy is initiated for children and adolescents with type 2 DM who are ketotic or in DKA and in whom the distinction between types 1 and 2 DM is unclear and, in usual cases, should initiate insulin therapy for patients
   a. who have random venous or plasma BG concentrations 14 mmol/L; or
   b. whose HbA1c is >9%.
2. Clinicians should initiate a lifestyle modification program, including nutrition and physical activity, and start metformin as first-line therapy for children and adolescents at the time of diagnosis of type 2 DM.
3. The committee suggests that clinicians monitor HbA1c concentrations every 3 mo and intensify treatment if treatment goals for finger-stick BG and HbA1c concentrations are not being met.
4. Clinicians should advise patients to monitor finger-stick BG concentrations in patients who
   a. are taking insulin or other medications with a risk of hypoglycemia; or
   b. are initiating or changing their diabetes treatment regimen; or
   c. have not met treatment goals; or
   d. have intercurrent illnesses.
5. Clinicians should incorporate the Academy of Nutrition and Dietetics' Pediatric Weight Management Evidence-Based Nutrition Practice Guidelines in their dietary or nutrition counselling of patients with type 2 DM at the time of diagnosis and as part of ongoing management.
6. Clinicians should encourage children and adolescents with type 2 DM to engage in moderate-to-vigorous exercise for at least 60 min daily and to limit nonacademic "screen time" to less than 2 h/d.

# Growth (see Failure to Thrive)

## APPROACH TO SHORT STATURE

### Definition
- short stature: height <3rd percentile
- poor growth evidenced by growth deceleration (height crosses major percentile lines, growth velocity <25th percentile)

### Epidemiology
- ~2.5% of the population by definition

### Etiology
- see sidebar

### Clinical Feature
- history and physical exam
  - plot on growth curve (special growth charts available for Turner syndrome, achondroplasia, DS)
  - assess for dysmorphic features, disproportionate short stature
  - risk factors for GH deficiency: previous head trauma, history of intracranial bleed or infection, head surgery or irradiation, positive family history, breech delivery
  - decreased growth velocity may be more worrisome than actual height
- investigations
  - calculate mid-parental height: children are usually in a percentile between their parents' height (mid-parental height = (mother + father's height in cm ± 12.5cm)/2)
  - AP x-ray of left hand and wrist for bone age
  - GH testing
  - remaining investigations guided by history and physical (e.g. TSH, sweat chloride, etc.)

### Management
- depends on severity of problem as perceived by parents/child
- no treatment for non-pathological short stature, except for idiopathic short stature
- GH therapy for GH deficiency: if administered at an early age, can help patients achieve adult height
- requirements
  - GH shown to be deficient by 2 different stimulation tests (with arginine, glucagon, insulin)
  - growth velocity <3rd percentile or height <<3rd percentile
  - bone age x-rays show unfused epiphyses/delayed bone age
- support and management of resultant self-image issues, social anxiety, etc.

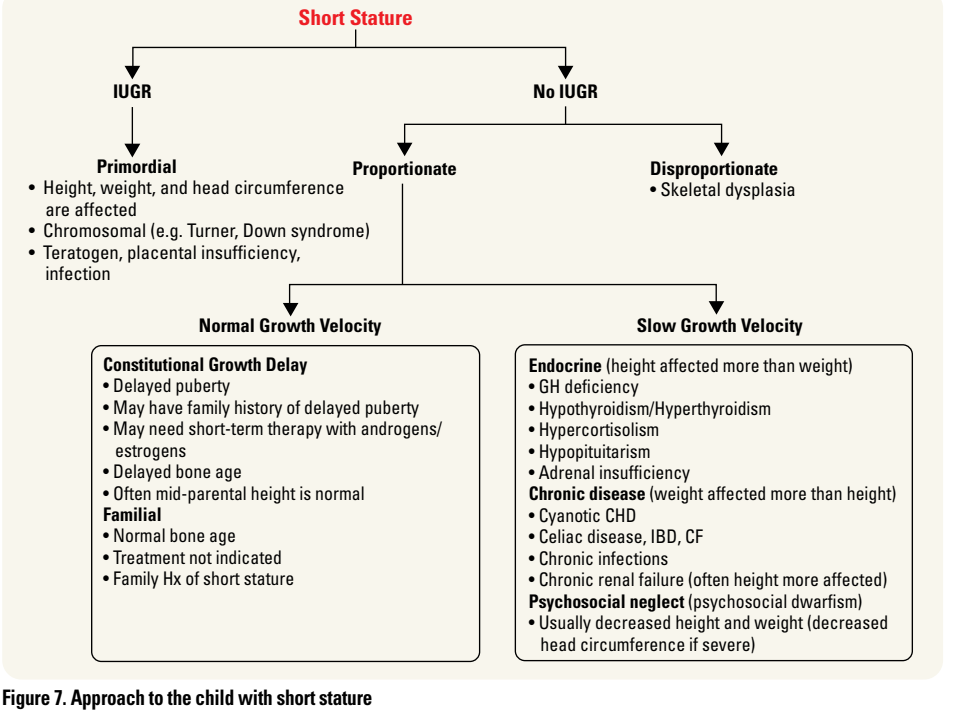

**Figure 7. Approach to the child with short stature**

**Short Stature DDx**

**ABCDEFG**
**A**lone (neglected infant)
**B**one dysplasias (rickets, scoliosis, mucopolysaccharidoses)
**C**hromosomal (Turner, Down)
**D**elayed growth (constitutional)
**E**ndocrine (low GH, Cushing, hypothyroid)
**F**amilial
**G**I malabsorption (celiac, Crohn's)

**4 Questions to Ask when Evaluating Short Stature**
- Was there IUGR?
- Is the growth proportionate?
- Is the growth velocity normal?
- Is bone age delayed?

To check for proportionality, measure upper to lower segment ratio (U/L) using the pubic symphysis as your landmark. Normals are 1.7 for newborn, 1.4 for young child, 0.9 for adult male, 1.0 for adult female

### TALL STATURE
- height greater than two SD above the mean for a given age, sex, and race

#### Etiology
- constitutional/familial
- endocrine: Beckwith-Wiedemann syndrome, hyperthyroidism, hypophyseal gigantism, precocious puberty
- genetic: homocystinuria, Klinefelter syndrome, Marfan syndrome, Sotos syndrome

## Hypercalcemia/Hypocalcemia/Rickets

- see Endocrinology, E40, E41, E45

## Hyperthyroidism and Hypothyroidism

- may be congenital or acquired (for acquired causes, see Endocrinology, E27)

### CONGENITAL HYPERTHYROIDISM
- also known as neonatal Graves' disease

#### Epidemiology
- ~1:25,000 neonates, M=F

#### Etiology
- typically caused by transplacental transfer of TSH receptor antibody
- rare causes include mutations in the TSH receptor pathway

#### Clinical Feature
- history and physical exam
  - maternal history of thyroid pathology and management
  - low birthweight, IUGR, microcephaly, premature birth, tachycardia, irritability, frontal bossing, triangular facies, hepatosplenomegaly, goitre

#### Investigations
- TSH receptor antibody levels during the 3rd trimester or in the cord blood
- neonatal TSH, T3, free T4

#### Management
- methimazole and β-adrenergic blocker (E.g. propranolol)

#### Prognosis
- with prompt treatment, hyperthyroidism improves
  - however, long-term cognitive and CNS problems can still occur
- risk for development of central hypothyroidism later in life

### CONGENITAL HYPOTHYROIDISM

#### Epidemiology
- incidence: 1:4000-1:20,000 newborn births; F:M = 2:1
- one of the most common preventable causes of intellectual disability

#### Etiology
- may be classified as permanent or transient congenital hypothyroidism (CH)
  - subcategorize into primary (85% dysgenesis, 15% thyroid gland disorder), secondary/central (pituitary/hypothalamic issue), or peripheral CH (deficits in thyroid hormone transport, metabolism or action)
  - permanent CH requires lifelong treatment, transient CH recovers to normal thyroid after neonatal period
- causes of transient hypothyroidism: maternal - antibody-mediated, iodine deficiency (rare in developed countries), prenatal exposure to antithyroid medications; neonatal – neonatal iodine deficiency/excess, congenital liver hemangiomas, certain gene mutations

#### Clinical Feature
- history and physical exam
  - usually asymptomatic in neonatal period because maternal T4 crosses the placenta
  - prolonged jaundice, feeding difficulty, lethargy, constipation, umbilical hernia, macroglossia, large fontanelles, puffy face, swollen eyes
  - examine for congenital malformations (especially cardiac) and dysmorphic features
  - most commonly presents as a positive newborn screen result

- investigations
  - screen all infants for primary CH
  - repeat screening at 2 wk for infants at high risk: preterm, (very)-low birth weight, infants in NICU, specimen collection <24 h of life, multiple births
  - diagnosis through newborn screening of TSH (most sensitive for primary CH) or free T4; abnormal results should be confirmed with serum levels from venipuncture
    - ↑ TSH, ↓ free T4 in primary CH
    - ↓ TSH, ↓ free T4 in secondary CH
  - primary CH (optional): radioisotope scanning/ultrasound of thyroid for severity, serum thyroglobulin, maternal antithyroid antibodies, urinary iodine
  - secondary CH: MRI, gene analysis, eye exam for optic nerve hypoplasia (assess pituitary)

### Management
- thyroxine replacement, hormone normalization should be done within 2 wk to avoid cognitive impairment

### Prognosis
- excellent outcome if treatment started within 1-2 mo of birth
- if treatment started after 3-6 mo of age, may result in permanent developmental delay and/or disability (mild to profound), intellectual impairment, poor growth, hearing loss

# Disorders of Sexual Development

## AMBIGUOUS GENITALIA

### Definition
- newborn or child whose gender is difficult to assign based on the appearance of genitalia
- subtype of DSD: a condition in which development of chromosomal, gonadal, or anatomic sex is atypical
- subtypes: 46,XX DSD, 46,XY DSD, ovotesticular DSD (true hermaphrodite)

### Epidemiology
- incidence of genital abnormalities at birth is as high as 1:300
- prevalence of complex anomalies with true sexual ambiguity much lower at ~1:5000

### Etiology
- 46,XY DSD
  - inborn error of testosterone biosynthesis or Leydig cell hypoplasia
  - 5-α-reductase deficiency, androgen receptor deficiency or insensitivity
  - LH/hCG unresponsiveness
- 46,XX DSD
  - virilizing CAH (most common)
  - maternal source: virilizing ovarian or adrenal tumours, untreated maternal CAH, placental aromatase deficiency
- ovotesticular DSD
  - both ovarian follicles and seminiferous tubules in the same patient with a 46,XX karyotype
  - mixed gonadal dysgenesis

### Risk Factors
- parental consanguinity, positive family history of ambiguous genitalia, early childhood illness/death, or primary amenorrhea, maternal medications during pregnancy (e.g. androgens, progesterones, danazol, phenytoin, aminoglutethimide, endocrine disruptors)

### Clinical Feature
- history
  - thorough obstetrical history, including prenatal screens and maternal medications
  - family history: autosomal recessive pattern may suggest CAH, X-linked recessive pattern may suggest androgen insensitivity syndrome
- physical exam
  - male pseudohermaphrodite (XY): small phallus, hypospadias, undescended testicles
  - female pseudohermaphrodite (XX): clitoral hypertrophy, labioscrotal fusion
  - look for concurrent midline defects, dysmorphic features, and congenital abnormalities
- investigations
  - karyotype and genetic workup as indicated
  - blood work: electrolytes and renin (evidence of salt-wasting in CAH); 17-OH-progesterone, androgens, FSH, and LH
  - imaging: abdominal U/S to look for uterus, testicles, ovaries

### Management
- avoid announcement of probable sex or use of personal pronouns until all tests are complete
- continuous psychosocial support for parents and child during development
- elective surgical reconstruction of genitalia is sometimes possible

## CONGENITAL ADRENAL HYPERPLASIA

### Definition
- autosomal recessive disorder characterized by the partial or total defect of various synthetic enzymes required for cortisol and aldosterone production in the adrenal cortex
  - adrenal cortex normally produces balanced levels of aldosterone, cortisal and androgens

### Epidemiology
- occurs in ~1:15,000 live births
- most common cause of ambiguous genitalia in genotypically normal females (46XX)

### Etiology
- for biosynthetic pathways of adrenal cortex
- 21-OH responsible for ~95% of CAH cases
- results in ↓ cortisol and aldosterone production with shunting toward ↑↑ androgens
- cortisol deficiency leads to elevated ACTH, which causes adrenal hyperplasia
- rarer causes include deficiencies in 11-OH, cholesterol desmolase, 17-OH, and 3-HSD

### Clinical Feature
- depends on which enzyme in cortisol synthesis pathway is defective
- presentation of 21-OH deficiency can be divided into:
  - classic deficiency with salt wasting: inadequate aldosterone resulting in FTT, hyperkalemia, hyponatremia, hypoglycemia, acidosis (majority of classic CAH types)
  - classic deficiency without salt wasting: simple virilization with adequate aldosterone levels
    - females typically present with amenorrhea, precocious puberty, polycystic ovaries, hirsutism
    - males typically asymptomatic at birth, may show hyperpigmentation (from overproduction of melanocyte stimulating hormone), penile enlargement, rapid growth and accelerated skeletal maturation; present with signs of virilization later in life
  - non-classic CAH – mild androgen excess, sometimes asymptomatic, virilization present later in life, rarely associated with Addisonian crises
- 21-OH deficiency screening is part of many newborn screening programs across North America
- high serum levels of 17-OH progesterone in random blood sample diagnostic for 21-OH deficiency
  - assess plasma ACTH, serum electrolytes, plasma glucose, plasma aldosterone, plasma renin activity, blood gas
  - ultrasound – look for enlarged adrenal gland and presence of uterus

### Management
- correct any abnormalities in fluids, electrolytes, or serum glucose
- provide glucocorticoids (e.g. hydrocortisone)/mineralocorticoids (fludrocortisone) as necessary to reduce ACTH levels, extra glucocorticoids in times of stress
- psychosocial support

### Prognosis
- complications if untreated include virilization, acne, salt wasting, hypotension

## NORMAL PUBERTAL DEVELOPMENT

### Physiology
- puberty occurs with the maturation of the HPG axis
- ↑ pulsatile release of GnRH → ↑ release of LH and FSH → maturation of gonads, release of sex steroids → secondary sexual characteristics
- adrenal production of androgens also required

### Females
- onset: age 8-13 yr old (may start as early as 7 yr in girls of African descent)
- usual sequence
  1. thelarche: breast budding
  2. pubarche: axillary hair, body odour, mild acne
  3. growth spurt
  4. menarche: mean age 12.5 yr; indicates that growth spurt is almost complete; menses may be irregular in duration and length of cycle
- early puberty is common and often constitutional, late puberty is rare (rule out organic causes)

### Males
- onset: age 9-14 yr old
- usual sequence
  1. testicular enlargement
  2. penile enlargement
  3. pubarche: axillary and facial hair, body odour, mild acne
  4. growth spurt: occurs later in boys
- early puberty is uncommon (rule out organic causes), late puberty is common and often constitutional
- gynecomastia (transient development of breast tissue) is a common self-limited condition seen in 50% of males during puberty (but any discharge from nipple or fixed mass should be investigated)

### Tanner Staging
- scale used in pediatrics that defines physical measurements of development based on external primary and secondary sex characteristics

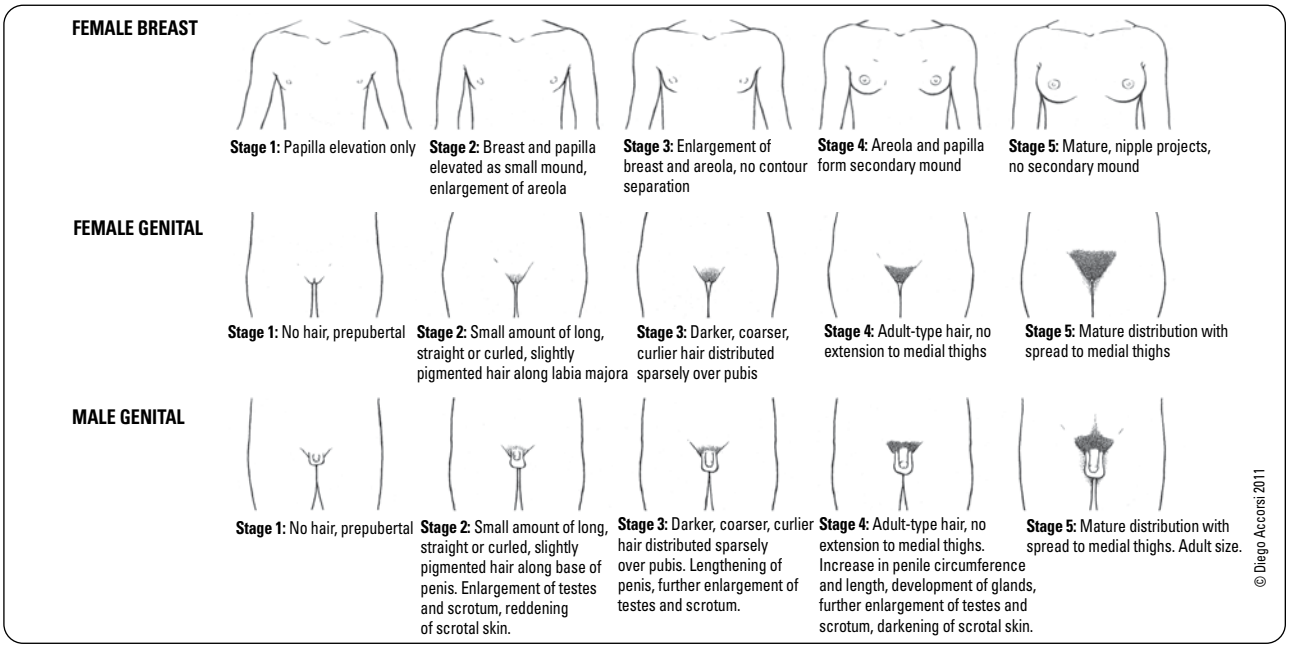

**Figure 8. Tanner staging**

## PRECOCIOUS PUBERTY

### Definition
- development of secondary sexual characteristics 2-2.5 SD before population mean
- <8 yr old for females, <9 yr old for males

### Epidemiology
- 1/10,000; F>M

### Etiology
- usually idiopathic in females (90%), more suggestive of pathology in males (50%)
- central (GnRH dependent)
  - hypergonadotropic hypergonadism; hormone levels as in normal puberty
  - premature activation of the HPG axis
  - differential diagnosis: idiopathic or constitutional (most common in females), CNS disturbances (tumours, hamartomas, post-meningitis, increased ICP, radiotherapy), NF, primary severe hypothyroidism
- peripheral (GnRH independent)
  - hypogonadotropic hypergonadism
  - differential diagnosis: adrenal disorders (CAH, adrenal neoplasm), testicular/ovarian tumour, gonadotropin/hCG secreting tumour (hepatoblastoma, intracranial teratoma, germinoma), exogenous steroid administration, McCune-Albright syndrome, aromatase excess syndrome, rarely hypothyroidism (Van Wyk-Grumbach syndrome), primary severe hypothyroidism

### Clinical Feature
- history
  - symptoms of puberty, family history of precocious puberty, medical illness
- physical exam
  - growth velocity
    - prepubertal: 4 to 6 cm/yr
    - growth spurt: boys 8-10 cm/yr, girls 6-8 cm/yr
  - complete physical exam, including Tanner staging and neurological assessment
- investigations
  - initial screening tests: bone age, serum hormone levels (estradiol, testosterone, LH, FSH, TSH, free T4, DHEA-S, 17-OH-progesterone)
  - secondary tests: MRI head, pelvic U/S, β-hCG, GnRH, and/or ACTH stimulation test

A child with proven central precocious puberty should receive an MRI of the brain

### Management
- indications for medical intervention to delay progression of puberty: rapid advancement of puberty, early age, risk of compromise of final adult height, psychological
- central causes: goals are to preserve height and alleviate psychosocial stress; GnRH agonists (e.g. leuprolide) most effective
- peripheral causes: goal is to limit effects of elevated sex steroids; treat underlying cause; medications that decrease the production of a specific sex steroid or block its effects (e.g. ketoconazole, spironolactone, tamoxifen, anastrozole), surgical intervention

## DELAYED PUBERTY

### Definition
- failure to develop secondary sex characteristics by 2-2.5 SD beyond the population mean
  - for males: lack of testicular enlargement by 14 yr old
  - for females: lack of breast development by 13 yr old OR absence of menarche by 16 yr old or within 5 yr of pubertal onset

### Epidemiology
- M>F

### Etiology
- usually constitutional delay in males, more suggestive of pathology in females
- central causes
  - constitutional delay in activation of HPG axis (most common)
  - hypogonadotropic hypogonadism
- peripheral causes
  - hypergonadotropic hypogonadism (e.g. primary gonadal failure, gonadal damage, Turner syndrome, hormone deficiency, androgen insensitivity syndrome, etc.)

### Clinical Feature
- history: weight loss, short stature, family history of puberty onset, medical illness, high performance athletes (females)
- physical exam: growth velocity (minimum 4 cm/yr), Tanner staging, neurological exam, complete physical exam
- investigations
  - initial screening tests: bone age, serum hormone levels (estradiol, testosterone, LH, FSH, TSH, free T4, IGF-1), CBC, electrolytes, BUN, Cr, LFTs, liver enzymes, ESR, CRP, urinalysis
  - secondary tests: MRI head, pelvic U/S, karyotype, IBD panel, celiac disease panel, LH levels following GnRH agonist

### Management
- identify and treat underlying cause
- hormonal replacement: cyclic estradiol and progesterone for females, testosterone for males

# Fluids and Electrolytes

## Approach to Infant/Child with Dehydration

### Etiology
- decreased intake: poor oral intake during acute illness, breastfeeding difficulties, eating disorders
- increased losses: common sites include GI tract (diarrhea, vomiting, bleeding), skin/mucous membranes (fever, burns, hemorrhage, stomatitis), urine (osmotic diuresis [e.g. hyperglycemia, DKA], diuretic therapy, DI, post-obstructive/post ATN recovery diuresis), and respiratory tract (tachypnea, bronchiolitis, pneumonia)

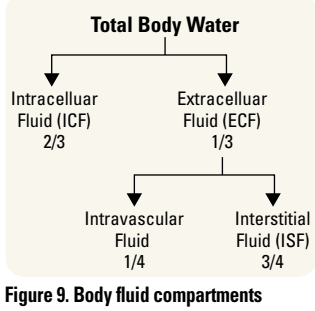

**Figure 9. Body fluid compartments**

### Management
- if suspect dehydration based on history (acute illness, decreased number of wet diapers, lethargy, changes in mental status, increased thirst, etc.), you must:

#### 1) Determine degree of extracellular volume contraction

**Table 14. Assessment of Degree of Extracellular Volume Contraction Based on Physical Exam**

| | Mild | Moderate | Severe |
|---|---|---|---|
| **<2 yr** | 5%* | 10%* | 15%* |
| **>2 yr** | 3%* | 6%* | 9%* |
| **Pulse** | Normal, full | Rapid | Rapid, weak |
| **Blood Pressure** | Normal | Low to normal | Decreased in shock (very late finding in pediatrics and very dangerous) |
| **Urine Output** | Decreased | Markedly decreased | Anuria |
| **Oral Mucosa** | Slightly dry | Dry | Parched |
| **Anterior Fontanelle** | Normal | Sunken | Markedly sunken |
| **Eyes** | Normal | Sunken | Markedly sunken |
| **Skin Turgor** | Normal | Decreased | Tenting |
| **Capillary Refill** | Normal (<3 s) | Normal to increased | Increased (>3 s) |

* Note that percentages refer to percent loss of pre-illness body weight

**Assessment of Severity of Dehydration**

**C BASE H$_2$0**
**C**apillary refill
**BP**
**A**nterior fontanelle
**S**kin turgor
**E**yes sunken
**HR**
**O**ral mucosa
**O**utput of urine

#### 2) Determine the likely electrolyte disturbance
- dependent on etiology of dehydration and type of fluid loss (isotonic vs. hypertonic vs. hypotonic)

**Table 15. Electrolyte Content of Various Bodily Fluids**

| Bodily Fluid | $Na^+$ (mmol/L) | $K^+$ (mmol/L) | $Cl^-$ (mmol/L) | $HCO_3^-$ (mmol/L) |
|---|---|---|---|---|
| Saliva | 30-80 | 20 | 70 | 30 |
| Gastric Juice | 60-80 | 15 | 100 | 0 |
| Pancreatic Juice | 140 | 5-10 | 60-90 | 40-100 |
| Bile | 140 | 5-10 | 100 | 40 |
| Small Bowel | 140 | 20 | 100 | 25-50 |
| Large Bowel | 75 | 30 | 30 | 0 |
| Sweat | 20-70 | 5-10 | 40-60 | 0 |

- for moderate and severe dehydration, initial investigations should include urinalysis and blood work examining electrolyte ($Na^+$, $K^+$, $Cl^-$), glucose, and acid-base (blood pH, $pCO_2$, $HCO_3^-$ disturbances), and impaired renal function (creatinine, BUN)

### 3) Determine if the child requires PO or IV rehydration

- dehydrated child must receive adequate fluid management, including replacement of ongoing losses and maintenance fluids
- ORT indication: mild to moderate dehydration
  - advantages: ↓ cost, no IV needed, no increase in incidence of iatrogenic hyper/hyponatremia, parental involvement in therapy
- indications for IV rehydration therapy: severe dehydration requiring close monitoring and frequent assessment of electrolytes, inability to tolerate ORT (e.g. vomiting, alteration in mental status, ileus, monosaccharide malabsorption, etc.), inability to provide ORT, failure of ORT in providing adequate rehydration (e.g. persistent diarrhea or vomiting)

### 4) Return the child to a normal volume and electrolyte status by replacing current deficits and ongoing losses

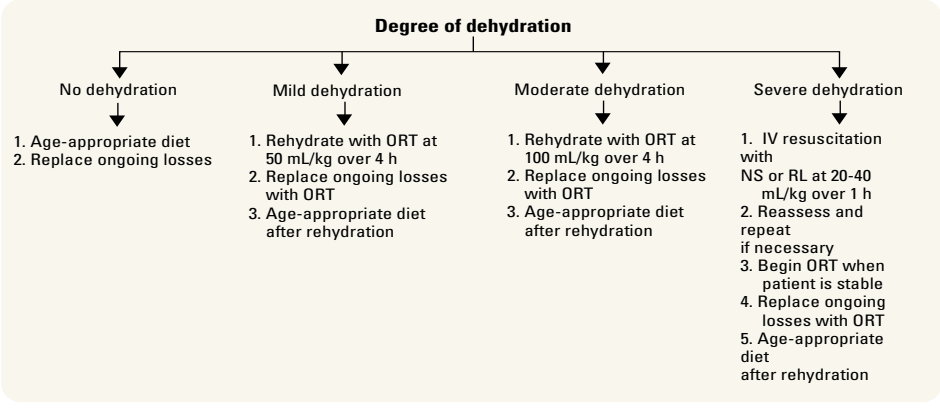

**Figure 10. Algorithm for deficit replacement and replacement of ongoing losses in the dehydrated child**

**Special Consideration – SIADH**
**Clinical Signs:** hyponatremia and excretion of concentrated urine
**Risk Factors:** certain medications (e.g. morphine), post-operative, pain, N/V, pulmonary disease (e.g. pneumonia), CNS disease (e.g. meningitis)
**Caution:** acute hyponatremia is associated with rapid administration of hypotonic IV fluids, this can lead to cerebral edema and brain herniation or central pontine myelinolysis

### 5) Provide the appropriate fluid and electrolyte maintenance daily requirements

**Table 16. Maintenance Fluid Requirements**

| Body Weight | 100:50:20 Rule (24 h maintenance fluids) | 4:2:1 Rule (hourly rate of maintenance fluids) |
|---|---|---|
| 1-10 kg | 100 cc/kg/d | 4 cc/kg/h |
| 11-20 kg | 1000 cc + 50 cc/kg/d for every kg >10 kg | 40 cc + 2 cc/kg/h for every kg >10 kg |
| >20 kg | 1500 cc + 20 cc/kg/d for every kg >20 kg | 60 cc + 1 cc/kg/h for every kg >20 kg |

- in children, all maintenance fluids should have a dextrose component due to their higher risk of hypoglycemia, especially if they are NPO
- common IV fluid combinations used in pediatrics
  - newborn: D10W
  - 1st mo of life: D5W/0.45 2 NS + KCl 20 mEq/L (only add KCl if voiding well)
  - children
  - without special considerations:
    - D5W/NS + KCl 20 mEq/L – decreased risk of hyponatremia
    - NS bolus for dehydration
  - other options: D5W0.45%NS + KCl 20 mEq/L
- most important thing to remember when correcting $Na^+$ aberrations due to fluid deficits
  - risk of cerebral edema with rapid rehydration with hypotonic or isotonic solutions (i.e. NS)
    - therefore replace fluid slowly with close monitoring
    - aim to adjust (increase or decrease) plasma [$Na^+$] by no more than 12 mmol/L/d
- management depends on etiology, severity of symptoms, and timing (acute vs. chronic)

### 6) Continue to monitor fluid and electrolyte status
- accurate monitoring of daily fluid intake (PO and IV) and ongoing losses (urine output, diarrhea, emesis, drains)
- if child receiving >50% of maintenance fluids through IV, serum electrolyte values should be monitored daily and therapy adjusted accordingly
- avoid iatrogenic hyper/hyponatremia, keep the possibility of SIADH in mind

# Gastroenterology

## Vomiting

**Vomiting:** forceful expulsion of stomach contents through the mouth
**Regurgitation:** the return of partially digested food from the stomach to the mouth

**Pyloric Stenosis 3 Ps**
**P**alpable mass
**P**eristalsis visible
**P**rojectile vomiting (2-4 wk after birth)

### History
- characteristic of emesis (e.g. projectile, bilious, bloody)
- pattern of emesis (e.g. association with feeds, cyclic, morning)
- associated symptoms (e.g. anorexia, diarrhea, etc.)
- red flags: bilious or bloody emesis, projectile vomit, abdominal distension and tenderness, high fever, signs of dehydration
- note that vomiting without diarrhea is often not gastroenteritis
  - post-tussive vomiting is also common with coughing fits in children

### Physical Findings
- vital signs to determine clinical status and hydration state

### Investigations
- CBC, electrolytes, BUN, Cr, amylase, lipase, glucose done routinely
- in sick child, add: ESR, venous blood gases, C&S (blood, stool), imaging

**Table 17. Common Differential Diagnosis, Associated Findings, and Diagnostic Approach Based on Age**

| Cause | Suggestive Findings | Diagnostic Approach |
|---|---|---|
| **NEONATES – NON-BILIOUS** | | |
| Tracheoesophageal Fistula | Vomiting, excessive secretions soon after birth (e.g. drooling, choking, respiratory distress), inability to feed, inability to advance NG tube | Inability to advance NG tube, CXR, upper GI series with water-soluble contrast |
| Pyloric stenosis | Projectile vomiting immediately after feeding, dehydrated, palpable "olive" in RUQ, decreased stools, hunger | U/S of pylorus, upper GI study (if U/S not diagnostic)<br>Electrolytes, ABG (hypokalemic, hypochloremic metabolic alkalosis) |
| GERD | Fussiness after feeds, spit ups, arching of back, poor weight gain | Empiric trial of acid suppression, pH monitoring study, upper GI study, endoscopy |
| Sepsis | Fever, lethargy, tachycardia, tachypnea, widening pulse pressure | CBC, cultures (blood, urine, CSF), CXR |
| Inborn error of metabolism | Poor feeding, FTT, jaundice, hepatosplenomegaly, cardiomyopathy, dysmorphia, developmental delay | Electrolytes, ABG (hyponatremic, hyperkalemic metabolic acidosis), lactate, ammonia, LFTs, BUN, Cr, serum glucose, bilirubin, PT/PTT, CBC |
| **NEONATES – BILIOUS** | | |
| Intestinal obstruction – malrotation with volvulus, meconium ileus | Bilious emesis, abdominal distension, pain, bloody stool, shock | AXR, upper GI series, contrast enema |
| Duodenal atresia/stenosis | Bilious emesis, abdominal distension, often seen in DS, jaundice, polyhydramnios during pregnancy. Hypokalemic, hypochloremic metabolic alkalosis | AXR, upper GI series ('double bubble' sign) |
| Hirschsprung's disease | Bilious emesis, abdominal distension, pain, failure to pass stool | AXR, upper GI series, contrast enema, rectal biopsy |
| Necrotizing enterocolitis | Premature neonate, bilious emesis, bloody stools, abdominal distension, intolerance of feeds | AXR, CBC |
| **CHILDREN AND ADOLESCENTS** | | |
| Acute viral gastroenteritis | Diarrhea, fever, sick contact, recent travel | CBC, stool culture |
| Appendicitis | Periumbilical discomfort that later localizes to RLQ, fever, anorexia | Abdominal U/S |
| Intussusception | Colicky progressive abdominal pain, drawing of legs up to chest, lethargy, bloody "red currant jelly" stool (Triad) | Abdominal U/S |
| Non-GI infection (e.g. meningitis) | Fever, localized findings depending on cause | Cultures (CSF, blood, urine), brain imaging, CXR |
| Increased ICP | Nocturnal wakening, progressive recurrent headache worse with Valsalva, nuchal rigidity | Brain CT without contrast<br>Therapeutic LP in idiopathic intracranial HTN |
| Toxic ingestion | Finding possibly varying by substance- toxidrome, often a history of ingestion | Qualitative and sometimes quantitative levels (urine, blood) |
| Pregnancy | Amenorrhea, morning sickness, bloating, breast tenderness | Urine β-hCG |
| Cyclic vomiting | At least 3 self-limited episodes of vomiting lasting 12 h, 7 d between episodes, no organic cause of vomiting | Diagnosis of exclusion |

### Management
- rehydration (see *Fluids and Electrolytes*, P33)
- treat underlying cause
- antiemetic drugs can be used in children >2 yr with severe vomiting: promethazine, prochlorperazine, metoclopramide, ondansetron

# Gastroesophageal Reflux

### Epidemiology
- extremely common in infancy (up to 50%) but rarely causes GERD

### Clinical Feature
- vomiting typically soon after feeding, non-bilious, rarely contains blood, small volume (<30 mL)
  - should suspect GERD, defined as when gastroesophageal reflux causes troublesome symptoms/complications
    - infant: poor weight gain, irritability, sleep disturbance, respiratory symptoms (coughing, choking, wheezing)
    - older child/adolescent: abdominal pain/heart burn, dysphagia, asthma, recurrent pneumonia/upper respiratory infections, recurrent otitis media, upper airway symptoms (chronic cough, hoarseness), dental erosions

### Investigations
- thriving baby requires no investigation
- GERD can be a clinical diagnosis but diagnostic investigations may include:
  - upper GI tract radiography – assesses anatomy and motility disorder
  - esophageal pH – quantify GER
  - upper endoscopy and esophageal biopsy – rule out other conditions that mimic GERD symptoms, assess GERD-related esophageal injury
  - warning signs of associated disorders requiring further investigations: bilious vomiting, GI tract bleeding, consistently forceful vomiting, fever, lethargy, hepatosplenomegaly, bulging fontanelle, micro/macrocephaly, seizures, abdominal tenderness/distension, suspected genetic, metabolic syndrome or chronic disease

### Management
- conservative (infant): thickened feeds, frequent and smaller feeds, elevation of head, changing formula to hydrolyzed protein or amino acid based formula
  - breastfeeding infants – mothers exclude milk and egg in diet
  - older children/adolescent – same as adult management
- medical
  - short-term parenteral feeding to enhance weight gain
  - ranitidine, PPI: decreases gastric acidity, decreases esophageal irritation
  - domperidone, metoclopramide: improves gastric emptying and GI motility; safety concerns and limited efficacy, should be reserved for children with gastroparesis contributing to GERD
- interventional: indicated for failure of medical therapy: - Nissen fundoplication – or insertion of gastrojejunal tube for post-pylorus feeds

### Complications
- esophagitis, strictures, Barrett's esophagus, FTT, aspiration, oral feeding aversion

# Tracheoesophageal Fistula

- see General Surgery, GS69

# Pyloric Stenosis

- see General Surgery, GS67

# Duodenal Atresia

- see General Surgery, GS68

# Malrotation of the Intestine

- see General Surgery, GS68

# Diarrhea

- definition of diarrhea varies with diet and age (stool normalcy difficult to define in children)
- infants → increase in stool frequency to twice as often per day; older children → 3+ loose or watery stools/d
- duration: acute: <2 wk; chronic: >2 wk

### Pathophysiology
- osmotic: due to non-absorbable solutes in GI tract (e.g. lactose intolerance)
- secretory: increased secretion of $Cl^-$ ions and water in intestinal lumen (e.g. bacterial toxin)
- malabsorption: less time for absorption due to increased motility or less villi to absorb (e.g. short bowel syndrome)

Diarrhea is defined as an increase in frequency and/or decreased consistency of stools compared to normal

Normal stool volume
Infants: 5-10 g/kg/d
Children: 200 g/d

**Diarrhea Red Flags**
Bloody stool, fever, petechiae or purpura, signs of severe dehydration, weight loss/FTT

### History
- frequency, duration, quality of diarrhea
- associated symptoms (e.g. fever, abdominal pain, hematochezia, etc.)
- recent antibiotic use or recent travel
- elements of diet

### Physical Findings
- vital signs to determine clinical status and hydration state

### Investigations
- acute diarrhea
  - stool for C&S, O&P, electron microscopy for viruses, *C. difficile* toxin, microscopy (leukocytes suggestive of invading pathogen), blood and urine cultures, blood work
- chronic diarrhea
  - serial heights, weights, growth percentiles
  - if child growing well and thriving, workup is limited (stool cultures as above, stool reducing substances)
  - red flags: poor growth, chronic rash, other serious infections, hospitalizations for dehydration (require full workup)
    - stool: consistency, pH, reducing substances, microscopy, occult blood, O&P, C&S, *C. difficile* toxin, 3 d fecal fat, α-1-antitrypsin clearance, fecal elastase
    - urinalysis, urine culture
    - CBC, differential, ESR/CRP, smear, electrolytes, total protein, albumin, carotene, $Ca^{2+}$, $PO_4^{3-}$, $Mg^{2+}$, Fe, ferritin, folate, fat-soluble vitamins, PTT, INR
    - sweat chloride, celiac screen, thyroid function tests, urine VMA and HVA, HIV test, lead levels
    - CXR, upper GI series and follow-through
    - specialized tests: endoscopy, small bowel biopsy

**Common Antibiotics that Can Lead to *C. difficile* Infection**
- Fluoroquinolones
- Clindamycin
- Penicillin (broad spectrum)
- Cephalosporincs (broad spectrum)

### Differential Diagnosis

**Table 18. Differential Diagnosis of Diarrhea**

| | Infectious | | | Non-infectious |
|---|---|---|---|---|
| **Acute** | **Viral**<br>Rotavirus<br>Norwalk<br>Enteric adenovirus | **Bacterial**<br>*Salmonella*<br>*Campylobacter*<br>*Shigella*<br>Pathogenic *E. coli*<br>*Yersinia*<br>*C. difficile* | **Parasitic**<br>*Giardia lamblia*<br>*Entamoeba histolytica* | Antibiotic-induced<br>Non-specific: associated with systemic infection<br>Hirschsprung's disease<br>Toxin ingestion<br>Primary disaccharidase deficiency |
| **Chronic** | **0 – 3 mo** | **3 mo – 3 yr** | **3 – 18 yr** | **Uncommon** |
| **No FTT** | GI infection | GI infection<br>Toddler's diarrhea | GI infection<br>Lactase deficiency<br>Irritable bowel syndrome | Drug-induced<br>Chronic constipation<br>UTI |
| **FTT** | Disaccharidase deficiency<br>Cow's milk protein intolerance<br>CF | Celiac disease | IBD<br>Endocrine (thyrotoxicosis, Addison's)<br>Neoplastic (pheochromocytoma, lymphoma) | Short bowel syndrome<br>Schwachman-Diamond syndrome |

## Gastroenteritis

### History
- non-specific: diarrhea, vomiting, fever, anorexia, headache, myalgias, abdominal cramps
- bacterial and parasitic agents more common in older children (2-4 yr)
- recent infectious contacts: symptoms usually begin 24-48 h after exposure

### Physical Exam
- febrile
- dehydrated: must assess extent (see *Approach to Infant/Child with Dehydration*, P33)

### Investigations
- not usually necessary in young children
- stool analysis: leukocytes/erythrocytes suggests bacterial or parasitic etiology; pH <6 and presence of reducing substances suggests viral etiology

### Complications
- viral gastroenteritis usually self-limiting (lasts 3-7 d in most cases)
- adverse effects related to hypovolemia, shock, tissue acidosis, and rapid onset and over-correction of electrolyte imbalances
- death in severe dehydration (rare in developed countries)

**Table 19. Gastroenteritis**

| | Viral Infection | Bacterial Infection |
|---|---|---|
| **Etiology** | Most common cause of gastroenteritis<br>Commonly: rotaviruses (most common), enteric adenovirus, norovirus (typically older children) | *Salmonella, Campylobacter, Shigella*, pathogenic *E. coli, Yersinia, C. difficile* |
| **Clinical Feature** | Associated with URTIs<br>Resolves in 3-7 d<br>Slight fever, malaise, vomiting, vague abdominal pain | Severe abdominal pain<br>High fever<br>Bloody diarrhea |
| **Risk Factors** | Daycare, young age, sick contacts, immunocompromised<br>Bacterial infection: travel, poorly cooked meat, poorly refrigerated foods, antibiotics | |
| **Management** | Prevention and treatment of dehydration most important (see *Dehydration*, P33)<br>Early refeeding advisable, with age-appropriate diet upon completion of rehydration<br>Ondansetron for suspected gastroenteritis with mild to moderate dehydration or failed ORT and significant vomiting<br>Antibiotic or antiparasitic therapy when indicated, antidiarrheal medications not indicated<br>Notify Public Health authorities if appropriate<br>Promote regular hand-washing and return to school 24 h after last diarrheal episode to prevent transmission<br>Rotavirus vaccine | |

# Toddler's Diarrhea

### Epidemiology
- most common cause of chronic diarrhea during infancy
- onset between 6-36 mo of age, ceases spontaneously between 2-4 yr

### Clinical Feature
- diagnosis of exclusion in thriving child
- 4-6 bowel movements per day
- diet history (e.g. excess juice intake overwhelms small bowel resulting in disaccharide malabsorption)
- stool may contain undigested food particles
- excoriated diaper rash

### Management
- reassurance that it is self-limiting
- 4Fs (adequate **F**ibre, normal **F**luid intake, 35-40% **F**at, discourage excess **F**ruit juice)

# Lactase Deficiency (Lactose Intolerance)

### Clinical Feature
- chronic, watery diarrhea and abdominal pain, bloating associated with dairy intake
- primary lactose intolerance: crampy abdominal pain with loose stool (older children, usually of East Asian and African descent)
- secondary lactose intolerance: older infant, persistent diarrhea (decreased lactase production post viral/bacterial infection, celiac disease, or IBD)

### Diagnosis
- trial of lactose-free diet
- watery stool, acid pH, positive reducing sugars
- positive breath hydrogen test if >6 yr

### Management
- lactose-free diet, soy formula
- lactase-containing tablets/capsules/drops (e.g. Lacteeze®, Lactaid®)

# Irritable Bowel Syndrome

- see Gastroenterology, G26

# Celiac Disease

- see Gastroenterology, G21
- in children: presents at any age, usually 6-24 mo with the introduction of gluten in the diet
- FTT with poor appetite, irritability, apathy, rickets, wasted muscles, flat buttocks, rarely distended abdomen
- GI symptoms: anorexia, N/V, edema, anemia, abdominal pain
- non-GI manifestations: iron-deficiency anemia, dermatitis herpetiformis, dental enamel hypoplasia, osteopenia/osteoporosis, short stature, delayed puberty, behavioural changes
- associated with other autoimmune disorders (e.g. Type 1 diabetes, MS, autoimmune hepatitis)

Celiac disease is associated with an increased prevalence of IgA deficiency. Since tTG is an IgA-detecting test, you must order an accompanying IgA level

A Celiac disease diet must avoid gluten present in "**BROW**" foods
**B**arley
**R**ye
**O**ats (controversial)
**W**heat

# Milk Allergy (MA) & Cow's Milk Protein Allergy

### Pathophysiology
- milk allergy (MA) is IgE mediated whereas cow's milk protein allergy (i.e. food protein induced proctocolitis of infancy [FPIPI]) is non-IgE mediated and more common

### Clinical Feature
- MA reactions occur within hours of exposure and are present on the skin (urticarial, pruritus), upper and lower resp tract symptoms (wheeze, cough)
- occurs between 2-8 mo of infancy, presents with:
  - proctocolitis: mild diarrhea, small amounts of bloody stools (common presentation in young infant)
  - enterocolitis: vomiting, diarrhea, anemia, hematochezia, constipation
  - enteropathy: chronic diarrhea, hypoalbuminemia
- up to 50% of children intolerant to cow's milk may be intolerant to soy protein as well

### Investigations
- food challenge (gold standard), skin prick test, serum measurement of allergen-specific IgE, patch testing

### Management
- MA: stop exposure
- FPIPI: stop, reintroduce milk at 6-8 mo, vast majority (>90%) will outgrow intolerance by 1 yr
- casein hydrolysate formula (dairy-free e.g. Nutramigen®, Pregestimil®) or mother may sequentially remove cow's milk protein, all bovine protein, soy protein, legumes (7 d washout), and continue breastfeeding (with adequate calcium and vitaminD intake)

# Inflammatory Bowel Disease

- see Gastroenterology, G22

# Cystic Fibrosis

- see *Respirology*, P82

# Constipation

- decreased stool frequency (<3 stools/wk) and/or stool fluidity (hard, pellet-like)

### FUNCTIONAL CONSTIPATION
- 99% of cases of constipation
- Rome III criteria
  - ≥2 of the following for at least 1 mo:
    - ≤2 defecations/wk
    - history of excessive stool retention
    - history of large-diameter stools
    - history of painful or hard bowel movements
  - in toilet trained children, the following additional criteria may be used:
    - at least one episode/wk of incontinence after the acquisition of toileting skills
    - history of large-diameter stools that may obstruct toilet

### Pathophysiology
- lack of fibre in diet or change in diet, poor fluid intake, behavioural
  - infants: often occurs when introducing cow's milk after breast milk due to high fat and solute content, lower water content
  - toddlers/older children: can occur during toilet training, or due to pain on defecation, leading to withholding of stool
  - two crucial time periods: toilet training and starting school

### Management
- education: explanation of mechanism of functional constipation for parents/older children
- clean out: PEG 3350 flakes (1-1.5 g/kg/d, max 100 g/d), picosalax, PEGlyte®
- maintenance: adequate fluid intake (if <6 mo, 150 mL/kg/d), adequate dietary fibre (fruit, vegetables, whole grains), stool softening (PEG 3350, mineral oil), appropriate toilet training technique (dedicated time for defecation: 3-10 min, 1-2 x/d)
- children should be treated for at least 6 mo, and should not be weaned from maintenance therapy until they are having regular bowel movements without difficulty
- regular follow-up with ongoing support and encouragement is essential

### Complications
- pain retention cycle: anal fissures + pain from withholding passing stool, chronic dilatation ± overflow incontinence

### HIRSCHSPRUNG'S DISEASE (Congenital Aganglionic Megacolon)
- see General Surgery, GS69

### OTHER ORGANIC DISORDERS CAUSING CONSTIPATION
- endocrine: hypothyroidism, DM, hypercalcemia
- neurologic: spinal cord abnormalities/trauma, NF
- anatomic: bowel obstruction, anus (imperforate, atresia, stenosis, anteriorly displaced)
- drugs: lead, chemotherapy, opioids
- others

# Abdominal Pain

### ACUTE ABDOMINAL PAIN

#### History
- description of pain (location, radiation, duration, constant vs. colicky, relation to meals)
- associated symptoms: N/V, diarrhea, fever

#### Physical Exam
- abdominal exam, rectal exam, rash

#### Investigations
- CBC, differential, urinalysis to rule out UTI

**Table 20. Differential Diagnosis of Acute Abdominal Pain**

| Gastrointestinal | Hepatobiliary Tract | Genitourinary | Hematologic | Metabolic | Drug and Toxins | Pulmonary | Miscellaneous |
|---|---|---|---|---|---|---|---|
| Gastroenteritis<br>Appendicitis<br>Mesenteric adenitis<br>Constipation<br>Ileus<br>Abdominal trauma<br>Intestinal obstruction (incarcerated hernia, intussusception, volvulus)<br>Peritonitis<br>Peptic ulcer<br>Meckel's diverticulum<br>IBS<br>Food poisoning<br>Lactose intolerance | Hepatitis<br>Cholecystitis<br>Cholelithiasis<br>Spleen – infarction, rupture<br>Pancreatitis | UTI<br>Urinary calculi<br>Dysmenorrhea<br>Mittelschmerz<br>PID<br>Threatened abortion<br>Ectopic pregnancy<br>Nephrolithiasis<br>Testicular torsion<br>Ovarian torsion<br>Endometriosis<br>Hematocolpos | Sickle cell crisis<br>Henoch-Schönlein purpura<br>Hemolytic uremic syndrome | Diabetic ketoacidosis<br>Hypoglycemia<br>porphyria | Erythromycin<br>salicylates<br>lead<br>poisoning<br>venoms | Pneumonia<br>Diaphragmatic pleurisy | Functional pain<br>Infantile colic<br>Pharyngitis<br>Angioneurotic edema<br>Mediterranean fever |

### APPENDICITIS
- see General Surgery, GS32
- most common cause of acute abdomen after 5 yr of age
- clinical features: low grade fever, abdominal pain, anorexia, N/V (after onset of pain), peritoneal signs (generalized peritonitis is a common presentation in infants/young children)
- treatment: surgical
- complications: perforation (common in young children), abscess

### INTUSSUSCEPTION
- telescoping of segment of bowel into distal segment causing ischemia and necrosis

**Intussusception – Classic Triad**
- Abdominal pain
- Palpable mass
- Red currant jelly stools

#### Epidemiology
- 90% idiopathic, children with CF or GJ tube at significantly increased risk; M:F = 3:1
- 50% between 3-12 mo, 75% before 2 yr of age

#### Pathophysiology
- usual site: ileocecal junction; jejunum in children with GJ tubes
- lead point of telescoping segment may be swollen Peyer's patches, Meckel's diverticulum, polyp, malignancy, HSP, structural abnormalities

#### Clinical Feature
- "classic triad" (<25% patients) - abdominal pain, palpable mass, red currant jelly stools
- often preceded by URTI
- sudden onset of recurrent, paroxysmal, severe periumbilical pain with pain-free intervals
- later vomiting (may be bilious) and rectal bleeding (late finding)
- shock and dehydration; lethargy may be only presenting symptom

#### Diagnosis
- U/S, air enema

### Management
- air enema can be therapeutic (reduces intussusception in 75% of cases), reduction under hydrostatic pressure, surgery rarely needed
- recurrence rate 10-15%, need to consider pathologic lead point

# Chronic Abdominal Pain

### Epidemiology
- prevalence: 10% of school children (peak at 8-10 yr), F>M

### Etiology
- organic (<10%)
  - gastrointestinal
    - constipation (cause vs. effect), infectious
    - IBD, esophagitis, peptic ulcer disease, lactose intolerance
    - anatomic anomalies, masses
    - pancreatic, hepatobiliary
    - celiac disease
  - genitourinary causes: recurrent UTI, nephrolithiasis, chronic PID, Mittelschmerz
  - neoplastic
- functional abdominal pain (90%): can be diagnosed when there are no alarming signs or symptoms, physical exam is normal, and stool sample tests are negative for occult blood; no further testing is required, unless high suspicion for organic cause
  - alarming symptoms include involuntary weight loss, deceleration of linear growth, GI blood loss, significant vomiting, chronic severe diarrhea, persistent upper or right lower quadrant pain, unexplained fever, family history of IBD
  - can be further subclassified into functional dyspepsia (pain in upper abdomen), irritable bowel syndrome (alternating bowel movements), abdominal migraine (paroxysmal abdominal pain, associated with anorexia, nausea, vomiting, pallor), functional abdominal pain syndrome

**Chronic Abdominal Pain**

**Rule of 3s**
3 episodes of severe pain
Child >3 yr old
Over 3 mo period

**Red Flags for Organic Etiology of Chronic Abdominal Pain**
- Age <5 yr old
- Fever
- Localizes pain away from midline
- Anemia
- Evidence of GI blood loss
- Rash
- Pain awakens child at night
- Travel history
- Prominent vomiting, diarrhea
- Weight loss or failure to gain weight
- Deceleration in linear growth
- Joint pain
- Family history of IBD
- Abnormal or unexplained physical exam findings

### Clinical Feature
- clustering episodes of vague, crampy periumbilical/epigastric pain, vivid pain description
- seldom awakens child from sleep, less common on weekends
- aggravated by exercise, alleviated by rest
- psychological factors related to onset and/or maintenance of pain, school avoidance
- psychiatric comorbidity: anxiety, somatoform, mood, learning disorders, sexual abuse, eating disorders, elimination disorders
- diagnosis of exclusion

### Investigations
- fecal occult blood and others based on clinical suspicion (CBC, ESR, urinalysis, etc.)

### Management
- continue to attend school
- manage any emotional or family problems, counselling, CBT
- trial of high fibre diet, trial of lactose-free diet
  - medication should be for symptom relief – acid reduction therapy for dyspepsia, antispasmodic agents, smooth muscle relaxants for pain, nonstimulating laxatives or antidiarrheals for altered bowel pattern
- possible role for amitriptyline
- reassurance

### Prognosis
- pain resolves in 30-50% of children within 2-6 wk of diagnosis
- 30-50% of children with functional abdominal pain have functional pain as adults (e.g. IBS)

# Abdominal Mass

**Table 21. Differential Diagnosis for Abdominal Mass**

| | Benign | Malignant |
|---|---|---|
| **Renal**<br>(note: 50% of abdominal masses in newborn are renal in origin) | Hydronephrosis<br>Polycystic kidney disease<br>Hamartoma | Nephroblastoma (Wilms' tumour)<br>Renal cell carcinoma |
| **Adrenal** | | Neuroblastoma |
| **Ovarian** | Ovarian cysts | Ovarian tumours |
| **Other** | Hepatomegaly/splenomegaly<br>Pyloric stenosis<br>Abdominal hernia<br>Teratoma<br>Fecal impaction | Lymphoma<br>Rhabdomyosarcoma<br>Retroperitoneal sarcoma |

**Table 22. Abdominal Mass**

| Abdominal Mass | Benign or Malignant | Clinical Feature | Management |
|---|---|---|---|
| Hydronephrosis | Benign | Usually asymptomatic<br>Urinary tract obstruction<br>Vesicoureteral reflux | Genetic counselling<br>Unilateral hydronephrosis >4 mm in second trimester, a follow-up US scan in third trimester is performed<br>Persistent hydronephrosis >10 mm require postnatal evaluation |
| Polycystic Kidney Disease | Benign | Progressive renal failure, hypertension, urinary tract infection, concentrating defects, hematuria, nephrolithiasis, flank pain | BP control with ACE inhibitors<br>Dietary sodium restrictions<br>Statins<br>Vasopressin receptor antagonists |
| Hamartoma | Benign | Asymptomatic abdominal swelling<br>Abdominal pain (30-40%)<br>Hematuria (12-25%)<br>Fever and hypertension (25%) | Surgery, chemotherapy, radiation |
| Wilm's Tumour | Malignant | Asymptomatic abdominal swelling<br>Abdominal pain (30-40%)<br>Hematuria (12-25%)<br>Fever and hypertension (25%) | Surgery, chemotherapy, radiation |
| Renal Cell Carcinoma | Malignant | Classic triad of flank pain, hematuria and palpable abdominal renal mass | For localized RCC, surgery is curative<br>For advanced RCC, immunotherapy and radiation |

# Upper Gastrointestinal Bleeding

- see Gastroenterology, G28

# Lower Gastrointestinal Bleeding

- see Gastroenterology, G30

## Etiology

- acute
  - infectious (bacterial, parasitic)
  - antibiotic-induced (*C. difficile*)
  - NEC in preterm infants
  - anatomic
  - malrotation/volvulus, intussusception
  - Meckel's diverticulitis
  - anal fissures, hemorrhoids
  - vascular/hematologic
  - HSP
  - HUS
  - coagulopathy
- chronic
  - anal fissures (most common)
  - colitis
  - IBD
  - allergic (milk protein)
  - structural
  - polyps (most are hamartomas)
  - neoplasms (rare)
  - coagulopathy

## Physical Exam

- hemodynamic status, evidence of FTT, fever
- anal and rectal exam: tags, fissures, anal fistulas, polyps, foreign body, blood per rectum
- stool appearance
- NG aspirate
- lower GI bleed may present as melena (if it involves the small bowel) or hematochezia

## Investigations

- stool cultures (C&S, *C. difficile* toxin)
- urinalysis and microscopy
- CBC, smear, differential, ESR, CRP, electrolytes, urea, Cr, INR, PTT, albumin, iron studies, amoeba titers
- radiologic investigations (including abdominal x-ray to rule out obstruction)
- Meckel's radionuclide scan

## Management

- acute stabilization: ABCs, volume and blood replacement, bowel rest (NPO, NG tube)
- once stable, endoscopy and/or surgery as indicated

# Genetics, Dysmorphisms, and Metabolism

- see Medical Genetics

# Hematology

## Approach to Anemia

### CLASSIFICATION

- mechanism: decreased production (inadequate reticulocyte response) vs. increased destruction or loss (adequate reticulocyte response)
  - in the context of anemia, a normal retic count is inappropriate

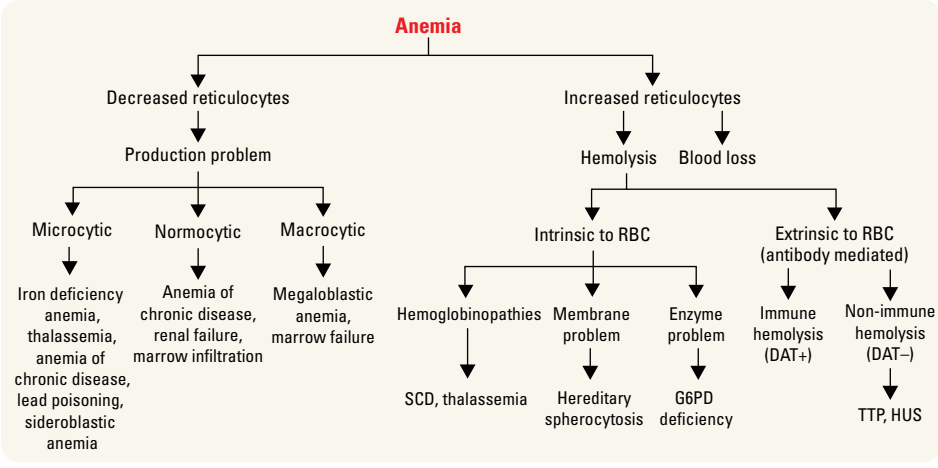

**Figure 11. Approach to anemia**

**Normal Hb Values by Age**

| Age | Hb Range (g/L) |
|---|---|
| Newborn | 137-201 |
| 2 wk | 130-200 |
| 3 mo | 95-145 |
| 6 mo-6 yr | 105-140 |
| 7-12 yr | 110-160 |
| Adult female | 120-160 |
| Adult male | 140-180 |

## Physiologic Anemia

- high Hb (>170 g/L) and reticulocyte count at birth is caused by a hypoxic environment in utero
- after birth, levels start to fall due to shorter fetal RBC lifespan, decreased RBC production (during first 6-8 wk of life, there is virtually no erythropoiesis due to new $O_2$ rich environment), and increasing blood volume secondary to growth
- lowest levels about 100 g/L at 8-12 wk age (earlier and more exaggerated in premature infants); levels rise spontaneously with activation of erythropoiesis
- usually no treatment required

MCV in childhood varies with age
Rule of thumb: lower normal limit of MCV = 70 + age (yr) until 80 fL (adult standard)

## Iron Deficiency Anemia

- most common cause of childhood anemia
- full term infants exhaust iron reserves by 6 mo of age
- premature infants have lower reserves, therefore exhausted by 2-3 mo of age
- common diagnosis between 6 mo-3 yr and 11-17 yr due to periods of rapid growth and increased iron requirements; adolescents also have poor diet and menstrual losses

Ferritin is an acute phase reactant, therefore, normal or high ferritin does not exclude iron deficiency anemia during an infection

### Etiology

- children at risk (premature, LBW, low SES, etc.)
- dietary risk factors: cow's milk in first year of life
- age >6 mo: <2 servings/d of iron-fortified cereal, red meat, or legumes
- age <12 mo: use of low-iron formula (<10 mg/L), primary diet of cow, goat, or soy milk
- age 1-5 yr: >16-20 oz/d of non-iron fortified milk
- blood loss
  - iatrogenic: repeated blood sampling (especially in hospitalized neonates)
  - allergic: cow's milk protein-induced colitis

Iron deficiency is rare in children <6 mo in the absence of blood loss or prematurity

### Clinical Feature

- usually asymptomatic until marked anemia
- symptoms may include: pallor, fatigue, pica (eating non-food materials), tachycardia, systolic murmur, angular cheilitis, koilonychia (spoon nails)

### Investigations

- CBC: low Hb, MCV, and MCH, reticulocyte count normal or high (absolute number low)
- Mentzer index (MCV/RBC) can help distinguish iron deficiency anemia from thalassemia
  - ratio <13 suggests thalassemia
  - ratio >13 suggests iron deficiency
- blood smear: hypochromic, microcytic RBCs, pencil shaped cells, poikylocytosis

- iron studies: low ferritin, other (low iron, high total iron binding capacity, high transferrin, low transferrin saturation)
- initial therapy: trial of iron

### Prevention
- breastfed term infants: begin iron supplementation (1 mg/kg/d) at 4-6 mo, continuing until able to eat ≥2 feeds/d of iron-rich foods
- non-breastfed (<50% of diet) term infants: give iron-fortified formula from birth
- premature infants: give iron supplements from 1 mo through to 1 yr of age
- no cow's milk until 9-12 mo, early introduction of red meat and iron-rich vegetables: total daily iron should be 11 mg (age 6-12 mo), 7 mg (age 1-3 yr)
- consider screening Hb levels in infants not receiving iron-fortified formula at 9-12 mo, and earlier if other risk factors

### Management
- encourage diverse, balanced diet, limit homogenized milk to 16-20 oz/d
- oral iron therapy: 4-6 mg/kg/d elemental iron, divided bid to tid, for 3- 6 mo to replenish iron stores
  - increased reticulocyte count in 2-3 d (peaks day 5-7)
  - increased hemoglobin in 4-30 d
  - repletion of iron stores in 1-3 mo
  - repeat hemoglobin levels after 1 mo of treatment
- poor response to oral iron therapy: non-adherance, medication intolerance, ongoing blood loss, IBD, celiac disease, incorrect diagnosis

### Complications
- can cause irreversible effects on development if untreated (behavioural and intellectual deficiencies)
- angular cheilitis, glossitis, koilonychia (spoon nails)

## Vitamin K Deficiency

### Etiology
- hemorrhagic disease of the newborn (HDNB) due to relative deficiencies of vitamin K-dependent coagulation factors
  - generalized bleeding; GI/intracranial hemorrhage
  - early-onset (in first 24 hours), classic (day 2 to 2 weeks), and late-onset (2 weeks up to 3-6 mo)
- IM injection at birth, can also be given orally (3 doses: at birth, 2-4 wk, 6-8 wk) but infants at higher risk of HDNB
- reason for administration at birth:
  - insufficient prenatal storage of vitamin K and human milk contains small amounts of vitamin K
  - risk factors for non-classic presentation: maternal medication (i.e. antiepileptic drugs), chronic malabsorption, no prophylaxis

## Anemia of Chronic Disease

- see Hematology, H16

## Sickle Cell Disease

- see Hematology, H20

## Thalassemia

- see Hematology, H19

## Hereditary Spherocytosis

- see Hematology, H22

## Glucose-6-Phosphate Dehydrogenase Deficiency

- see Hematology, H23

G6PD deficiency protects against parasitism of RBCs (i.e. malaria)

## Bleeding Disorders

- see Hematology, H25

**Table 23. Evaluation of Abnormal Bruising/Bleeding**

| | PFA | PT | PTT | VIII:C | vWF | Platelets | Fibrinogen |
|---|---|---|---|---|---|---|---|
| **Hemophilia A** | N | N | ↑ | ↓ | N | N | N |
| **Hemophilia B** | N | N | ↑ | N | N | N | N |
| **von Willebrand Disease** | ↑ | N | N or ↑ | ↓ | N or ↓ | N | N |
| **DIC** | N or ↑ | ↑ | ↑ | ↓ | N | ↓ | ↓ |
| **Vitamin K Deficiency** | N | ↑ | ↑ | N | N | N | N |
| **Thrombocytopenia** | ↑ | N | N | N | N | ↓ | N |

DIC = disseminated intravascular coagulation; PFA = platelet function assay; VIII:C = Factor VIII coagulant activity; vWF = von Willebrand Factor

Extensive bruising in the absence of lab abnormalities: consider child maltreatment

# Immune Thrombocytopenic Purpura

## Epidemiology
- most common cause of thrombocytopenia in childhood
- peak age: 2-6 yr, M=F
- incidence 5:100,000 children per year

## Etiology
- caused by autoantibodies that bind to platelet membranes → Fc-receptor mediated splenic uptake → destruction of platelets

## Clinical Feature
- 50% present 1-3 wk after viral illness (e.g. URTI, chicken pox)
- sudden onset of petechiae, purpura, epistaxis in an otherwise well child
- clinically significant bleed in only 3% (severe bleed more likely with platelet count <10) with <0.5% risk of intracranial bleed
- no lymphadenopathy, no hepatosplenomegaly
- labs: thrombocytopenia with normal RBC, WBC
- bone marrow aspirate only if atypical presentation (≥1 cell line abnormal, hepatosplenomegaly)
- differential diagnosis: leukemia, drug-induced thrombocytopenia, HIV, infection (viral), autoimmune (SLE, ALPS)

## Management
- observation vs. pharmacologic intervention highly debated; spontaneous recovery in >70% of cases within 3 mo
- involve family in management; shared decision-making
- no or mild bleeding – strongly consider observation
- moderate bleeding (i.e. severe skin manifestations with some mucosal lesions and some troublesome epistaxis or menorrhagia) – IVIG or steroids; if Rh-positive can use anti-D but not first line due to serious adverse effects
- severe (i.e. prolonged epistaxis, GI bleeding or intracranial hemorrhage) - immediate treatment with IV steroids and IVIG; may use transexamic acid as adjunct therapy
- treatment with IVIg or prednisone if mucosal or internal bleeding, platelets <10, or at risk of significant bleeding (surgery, dental procedure, concomitant vasculitis or coagulopathy)
- life-threatening bleed: additional platelet transfusion ± emergency splenectomy
- persistent (>3-12 mo) or chronic (>12 mo): re-evaluate; treat if symptoms persist
- supportive: avoid contact sports and ASA/NSAIDs

**The American Society of Hematology 2011 Evidence-Based Practice Guideline for Immune Thrombocytopenia**
Blood 2011;117(16):4190-207

**Recommendations**
- Bone marrow examination is unnecessary in children and adolescents with the typical features of ITP.
- Bone marrow examination is not necessary in children who fail IVIg therapy (grade 1B).
- Children with no bleeding or mild bleeding (defined as skin manifestations only, such as bruising and petechiae) may be managed with observation alone regardless of platelet count.
- For pediatric patients requiring treatment, a single dose of IVIg (0.8-1 g/kg) or a short course of corticosteroids may be used as first-line treatment.
- IVIg can be used if a more rapid increase in the platelet count is desired.
- Anti-D therapy is not advised in children with a hemoglobin concentration that is decreased due to bleeding, or with evidence of autoimmune hemolysis.

**Suggestions**
- Bone marrow examination is also not necessary in similar patients prior to initiation of treatment with corticosteroids or before splenectomy.
- Testing for antinuclear antibodies is not necessary in the evaluation of children and adolescents with suspected ITP.
- A single dose of anti-D can be used as first-line treatment in Rh-positive, nonsplenectomized children requiring treatment.

# Hemophilia

- see Hematology, H31

# von Willebrand's Disease

- see Hematology, H30

# Oncology

- cancer is the second most common cause of death after injuries in children >1 yr of age
- cause is rarely known, but increased risk for children with: chromosomal syndromes (e.g. Trisomy 21), cancer predisposition syndromes (e.g. Li-Fraumeni syndrome), prior malignancies, neurocutaneous syndromes, immunodeficiency syndromes, family history, exposure to radiation, chemicals, biologic agents
- leukemias are the most common type of pediatric malignancy (30%) followed by brain tumours (25%), and lymphomas (15%)
- some malignancies are more prevalent in certain age groups
  - newborns: neuroblastoma, Wilms' tumour, retinoblastoma
  - infancy and childhood: leukemia, neuroblastoma, CNS tumours, Wilms' tumour, retinoblastoma
  - adolescence: lymphoma, gonadal tumours, germ cell tumours, bone tumours
- unique treatment considerations in pediatrics because radiation, chemotherapy, and surgery can impact growth and development, endocrine function, and fertility
- good prognosis: treatments have led to remarkable improvements in overall survival and cure rates for many pediatric cancers (>80%)

# Lymphadenopathy

### Clinical Features

- features of malignant lymphadenopathy: firm, discrete, non-tender, enlarging, immobile, abnormal imaging findings or bloodwork, constitutional symptoms, worrisome location (i.e. supraclavicular or generalized)
- fluctuance, warmth, or tenderness are more suggestive of benign nodes (infection)

### Differential Diagnosis

- infection
  - viral: URTI, EBV, CMV, adenovirus, HIV
  - bacterial: *S. aureus*, GAS, anaerobes, *Mycobacterium* (e.g. TB), cat scratch disease (*Bartonella*)
  - other: fungal, protozoan, Rickettsia
- autoimmune: rheumatoid arthritis, SLE, serum sickness
- malignancy: lymphoma, leukemia, metastatic solid tumours
- storage diseases: Niemann-Pick, Gaucher's
- other: sarcoidosis, Kawasaki disease, histiocytoses

### Investigations

Most common cause of acute bilateral cervical LAD is viral illness

- generalized lymphadenopathy
  - CBC and differential, blood culture
  - inflammatory markers (ESR, CRP)
  - serology: EBV, CMV and others as indicated (e.g. HIV, fungal, toxoplasmosis)
  - uric acid, LDH, electrolytes
  - CXR
  - TST
  - if indicated other blood work i.e. inflammatory panel (ANA, RF, dsDNA)
  - biopsy: if increasing in size; or >2 cm and unclear diagnosis or no response to treatment. Do early biopsy if supraclavicular or very large single or group of nodes (>3-4 cm)
- regional lymphadenopathy
  - period of observation if asymptomatic
  - trial of oral antibiotics
  - ultrasound
  - biopsy (especially if persistent >6 wk and/or constitutional symptoms)

# Leukemia

- see Hematology, H38

### Epidemiology

- mean age of diagnosis 2-5 yr but can occur at any age
- heterogeneous group of diseases
  - ALL (80%)
  - AML (15%)
  - CML (<5%)
- children with DS are 15x more likely to develop leukemia

### Clinical Feature

- infiltration of leukemic cells into bone marrow results in bone pain and bone marrow failure (anemia, neutropenia, thrombocytopenia)
- infiltration into tissues results in lymphadenopathy, hepatosplenomegaly, CNS manifestations, testicular disease

- fever, fatigue, weight loss, bruising, and easy bleeding
- investigations: CBC and differential, peripheral blood smear, uric acid, LDH, extended electrolytes, renal function and blood culture
- specialized tests: BM ± lymph node biopsy, flow cytometry, cytogenetics, molecular studies
- hyperleukocytosis (total WBC >100 x $10^9$/L) is a medical emergency
  - presents clinically with respiratory or neurological distress caused by hyperviscosity of blood and leukostasis
  - risk of ICH, pulmonary leukostasis syndrome, tumour lysis syndrome
  - management: fluids, allopurinol/rasburicase, fresh frozen plasma/platelets to correct thrombocytopenia, induction chemotherapy, avoid transfusing RBCs unless symptomatic (and then use very small volumes)

### Management
- combination chemotherapy using non-cross resistant chemotherapy agents, allogeneic stem cell transplantation for high-grade or recurrent disease
- supportive care and management of treatment complications
  - febrile neutropenia: see Infectious Diseases, ID42
  - tumour lysis syndrome: see Hematology, H52

### Prognosis
- 80-90% 5 yr event-free survival for ALL, 50-60% 5-yr survival for AML
- patients are stratified into standard risk and high risk based on WBC and age; other prognostic factors include presence of CNS/testicular disease, immunophenotype, cytogenetics, and initial response to therapy (most important prognostic variable)

## Lymphoma

- see Hematology, H45

### Epidemiology
- Hodgkin lymphoma: incidence is bimodal, peaks at ages 15-34 and >50 yr old
- non-Hodgkin lymphoma: incidence peaks at 7-11 yr

### Clinical Feature
- Hodgkin lymphoma
  - most common presentation is persistent, painless, firm, cervical or supraclavicular lymphadenopathy
  - can present as persistent cough or dyspnea (secondary to mediastinal mass) or less commonly as splenomegaly, axillary, or inguinal lymphadenopathy
  - constitutional symptoms in 30% of children
  - lymph nodes become sequentially involved as disease spreads
- non-Hodgkin lymphoma
  - generally categorized into lymphoblastic, diffuse large B cell, Burkitt's lymphoma, and anaplastic large cell
  - rapidly growing tumour with distant metastases (unlike adult non-Hodgkin lymphoma)
  - signs and symptoms related to disease site: most commonly abdomen, chest (mediastinal mass), head and neck region
- investigations: CBC and differential, peripheral blood smear, extended electrolytes, uric acid, LDH, renal function, liver enzymes and function, ESR, ferritin, and blood culture if concerns for infection. CXR and CT of chest/abdomen/pelvis. Specialized tests: BM aspirate and biopsy ± LN biopsy, lumbar puncture, nuclear medicine scans

Back pain in children must always be investigated!
Unlike adults, back pain in children often points to a pathological process

### Management
- Hodgkin lymphoma
  - combination chemotherapy and radiation
  - increasing role for use of PET scanning to assess early disease response and plan therapy
- non-Hodgkin lymphoma
  - combination chemotherapy
  - no added benefit of radiation in pediatric protocols

Constitutional symptoms = fever, chills, night sweats, unexplained weight loss

### Prognosis
- Hodgkin lymphoma: >90% 5 yr survival
- non-Hodgkin lymphoma: 75-90% 5 yr survival

## Brain Tumours

- see Neurosurgery, NS38

# Wilms' Tumour (Nephroblastoma)

### Epidemiology
- usually diagnosed between 2-5 yr; M=F
- most common primary renal neoplasm of childhood
- 5-10% of cases both kidneys are affected (simultaneously or in sequence)

### Differential Diagnosis
- hydronephrosis, polycystic kidney disease, renal cell carcinoma, neuroblastoma

### Clinical Feature
- 80% present with asymptomatic, unilateral abdominal mass
- may also present with HTN, gross hematuria, abdominal pain, vomiting
- may have pulmonary metastases at time of diagnosis (respiratory symptoms)

### Associated Congenital Abnormalities
- **WAGR** syndrome (**W**ilms' tumour, **A**niridia, **G**enital anomalies, mental **R**etardation) with 11p13 deletion
- Beckwith-Wiedemann syndrome:
  - characterized by enlargement of body organs (especially tongue), hemihypertrophy, renal medullary cysts, and adrenal cytomegaly
  - also at increased risk for developing hepatoblastoma, and less commonly adrenocortical tumours, neuroblastomas, and rhabdomyosarcomas
- Denys-Drash syndrome: characterized by gonadal dysgenesis and nephropathy leading to renal failure

### Management
- staging ± nephrectomy
- chemotherapy, radiation for higher stages

### Prognosis
- 90% long-term survival

# Neuroblastoma

### Epidemiology
- most common cancer occurring in first year of life
- neural crest cell tumour arising from sympathetic tissues (neuroblasts)

### Clinical Feature
- can originate from any site in sympathetic nervous system, presenting as mass in neck, chest, or abdomen (most common site is adrenal gland)
- signs and symptoms of disease vary with location of tumour
  - thoracic: dyspnea, Horner's syndrome
  - abdomen: palpable mass
  - spinal cord compression
- metastases are common at presentation (>50% present with advanced stage disease):
  - usually to bone or bone marrow (presents as bone pain, limp)
  - can also present with periorbital ecchymoses, abdominal pain, emesis, fever, weight loss, anorexia, hepatomegaly, "blueberry muffin" skin nodules
- paraneoplastic: HTN, palpitations, sweating (from excessive catecholamines), diarrhea, FTT (from vasoactive intestinal peptide secretion), opsomyoclonus

### Management
- depends on prognostic factors and may include combination of: surgery, radiation, chemotherapy, autologous stem cell transplantation, immunotherapy

### Prognosis
- prognosis is often poor due to late detection
- good prognostic factors
  - "age and stage" are important determinants of better outcome: <18 mo, stage I, II, IV-S disease ("S" designates a "Special" classification only pertaining to infants)
  - primary site: posterior mediastinum and neck
  - low serum ferritin
  - more differentiated histology
  - tumour cell markers: aneuploidy, absent MYCN oncogene amplification

# Bone Tumours

- see Orthopedic Surgery, OR46

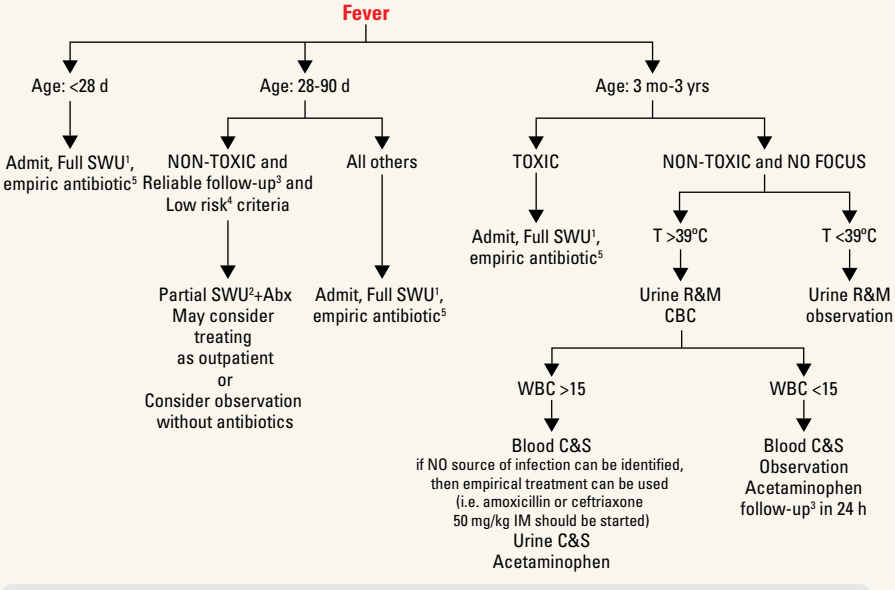
# Cancer Predisposition Syndromes

- suspected in cases of multiple primary neoplasms, especially early onset for cancer type and/or family history consistent with known cancer predisposition syndrome (critical to obtain family history and refer if syndrome suspected)
- cancer predisposition syndromes with pediatric onset include Li-Fraumeni syndrome (soft tissue sarcomas, osteosarcoma, CNS tumours and adrenal cortical carcinoma), hereditary retinoblastoma, and Fanconi anemia (leukemias)

# Infectious Diseases

## Fever

### Definition



- fever: a practical definition is >38°C/100.4°F oral or rectal
- fever without a source/focus: acute febrile illness (typically <10 d duration) with no cause of fever even after careful history and physical
- fever of unknown origin: daily or intermittent fevers for at least 2 consecutive wk of uncertain cause after careful history and physical, and initial laboratory assessment

### Etiology

- infectious: anatomic approach (CNS, ears, upper and lower respiratory tract, GI, GU, skin, soft tissue, bones and joints, etc.)
- inflammatory: mainly autoimmune (Kawasaki disease, JIA, IBD, SLE, etc.)
- malignancy: childhood cancers (leukemia, lymphoma, neuroblastoma, etc.)
- miscellaneous: dehydration, drugs and toxins, post-immunization, familial dysautonomia, factitious disorder, etc.

### Diagnosis

- history: duration, height and pattern of fever, associated symptoms, exposures, constitutional symptoms, recent antipyretic use, ethnic or genetic background, daycare, sick contacts, travel, tick bites, age of child
- physical exam: toxic vs. non-toxic, vitals, growth, complete exams of the skin, HEENT, chest, abdomen, lymph nodes, genitalia
- investigations: guided by history, physical exam, and clinical suspicion

**NOTES**
1. SWU = Septic Workup
2. Partial Septic Workup – blood C&S, CBC and differential, urine R&M, C&S, LP, CXR if respiratory symptoms, stool C&S if GI symptoms
3. Follow-up is crucial – if adequate follow-up is not assured, a more aggressive diagnostic and therapeutic approach may be indicated
4. Low-risk (Rochester) criteria
5. Considerable practice variation exists in terms of empiric antibiotic treatment
6. Important principles – the younger the child, the greater the difficulty to clinically assess the degree of illness

**Figure 12. Approach to the febrile child**

**Rochester Criteria – Developed to Identify Infants ≤60 d of Age with Fever at Low Risk of Serious Bacterial Infection**

| | |
|---|---|
| Clinically | Well |
| WBC Count | 5-15 x $10^9$/L |
| Bands | <1.5 x $10^9$/L |
| Urinalysis | <10 WBC/HPF |
| Stool (if diarrhea) | <5 WBC/HPF |
| Past Health | Born >37 wk<br>Home with/before mom<br>No hospitalizations<br>No prior antibiotic use<br>No prior treatment for unexplained hyperbilirubinemia<br>No chronic disease |

### Evaluation of Neonates and Infants with Fever
- several protocols exist that attempt to identify neonates and young infants at low risk of serious bacterial infection (e.g. Rochester Criteria)
  - such protocols are not as sensitive in the 1-28 d age group; therefore, febrile neonates should be considered high risk regardless of clinical features and laboratory findings

### Management
- admit to hospital if appropriate
- treat the source if known
- replace fluid losses (e.g. from vomiting, diarrhea, etc.); maintenance fluid needs are higher in febrile child
- reassure parents that most fevers are benign and self-limited
- antipyretics (acetaminophen and/or ibuprofen) may be given if child is uncomfortable

## Acute Otitis Media

All of:
1. presence of middle ear effusion
2. presence of middle ear inflammation
3. acute onset of symptoms of middle ear effusion and inflammation

### Epidemiology
- 60-70% of children have at least 1 episode of AOM before 3 yr of age
- 18 mo-6 yr most common age group
  - 22% of children in this age range will develop AOM in the first wk of a viral URI
- one third of children have had ≥3 episodes by age 3; peak incidence January to April

### Etiology
- bacterial – *S. pneumoniae* (decreasing since the introduction of PCV7 and PCV13), *H. influenza, M. catarrhalis*, GAS
- less common - anaerobes (newborns) , Gram-negative enterics (infants)
- viral – more likely to spontaneously resolve

### Risk Factors
- Eustachian tube related:
  - dysfunction/obstruction (URTI, allergic rhinitis, chronic rhinosinusitis, adenoid hypertrophy, barotrauma)
  - inadequate tensor palatine function (cleft palate)
  - genetic syndromes (DS, Crouzon, Apert)
  - cilia disruption (Kartagenger's syndrome, CF)
- genetic predisposition (family history, ethnicity – First Nations and Inuit, low levels of secretory IgA or persistent biofilm in middle ear)
- behavioural and environmental exposures (not breastfed or shorter duration of breastfeeding, prolonged bottle feeding, bottle feeding laying down, pacifier use, second-hand smoke exposure, crowded living conditions/daycare, sick contacts)
- immunosuppression/deficiency (chemotherapy, steroids, DM, hypogammaglobulinemia, CF)

### Pathogenesis
- obstruction of Eustachian tube → air absorbed in middle ear → negative pressure (an irritant to middle ear mucosa) → edema of mucosa with exudate/effusion → infection of exudate from nasopharyngeal secretions

### Clinical Features
- acute onset of symptoms
- triad of otalgia, fever (especially in younger children), and conductive hearing loss – not all symptoms such as fever or hearing loss may be present
- rarely tinnitus, vertigo, and/or facial nerve paralysis
- otorrhea if tympanic membrane perforated
- infants/toddlers: ear-tugging (this alone is not a good indicator of pathology), hearing loss, balance disturbances (rare), irritable, poor sleeping, vomiting and diarrhea, anorexia
- otoscopy of TM: hyperemia, bulging, pus may be seen behind TM, loss of landmarks (e.g. handle and long process of malleus not visible), discolouration (hemmorhagic, grey, red, yellow)

### Diagnosis
- requires middle ear effusion and signs of inflammation (most important is a bulging TM)

### Management
- symptomatic therapy: antipyretics/analgesics (e.g. acetaminophen or ibuprophen)
- watchful waiting if criteria met (see table 10)
- antibiotic therapy if <6 mo or moderate-severe illness:
  - 1st line: high dose amoxicillin 75-90 mg/kg/d dosed BID (if penicillin allergic: macrolides, TMP-SMX)
  - 2nd line: amoxicillin-clavulanic acid, cephalosporins: cefuroxime axetil, ceftriaxone, cefaclor, cefixime
    - used when AOM unresponsive and clinical signs/symptoms persist beyond 48 h of antibiotic treatment, or for treatment of otitis-conjunctivitis syndrome

**Clinical Assessment of AOM in Pediatrics**
JAMA 2010;304:2161-2169
**Purpose**: To summarize the evidence on AOM diagnosis, treatment and the association of the heptavalent pneumococcal conjugate vaccine (PCV7) use with AOM microbiology.
**Methods**: Systematic review of diagnostic studies with a criterion standard, observational studies, and RCTs comparing AOM microbiology with and without PCV7, and RCTs assessing antibiotic treatment.
**Results**: 135 studies were included. Otoscopic findings of tympanic membrane bulging (positive likelihood ratio (PLR 51, 95% CI 36-73) and redness (PLR 8.4, 7-11) were associated with accurate diagnosis. Prevalence of S. pneumoniae decreased while that of H. influenza increased pre vs. post-PCV7. Clinical success was higher with immediate ampicillin or amoxicillin versus placebo (73% vs. 60%; pooled rate difference 12%, 95% CI 5-18%; NNT 9, 95% CI 6-20). The risk of rash or diarrhea was increased by 3 to 5%. Some evidence suggested greater success with immediate versus delayed antibiotics. No significant differences were seen in terms of comparative effectiveness of antibiotics.
**Conclusion**: Otoscoipc findings are critical to accurate AOM diagnosis. Antibiotics are somewhat more effective than no treatment despite a higher incidence of adverse effects, and generally are comparatively equal in effectiveness.

**The Diagnosis and Management of Acute Otitis Media**
Pediatrics 2013;131:e964-e999
**Recommendations**
- Management of AOM should include an assessment of pain; if pain is present, the clinician should recommend treatment to reduce pain.
- Prescribe antibiotic therapy for AOM (bilateral or unilateral) in children 6 mo and older with severe signs or symptoms (i.e. moderate or severe otalgia or otalgia for at least 48 h or temperature 39°C [102.2°F] or higher).
- For bilateral or unilateral AOM in children 6 mo through 23 mo of age without severe signs or symptoms (i.e. mild otalgia for less than 48 h and temperature less than 39°C [102.2°F]) either prescribe antibiotic therapy or offer observation with close follow-up based on joint decision-making with the parent(s)/caregiver(s). With observation ensure follow-up and begin antibiotic therapy if the child worsens or fails to improve within 48-72 h of onset of symptoms.
- Do NOT prescribe prophylactic antibiotics to reduce the frequency of episodes of AOM in children with recurrent AOM.
- Recommend annual influenza vaccine and pneumococcal conjugate vaccine to all children according to vaccination schedule.

**Option**
- Offer tympanostomy tubes for recurrent AOM (3 episodes in 6 mo or 4 episodes in 1 yr with 1 episode in the preceding 6 mo).

- signs of a perforated TM should always be treated with antimicrobial therapy (most commonly topical Ciprodex) and examined for complications
- prevention: parent education about risk factors, pneumococcal and influenza vaccines, surgery (e.g. tympanostomy tubes)
  - choice of surgical therapy for recurrent AOM depends on whether local factors (Eustachian tube dysfunction) are responsible (use ventilation tubes), or regional disease factors (tonsillitis, adenoid hypertrophy, sinusitis) are responsible

### Complications
- extracranial: hearing loss and speech delay (secondary to persistent middle ear effusion), TM perforation, extension of suppurative process to adjacent structures (mastoiditis, petrositis, labyrinthitis), cholesteatoma, facial nerve palsy, middle ear atelectasis, ossicular necrosis, vestibular dysfunction
- intracranial: meningitis, epidural and brain abscess, subdural empyema, lateral and cavernous sinus thrombosis, carotid artery thrombosis

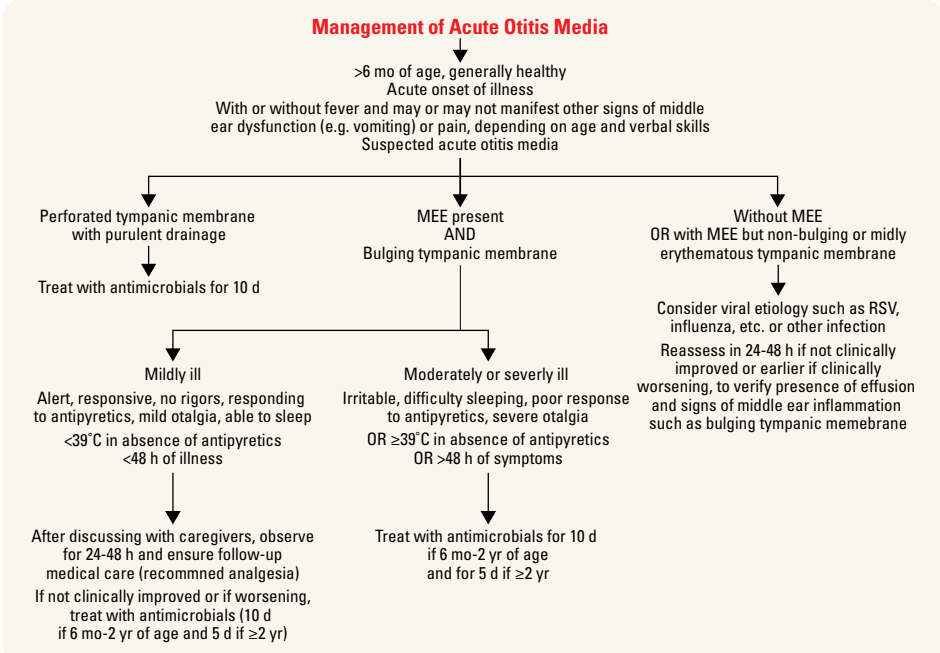


**Figure 13. Management of acute otitis media**
Flow diagram for the management of children with suspected and confirmed acute otitis media – from CPS statement Feb 2016

# Otitis Media with Effusion

### Definition
- presence of fluid in the middle ear without signs or symptoms of ear infection

### Epidemiology
- most common cause of pediatric hearing loss
- not exclusively a pediatric disease
- follows AOM frequently in children
- middle ear effusions have been shown to persist following an episode of AOM for 1 mo in 40% of children, 2 mo in 20%, and >3 mo in 10%

### Risk Factors
- same as AOM

### Clinical Features
- conductive hearing loss ± tinnitus
- fullness – blocked ear
- ± pain, low grade fever
- otoscopy of TM
  - discolouration – amber or dull grey
  - meniscus fluid level behind TM
  - air bubbles
  - retraction pockets/TM atelectasis
  - flat tympanogram
  - most reliable finding with pneumatic otoscopy is immobility

### Treatment
- expectant: 90% resolve by 3 mo
- document hearing loss with audiogram (see Otolaryngology Figure 16B and Figure 17B, OT10)
- no statistical proof that antihistamines, decongestants, antibiotics clear disease faster
- surgery: myringotomy ± ventilation tubes ± adenoidectomy (if enlarged or on insertion of second set of tubes after first set falls out)
- ventilation tubes to equalize pressure and drain ear

### Complications
- hearing loss, speech delay, learning problems in young children
- chronic mastoiditis
- ossicular erosion
- cholesteatoma especially when retraction pockets involve pars flaccida
- retraction of tympanic membrane, atelectasis, ossicular fixation

## Gastroenteritis

- see *Gastroenterology*, P37

## HIV Infection

- see Infectious Diseases, ID25

## Infectious Pediatric Exanthems

**Table 24. Common Infectious Pediatric Exanthems**

| Disease | Pathogen(s) | Incubation Period | Communicability | Mode of Transmission | Rash | Associated Features | Management | Outcomes and Complications |
|---|---|---|---|---|---|---|---|---|
| **Erythema Infectiosum** (i.e. Fifth Disease/ Slapped Cheek) | Parvovirus B19 | 4-14 d | Low risk of transmission once symptomatic | Respiratory secretions or infected blood | Appearance: uniform, erythematous, maculopapular 'lacy' rash<br>Timing: 10-17 d after symptoms (immune response)<br>Distribution: bilateral cheeks ('slapped cheeks') with circumoral sparing; may affect trunk and extremities | Initial 7-10 d of flu-like illness and fever<br>Rash may be warm, non-tender, and pruritic<br>Less common presentations include 'gloves and socks syndrome' or STAR complex (sore throat, arthritis, rash) | Supportive | Rash fades over days to week, but may reappear months later with sunlight, exercise<br>Aplastic crisis |
| **Gianotti-Crosti Syndrome** (i.e. Papular Acrodermatitis) | EBV and Hep B (majority) | Variable | None | — | Appearance: asymptomatic symmetric papules<br>Distribution: face, cheeks, extensor surfaces of the extremities, spares trunk | Viral prodrome<br>May have lymphadenopathy and/ or hepatosplenomegaly | Supportive<br>Pain control | Resolves in 3-12 wk |
| **Hand, Foot, and Mouth Disease** | Coxsackie group A | 3-5 d | Likely 1-7 d after symptoms but may be up to months | Direct and indirect contact with infected bodily fluids, fecal-oral | Appearance: vesicles and pustules on an erythematous base<br>Distribution: acral, but may exentend up the extremity | Enanthem: vesicles in the POSTERIOR oral cavity (pharynx, tongue) | Supportive | Mainly dehydration |
| **Herpes Simplex** | HSV 1, 2 | 1-26 d | | Direct contact, often through saliva for HSV-1 and sexual contact for HSV-2 | Grouped vesicles on an erythematous base | Enanthem: vesicles/erosions in the ANTERIOR oral cavity (buccal mucosa, tongue)<br>May present with herpetic whitlow (autoinoculation) | Mainly supportive<br>Consider oral or topical antivirals | Local: secondary skin infections, keratitis, gingivostomatitis<br>CNS: encephalitis<br>Disseminated hepatitis, DIC<br>Eczema herpeticum |
| **Kawasaki Disease** | See P88 | | | | | | | |
| **Measles** | Morbillivirus | 8-13 d | 4 d before and after rash | Airborne | Appearance: erythematous maculopapular<br>Timing: 3 d after start of symptoms<br>Distribution: starts at hairline and spreads downwards with sparing of palms and soles | Prodome of cough, coryza, conjunctivitis (3 Cs)<br>Enanthem: Koplik's spots 1-2 d before rash<br>Desquamation<br>Positive serology for measles IgM | Infected: supportive<br>Unimmunized contacts: measles vaccine within 72 h of exposure or IgG within 6 d of exposure<br>Respiratory isolation, report to Public Health<br>Prevention: MMR vaccine | Secondary bacterial infections: AOM, sinusitis, pneumonia<br>Encephalitis<br>Rare: myocarditis, pericarditis, thrombocytopenia, Stevens-Johnson syndrome, GN, subacute sclerosing panencephalitis |

**Table 24. Common Infectious Pediatric Exanthems** (continued)

| Disease | Pathogen(s) | Incubation Period | Communicability | Mode of Transmission | Rash | Associated Features | Management | Outcomes and Complications |
|---|---|---|---|---|---|---|---|---|
| **Non-Specific Enteroviral Exanthems** | Enteroviruses | Variable | Variable | Direct and indirect contact with infected bodily fluids | Polymorphous rash (macules, papules, vesicles, petechiae, urticaria) | Systemic involvement is rare, but possible | Supportive<br>Diagnosis confirmed using viral cultures (NP and rectal swabs) | Self-limiting |
| **Roseola** | HHV 6 | 5-15 d | Unknown | — | Appearance: blanching, pink, maculopapular<br>Timing: appears once fever subsides<br>Distribution: starts at the neck and trunk and spreads to the face and extremities | High grade fever<br>Common: irritability, anorexia, lymphadenopathy, erythematous TM and pharynx, Nagayama spots (erythematous papules on soft palate and uvula)<br>Less common: cough, coryza, bulging fontanelles | Supportive | CNS: febrile seizures (10-25%), aseptic meningitis<br>Thrombocytopenia |
| **Rubella** | Rubivirus | 14-21 d | 7 d before and after eruptions | Droplet | Appearance: pink, maculopapular<br>Timing: 1-5 d after start of symptoms<br>Distribution: starts on face and spreads to neck and trunk | Prodrome of low grade fever and occipital/retroauricular nodes<br>STAR complex (sore throat, arthritis, rash)<br>Positive serology for rubella IgM. Caution to pregnant women with expsoure | Infected: supportive<br>Prevention: MMR vaccine<br>Report to Public Health | Excellent prognosis with acquired disease<br>Arthritis may last days to weeks<br>Encephalitis<br>Irreversible defects in congenitally infected patients (i.e. congenital rubella syndrome) |
| **Scarlet Fever** | See P56 | | | | | | | |
| **Varicella** | Varicella zoster virus | 0-21 d | 1-2 d pre-eruptions and 5 d post-eruption | Mainly airborne, but also through direct contact with vesicle fluid | Appearance: groups of skin lesions, polymorphic, from macules to papules to vesicles to crusts<br>Timing: 1-3 d after start of symptoms<br>Distribution: generalized | Significant pruritis<br>Enanthem: vesicular lesions which may become pustular or ulcerate. Caution to pregnant women | Supportive<br>Avoid salicylates (due to risk of Reye syndrome)<br>Consider antivirals<br>Respiratory and contact isolation, report to Public Health<br>Prevention: varicella vaccine | Skin: bacterial suprainfection, necrotizing fasciitis<br>CNS: acute encephalitis and cerebellar ataxia<br>Systemic: hepatitis, DIC<br>Congenital varicella syndrome if intrapartum infection |

# Infectious Mononucleosis

### Definition
- systemic viral infection caused by EBV with multivisceral involvement; often called "the great imitator"

### Epidemiology
- peak incidence between 15-19 yr old
- ~50% of children in developed countries have a primary EBV infection by 5 yr old, but <10% of children develop clinical infection

### Etiology
- EBV: a member of herpesviridae
- transmission is mainly through infected saliva ("kissing disease") and sexual activity (less commonly); incubation period of 1-2 mo

### Risk Factors
- infectious contacts, sexually active, multiple sexual partners in the past

### History
- prodrome: 2-3 d of malaise, anorexia
- infants and young children: often asymptomatic or mild disease
- older children and adolescents: malaise, fatigue, fever, sore throat, abdominal pain (often LUQ), headache, myalgia

### Physical Exam
- classic triad: febrile, generalized non-tender lymphadenopathy, pharyngitis/tonsillitis (exudative)
- ± hepatosplenomegaly
- ± periorbital edema, ± rash (urticarial, maculopapular, or petechial) – more common after inappropriate treatment with β-lactam antibiotics
- any "-itis" (including arthritis, hepatitis, nephritis, myocarditis, meningitis, encephalitis, etc.)

### Investigations
- heterophil antibody test (Monospot® test)
  - 85% sensitive in adults and older children, but only 50% sensitive if <4 yr of age
  - false positive results with HIV, SLE, lymphoma, rubella, parvovirus
- EBV titres
- CBC and differential, blood smear: reactive lymphocytes, lymphocytosis, Downey cells ± anemia ± thrombocytopenia
- throat culture to rule out streptococcal pharyngitis

### Management
- supportive: adequate rest, hydration, saline gargles, and analgesics for sore throat
- splenic enlargement is often not clinically apparent so all patients should avoid contact sports for 6-8 wk
- if airway obstruction secondary to nodal and/or tonsillar enlargement is present (especially younger children), admit for steroid therapy
- acyclovir does NOT reduce duration of symptoms or result in earlier return to school/work

### Prognosis
- most acute symptoms resolve in 1-2 wk, though fatigue may last for months
- short-term complications: splenic rupture, Guillain-Barré syndrome

# Infectious Pharyngitis/Tonsillitis

### Definition
- inflammation of the pharynx, especially the tonsils if present, causing a sore throat

### Etiology
- viral (~80%): adenoviruses, enteroviruses, coxsackie, upper respiratory tract viruses, EBV, CMV
- bacterial (~20%): mainly GAS, *M. pneumoniae* (older children), *N. gonorrhoeae* (sexually active), *C. diphtheriae* (unvaccinated), *Fusobacterium necrophorum* (anaerobe causing Lemierre syndrome)
- fungal: *Candida*

### Epidemiology
- season: GAS pharyngitis more common in late winter or early spring; viral all year long
- age: GAS pharyngitis peak incidence at 5-12 yr of age and uncommon <3 yr; viral pharyngitis affects all ages

### Presentation
- GAS: sore throat (may be severe), febrile, malaise, headache, abdominal pain, N/V, absence of other URTI symptoms, pharyngeal/tonsillar serythema and exudates, enlarged (>1 cm) and tender anterior cervical lymph nodes, palatal petechiae, strawberry tongue, scarlatiniform rash
- viral: sore throat (often mild), afebrile, conjunctivitis, cough, rhinorrhea, hoarseness, diarrhea, flu-like symptoms (fever, malaise, myalgias), absent/mild tonsillar exudates, minor and non-tendor adenopathy, viral exanthems

### Investigations
- no single sign or symptom reliably identifies GAS as the causative organism in children with sore throat
- scores are used to predict if throat culture will be positive (e.g. m-CENTOR score)
  - these score systems have not been found to be sensitive or specific enough to diagnose GAS in children and adolescents with sore throat
- suspected diagnosis of GAS pharyngitis should be confirmed with a rapid streptococcal antigen test and a follow-up throat culture if the rapid test is negative

**m-CENTOR Score for Probability of Streptococcal Pharyngitis**
For patients presenting with sore throat/pharyngitis and URTI symptoms:
**M**ust be older than 3 years old
**C**ough — no Cough (+1)
**E**xudates or Swelling — tonsillar exudates/swelling (+1)
**N**odes — anterior Cervical adenopathy (+1)
**T**emperature — hx of fever or Temperature >38 (+1)
**O**nly Young — patients <15yo (+1)
**R**arely Elder — Patients >45 (-1)

### Management
- antibiotics (for GAS/*S. pyogenes*)
  - penicillin V or amoxicillin or erythromycin (if penicillin allergy) x 10 d
  - can prevent rheumatic fever if given within 9 d of symptoms; does NOT alter risk of post-streptococcal GN
- supportive: hydration and acetaminophen for discomfort due to pain and/or fever
- follow-up: if uncomplicated course, no follow-up or post-antibiotic throat cultures needed
- prophylaxis: consider tonsillectomy for proven, recurrent streptococcal tonsillitis

### Complications
- preventable with antibiotics: AOM, sinusitis, cervical adenitis, mastoiditis, retropharyngeal/peritonsillar abscess, sepsis
- immune-mediated complications: scarlet fever, acute rheumatic fever, post-streptococcal GN, reactive arthritis, pediatric autoimmune neuropsychiatric disorder associated with group A streptococci (i.e. PANDAS)

## SCARLET FEVER
- diffuse erythematous eruption
- delayed-type hypersensitivity reaction to pyrogenic exotoxin produced by GAS
- acute onset of fever, sore throat, strawberry tongue
- 24-48 h after pharyngitis, rash begins in the groin, axillae, neck, antecubital fossa; Pastia's lines may be accentuated in flexural areas
- within 24 h, sandpaper rash becomes generalized with perioral sparing, non-pruritic, non-painful, blanchable
- rash fades after 3-4 d, may be followed by desquamation
- treatment is penicillin, amoxicillin, or erythromycin x 10 d

## RHEUMATIC FEVER
- inflammatory disease due to antibody cross-reactivity following GAS infection
- affects ~1:10,000 children in developed world; much more prevalent in developing nations; peak incidence at 5-15 yr of age
- clinical diagnosis based on Jones Criteria (revised)
  - requires 2 major OR 1 major and 2 minor PLUS evidence of preceding strep infection (history of scarlet fever, GAS pharyngitis culture, positive rapid Ag detection test, ASOTs)
- treatment: penicillin or erythromycin for acute course x 10 d, prednisone if severe carditis
- secondary prophylaxis with daily penicillin or erythromycin
- complications
  - acute: myocarditis, conduction system aberrations (sinus tachycardia, atrial fibrillation), valvulitis (acute MR), pericarditis
  - chronic: valvular heart disease (mitral and/or aortic insufficiency/stenosis), infectious endocarditis ± thromboembolic phenomenon
  - onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever

## POST-STREPTOCOCCAL GLOMERULONEPHRITIS
- most common in children aged 4-8 yr old; M>F
- antigen-antibody mediated complement activation with diffuse, proliferative GN
- occurs 1-3 wk following initial GAS infection (skin or throat)
- clinical feature varies from asymptomatic, microscopic and macroscopic hematuria (cola-coloured urine) to all features of nephritic syndrome (see *Nephritic Syndrome*, P74)
- diagnosis is confirmed with elevated serum antibody titres against streptococcal antigens (ASOT, anti-DNAse B), low serum complement (C3)
- management
  - symptomatic: fluid and sodium restrictions; loop diuretics for HTN and edema
  - in severe cases, may require dialysis if renal function significantly impaired
  - treat with penicillin or erythromycin if evidence of persistent GAS infection
- 95% of children recover completely within 1-2 wk; 5-10% have persistent hematuria

# Meningitis

## Definition
- inflammation of the meninges surrounding the brain and spinal cord

## Epidemiology
- peak age: 6-12 mo; 90% of cases occur in children <5 yr old

## Etiology
- viral: enteroviruses, HSV
- bacterial: age-related variation in specific pathogens
- fungal and parasitic meningitis also possible
- most often due to hematogenous spread or direct extension from a contiguous site

## Risk Factors
- unvaccinated
- immunocompromised: asplenia, DM, HIV, prematurity
- recent or current infections: AOM, sinusitis, orbital cellulitis
- neuroanatomical: congenital defects, dermal sinus, neurosurgery, cochlear implants, recent head trauma
- exposures: daycare centres, household contact, recent travel

## History
- signs and symptoms variable and dependent on age, duration of illness, and host response to infection
- infants: fever, lethargy, irritability, poor feeding, vomiting, diarrhea, respiratory distress, seizures
- children: fever, headache, photophobia, N/V, confusion, back/neck pain/stiffness, lethargy, irritability

## Physical Exam
- infants: toxic, hypothermia, bulging anterior fontanelle, respiratory distress, apnea, petechial/purpuric rash, jaundice
- children: toxic, ↓ LOC, nuchal rigidity, Kernig's and Brudzinski's signs, focal neurologic findings, petechial/purpuric rash

## Investigations
- blood work: CBC, electrolytes, Cr, BUN, glucose, C&S
- LP required for definitive diagnosis
  - Gram stain, bacterial C&S, WBC count and differential, RBC count, glucose, protein concentration
  - acid-fast stain if suspect TB
  - PCR for specific bacteria if available (helpful if already treated with antibiotics)
  - urinalysis and urine C&S in infants, Gram stain and culture of petechial/purpuric lesions
  - HSV and enterovirus PCR if suspected

**Table 25. CSF Findings of Meningitis**

| Component | Normal Child | Normal Newborn | Bacterial Meningitis | Viral Meningitis | Herpes Meningitis | Tuberculosis Meningitis |
|---|---|---|---|---|---|---|
| WBC ($x10^6$/L) | ≤ 5 | 0-30 | Usually <100 | 10-1000 (can be normal) | 50-1000 (can be normal) | 100-500 |
| Neutrophils ($x10^6$/L) | | <20 | 100-10,000 (can be normal) | Usually <100 | Usually <100 | <30 |
| Glucose (CSF:Blood) | 0 | 0 | <0.4 (can be normal) | Usually normal | <0.3 (can be normal) | <0.5 |
| Protein (g/L) | ≥0.6 (or ≥2.5 mmol/L) | ≥0.6 (or ≥2.5 mmol/L) | >1.0 (can be normal) | 0.4-1.0 (can be normal) | 1-5 (Can be normal) | 0.5-0.8 |

Modified from https://www.rch.org.au/clinicalguide/guideline_index/CSF_Interpretation/

## Management
- supportive care
  - preservation of adequate cerebral perfusion by maintaining normal BP and managing ↑ ICP
  - close monitoring of fluids, electrolytes, glucose, acid-base disturbances, coagulopathies
- bacterial meningitis
  - if suspected or cannot be excluded, commence empiric antibiotic therapy while awaiting cultures or if LP contraindicated or delayed
  - adjuvant dexamethasone BEFORE antibiotic for Hib meningitis; consider for those >6 wk with pneumococcal meningitis
  - isolation with appropriate infection control procedures until 24 h after culture-sensitive antibiotic therapy
  - fluid restrict if any concern for SIADH
  - hearing test
  - report to Public Health; prophylactic antibiotics for close contacts of Hib and *N. meningitidis* meningitis

**Table 26. Antibiotic Management of Bacterial Meningitis**

| Age | Main Pathogens | Antibiotics |
|---|---|---|
| 0 to 28 d | GBS, *E. coli, Listeria*<br>Other: Gram-negative bacilli | Ampicillin + cefotaxime |
| 28 to 90 d | Overlap of neonatal pathogens and those seen in older children | Cefotaxime + vancomycin (+ Ampicillin If immunocompromised) |
| >90 d | *S. pneumoniae, N. meningitidis, H influenzae* | Ceftriaxone ± vancomycin<br>If Penicillin allergic: vancomycin + rifampin |

**Signs of Meningismus**

**BONK on the head**
**B**rudzinski's sign
**O**pisthotonos*
**N**uchal rigidity
**K**ernig's sign

*Opisthotonos: rigid spasm of the body, with the back fully arched and the heels and head bent back

- viral meningitis
  - mainly supportive (except for HSV)
  - acyclovir for HSV meningitis
  - report to Public Health
- prophylaxis: appropriate vaccinations significantly decrease incidence of bacterial meningitis (see *Routine Immunization*, P4)

### Complications
- mortality: neonate 15-20%, children 4-8%; pneumococcus > meningococcus > Hib
- acute: SIADH, subdural effusion/empyema, brain abscess, disseminated infection (osteomyelitis, septic arthritis, abscess), shock/DIC
- chronic: hearing loss, neuromotor/cognitive delay, learning disabilities, neurological deficit, seizure disorder, hydrocephalus

## Mumps

### Definition
- acute, self-limited viral infection that is most commonly characterized by adenitis and swelling of the parotid glands

### Epidemiology
- incidence in Ontario has declined since introduction of two-dose MMR vaccination schedule
- average of 25 reported cases per yr
- majority of reported cases in children between 5-10 yr of age

### Etiology
- mumps virus (RNA virus of the genus *Rubulavirus* in the *Paramyxoviridae* family)
- transmission via respiratory droplets, direct contact, fomites
- incubation period: 14-25 d
- infectivity period: 7 d pre-parotitis to 5 d post-parotitis
- upper respiratory tract, lymph nodes, salivary glands, gonads, pancreas, meninges, kidney, heart, thyroid

### History
- non-specific prodome of fever, headache, malaise, myalgias (especially neck pain)
- usually followed within 48 h by parotid swelling secondary to parotitis (bilateral, preauricular, ear pushed up and out)
- parotid gland is tender and pain worsened with spicy or sour foods
- one third of infections do not cause clinically apparent salivary gland swelling and may simply present as an URTI

### Investigations
- clinical diagnosis, but may be confirmed with IgM positive serology within 4 wk of acute infection
  - may also use PCR or viral cultures from oral secretions, urine, blood, and CSF
  - blood work: CBC (leukopenia with relative lymphocytosis), serum amylase (elevated)

### Management
- mainly supportive: analgesics, antipyretics, warm or cold packs to parotid may be soothing
- admit to hospital if serious complications (meningitis, pancreatitis)
- droplet precautions recommended until 5 d after onset of parotid swelling
- prophylaxis: routine vaccination (see *Routine Immunization*, P4)

### Complications
- common: aseptic meningitis, orchitis/oophoritis
- less common: encephalitis, pancreatitis, thyroiditis, myocarditis, arthritis, GN, ocular complications, hearing impairment

# Pertussis

### Definition
- prolonged respiratory illness characterized by paroxysmal coughing and inspiratory "whoop"

### Epidemiology
- ~10 million children <1 yr old affected worldwide, causes up to 400,000 deaths/yr
- greatest incidence among children <1 yr (not fully immunized) and adolescents (waning immunity)

### Etiology
- *Bordetella pertussis*: Gram negative pleomorphic rod
- highly contagious; transmitted via respiratory droplets released during intense coughing
- incubation period: 6-20 d; most contagious during catarrhal phase but may remain contagious for weeks after

### History
- prodromal catarrhal stage
  - lasts 1-7 d; URTI symptoms (coryza, mild cough, sneezing) with NO or low-grade fever
- paroxysmal stage
  - lasts 4-6 wk; characterized by paroxysms of cough ("100 day cough"), sometimes followed by inspiratory whoop ("whooping cough")
  - infants <6 mo may present with post-tussive apnea, whoop is often absent
  - onset of attacks precipitated by yawning, sneezing, eating, physical exertion
  - ± post-tussive emesis, may become cyanotic before whoop
  - vomiting after whooping episodes
- convalescent stage
  - lasts 1-2 wk; characterized by occasional paroxysms of cough, but decreased frequency and severity
  - non-infectious but cough may last up to 6 mo

### Investigations
- NP specimen using aspirate or NP swab
  - gold standard: culture using special media (Regan-Lowe agar)
  - PCR to detect pertussis antigens
- blood work: CBC (lymphocytosis) and serology (antibodies against *B. pertussis*)

### Management
- admit if paroxysms of cough are associated with cyanosis and/or apnea and give $O_2$
- supportive care
- antimicrobial therapy indicated if *B. pertussis* isolated, or symptoms present for <21 d
  - use macrolide antibiotics (azithromycin, erythromycin, or clarithromycin)
- droplet isolation until 5 d of treatment and report to Public Health
- prophylaxis
  - macrolide antibiotics for all household contacts
  - prevention with vaccination in infants and children (Pentacel®), and booster in adolescents (Adacel®) (see *Routine Immunization*, P4)

### Complications
- pressure-related from paroxysms: subconjunctival hemorrhage, rectal prolapse, hernias, epistaxis
- respiratory: sinusitis, pneumonia, aspiration, atelectasis, pneumomediastinum, pneumothorax, alveolar rupture
- neurological: seizures (~3%), encephalopathy, ICH
- mortality: ~0.3%; highest risk in infants <6 mo old

# Pneumonia

- see *Respirology*, P83

# Periorbital (Preseptal) and Orbital Cellulitis

- see Ophthalmology, OP9

**Cardinal Signs of Orbital Cellulitis**
- Ophthalmoplegia/diplopia
- Decreased visual acuity
- Pain with extraocular eye movement

# Sexually Transmitted Infections

- see Family Medicine, FM42 and Gynecology, GY26

# Sinusitis

- see Family Medicine, FM43
- complication of ≤10% of URTIs in children
- clinical diagnosis
- diagnostic imaging is NOT required to confirm diagnosis in children
  - routine CT not recommended, but consider if suspect complications of sinusitis, persistent/recurrent disease, need for surgery
- antibiotic therapy (Amoxicillin) for all children (although nearly half resolve spontaneously within 4 wk)
- complications: preseptal/orbital (preseptal/orbital cellulitis, orbital abscess, osteomyelitis, etc.), intracranial (meningitis, abscess, etc.), Pott's Puffy tumour (presents with tender soft tissue erythematous swelling of the forehead, symptoms include headache, photophobia, and fever; managed with IV antibiotics and ENT consult)

# Urinary Tract Infection

## Definition
- infection of the urinary bladder (cystitis) and/or kidneys (pyelonephritis)

## Epidemiology
- overall prevalence in infants and young children presenting with fever is 7%
- <4-6 wk old: more common in boys
- >1 yr old: females have two- to four-fold higher prevalence

## Etiology
- majority (>95%) have a single cause (~70% *E. coli*)
- Gram-negative bacilli: *E. coli, Klebsiella, Proteus, Enterobacter, Pseudomonas*
- Gram-positive cocci: *S. saprophyticus, Enterococcus*

## Risk Factors
- non-modifiable: female gender, Caucasian, previous UTIs, family history
- modifiable: urinary tract abnormalities (VUR, neurogenic bladder, obstructive uropathy, posterior urethral valve), dysfunctional voiding, repeated bladder catheterization, uncircumcised males, labial adhesions, sexually active, constipation, toilet training

## History
- infants and young child: often just fever or non-specific symptoms (poor feeding, irritability, FTT, jaundice if <28 d old, vomiting)
- older child: fever, urinary symptoms (dysuria, urgency, frequency, incontinence, hematuria), abdominal, and/or flank pain

## Physical Exam
- infants and young child: toxic vs. non-toxic, febrile, FTT, jaundice; look for external genitalia abnormalities (phimosis, labial adhesions) and lower back signs of occult myelodysplasia (e.g. hair tufts), which may be associated with neurogenic bladder
- older child: febrile, suprapubic and/or CVA tenderness, abdominal mass (enlarged bladder or kidney); may present with short stature, FTT, or HTN secondary to renal scarring from previously unrecognized or recurrent UTIs

## Investigations
- sterile urine specimen
  - clean catch, catheterization, suprapubic aspiration or 'Tap and Rub' technique
  - urinalysis (leukocyte esterase, nitrites, erythrocytes, hemoglobin), microscopy (bacteria and leukocytes, erythrocytes), C&S
- diagnosis established if urinalysis suggests infection AND if ≥50,000 colony-forming units per mL of a uropathogen cultured

**Features Suggestive of Pyelonephritis**
- High-grade fever
- Flank or high abdominal pain
- CVA tenderness on palpation

Bagged urine specimen not useful for ruling in UTI (high false positive rate >85%), but useful for ruling out UTI (high sensitivity)

## Management
- admit if: <2 mo old, urosepsis, persistent vomiting, inability to tolerate oral medication, moderate-severe dehydration, immunocompromised, complex urologic pathology, inadequate follow-up, failure to respond to outpatient therapy
- supportive care: maintenance of hydration and adequate pain control
- antibiotics
  - base on local antimicrobial susceptibility patterns
  - commence broad empiric therapy until results of urine C&S known, and then tailor as appropriate
  - neonates: IV ampicillin and gentamicin
  - infants and older children: oral antibiotics (based on local *E. coli* sensitivity) if outpatient; IV ampicillin and gentamicin if inpatient
  - duration 7-10 d
- imaging
  - renal and bladder U/S for all febrile infants (<2 yr) with UTIs looking for anatomical abnormalities, hydronephrosis, abscess
  - VCUG not recommended after 1st febrile UTI unless U/S reveals hydronephrosis, obstructive uropathies or other signs suggestive of high-grade VUR

**Prophylaxis After First Febrile Urinary Tract Infection in Children? A Multicentre, Randomized Controlled, Noninferiority Trial**
Pediatrics 2008;122:1064-1071
**Study:** Randomized, controlled, open-label, 2 armed, noninferiority trial.
**Patients:** 338 patients aged 2 mo to <7 yr who had a first episode of febrile UTI.
**Intervention:** No prophylaxis vs. prophylaxis.
**Outcome:** Recurrence rate of febrile UTI and rate of renal scarring.
**Results:** No significant difference in recurrence rate or in the rate of renal scarring between the prophylaxis and no prophylaxis group.

- follow-up: outpatients to return in 24-48 h if no clinical response and seek prompt medical evaluation for future febrile illnesses
- prophylaxis: generally not recommended unless higher grades of VUR

### Complications
- long-term morbidity: focal renal scarring develops in 8% of patients; long-term significance unknown

# Neonatology

## Gestational Age and Size

### Definitions
- classification by GA
  - preterm: <37 wk (extremely preterm <28 wk, very preterm 28-32 wk, moderate-late preterm 32-37 wk)
  - term: 37-42 wk
  - post-term: >42 wk
- classification by birth weight
  - SGA: 2 SD < mean weight for GA or <10th percentile
  - AGA: within 2 SD of mean weight for GA
  - LGA: 2 SD > mean weight for GA or >90th percentile
- classification of preterm infants by birth weight
  - low birthweight (LBW) <2500 g
  - very low birthweight (VLBW) <1500 g
  - extremely low birthweight (ELBW) <1000 g

**Dubowitz/Ballard Scores**
GA can be determined after birth using Dubowitz/Ballard scores:
- Assessment at delivery of physical maturity (e.g. plantar creases, lanugo, ear maturation) and neuromuscular maturity (e.g. posture, arm recoil) translates into a score from -10 to +50
- Higher score means greater maturity (increased GA)
- -10 = 20 wk; +50 = 44 wk
- Ideal = 35-40, which corresponds to GA 38-40 wk
- Only accurate ± 2 wk

**Table 27. Abnormalities of Gestational Age and Size**

| Features | Causes | Problems |
|---|---|---|
| **Pre-Term Infants**<br><37 wk | Spontaneous: cause unknown<br>Maternal disease: HTN, DM, cardiac and renal disorders<br>Fetal conditions: multiple pregnancy, congenital abnormalities, macrosomia, red blood cell isoimmunization, fetal infection<br>Pregnancy issues: placental insufficiency, placenta previa, uterine malformations, previous preterm birth, infection, placental abruption<br>Behavioural and psychological contributors: smoking, EtOH, drug use, psychosocial stressors<br>Sociodemographic factors: age, socioeconomic conditions | RDS, apnea of prematurity, chronic lung disease, bronchopulmonary dysplasia<br>Feeding difficulties, NEC<br>Hypocalcemia, hypoglycemia, hypothermia<br>Anemia, jaundice<br>Retinopathy of prematurity<br>ICH/IVH<br>PDA |
| **Post-Term Infants**<br>>42 wk<br>Leathery skin<br>Meconium staining | Most cases unknown<br>Increased in first pregnancies<br>Previous post-term birth<br>Genetic factors | Increased risk of stillbirth or neonatal death<br>Increased birthweight<br>Fetal "postmaturity syndrome": impaired growth due to placental dysfunction<br>Meconium aspiration |
| **SGA Infants**<br><10th percentile<br>Asymmetric (head-sparing): late onset, growth arrest | Extrinsic causes: placental insufficiency, poor nutrition, HTN, multiple pregnancies, drugs, EtOH, smoking | Perinatal hypoxia<br>Hypoglycemia, hypocalcemia, hypothermia, hyperviscosity (polycythemia), jaundice, hypomotility |
| Symmetric: early onset, lower growth | Intrinsic causes: maternal infections (TORCH), congenital abnormalities, syndromal, idiopathic | PDA |
| **LGA Infants**<br>>90th percentile | Maternal DM<br>Racial or familial factors<br>Increasing parity<br>Previous LGA infant, high BMI, large pregnancy weight gain<br>Certain syndromes | Birth trauma, perinatal depression (meconium aspiration)<br>RDS, TTN<br>Jaundice, polycythemia<br>Hypoglycemia, hypocalcemia |

## Routine Neonatal Care

- history taking
  - passage of meconium in 24-48 h, urination/number of wet diapers
  - feeding: breast milk or formula, route (breast or bottle), duration, frequency and volume of feeds
  - issues: jaundice, poor feeding, difficulty breathing, cyanosis, seizures
  - weight: discharge weight (close follow-up if >10% below birth weight), initial weight gain (goal 20-25 g/d), number of days until birth weight regained (should regain by day 10 of life)
- erythromycin ointment: applied to both eyes for prophylaxis of ophthalmia neonatorum (of questionable efficacy)
- vitamin K IM: prophylaxis against HDNB
- newborn screening tests in Ontario
  - in Ontario, newborn screening tests for:
    - metabolic disorders (amino acid disorders, organic acid disorders, fatty acid oxidation defects, biotinidase deficiency, galactosemia)
    - blood disorders (SCD, other hemoglobinopathies)
    - endocrine disorders (CAH, congenital hypothyroidism)
    - others (CF, severe combined immunodeficiency)
    - congenital hearing loss
- if mother Rh negative: send cord blood for blood group and direct antiglobulin test
- if household contact is hepatitis B surface antigen positive: start hepatitis B vaccine series (and if mother is positive, give HBIg within 12 h of birth)

# Neonatal Resuscitation

- assess Apgar score at 1 and 5 min
- if <7 at 5 min then reassess q5min, until >7
- do not wait to assign Apgar score before initiating resuscitation

**Apgar Score**
**A**ppearance (colour)
**P**ulse (heart rate)
**G**rimace (irritability)
**A**ctivity (tone)
**R**espiration (respiratory effort)
Or: "How Ready Is This Child?"

**Table 28. Apgar Score**

| Sign | 0 | 1 | 2 |
|---|---|---|---|
| Heart Rate | Absent | <100/min | >100/min |
| Respiratory Effort | Absent | Slow, irregular | Good, crying |
| Irritability | No response | Grimace | Cough/cry |
| Tone | Limp | Some flexion of extremities | Active motion |
| Colour | Blue, pale | Body pink, extremities blue (acrocyanosis) | Completely pink |

## Initial Resuscitation

- anticipation: know maternal history, history of pregnancy, labour, and delivery
- steps to take for all infants
  - pre-delivery team debriefing including assigning roles, checking equipment, and discussing possible complications and management plan
  - warm (radiant heater, warm blankets) and dry the newborn (remove wet blankets)
  - stimulate infant: rub lower back gently or flick soles of feet
  - position airway ("sniffing" position) and clear or suction if necessary
  - assess breathing and heart rate
  - if no response to stimulation: bag and mask ventilation. Continue until HR >100 and breathing spontaneously
  - if HR <60: establish effective ventilation and start chest compressions
  - if meconium present: a team with advanced resuscitation skills should be present. If the newborn is hypotonic with ineffective respirations, routine intubation for tracheal suction is not suggested. Do initial resuscitation and administer PPV as required

**Use of 100% Oxygen in Neonatal Resuscitation**
Circulation 2015;132(suppl 2):S543–S560
Findings from animal and theoretical studies have suggested potential adverse effects with the administration of 100% oxygen. However, given available data is limited in general and only obtained from newborn samples, the 2015 neonatal resuscitation guidelines have provided the following recommendation: "Since an oxygen saturation of 100% may correspond to a $PaO_2$ anywhere between ~80 and 500 mm Hg, in general it is appropriate to wean the $FIO_2$ for a saturation of 100%, provided the oxyhemoglobin saturation can be maintained ≥94%." (Class IIb, LOE C).

**Table 29. Interventions Used in Neonatal Resuscitation**

| Intervention | Schedule | Indications | Comments |
|---|---|---|---|
| **Epinephrine** (adrenaline) | 0.1-0.3 mL/kg/dose of 1:10,000 (0.01-0.03 mg/kg) IV<br>0.5-1 mL/kg/dose of 1:10,000 (0.05-0.1 mg/kg) endotracheally can be considered while awaiting IV access (IV preferred)<br>Can be repeated q3-5 min prn | HR <60 and not rising | Side effects: tachycardia, HTN, cardiac arrhythmias |
| **Fluid Bolus** (NS, whole blood, Ringer's lactate) | 10 mL/kg<br>May need to be repeated<br>Avoid giving too rapidly as large volume rapid infusions can be associated with IVH | Evidence of hypovolemia | |

**Corrective Actions for PPV in Neonatal Resuscitation**

**MR SOPA**
**M**ask readjustment
**R**eposition airway
**S**uction mouth and nose
**O**pen mouth
**P**ressure increase
**A**lternative airway

## Approach to the Depressed Newborn

- a depressed newborn lacks one or more of the following characteristics of a normal newborn
  - pulse >100 bpm
  - cries when stimulated
  - actively moves all extremities
  - has a good strong cry
- approximately 10% of newborn babies require assistance with breathing after delivery

**Table 30. Etiology of Respiratory Depression in the Newborn**

| Etiology | Examples |
|---|---|
| **Respiratory Problems** | RDS/hyaline membrane disease<br>Pulmonary hypoplasia<br>CNS depression<br>MAS<br>Pneumonia<br>Pneumothorax<br>Pleural effusions<br>Congenital malformations |
| **Anemia** (severe) | Erythroblastosis fetalis<br>Secondary hydrops fetalis |
| **Maternal Causes** | Drugs/anesthesia (opiates, magnesium sulphate)<br>DM<br>Maternal myasthenia gravis |
| **Congenital Malformations/Birth Injury** | Nuchal cord, perinatal depression<br>Bilateral phrenic nerve injury<br>Potter's sequence |
| **Shock** | Antepartum hemorrhage |
| **CHD** | Transposition of the great arteries with intact ventricular septum |
| **Other** | Hypothermia<br>Hypoglycemia<br>Infection |

**Targeted Preductal $SpO_2$ After Birth**

| | |
|---|---|
| 1 min | 60-65% |
| 2 min | 65-70% |
| 3 min | 70-75% |
| 4 min | 75-80% |
| 5 min | 80-85% |
| 10 min | 85-95% |

### Diagnosis
- vital signs including pre- and post-ductal oxygen saturations and 4 limb blood pressure
- detailed maternal history: include prenatal care, illnesses, use of drugs, previous high risk pregnancies, infections during pregnancy (including GBS status), duration of ruptured membranes, maternal fever or signs of chorioamnionitis during labour/delivery, blood type and Rh status, amniotic fluid status, GA, meconium, Apgar scores
- clinical findings (observe for signs of respiratory distress such as cyanosis, tachypnea, retractions, grunting, temperature instability)
- laboratory results (CBC, blood gas, blood type and DAT, glucose)
- transillumination of chest to evaluate for pneumothorax
- CXR, ECG, echocardiogram

### Management
- see *Neonatal Resuscitation*, P62, identify and treat underlying cause

# Common Conditions of Neonates

## Apnea

### Definition
- periodic breathing: normal respiratory pattern seen in newborns in which periods of rapid respiration are alternated with pauses lasting 5-10 s
- apnea: absence of respiratory gas flow for >20 s (or less if associated with bradycardia or desaturation)
- three types of apnea
  - central: no chest wall movement, no signs of obstruction
  - obstructive: chest wall movement continues against obstructed upper airway, no airflow
  - mixed: combination of central and obstructive apnea

### Differential Diagnosis
- in term infants, apnea requires full septic workup (CBC and differential, blood and urine cultures ± LP, CXR)
- other causes
  - CNS: seizures, ICH
  - apnea of prematurity (<34 wk): combination of CNS immaturity and obstructive apnea; resolves by 36 wk GA; diagnosis of exclusion
  - hypoxic injury
  - infectious: sepsis, meningitis, NEC
  - GI: GERD, aspiration with feeding
  - metabolic: hypoglycemia, hyponatremia, hypocalcemia, inborn error of metabolism
  - cardiovascular: anemia, hypovolemia, PDA, heart failure
  - medications: morphine

### Management
- $O_2$, ventilatory support, maintain normal blood gases
- tactile stimulation
- correct underlying cause
- medications: methylxanthines (caffeine) stimulate the CNS and diaphragm and are used for apnea of prematurity (not in term infants)
- if apnea of prematurity is diagnosed, infants should receive cardiorespiratory monitoring in a neonatal intensive care unit

## Bleeding Disorders in Neonates

### Clinical Feature
- oozing from the umbilical stump, excessive bleeding from peripheral venipuncture/heel stick sites/IV sites, large caput succedaneum, cephalohematomas (in absence of significant birth trauma), subgaleal hemorrhage and prolonged bleeding following circumcision

### Etiology
- 4 major categories
  - increased platelet destruction: maternal ITP or SLE, infection/sepsis, DIC, neonatal alloimmune thrombocytopenia, autoimmune thrombocytopenia
  - decreased platelet production/function: pancytopenia, bone marrow replacement, Fanconi anemia, Trisomy 13 and 18
  - metabolic: congenital thyrotoxicosis, inborn error of metabolism
  - coagulation factor deficiencies (see Hematology, H53): hemophilia A/B, HDNB

### NEONATAL ALLOIMMUNE THROMBOCYTOPENIA

#### Epidemiology
- 1 per 4000-5000 live births

#### Pathophysiology
- platelet equivalent of Rh disease of the newborn
- occurs when mother is negative for HPA and fetus is positive
- development of maternal IgG antibodies against HPA antigens on fetal platelets

#### Clinical Feature
- petechiae, purpura, thrombocytopenia in otherwise healthy neonate
- severe disease can lead to intracranial bleeding

#### Diagnosis
- maternal and paternal platelet typing and identification of platelet alloantibodies

#### Treatment
- IVIg to mother prenatally starts in second trimester ± steroids ± fetal platelet transfusions
- if transfusion required, use washed maternal platelets or donor HPA negative platelets
- treat neonate with IVIg (less effective than platelet transfusions)

### AUTOIMMUNE THROMBOCYTOPENIA

#### Pathophysiology
- caused by antiplatelet antibodies from maternal ITP or SLE
- passive transfer of antibodies across placenta

#### Clinical Feature
- similar presentation to neonatal alloimmune thrombocytopenia, but thrombocytopenia usually less severe

#### Treatment
- steroids to mother for 10-14 d prior to delivery or IVIg to mother before delivery
- treat neonate with IVIg (usually if platelets <60,000)
- transfusion of infant with maternal/donor platelets only in severe cases, as antibodies will destroy transfused platelets

### HEMORRHAGIC DISEASE OF THE NEWBORN

#### Pathophysiology
- caused by vitamin K deficiency
- factors II, VII, IX, X are vitamin K-dependent, therefore both PT and PTT are abnormal

#### Etiology and Clinical Feature
- neonates at increased risk of vitamin K deficiency due to:
  - poor transfer of vitamin K across the placenta
  - insufficient bacterial colonization of colon at birth to synthesize vitamin K
  - breastfeeding (inadequate vitamin K intake)
  - additional risk if maternal use of antiepileptics
- neonate may present with hematomas, ICH (causing apnea or seizures), internal bleeding, hematuria, bruising, prolonged bleeding (often from mucous membranes, umbilicus, circumcision, and venipunctures)

#### Prevention
- vitamin K IM administration at birth to all newborns

## Bronchopulmonary Dysplasia

#### Definition
- also known as chronic lung disease
- clinically defined as $O_2$ requirement for >28 d plus persistent need for oxygen and/or ventilatory support at 36 wk corrected GA
- damage to developing lungs with prolonged intubation/ventilation, high levels $O_2$, infections

#### Investigations
- CXR findings may demonstrate decreased lung volumes, areas of atelectasis, signs of inflammation, and hyperinflation

### Treatment
- no good treatments
- gradual wean from ventilator, optimize nutrition
- dexamethasone may help decrease inflammation and encourage weaning, but use of dexamethasone is associated with increased risk of adverse neurodevelopmental outcomes

### Prognosis
- chronic respiratory failure may lead to pulmonary HTN, poor growth, and right-sided heart failure
- patients with bronchopulmonary dysplasia may continue to have significant impairment and deterioration in lung function late into adolescence
- some lung abnormalities may persist into adulthood including airway obstruction, airway hyperreactivity, and emphysema
- associated with increased risk of adverse neurodevelopmental outcomes

## Cyanosis

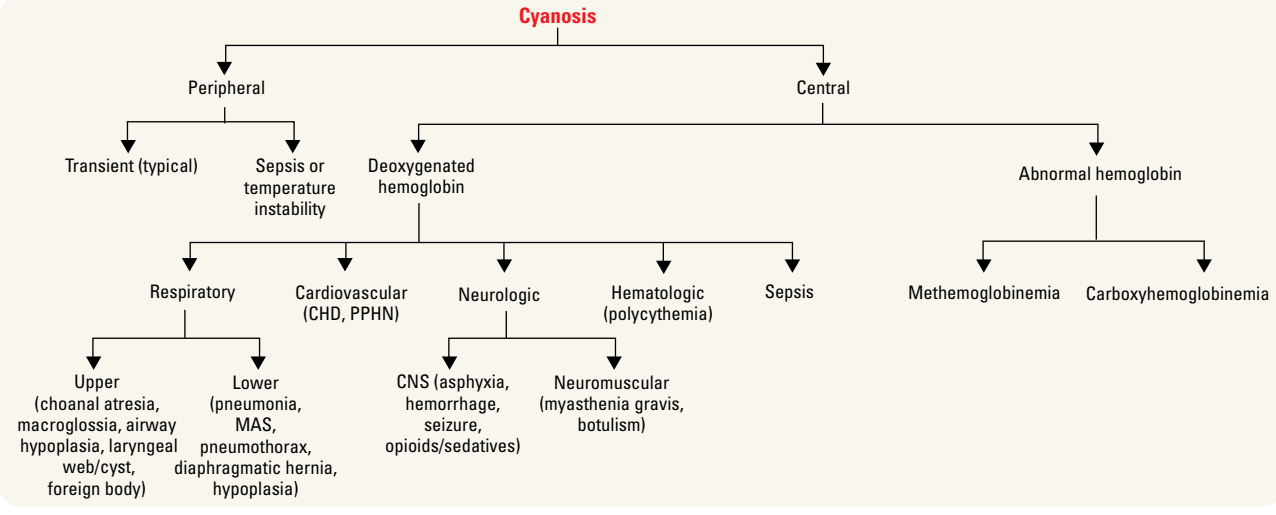

**Figure 14. Approach to neonatal cyanosis**

### Management
- ABGs
  - elevated $CO_2$ suggests respiratory cause
  - hyperoxia test (to distinguish between cardiac and respiratory causes of cyanosis): get baseline $PaO_2$ in room air, then $PaO_2$ on 100% $O_2$ for 10-15 min
    - $PaO_2$ <150 mmHg: suggests cyanotic CHD or possible PPHN (see *Cardiology*, P20)
    - $PaO_2$ >150 mmHg: suggests cyanosis likely due to respiratory or non-cardiac cause
- CXR: look for respiratory abnormalities (pneumothorax, respiratory tract malformations, evidence of shunting, pulmonary infiltrates) and cardiac abnormalities (cardiomegaly, abnormalities of the great vessels)

**Carboxyhemoglobinemia** (secondary to carbon monoxide poisoning) results in impaired binding of oxygen to hemoglobin but does not discolour the blood. Therefore it may not register on pulse oximetry and cyanosis may not be evident clinically

**Methemoglobinemia** typically reads higher on pulse oximetry than the true level of oxyhemoglobin. Methemoglobin alters the absorption of red light at the two wavelengths that pulse oximetry uses to predict oxygen saturation

## Diaphragmatic Hernia

- see General Surgery, GS67

### Definition
- developmental defect of the diaphragm with herniation of abdominal organs into thorax
- associated with pulmonary hypoplasia and PPHN

### Clinical Feature
- respiratory distress, cyanosis
- scaphoid abdomen and barrel-shaped chest
- affected side dull to percussion and breath sounds absent, may hear bowel sounds instead
- heart sounds shifted to contralateral side
- asymmetric chest movements, trachea deviated away from affected side
- may present outside of neonatal period
- often associated with other anomalies (cardiovascular, CNS, chromosomal abnormalities)
- CXR: bowel loops in thorax (usually left side), displaced mediastinum

### Treatment
- immediate intubation required at birth: DO NOT bag mask ventilate because air will enter stomach and further compress lungs
- place large bore orogastric tube to decompress bowel
- initial stabilization and management of pulmonary hypoplasia and PPHN if present, hemodynamic support and surgery when stable

## Hypoglycemia

### Definition
- glucose <2.6 mmol/L

### Etiology
- decreased carbohydrate stores: premature, SGA, RDS, maternal HTN
- endocrine: hormonal deficiencies (GH, cortisol, epinephrine), insulin excess (infant of diabetic mother, Beckwith-Wiedemann syndrome/islet cell hyperplasia), HPA axis suppression (panhypopituitarism)
- inborn errors of metabolism: fatty acid oxidation defects, galactosemia
- miscellaneous: sepsis, hypothermia, polycythemia

### Clinical Findings
- signs often non-specific and subtle: lethargy, poor feeding, irritability, tremors, apnea, cyanosis, seizures

### Management
- identify and monitor infants at risk (pre-feed blood glucose checks) until blood glucose stable and for at least 12 h (for infant of diabetic mother or LGA) or 36 h (if preterm or SGA)
- begin oral feeds as soon as possible after birth and ensure regular feeds
- if significant and/or symptomatic hypoglycemia, provide glucose IV and titrate according to blood sugar levels
- if persistent hypoglycemia or no predisposing cause, send "critical blood work" during an episode of hypoglycemia: ABG, ammonia, β-hydroxybutyrate, cortisol, free fatty acids, GH, insulin, lactate, urine dipstick for ketones

## Neonatal Hyperbilirubinemia

### Definition
- total serum bilirubin >95th percentile (high risk zone) on Bhutani nomogram in infants >35 wk GA

### Clinical Feature
- jaundice typically visible at serum bilirubin levels of 85-120 μmol/L
- visual assessment is often misleading and should confirm with blood test

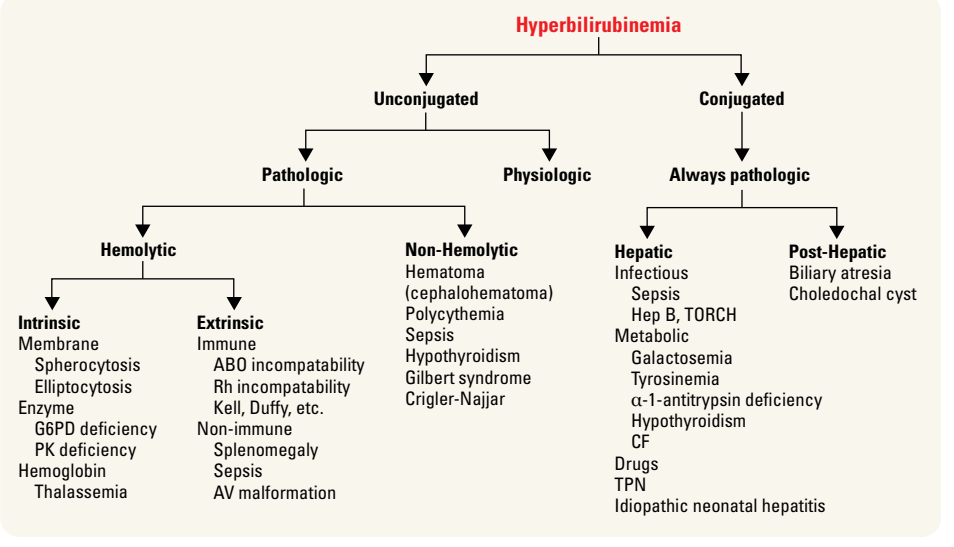

**Figure 15. Approach to neonatal hyperbilirubinemia**

Jaundice is very common – 60% of term newborns develop visible jaundice

Jaundice in the first 24 h of life and conjugated hyperbilirubinemia are always pathological

**Jaundice must be investigated if:**
- It occurs within 24 h of birth
- Conjugated hyperbilirubinemia is present
- Unconjugated bilirubin rises rapidly or is excessive for patient's age and weight
- Persistent jaundice lasts beyond 1-2 wk of age

## PHYSIOLOGIC JAUNDICE

### Epidemiology
- term infants: onset 3-4 d of life, resolution by 10 d of life
- premature infants: higher peak and longer duration

### Pathophysiology
- increased hematocrit and decreased RBC lifespan
- immature glucuronyl transferase enzyme system (slow conjugation of bilirubin)
- increased enterohepatic circulation

### Breastfeeding Jaundice
- common: due to a lack of milk production → dehydration → exaggerated physiologic jaundice

### Breast Milk Jaundice
- 1 per 200 breastfed infants
- glucuronyl transferase inhibitor found in breast milk
- onset 7 d of life, peak at 2-3 wk of life, usually resolved by 6 wk

**Table 31. Risk Factors for Jaundice**

| Maternal Factors | Perinatal Factors | Neonatal Factors |
|---|---|---|
| Ethnic group (e.g. Asian, Indigenous)<br>Complications during pregnancy (infant of diabetic mother, Rh or ABO incompatibility)<br>Breastfeeding<br>Family history/previous child required phototherapy | Birth trauma (cephalohematoma, ecchymoses)<br>Prematurity | Difficulty establishing breastfeeding<br>Infection (sepsis, hepatitis)<br>Genetic factors<br>Polycythemia<br>Drugs<br>TPN |

**Table 32. Causes of Neonatal Jaundice by Age**

| <24 h | 24-72 h | 72-96 h | Prolonged (>1 wk) |
|---|---|---|---|
| **ALWAYS PATHOLOGIC**<br>Hemolytic<br>Rh or ABO incompatibility<br>Sepsis<br>Congenital infection (TORCH)<br>Severe bruising/hemorrhage | Physiologic, polycythemia<br>Dehydration (breastfeeding jaundice)<br>Hemolysis<br>G6PD deficiency<br>Pyruvate kinase deficiency<br>Spherocytosis<br>Bruising, hemorrhage, hematoma<br>Sepsis/congenital infection | Physiologic ± breastfeeding<br>Sepsis | Breast milk jaundice<br>Prolonged physiologic jaundice in preterm<br>Hypothyroidism<br>Neonatal hepatitis<br>Conjugation dysfunction e.g. Gilbert syndrome, Crigler-Najjar syndrome<br>Inborn errors of metabolism e.g. galactosemia<br>Biliary tract obstruction e.g. biliary atresia |

## PATHOLOGIC JAUNDICE
- all cases of conjugated hyperbilirubinemia; some cases of unconjugated hyperbilirubinemia are pathologic

### Investigations
- unconjugated hyperbilirubinemia
  - hemolytic workup: CBC, reticulocyte count, blood group (mother and infant), peripheral blood smear, Coombs test
  - if baby is unwell or has fever: septic workup (CBC and differential, blood and urine cultures ± LP, CXR)
  - other: G6PD screen (especially in males), TSH
- conjugated hyperbilirubinemia must be investigated without delay
  - consider liver enzymes (AST, ALT), coagulation studies (PT, PTT), serum albumin, ammonia, TSH, TORCH screen, septic workup, galactosemia screen (erythrocyte galactose-1-phosphate uridyltransferase levels), metabolic screen, abdominal U/S, HIDA scan, sweat chloride
- predicting occurrence of severe hyperbilirubinemia
  - measure either TSB or TcB concentration in all infants between 24 h and 72 h of life and plot on appropriate hyperbilirubinemia treatment graph. If infant does not require immediate treatment, results should be plotted on predictive nomogram to determine the risk of progression to severe hyperbilirubinemia and need for repeat measurement (refer to: http://www.cps.ca/documents/position/hyperbilirubinemia-newborn)

## TREATMENT OF UNCONJUGATED HYPERBILIRUBINEMIA

- to prevent kernicterus
- breastfeeding does not usually need to be discontinued, ensure adequate feeds and hydration
- lactation consultant support, mother to pump after feeds
- treat underlying causes (e.g. sepsis)
- phototherapy (blue-green wavelength, not UV light) – standard intensive or multiple intensive protocol depending on severeity of hyperbilirubinemia
  - insoluble unconjugated bilirubin is converted to excretable form via photoisomerization
  - serum bilirubin should be monitored during and immediately after therapy (risk of rebound because photoisomerization reversible when phototherapy discontinued)
  - contraindicated in conjugated hyperbilirubinemia: results in "bronzed" baby
  - side effects: skin rash, diarrhea, eye damage (eye shield used routinely for prevention), dehydration
  - use published guidelines and nomogram for initiation of phototherapy
- exchange transfusion
  - indications: high bilirubin levels as per published graphs based on age, weeks gestation
  - most commonly performed for hemolytic disease and G6PD deficiency
  - use of IVIg in case of severe hyperbilirubinemia (DAT+) becoming evidence-based practice

"Bronzed" Baby in Infants with Conjugated Hyperbilirubinemia
Phototherapy results in the production and accumulation of a toxic metabolite which also imparts a bronze hue on the baby's skin

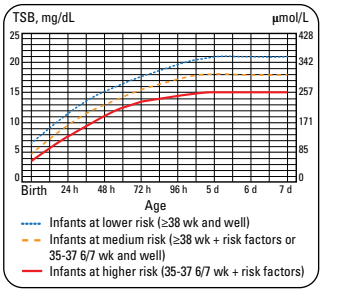

**Figure 16. Gold standard in deciding when to initiate phototherapy for unconjugated hyperbilirubinemia**
Licence number: 4601410094382

## KERNICTERUS

### Etiology

- unconjugated bilirubin concentrations exceed albumin binding capacity and bilirubin is deposited in the brain resulting in tissue necrosis and permanent damage (typically basal ganglia or brainstem)
- incidence increases as serum bilirubin levels increase above 340 µmol/L
- can occur at lower levels in presence of sepsis, meningitis, hemolysis, hypoxia, acidosis, hypothermia, hypoglycemia, and prematurity

### Clinical Feature

- up to 15% of infants have no obvious neurologic symptoms
- early stage: lethargy, hypotonia, poor feeding, emesis (bilirubin encephalopathy)
- mid stage: hypertonia, high pitched cry, opisthotonic posturing (back arching), bulging fontanelle, seizures, pulmonary hemorrhage
- late stage (during first year and beyond)
  - hypotonia, delayed motor skills, extrapyramidal abnormalities (choreoathetoid CP), gaze palsy, mitral regurgitation, sensorineural hearing loss

### Prevention

- exchange transfusion, IVIg if indicated

## BILIARY ATRESIA

### Definition

- atresia of the extrahepatic bile ducts which leads to cholestasis and increased conjugated bilirubin after the first wk of life
- progressive obliterative cholangiopathy

### Epidemiology

- incidence: 1:10,000-15,000 live births
- associated anomalies in 10-35% of cases: situs inversus, congenital heart defects, polysplenia

### Clinical Feature

- dark urine, pale stool, jaundice (persisting for >2 wk), abdominal distension, hepatomegaly

### Diagnosis

- conjugated hyperbilirubinemia, abdominal U/S, operative cholangiogram
- HIDA scan (may be bypassed in favour of biopsy if timing of diagnosis is critical)
- liver biopsy

### Treatment

- surgical drainage procedure
- hepatoportoenterostomy (Kasai procedure; most successful if <8 wk of age)
- two-thirds will eventually require liver transplantation
- vitamins A, D, E, and K; diet should be enriched with medium-chain triglycerides to ensure adequate fat ingestion

# Necrotizing Enterocolitis

### Definition
- intestinal inflammation associated with focal or diffuse ulceration and necrosis
- primarily affecting terminal ileum and colon

### Epidemiology
- affects 1-5% of preterm newborns admitted to NICU

### Pathophysiology
- postulated mechanism of bowel ischemia: mucosal damage and enteral feeding → bacterial growth → bowel necrosis/gangrene/perforation

### Risk Factors
- prematurity (immature defenses)
- asphyxia, shock (poor bowel perfusion)
- hyperosmolar feeds
- enteral feeding with formula (breast milk can be protective)
- sepsis

### Clinical Feature
- usually presents at 2-3 wk of age
- distended abdomen, diminished bowel sounds, feeding intolerance
- increased amount of gastric aspirate/vomitus with bile staining
- frank or occult blood in stool
- signs of bowel perforation (sepsis, shock, peritonitis, DIC)

### Investigations
- AXR: pneumonitis intestinalis (intramural air is a hallmark of NEC), free air, fixed loops, ileus, thickened bowel wall, portal venous gas
- CBC, ABG, lactate, blood culture, electrolytes
- high or low WBC, low platelets, hyponatremia, acidosis, hypoxia, hypercapnea

### Treatment
- NPO (7-10 d), vigorous IV fluid resuscitation, decompression with NG tube, supportive therapy
- TPN
- antibiotics (usually ampicillin, gentamicin ± metronidazole if risk of perforation x 7-10 d)
- serial AXRs detect early perforation (40% mortality in perforated NEC)
- peritoneal drain/surgery if perforation
- surgical resection of necrotic bowel and surgery for complications (e.g. perforation, strictures)

**Influence of Enteral Nutrition on Occurrences of Necrotizing Enterocolitis in Very-Low-Birth-Weight Infants**
J Pediatr Gastroenterol Nutr 2015;61(4):445-50
**Study**: Case-control study of very-low-birth-weight (VLBW) infants and occurrences of NEC within 30 d of life.
**Population**: 1028 VLBW infants in neonatal intensive care unit Jan 2003-May 2008.
**Main Outcome**: NEC defined using stage ≥2 of modified Bell criteria.
**Results**: 55 infants developed NEC within 30 d of life (5.4%). Those with NEC had higher odds of having been fed breast milk <7 d (OR: 4.02), not having achieved full enteral feeding during the first mo (OR: 3.50), and having had parenteral feeding (OR: 2.70).
**Conclusions**: Occurrence of NEC can be reduced with breast milk feeding beyond 7 d and early full enteral feeding.

# Persistent Pulmonary Hypertension of the Newborn

### Definition
- persistence of fetal circulation as a result of persistent elevation of pulmonary vascular resistance
- classified as primary (absence of risk factors) or secondary

### Epidemiology
- incidence 1.9/1000 live births

### Clinical Feature
- usually presents within 12 h of birth with severe hypoxemia/cyanosis; may have only mild respiratory distress

### Pathophysiology
- elevated pulmonary pressures cause R → L shunt through PDA, foramen ovale → decreased pulmonary blood flow and hypoxemia → further pulmonary vasoconstriction

### Risk Factors
- secondary PPHN: asphyxia, meconium aspiration syndrome, RDS, sepsis, pneumonia, structural abnormalities (e.g. diaphragmatic hernia, pulmonary hypoplasia)
- more common in term or post-term infants

### Investigations
- measure pre- and post-ductal oxygen levels
- hyperoxia test to exclude CHD
- ECG (RV strain)
- Echo reveals increased pulmonary arterial pressure and a R → L shunt across PDA and patent foramen ovale; also used to rule out other cardiac defects

### Treatment
- maintain good oxygenation ($SaO_2$ >95%) in at-risk infants
- $O_2$ given early and tapered slowly, minimize stress and metabolic demands, maintain normal blood gases, circulatory support
- mechanical ventilation, high frequency oscillation in a sedated muscle-relaxed infant
- nitric oxide, surfactant
- extracorporeal membrane oxygenation used in some centres when other therapy fails

## Respiratory Distress in the Newborn

### Clinical Feature
- tachypnea: RR >60/min; tachycardia: HR >160/min
- grunting, subcostal/intercostal indrawing, nasal flaring
- duskiness, central cyanosis
- decreased air entry, crackles on auscultation

### Differential Diagnosis of Respiratory Distress
- see Table 30 under Neonatal Resuscitation

### Investigations
- labs: CBC, blood gas, glucose, blood culture
- imaging: CXR
- if indicated: ECG, Echo, LP (CSF cell count, culture, and chemistry)

**Table 33. Distinguishing Features of RDS, TTN, MAS**

| | RDS | TTN | MAS |
|---|---|---|---|
| **Etiology** | Surfactant deficiency → poor lung compliance due to high alveolar surface tension → atelectasis → ↓ surface area for gas exchange → hypoxia + acidosis → respiratory distress<br>"Hyaline membrane disease" | Delayed resorption of fetal lung fluid → accumulation of fluid in peribronchial lymphatics and vascular spaces → tachypnea<br>"Wet lung syndrome" | Meconium is sterile but causes airway obstruction, chemical inflammation, and surfactant inactivation leading to chemical pneumonitis |
| **Gestational Age** | Preterm | Usually term and late preterm | Term and post-term |
| **Risk Factors** | Maternal DM<br>Preterm delivery<br>Male sex<br>LBW<br>Acidosis, sepsis<br>Hypothermia<br>Second born twin | Maternal DM<br>Maternal asthma<br>Male sex<br>Macrosomia (>4500 g)<br>Elective Cesarean section or short labour<br>Late preterm delivery | Meconium-stained amniotic fluid<br>Post-term delivery |
| **Clinical Feature** | Respiratory distress within first few hours of life, worsens over next 24-72 h<br>Hypoxia<br>Cyanosis | Tachypnea within the first few hours of life ± retractions, grunting, nasal flaring<br>Often NO hypoxia or cyanosis | Respiratory distress within hours of birth<br>Small airway obstruction, chemical pneumonitis tachypnea, barrel chest with audible crackles<br>Hypoxia |
| **CXR Findings** | Homogenous infiltrates<br>Air bronchograms<br>Decreased lung volumes<br>May resemble pneumonia (GBS)<br>If severe, "white-out" with no differentiation of cardiac border | Perihilar infiltrates<br>"Wet silhouette"; fluid in fissures | Hyperinflation<br>Patchy atelectasis<br>Patchy and coarse infiltrates<br>10-20% have pneumothorax |
| **Prevention** | Prenatal corticosteroids (e.g. Celestone® 12 mg q24h x 2 doses) if risk of preterm delivery <34 wk<br>Monitor lecithin:sphingomyelin (L/S) ratio with amniocentesis, L/S >2:1 indicates lung maturity | Where possible, avoidance of elective Cesarean delivery, particularly before 38 wk GA | If infant is depressed at birth, intubate and suction below vocal cords<br>Avoidance of factors associated with *in utero* passage of meconium (e.g. post term delivery) |
| **Treatment** | Resuscitation<br>Oxygen<br>Ventilation<br>Surfactant (decreases alveolar surface tension, improves lung compliance, and maintains functional residual capacity) | Supportive<br>Oxygen if hypoxic<br>Ventilator support (e.g. CPAP)<br>IV fluids and NG tube feeds if too tachypneic to feed orally | Resuscitation<br>Oxygen<br>Ventilatory support<br>Surfactant<br>Inhaled nitric oxide<br>Extracorporeal membrane oxygenation for PPHN |
| **Complications** | In severe prematurity and/or prolonged ventilation, increased risk of bronchopulmonary dysplasia | Hypoxemia<br>Hypercapnea<br>Acidosis<br>PPHN | Hypoxemia<br>Hypercapnea<br>Acidosis<br>PPHN<br>Pneumothorax<br>Pneumomediastinum<br>Chemical pneumonitis<br>Secondary surfactant inhibition<br>Respiratory failure |
| **Prognosis** | Dependent on GA at birth and severity of underlying lung disease; long-term risks of chronic lung disease | Recovery usually expected in 24-72 h | Dependent on severity, mortality up to 20% |

### PNEUMONIA

- see *Respirology*, P83
- consider in infants with prolonged (≥18 h) or premature rupture of membranes, maternal fever or other signs and symptoms of chorioamnionitis, or if mother is GBS positive
- suspect if infant exhibits respiratory distress, temperature instability, or WBC is low (<5 x $10^9$/L), elevated (>30 x $10^9$/L, or left-shifted)
- symptoms may be non-specific
- CXR: hazy lung and/or distinct infiltrates (may be difficult to differentiate from RDS)
- neonates with pneumonia should be admitted to the neonatal ICU (NICU) with blood and CSF cultures and antibiotics for management

## Retinopathy of Prematurity

- see Ophthalmology, OP39

# Sepsis in the Neonate

**Table 34. Sepsis Considerations in the Neonate**

| Early Onset (<72 h) | Late Onset (72 h – 28 d) |
|---|---|
| Vertical transmission, 95% present within 24 h after birth<br>Risk factors:<br>Maternal infection: UTI, GBS positive, previous child with GBS, sepsis, or meningitis<br>Maternal fever/leukocytosis/chorioamnionitis<br>Prolonged rupture of membranes (>18 h)<br>Preterm labour<br>Pathogens: GBS, *E. coli*, *Listeria* are most common<br>Pneumonia more common with early onset sepsis | Acquired after birth<br>Most common in preterm infants in NICU (most commonly due to coagulase negative *Staphylococcus*)<br>Other pathogens implicated include GBS, anaerobes, *E. coli*, *Klebsiella* |

**Chronic Perinatal Infections**

**CHEAP TORCHES**
**C**hicken pox/shingles
**H**epatitis B
**E**pstein-Barr virus
**A**IDS (HIV)
**P**arvovirus B19 (erythema infectiosum)
**T**oxoplasmosis
**O**ther
**R**ubella virus
**C**ytomegalovirus/Coxsackievirus
**H**SV
**E**very STI
**S**yphilis

## Clinical Feature

- no reliable absolute indicator of occult bacteremia in infants <3 mo, most specific result has been WBC <5
- temperature instability (hypo/hyperthermia)
- respiratory distress, cyanosis, apnea
- tachycardia/bradycardia
- lethargy, irritability
- poor feeding, vomiting, abdominal distension, diarrhea
- hypotonia, seizures, lethargy
- jaundice, hepatomegaly, petechiae, purpura

## Investigations

- suspicion of neonatal sepsis requires "full septic workup"
  - CBC, blood and urine cultures, CXR, ± LP (CSF analysis: cell count, glucose, protein, culture, and PCR for viruses)
  - LP must be conducted if blood culture is positive due to increased risk of meningitis

## Management

- supportive care
- IV antibiotics: typically ampicillin + cefotaxime or ampicillin + gentamicin chosen as first-line empiric therapy
- choice of antibiotic and duration of treatment dependent on symptoms, culture results, maternal GBS status, local resistance patterns
- if meningitis suspected, consider IV ampicillin + cefotaxime ± vancomycin
- addition of IV acyclovir if HSV infection suspected

# Skin Conditions of the Neonate

**Table 35. Common Neonatal Skin Conditions**

| Neonatal Skin Condition | Description |
|---|---|
| **Vasomotor Response** (Cutis Marmorata, Acrocyanosis) | Transient mottling when exposed to cold; usually normal, particularly if premature |
| **Vernix Caseosa** | Soft, creamy, white layer covering baby at birth |
| **Congenital Dermal Melanocytosis** ('Mongolian Spots') | Slate grey macules over lower back and buttocks (may look like bruises); common in dark skinned infants |
| **Capillary Hemangioma** | Raised red lesion, which increases in size after birth and involutes; 50% resolved by 5 yr, 90% by 9 yr |
| **Erythema Toxicum** | Yellow-white papules/pustules surrounded by erythema, eosinophils within the lesions; common rash, resolves by 2 wk |
| **Milia** | Lesions 1-2 mm firm white pearly papules on nasal bridge, cheeks, and palate; self-resolving |
| **Transient Pustular Melanosis** | Brown macular base with pustules, seen more commonly in African American infants; may be present at birth |
| **Nevus Simplex** (Salmon Patch) | Transient macular vascular malformation of the eyelids and/or neck ("Angel Kiss" or "Stork Bite"); most lesions disappear by 1 yr of life |
| **Neonatal Acne** | Inflammatory papules and pustules mainly on face; self-resolving usually within 4 mo |

# Nephrology

## Common Pediatric Renal Diseases

**Table 36. Common Manifestations of Renal Disease**

| Neonate | Common Causes |
|---|---|
| Flank Mass | Hydronephrosis, polycystic disease (autosomal dominant or recessive subtypes), tumour |
| Hematuria | Renal vein thrombosis, asphyxia, malformation, trauma |
| Anuria/Oliguria | Bilateral renal agenesis, obstruction, asphyxia |
| **Child and Adolescent** | |
| Cola/Red-Coloured Urine | Acute GN (post-streptococcal, HSP, IgA nephropathy, etc.), hemoglobinuria (hemolysis), myoglobinuria (rhabdomyolysis) |
| Gross Hematuria | Urologic disease (nephrolithiasis, trauma, etc.), UTI, acute GN |
| Edema | Nephrotic syndrome, nephritis, acute/chronic renal failure, consider cardiac or liver disease |
| HTN | GN, renal failure, dysplasia (consider coarctation, drugs, endocrine causes) |
| Polyuria | DM, central and nephrogenic DI, renal Fanconi's syndrome (genetic/metabolic/acquired causes), hypercalcemia, polyuric renal failure (renal dysplasia) |
| Proteinuria | Orthostatic, nephrotic syndrome (MCD, etc.), GN |
| Oliguria | Dehydration, ATN, interstitial nephritis, acute or chronic kidney disease (i.e. renal failure) |
| Urgency | UTI, vulvovaginitis |

## Hemolytic Uremic Syndrome

### Definition
- simultaneous occurrence of the triad of:
  1. non-immune microangiopathic hemolytic anemia
  2. thrombocytopenia
  3. acute renal injury

### Epidemiology
- annual incidence of 1-2 per 100,000 in Canada
- most common cause of acute renal failure in children

### Etiology
- diarrhea positive HUS: 90% of pediatric HUS from *E. coli* O157:H7, shiga toxin, or verotoxin
- diarrhea negative HUS: other bacteria, viruses, drugs, familial/genetic

### Pathophysiology
- toxin binds, invades, and destroys colonic epithelial cells, causing bloody diarrhea
- toxin enters the systemic circulation, attaches to, and injures endothelial cells (especially in kidney), causing a release of endothelial products (e.g. von Willebrand factor, platelet aggregating factor)
- platelet/fibrin thrombi form in multiple organ systems (e.g. kidney, pancreas, brain, etc.) resulting in thrombocytopenia
- RBCs are forced through occluded vessels, resulting in fragmented RBCs (schistocytes) that are removed by the reticuloendothelial system (hemolytic anemia)

### Clinical Feature
- initial presentation of abdominal pain and diarrhea, followed by bloody diarrhea; within 5-7 d begins to show signs of anemia, thrombocytopenia, and renal insufficiency
- pallor, jaundice (hemolysis), edema, petechiae, HTN

### Investigations
- CBC (anemia, thrombocytopenia), blood smear (schistocytes), electrolytes, renal function, urinalysis (microscopic hematuria), stool cultures, and verotoxin/shigella toxin assay

### Management
- mainly supportive: nutrition, hydration, ventilation (if necessary), blood transfusion for symptomatic anemia
- monitor electrolytes and renal function: dialysis if electrolyte abnormality (hyperkalemia) cannot be corrected, fluid overload, or uremia
- steroids are not helpful
- antibiotics are contraindicated as death of bacteria leads to increased toxin release and worse clinical course

### Prognosis
- death in <5% of cases, 5-25% long-term renal damage (HTN, proteinuria, decreased renal function)

# Nephritic Syndrome

## Definition
- acute or chronic syndrome affecting the kidney, characterized by glomerular injury and inflammation
- defined by hematuria (>5 RBCs per high-powered microscope field), presence of dysmorphic RBCs, and RBC casts on urinalysis
- often accompanied by at least one of proteinuria (<50 mg/kg/d), edema, HTN, azotemia, and oliguria

## Epidemiology
- highest incidence in children aged 5-15 yr old

## Etiology
- humoral immune response to a variety of etiologic agents → immunoglobulin deposition → complement activation, leukocyte recruitment, release of growth factors/cytokines → glomerular inflammation and injury → porous podocytes → hematuria + RBC casts ± proteinuria
- HTN secondary to fluid retention and increased renin secretion by ischemic kidneys

**Table 37. Major Causes of Nephritic Syndrome**

| | Decreased C3 | Normal C3 |
|---|---|---|
| **Primary** (idiopathic) | Post-infectious GN (most common cause of acute GN in pediatrics)<br>Membranoproliferative<br>Type I (50-80%)<br>Type II (>80%) | IgA nephropathy<br>Idiopathic rapidly progressive GN<br>Anti-GBM disease |
| **Secondary** (systemic disease) | SLE<br>Bacterial endocarditis<br>Abscess or shunt nephritis<br>Cryoglobulinemia | HSP (very common)<br>Polyarteritis nodosa<br>Granulomatosis with polyangiitis<br>Goodpasture's syndrome |

**Nephritic Syndrome**

**PHAROH**
**P**roteinuria (<50 mg/kg/d)
**H**ematuria
**A**zotemia
**R**BC casts
**O**liguria
**H**TN

## Clinical Feature
- often asymptomatic; some overlap in clinical findings for nephritic and nephrotic syndrome
- gross hematuria, mild-moderate edema, oliguria, HTN
- signs and symptoms suggestive of underlying systemic causes (e.g. fever, arthralgias, rash, dyspnea, pulmonary hemorrhage)

## Investigations
- urine
  - dipstick (hematuria, 0 to 2+ proteinuria) and microscopy (>5 RBCs per high-powered microscope field, acanthocytes, RBC casts)
  - first morning urine protein/creatinine ratio (<200 mg/mmol)
- blood work
  - CBC, electrolytes, Cr, BUN, albumin
  - impaired renal function (↑ Cr and BUN) resulting in ↑ pH and electrolyte abnormalities (hyperkalemia, hyperphosphatemia, hypocalcemia)
  - mild anemia on CBC (secondary to hematuria)
  - hypoalbuminemia (secondary to proteinuria)
  - appropriate investigations to determine etiology: C3/C4 levels, serologic testing for recent streptococcal infection (ASOT, anti-hyaluronidase, anti-streptokinase, anti-NAD, anti-DNAse B), ANA, anti-DNA antibodies, ANCA, serum IgA levels, anti-GBM antibodies
- renal biopsy should be considered only in the presence of acute renal failure, no evidence of streptococcal infection, normal C3/C4

## Management
- treat underlying cause
- symptomatic
  - renal insufficiency: supportive (dialysis if necessary), proper hydration
  - HTN: salt and fluid restriction (but not at expense of renal function), ACEI or ARBs for chronic persistent HTN (not acute cases because ACEI or ARBs may decrease GFR further)
  - edema: salt and fluid restriction, possibly diuretics (avoid if significant intravascular depletion)
- corticosteroids if indicated: IgA nephropathy, lupus nephritis, etc.

## Prognosis
- dependent on underlying etiology
- complications include HTN, heart failure, pulmonary edema, chronic kidney injury (requiring renal transplant)

# Nephrotic Syndrome

## Definition
- clinical syndrome affecting the kidney, characterized by significant proteinuria, peripheral edema, hypoalbuminemia, and hyperlipidemia

## Epidemiology
- highest incidence in children 2-6 yr old, M>F

## Etiology
- primary (idiopathic): nephrotic syndrome in the absence of systemic disease (most common cause in pediatrics)
  - glomerular inflammation ABSENT on renal biopsy: MCD (85%), focal segmental glomerular sclerosis
  - glomerular inflammation PRESENT on renal biopsy: membranoproliferative GN, IgA nephropathy
- secondary: nephrotic syndrome associated with systemic disease or due to another process causing glomerular injury (<10% in pediatrics)
  - autoimmune: SLE, DM, rheumatoid arthritis
  - genetic: sickle cell disease, Alport syndrome
  - infections: hepatitis B/C, post-streptococcal, infective endocarditis, HUS, HIV
  - malignancies: leukemia, lymphoma
  - medications: captopril, penicillamine, NSAIDs, antiepileptics
  - vasculitides: HSP, granulomatosis with polyangiitis
- congenital: congenital nephropathy of the Finnish type, Denys-Drash syndrome, etc.

**PALE**
**P**roteinuria (>50 mg/kg/d)
Hypo**A**lbuminemia (<20 g/L)
Hyper**L**ipidemia
**E**dema

Daily protein excretion can be estimated from a random urine protein/creatinine ratio

## Clinical Feature
- non-specific symptoms such as irritability, malaise, fatigue, anorexia, or diarrhea
- edema
  - often first sign; detectable when fluid retention exceeds 3-5% of body weight
  - starts periorbital and often pretibial → edematous areas are white, soft, and pitting
  - gravity dependent: periorbital edema ↓ and pretibial edema ↑ over the day
  - anasarca may develop (i.e. marked periorbital and peripheral edema, ascites, pleural effusions, scrotal/labial edema)
- decrease in effective circulating volume (e.g. tachycardia, HTN, oliguria, etc.)
- foamy urine is a possible sign of proteinuria

## Investigations
- urine
  - urine dipstick (3 to 4+ proteinuria, microscopic hematuria) and microscopy (oval fat bodies, hyaline casts)
  - first morning urine protein/creatinine ratio (>200 mg/mmol)
- blood work
  - diagnostic: hypoalbuminemia (<25 g/L), hyperlipidemia/hypercholesterolemia (total cholesterol >5 mmol/L)
  - secondary: electrolytes (hypocalcemia, hyperkalemia, hyponatremia), renal function (↑ BUN and Cr), coagulation profile (↓ PTT)
  - appropriate investigations to rule out secondary causes: CBC, blood smear, C3/C4, ANA, hepatitis B/C titres, ASOT, HIV serology, etc.
- consider renal biopsy if: HTN, gross hematuria, ↓ renal function, low serum C3/C4, no response to steroids after 4 wk of therapy, frequent relapses (>2 in 6 mo), presentation before first yr of life (high likelihood of congenital nephrotic syndrome), presentation ≥12 yr (rule out more serious renal pathology than MCD)

## Management
- MCD: oral prednisone 2 mg/kg/d (or equivalent) for up to 12 wk → varicella status should be known before starting
- consider cytotoxic agents, immunomodulators, or high-dose pulse corticosteroid if steroid resistant
- symptomatic
  - edema: salt and fluid restriction, possibly diuretic (avoid if significant intravascular depletion); furosemide + albumin for anasarca
  - hyperlipidemia: generally resolves with remission; limit dietary fat intake; consider statin therapy if persistently nephrotic
  - hypoalbuminemia: IV albumin and furosemide not routinely given; consider if refractory edema
  - abnormal BP: control BP; fluid resuscitation if severe intravascular depletion; ACEI or ARBs for persistent HTN
- diet: no added salt; monitor caloric intake and supplement with $Ca^{2+}$ and Vit D if on corticosteroids
- daily weights and BP to assess therapeutic progress
- secondary infections: treat with appropriate antimicrobials; antibiotic prophylaxis not recommended; pneumococcal vaccine at diagnosis and varicella vaccine after remission; varicella Ig + acyclovir if exposed while on corticosteroids
- secondary hypercoagulability: mobilize, avoid hemoconcentration due to hypovolemia, prompt sepsis treatment; heparin if thrombi occur

**Side Effects of Long-Term Steroid Use**
- Increased appetite
- Weight gain
- Dorsal hump
- Impaired growth
- Behavioural changes
- Risk of infection
- Salt and water retention
- HTN
- Bone demineralization
- Skin striae

### Prognosis
- generally good: 80% of children responsive to corticosteroids
- up to 2/3 experience relapse, often multiple times; sustained remission with normal kidney function usually by adolescence
- complications: ↑ risk of infections (spontaneous peritonitis, cellulitis, sepsis); hypercoagulability due to decreased intravascular volume and antithrombin III depletion (PE, renal vein thrombosis); intravascular volume depletion, leading to hypotension, shock, renal failure; side effects of drugs

## Hypertension in Childhood

### Definition
- HTN: sBP and/or dBP ≥95th percentile for sex, age, and height on ≥3 occasions
- pre-HTN: sBP and/or dBP ≥90th percentile but <95th percentile or BP ≥120/80 irrespective of age, gender, and height

**Table 38. 95th Percentile Blood Pressures (mmHg)**

| | Female | | Male | |
|---|---|---|---|---|
| **Age (Yr)** | **50th Percentile for Height** | **75th Percentile for Height** | **50th Percentile for Height** | **75th Percentile for Height** |
| 1 | 104/58 | 105/59 | 103/56 | 104/57 |
| 6 | 111/74 | 113/74 | 114/74 | 115/75 |
| 12 | 123/80 | 124/81 | 123/81 | 125/82 |
| 17 | 129/84 | 130/85 | 136/87 | 138/87 |

Adapted from: the Fourth report on the diagnosis, evaluation, and treatment of high blood pressure in children and adolescents. National Heart, Lung and Blood Institute. National Institutes of Health. May 2004

### Epidemiology
- prevalence: 3-5% for HTN, 7-10% for pre-HTN; M>F
- increasing prevalence of pre-HTN over the last 25+ yr

### Etiology
- primary HTN
  - diagnosis of exclusion
  - most common in older children (≥10 yr), especially if positive family history, overweight, and only mild HTN
  - responsible for ~90% of cases of HTN in adolescents, rarely in young children
- secondary HTN
  - identifiable cause of HTN (most likely etiology depends on age)
  - responsible for majority of childhood HTN
- always consider white coat HTN for all ages

**Table 39. Etiology of Secondary HTN by Age Group**

| System | Neonates | 1 mo-6 yr | 7-12 yr | >13 yr |
|---|---|---|---|---|
| **Endocrine/ Metabolic** | CAH | Wilms' tumour (↑ renin)<br>Neuroblastoma (↑ catecholamines) | Endocrinopathies* | Endocrinopathies* |
| **Renal** | Congenital renal disease | Renal parenchymal disease | Renal parenchymal disease | Renal parenchymal disease |
| **Vascular** | Coarctation of the aorta<br>Renal artery thrombosis | Coarctation of the aorta<br>RAS | Renovascular abnormalities | |
| **Drugs** | | Corticosteroids<br>Cyclosporine and tacrolimus | Corticosteroids<br>OCP<br>Cyclosporine and tacrolimus | Corticosteroids<br>OCP<br>Cyclosporine and tacrolimus<br>Recreational drugs (amphetamines, cocaine, etc.) |

*Note: may include hyperthyroidism, hyperparathyroidism, Cushing's syndrome, primary hyperaldosteronism/Conn's syndrome, pheochromocytoma

### Risk Factors
- primary HTN: male gender, positive family history, obesity, obstructive sleep apnea, African American, prematurity/LBW
- secondary HTN: history of renal disease, abdominal trauma, family history of autoimmune diseases, umbilical artery catheterization

**Signs of Secondary HTN**
- Edema (renal parenchymal disease)
- Abdominal or renal bruit (RAS)
- Differential 4 limb BP/diminished femoral pulses (coarctation)
- Abdominal mass (Wilms', neuroblastoma)
- Goitre/skin changes (hyperthyroidism)
- Ambiguous genitalia (CAH)

### Clinical Feature
- often asymptomatic, but can include FTT, fatigue, epistaxis
- symptoms of hypertensive emergency
  - neurologic: headache, seizures, focal complaints, change in mental status, visual disturbances
  - cardiovascular: symptoms of MI or heart failure (chest pain, palpitations, cough, SOB)
- symptoms of secondary HTN: guided by etiology; ask about medications and recreational drugs (current and past)
- physical exam: measure BP with correct cuff size, BMI, full neurologic exam, ophthalmoscopy, precordial exam, peripheral pulses, perfusion status

### Investigations
- laboratory
  - urine dipstick for hematuria and/or proteinuria (renal disease), urine catecholamines (pheochromocytoma, neuroblastoma)
  - blood work: renal function tests (electrolytes, Cr, BUN), consider renin and aldosterone levels (RAS, Conn's syndrome, Wilms' tumour)
  - other specific hormones if indicated on history and physical
- imaging: Echo (coarctation, heart function), abdominal U/S (RAS, abdominal mass), renal radionucleide imaging (renal scarring)

### Management
- treat underlying cause
- non-pharmacologic: modify concurrent cardiovascular risk factors (weight reduction, exercise, salt restriction, smoking cessation)
- pharmacologic: gradual lowering of BP using thiazide diuretics; no antihypertensives have been formally studied in children; if hypertensive emergencies use hydralazine, labetalol, sodium nitroprusside
- management of end-organ damage (e.g. retinopathy, LVH)
- consider referral to specialist

**Pediatric BP Calculation**
sBP= age x 2 + 90
dBP= 2/3 x sBP

### Prognosis
- end-organ damage (similar to adults) including LVH, CHF, cerebrovascular insults, renal disease, retinopathy

# Neurology

## Cerebral Palsy

### Definition
- a symptom complex, not a disease
- non-progressive central motor impairment syndrome due to insult to or anomaly of the immature CNS
- incidence: 1.5-2.5/1000 live births (industrialized nations)
- life expectancy is dependent on the degree of mobility and intellectual impairment, not on severity of CNS lesion

### Etiology
- often obscure, no definite etiology identified in 1/3 of cases
- 10% related to intrapartum asphyxia; 10% due to postnatal insult (infections, asphyxia, prematurity with IVH and trauma)
- association with LBW babies

### Clinical Feature
- general signs: delay in motor milestones, developmental delay, learning disabilities, visual/hearing impairment, seizures, microcephaly, uncoordinated swallow (aspiration)

**Table 40. Types of Cerebral Palsy**

| Type | % of Total | Characteristics | Area of Brain Involved |
|---|---|---|---|
| **Spastic** | 70-80% | Truncal hypotonia in first yr<br>Increased tone, increased reflexes, clonus<br>Can affect one limb (monoplegia), one side of body (hemiplegia), both legs (diplegia), or both arms and legs (quadriplegia) | UMN of pyramidal tract<br>Diplegia associated with periventricular leukomalacia in premature babies<br>Quadriplegia associated with HIE (asphyxia), higher incidence of intellectual disability |
| **Athetoid/ Dyskinetic** | 10-15% | Athetosis (involuntary writhing movements)<br>± chorea (involuntary jerky movements)<br>Can involve face, tongue (results in dysarthria) | Basal ganglia (may be associated with kernicterus) |
| **Ataxic** | <5% | Poor coordination, poor balance (wide based gait)<br>Can have intention tremor | Cerebellum |
| **Mixed** | 10-15% | More than one of the above motor patterns | |

### Investigations
- may include metabolic screen, chromosome studies, serology, neuroimaging (MRI), EMG, EEG (if seizures), ophthalmology assessment, audiology assessment

### Treatment
- maximize potential through multidisciplinary services such as primary care physician, OT, PT, SLP, school supports, etc.
- orthopedic management (e.g. dislocations, contractures, rhizotomy)
- management of symptoms: spasticity (baclofen, Botox®), constipation (stool softeners)

## Febrile Seizures

### Epidemiology
- most common cause of seizure in children (3-5% of children)
- M>F; age 6 mo-6 yr

### Clinical Feature
- often with associated illness or fever and family history
- no evidence of CNS infection/inflammation before or after seizure; no history of non-febrile seizures

**Table 41. Comparison of Typical and Atypical Febrile Seizures**

| **Simple/Typical** (70-80%) | **Complex/Atypical** (20-30%) |
|---|---|
| All of the following:<br>Duration <15 min (95% <5 min)<br>Generalized tonic-clonic<br>No recurrence in 24 h period<br>No neurological impairment or developmental delay before or after seizure | At least one of the following:<br>Duration >15 min<br>Focal onset or focal features during seizure<br>Recurrent seizures (>1 in 24 h period)<br>Previous neurological impairment or neurological deficit after seizure |

### Investigations
- history: determine focus of fever, description of seizure, medications, trauma history, development, family history
- physical exam: LOC, signs of meningitis, neurological exam, head circumference, focus of infection
- septic workup including LP if suspecting meningitis (strongly consider if child <12 mo; consider if child is 12-18 mo; only if meningeal signs present if child >18 mo)
- if typical febrile seizure, investigations only for determining focus of fever
- EEG/CT/MRI brain not warranted unless atypical febrile seizure or abnormal neurologic findings

### Management
- counsel and reassure patient and parents
  - febrile seizures do not cause brain damage
  - very small risk of developing epilepsy: 9% in child with multiple risk factors; 2% in child with typical febrile seizures compared to 1% in general population
  - 33% chance of recurrence (mostly within 1 yr of first seizure and in children <1 yr old)
- antipyretics and fluids for comfort (though neither prevent seizure)
- prophylaxis with antiepileptic drugs not recommended
- if high risk for recurrent or prolonged seizures, have rectal or sublingual lorazepam at home
- treat underlying cause of fever

## Hypotonia

- decreased resistance to passive movements – "floppy baby"

### Differential Diagnosis
- central: genetic (DS, Prader-Willi, Fragile X syndrome), metabolic (hypoglycemia, kernicterus), perinatal problems (asphyxia, ICH), endocrine (hypothyroidism, hypopituitarism), systemic illness (TORCH infection, sepsis, dehydration), CNS malformations, dysmorphic syndromes
- peripheral: motor neuron (spinal muscular atrophy, polio), peripheral nerve (Charcot-Marie-Tooth syndrome), neuromuscular junction (myasthenia gravis), muscle fibre (mitochondrial myopathy, muscular dystrophy, myotonic dystrophy)

### Clinical Feature
- proper assessment of tone requires accurate determination of GA
- differentiate between UMN and LMN lesion: spontaneous posture (spontaneous movement, movement against gravity, frog-leg position); muscle weakness; joint mobility (hyperextensibility); muscle bulk; presence of fasciculations

Causes of hypotonia that respond to rapid treatment: hypokalemia, hypermagnesemia, acidemia, toxins, drugs, hypoglycemia, seizure, infection, intracranial bleeding, hydrocephalus

- postural maneuvers
  - traction response: pull to sit, look for flexion of arms to counteract traction and head lag
  - axillary suspension: suspend infant by holding at axilla and lifting; hypotonic babies will slip through grasp because of low shoulder girdle tone
  - ventral suspension: infant is prone and supported under the abdomen by one hand; infant should be able to hold up extremities; inverted "U" posturing demonstrates hypotonia
- dysmorphic features, cognitive ability, reflexes, strength

### Investigations
- rule out systemic disorders (e.g. electrolytes, ABG, blood glucose, CK, and serum/urine investigations for multiple etiologies including mitochondrial causes)
- neuroimaging: MRI/MRA when indicated
- EMG, muscle biopsy/NCS
- chromosome analysis, genetic testing, metabolic testing, neuromuscular testing

### Management
- depends on etiology: some treatments available for specific diagnosis
- counsel parents on prognosis and genetic implications
- refer patients for specialized care, refer for rehabilitation, OT, PT, assess feeding ability

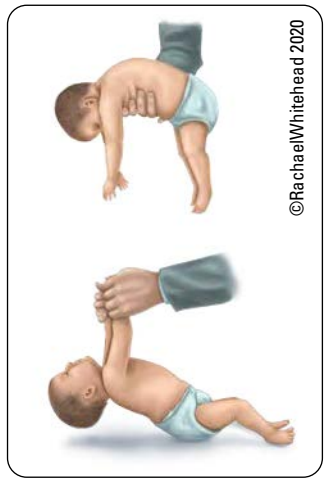

**Figure 17. Hypotonia**

## Neurocutaneous Syndromes

### Definition
- characterized by skin colour changes and tendency to form tumours of the CNS, PNS, viscera, and skin

In neurocutaneous syndromes, the younger the child at presentation, the more likely they are to develop intellectual disability

### NEUROFIBROMATOSIS TYPE I
- autosomal dominant but 50% are the result of new mutations
- also known as von Recklinghausen disease
- incidence 1:3000, mutation in NF1 gene on 17q11.2 (codes for neurofibromin protein)
- learning disorders, abnormal speech development, and seizures are common
- diagnosis of NF-1 requires 2 or more of:
  - ≥6 café-au-lait spots (>5 mm if prepubertal, >1.5 cm if postpubertal)
  - ≥2 neurofibromas of any type or one plexiform neurofibroma
  - ≥2 Lisch nodules (hamartomas of the iris)
  - optic glioma
  - freckling in the axillary or inguinal region
  - a distinctive bony lesion (e.g. sphenoid dysplasia, cortical thinning of long bones)
  - a first degree relative with confirmed NF-1
- management involves treatment of disease manifestations as they occur, as well as genetic counselling, OT, PT, and speech therapy as needed

### NEUROFIBROMATOSIS TYPE II
- autosomal dominant
- incidence 1:33,000
- characterized by predisposition to form intracranial, spinal tumours
- diagnosed when bilateral vestibular schwannomas are found, or a first-degree relative with NF-2 and either unilateral vestibular schwannoma, or any two of the following: meningioma, glioma, schwannoma, neurofibroma, posterior subcapsular lenticular opacities
- treatment consists of monitoring for tumour development and surgery

## Recurrent Headache

- see Neurology, N44

### Differential Diagnosis
- primary headache: tension, migraine, cluster
- secondary headache: see Neurology, N45

### General Assessment
- if unremarkable history and neurological and general physical exam is negative, most likely diagnosis is migraine or tension headache
- CT or MRI if history or physical reveals red flags
- inquire about level of disability, academic performance, after-school activities

**Headache – Red Flags**
- First and worst headache of their life
- Sudden onset
- Focal neurological deficits
- Constitutional symptoms
- Worse in morning
- Worse with bending over, coughing, straining
- Change in LOC
- Sudden mood changes
- Pain that wakes patient
- Fatigue
- Affecting school attendance

# Seizure Disorders

• see Neurology, N18

## Differential Diagnosis of Seizures in Children

- benign febrile seizure
- CNS: infection, tumour, HIE, trauma, hemorrhage
- metabolic: hypoglycemia, hypocalcemia, hyponatremia
- idiopathic epilepsy and epileptic syndromes
- others: neurocutaneous syndromes, AVM, drug ingestions/withdrawal
- seizure mimics

Heart problems, such as long QT syndrome and hypertrophic cardiomyopathy, are often misdiagnosed as epilepsy. Include cardiac causes of syncope in your differential diagnosis, particularly when the episodes occur during physical activity

## Investigations

- lab tests: CBC, electrolytes, calcium, magnesium, glucose
- toxicology screen if indicated
- EEG
- CT/MRI, if indicated (focal neurological deficit or has not returned to baseline several hours after seizure)
- consider LP if first-time non-febrile seizure (not indicated for determining recurrence risk of benign febrile seizures or to determine seizure type or epileptic syndrome)

**Seizure Mimics**

- Benign paroxysmal vertigo
- Breath holding
- Hypoglycemia
- Narcolepsy
- Night terror
- Pseudoseizure
- Syncope
- TIA
- Tic

## CHILDHOOD EPILEPSY SYNDROMES

### Infantile Spasms

- brief, repeated symmetric contractions of neck, trunk, extremities (flexion and extension) lasting 10-30 s
- occur in clusters; often associated with developmental delay; onset 4-8 mo
- 20% unknown etiology (usually good response to treatment); 80% due to metabolic or developmental abnormalities, encephalopathies, or are associated with neurocutaneous syndromes (usually poor response to treatment)
- can develop into West syndrome (infantile spasms, psychomotor developmental arrest, and hypsarrhythmia) or Lennox-Gastaut (see below)
- typical EEG: hypsarrhythmia (high voltage slow waves, spikes and polyspikes, background disorganization)
- management: ACTH, vigabatrin, benzodiazepines

**Ketogenic Diet and other Dietary Treatments for Epilepsy**
Cochrane DB Syst Rev 2012;3:CD001903
**Study:** Systematic review of all studies of ketogenic and related diets. Included the review of 4 RCTs, 6 prospective studies, and 5 retrospective studies.
**Population:** Adults and children with diagnosed epilepsy of any type.
**Intervention:** Ketogenic diet, control (placebo diet, any treatment with known antiepileptic properties).
**Main Outcome Measure:** Seizure control at 3, 6, 12 mo.
**Results:** Studies showed a response rate of at least 38-50% seizure reduction at 3 mo. This response was maintained for up to a year. A range of side effects were reported. The most frequent were gastrointestinal effects (30%).
**Conclusion:** The ketogenic diet is a valid option for people with medically-intractable epilepsy.

### Lennox-Gastaut

- characterized by triad of:
  1) multiple seizure types
  2) diffuse cognitive dysfunction
  3) slow generalized spike and slow wave EEG
- onset commonly 3-5 yr of age
- seen with underlying encephalopathy and brain malformations
- management: valproic acid, benzodiazepines, and ketogenic diet; however, response often poor

### Juvenile Myoclonic Epilepsy (Janz Syndrome)

- myoclonus particularly in morning; frequently presents as generalized tonic-clonic seizures
- adolescent onset (12-16 yr of age); autosomal dominant with variable penetrance
- typical EEG: 3.5-6 Hz irregular spike and wave, increased with photic stimulation
- management: lifelong treatment (valproic acid); excellent prognosis

### Childhood Absence Epilepsy

- multiple daily absence seizures lasting <30 s without post-ictal state that may resolve spontaneously or become generalized in adolescence
- peak age of onset 6-7 yr, F>M, strong genetic predisposition
- typical EEG: 3 Hz spike and wave
- management: valproic acid or ethosuximide

### Benign Focal Epilepsy of Childhood with Rolandic/Centrotemporal Spikes

- focal motor seizures involving tongue, mouth, face, upper extremity usually occuring in sleep-wake transition states; remains conscious, but aphasic post-ictally
- onset peaks at 5-10 yr of age; 16% of all non-febrile seizures; remits spontaneously in adolescence without sequelae
- typical EEG: repetitive spikes in centrotemporal area with normal background
- management: frequent seizures controlled by carbamazepine, no medication if infrequent seizures

### General Approach to Treatment

- education for patient and parents including education and precautions in daily life (e.g. buddy system, showers instead of baths)

- medication
  - initiate: treatment with drug appropriate to seizure type; often if >2 unprovoked afebrile seizures within 6-12 mo
  - optimize: start with one drug and increase dosage until seizures controlled
  - if no effect, switch over to another before adding a second antiepileptic drug
- continue antiepileptic drug therapy until patient free of seizures for >2 yr, then wean over 4-6 mo
- ketogenic diet (high fat diet): used in patients who do not respond to polytherapy or who do not wish to take medication (valproic acid contraindicated in conjunction with ketogenic diet because may increase hepatotoxicity)
- legal obligation to report to Ministry of Transportation if patient wishes to drive

### Generalized and Partial Seizures
- see Neurology, N18

# Respirology

## Asthma

### Definition
- see Respirology, R7
- inflammatory disorder of the airwarys characterized by recurrent episodes of reversible small airway obstruction, resulting from airway hyperresponsiveness to endogenous and exogenous stimuli
- very common, presents most often in early childhood
- associated with other atopic diseases such as allergic rhinitis or atopic dermatitis

### Clinical Feature
- episodic bouts of wheezing, dyspnea, tachypnea, cough (usually at night/early morning, with activity, or cold exposure)
- physical exam may reveal hyper-resonant chest, prolonged expiration, wheeze
- symptoms may be exacerbated by "triggers": URTI (viral or *Mycoplasma*), weather (cold exposure, humidity changes), allergens (pets), irritants (cigarette smoke), exercise, emotional stress, drugs (ASA, β-blockers)

### Classification
- mild: occasional attacks of wheezing or coughing (<2/wk); symptoms respond quickly to inhaled bronchodilator; never needs systemic corticosteroids
- moderate: more frequent episodes with symptoms persisting and chronic cough; decreased exercise tolerance; sometimes needs systemic corticosteroids
- severe: daily and nocturnal symptoms; frequent ED visits and hospitalizations; usually needs systemic corticosteroids

### Management
- acute
  - $O_2$ (keep $O_2$ saturation >94%) and fluids if dehydrated
  - β2-agonists: salbutamol (Ventolin®) MDI + spacer (nebulized or IV in very severe episodes with impending respiratory failure), 5 puffs (<20 kg) or 10 puffs q20min for first h (>20 kg)
  - ipratropium bromide (Atrovent®) if severe: MDI + spacer, 3 puffs (<20 kg) or 6 puffs (>20 kg) q20min with salbutamol, or add to first 3 salbutamol masks (0.25 mg if <20 kg, 0.5mg if >20 kg)
  - steroids: prednisone (1-2 mg/kg x 5 d) or dexamethasone (0.3 mg/kg/d x 5 d or 0.6 mg/kg/d x 2 d); in severe disease, use IV steroids
  - if no response, add magnesium sulphate
  - continue to observe; can discharge patient if asymptomatic for 2-4 h after last dose
- chronic
  - education, emotional support, avoid allergens or irritants, develop an "action plan"
  - exercise program (e.g. swimming)
  - monitor respiratory function with peak flow metre (improves self-awareness of status)
  - PFTs for children >6 yr
  - reliever therapy: short acting β2-agonists (e.g. salbutamol)
  - controller therapy (first line therapy for all children): low dose daily inhaled corticosteroids
  - second line therapy for children <12 yr: moderate dose of daily inhaled corticosteoroids
  - second line therapy for children >12 yr: leukotriene receptor antagonist OR long acting β2-agonist in conjunction with low dose inhaled corticosteroids; leukotriene receptor antagonist monotherapy may be considered an alternative second line therapy
  - severe asthma unresponsive to first and second line treatments: injection immunotherapy
  - aerochamber for children using daily inhaled corticosteroids
- indications for hospitalization
  - ongoing need for supplemental $O_2$
  - persistently increased work of breathing
  - β2-agonists are needed more often than q4h after 4-8 h of conventional treatment
  - patient deteriorates while on systemic steroids

**Updated guidance for palivizumab prophylaxis among infants and young children at increased risk of hospitalization for respiratory syncytial virus infection**
Pediatrics 2014 Aug;134(2):415-20
Palivizumab prophylaxis is recommended for the first year of life for infants born before 29 wk gestation, and preterm infants with chronic lung disease of maturity (born at <32 wk gestation and requiring >21% oxygen for at least 28 d after birth). Such prophylaxis may be administered in the first yr of life to infants with hemodynamically significant heart disease, and a maximum of 5 monthly 15 mg/kg doses may be administered during the RSV season to infants requiring it; infants born during the RSV season may need fewer doses. Prophylaxis may be considered in the first yr of life for children with pulmonary abnormalities or neuromuscular disease impairing the ability to clear secretions from the upper airway, and may be considered for children younger than 24 mo who are profoundly immunocompromised during the RSV season. Palivizumab prophylaxis is only recommended in the second year of life for children who required at least 28 d of supplemental oxygen after birth with ongoing medical intervention needs. Monthly prophylaxis should be discontinued in children experiencing breakthrough RSV hospitalizations. Insufficient evidence exists to support the use of prophylaxis for children with cystic fibrosis or Down's syndrome.

**Canadian Pediatric Asthma Consensus Guidelines for Assessing Adequate Control of Asthma**
CMAJ 2005;173(6 Suppl):S12-14
- Daytime symptoms <4 d/wk
- Night time symptoms <1 night/wk
- Normal physical activity
- Mild and infrequent exacerbations
- No work/school absenteeism
- Need for β-agonist <4 doses/wk
- $FEV_1$ or peak expiratory flow ≥90% of personal best
- Peak expiratory flow diurnal variation <10-15%

# Bronchiolitis

### Definition
- LRTI, usually in children <2 yr, that has wheezing and signs of respiratory distress

### Epidemiology
- the most common LRTI in infants, affects 50% of children in first 2 yr of life; peak incidence at 6 mo, winter or early spring
- increased incidence of asthma in later life

### Etiology
- RSV (>50%), parainfluenza, influenza, rhinovirus, adenovirus, *M. pneumoniae* (rare)

### Clinical Feature
- prodrome of URTI with cough and/or rhinorrhea, possible fever
- feeding difficulties, irritability
- wheezing, crackles, respiratory distress, tachypnea, tachycardia, retractions, poor air entry; symptoms often peak at 3-4 d

### Investigations
- routine investigations are not required when bronchiolitis is suspected (Choosing Wisely)
- CXR (only in poor response to therapy or atypical disease): air trapping, peribronchial thickening, atelectasis, increased linear markings

### Management
- self-limiting disease with peak symptoms usually lasting 2-3 wk
- mild to moderate distress
  - supportive: PO or IV hydration, antipyretics for fever, regular or humidified high flow $O_2$
- severe distress
  - as above ± intubation and ventilation as needed
  - consider rebetol (Ribavirin®) in high risk groups: bronchopulmonary dysplasia, CHD, congenital lung disease, immunodeficient
- monthly RSV-Ig or palivizumab (monoclonal antibody against the F-glycoprotein of RSV) is protective against severe disease in high risk groups; case fatality rate <1%
- bronchodilators, corticosteroids and antibiotics have no therapeutic value (unless there is secondary bacterial pneumonia)
- indications for hospitalization
  - hypoxia: $O_2$ saturation <92% on initial presentation
  - persistent resting tachypnea >60/min and retractions after several salbutamol masks
  - past history of chronic lung disease, hemodynamically significant cardiac disease, neuromuscular problem, immunocompromised
  - young infants <6 mo old (unless extremely mild)
  - significant feeding problems
  - social problem (e.g. inadequate care at home)

**Bronchodilators for Bronchiolitis**
Cochrane DB Syst Rev 2010;12:CD001266
**Purpose**: To assess the effects of bronchodilators in infants with acute bronchiolitis.
**Methods**: Meta-analysis of placebo-controlled RCTs evaluating bronchodilators for bronchiolitis. Oxygen saturation was the main outcome.
**Results**: 30 trials with 1992 infants with bronchiolitis were included. Oxygen saturation did not improve with bronchodilators (mean difference (MD) -0.43, 95% CI -0.92 to 0.06). Neither outpatient (11.9% vs. 15.9%, OR 0.75, 95% CI 1.21) nor inpatient (MD 0.06, 95% CI -0.27 to 0.39) reduced hospitalization rates. Effects on oximetry seen in inpatients (MD -0.62, 95% CI -1.40 to 0.16) were slightly larger than for outpatients (MD -0.25, 95% CI -0.61 to 0.11). No change in average clinical score was seen in inpatients (standardized MD -0.14, 95% CI -0.41 to 0.12), while a statistically significant decrease was seen in outpatients (MD -0.42, 95% CI -0.79 to -0.06). Adverse events included tachycardia, oxygen desaturation, and tremors.
**Results**: Bronchodilators do not improve oxygen saturation, rates of hospital admission, duration of hospitalizations, or durations to resolution of illness. They are not considered effective in routine management of bronchiolitis, especially given their adverse effects.

Children with bronchiolitis do not respond to ipratropium bromide (Atrovent®) or steroids

# Choanal Atresia

- **definition**: obliteration or blockage of the posterior nasal aperture, associated with bony abnormalities of the pterygoid plates and midfacial growth abnormalities
- **epidemiology**: 1/7000 live births
  - associated with bony abnormalities of the pterygoid plates and midfacial growth abnormalities
- **diagnosis**: by CT with intranasal contrast
- **treatment**: depends on extent
  - immediate treatment of bilateral choanal atresia: placement of an oral airway and initiation of gavage feedings
  - long term treatment: surgery

# Cystic Fibrosis

- see Respirology, R12

### Etiology
- 1 per 3000 live births, mostly Caucasians
- autosomal recessive, CFTR gene found on chromosome 7 (ΔF508 mutation in 70%, but >1600 different mutations identified) resulting in a dysfunctional chloride channel on the apical membrane of cells
- leads to relative dehydration of airway secretions, resulting in impaired mucociliary transport and airway obstruction

### Clinical Feature
- neonatal: meconium ileus, prolonged jaundice, antenatal bowel perforation
- infancy: pancreatic insufficiency with steatorrhea and FTT (despite voracious appetite), anemia, hypoproteinemia, hyponatremia

**CF Presenting Signs**

**CF PANCREAS**
**C**hronic cough and wheezing
**F**TT
**P**ancreatic insufficiency (symptoms of malabsorption such as steatorrhea)
**A**lkalosis and hypotonic dehydration
**N**eonatal intestinal obstruction (meconium ileus)/Nasal polyps
**C**lubbing of fingers/Chest radiograph with characteristic changes
**R**ectal prolapse
**E**lectrolyte elevation in sweat, salty skin
**A**bsence or congenital atresia of vas deferens
**S**putum with *S. aureus* or *P. aeruginosa* (mucoid)
- Pancreatic dysfunction – determined by 3 d fecal fat collection
- Genetics – useful where sweat chloride test is equivocal

- childhood: heat intolerance, wheezing or chronic cough, recurrent chest infections (*S. aureus, P. aeruginosa, H. influenzae*), hemoptysis, nasal polyps, distal intestinal obstruction syndrome, rectal prolapse, clubbing of fingers
- older patients: COPD, infertility (males), decreased fertility (female)

### Investigations
- sweat chloride test x 2 (>60 mEq/L)
  - false positive tests: malnutrition, atopic dermatitis, hypothyroidism, hypoparathyroidism, GSD, adrenal insufficiency, G6PD, Klinefelter syndrome, technical issues, autonomic dysfunction, familial cholestasis syndrome
  - false negative tests: technical problem with test, malnutrition, skin edema, mineralocorticoids
- CFTR gene mutation analysis
- disease often detected during newborn genetic screening; positive result requires DNA testing and subsequent sweat choride testing

### Management
- nutritional counselling: high calorie diet, pancreatic enzyme replacements, fat soluble vitamin supplements
- management of chest disease: physiotherapy, postural drainage, exercise, bronchodilators, aerosolized DNAase and inhaled hypertonic saline, antibiotics (e.g. cephalosporin, cloxacillin, ciprofloxacin, inhaled tobramycin depending on sputum C&S), lung transplantation
- genetic counselling

### Complications
- respiratory failure, pneumothorax (poor prognostic sign), cor pulmonale (late), pancreatic fibrosis with DM, gallstones, cirrhosis with portal HTN, infertility (male)
- early death (current median survival in Canada is 46.6 yr)

## Dyspnea

### Approach to Dyspnea
- determine if patient is sick or not sick; ABCs
- history: onset, previous episodes, precipitating events, associated symptoms, past medical/family history of respiratory disease
- physical exam: vitals, $SpO_2$, evidence of cyanosis, respiratory, cardiovascular
- investigations: CBC and differential, electrolytes, BUN, Cr, NP swab, ABG, CXR, ECG (based on clinical findings)

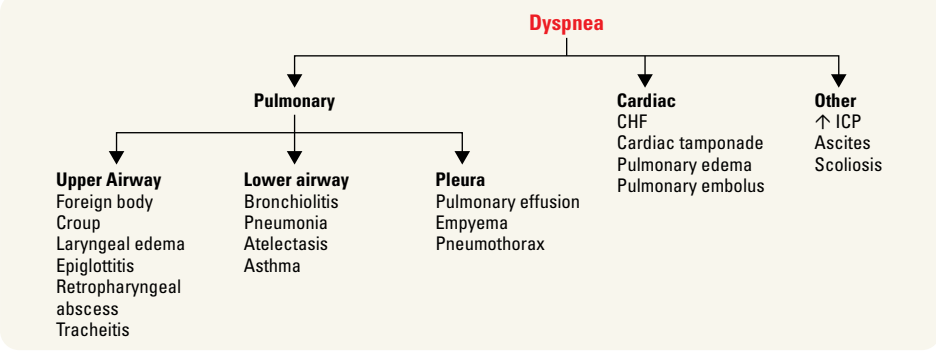

**Figure 18. Approach to dyspnea in childhood**

## Pneumonia

### Etiology
- inflammation of pulmonary tissue, associated with consolidation of alveolar spaces

### Clinical Feature
- incidence is greatest in first year of life with viral causes being most common in children <5 yr
- fever, cough, tachypnea
- CXR: diffuse, streaky infiltrates bilaterally
- bacterial causes may present with cough, fever, chills, dyspnea, more dramatic CXR changes (e.g. lobar consolidation, pleural effusion)

### Management
- supportive therapy: hydration, antipyretics, humidified $O_2$

**Table 42. Common Causes and Treatment of Pneumonia at Different Ages**

| Age | Bacterial | Viral | Atypical Bacteria | Treatment |
|---|---|---|---|---|
| **Neonates** | GBS<br>*E. coli*<br>*Listeria* | CMV<br>Herpes virus<br>Enterovirus | *Mycoplasma hominis*<br>*Ureaplasma urealyticum* | Ampicillin + gentamicin / tobramycin (add erythromycin if suspect *Chlamydia*) |
| **1-3 mo** | *S. aureus*<br>*H. influenzae*<br>*S. pneumoniae*<br>*B. pertussis* | CMV, RSV<br>Influenza<br>Parainfluenza | *Chlamydia trachomatis*<br>*Ureaplasma urealyticum* | Cefuroxime OR ampicillin ± erythromycin OR clarithromycin |
| **3 mo-5 yr** | *S. pneumoniae*<br>*S. aureus*<br>*H. influenzae*<br>GAS | RSV<br>Adenovirus<br>Influenza | *Mycoplasma pneumoniae*<br>TB | Amoxicillin (if mild) OR ampicillin OR cefuroxime |
| **>5 yr** | *S. pneumoniae*<br>*H. influenzae*<br>*S. aureus* | Influenza<br>Varicella<br>Adenovirus | *Mycoplasma pneumoniae*<br>*Chlamydia pneumoniae*<br>TB<br>*Legionella pneumophila* | Erythromycin OR clarithromycin (1st line) OR ampicillin OR cefuroxime |

# Respiratory Tract Diseases

## LOWER RESPIRATORY TRACT DISEASE

- obstruction of airways below thoracic inlet, produces more expiratory sounds
- classic symptom: wheezing

### Differential Diagnosis of Wheezing

- common: asthma (recurrent wheezing episodes, identifiable triggers, typically over 6 yr), bronchiolitis (first episode of wheezing, usually under 1 yr), recurrent aspiration (often neurological impairment), pneumonia (fever, cough, malaise)
- uncommon: foreign body (acute unilateral wheezing and coughing), CF (prolonged wheezing, unresponsive to therapy), bronchopulmonary dysplasia (often develops after prolonged ventilation in the newborn)
- rare: CHF, mediastinal mass, bronchiolitis obliterans, tracheobronchial anomalies

## UPPER RESPIRATORY TRACT DISEASE

- diseases above the thoracic inlet characterized by inspiratory stridor, hoarseness, and suprasternal retractions
- differential diagnosis of stridor: croup, bacterial tracheitis, epiglottitis, foreign body aspiration, subglottic stenosis (congenital or iatrogenic), laryngomalacia/tracheomalacia (collapse of airway cartilage on inspiration), retropharyngeal abscess

**Table 43. Common Upper Respiratory Tract Infections in Children**

| | Croup (Laryngotracheobronchitis) | Bacterial Tracheitis | Epiglottitis |
|---|---|---|---|
| **Anatomy** | Subglottic laryngitis | Subglottic tracheitis | Supraglottic laryngitis |
| **Epidemiology** | Common in children <6 yr, with peak incidence between 7-36 mo<br>Common in fall and early winter | Rare<br>All age groups | Very rare – due to Hib vaccination<br>Usually older (2-6 yr) |
| **Etiology** | Parainfluenza (75%)<br>Influenza A and B<br>RSV<br>Adenovirus | *S. aureus*<br>*H. influenzae*<br>α-hemolytic strep<br>Pneumococcus<br>*M. catarrhalis* | *H. influenzae*<br>β-hemolytic strep |
| **Clinical Presentation** | Common prodrome: rhinorrhea, pharyngitis, cough ± low-grade fever<br>Hoarse voice<br>Barking cough<br>Stridor<br>Worse at night | Similar symptoms as croup, but more rapid deterioration with high fever<br>Toxic appearance<br>Does not respond to croup treatments | Toxic appearance<br>Rapid progression<br>4 **D**s – **d**rooling, **d**ysphagia, **d**ysphonia, **d**istress<br>Stridor<br>Tripod position<br>Sternal recession<br>Anxious<br>Fever (>39°C) |
| **Investigations** | Clinical diagnosis<br>CXR in atypical presentation: "steeple sign" from subglottic narrowing | Clinical diagnosis<br>Endoscopy: definitive diagnosis | Clinical diagnosis<br>Avoid examining the throat to prevent further respiratory exacerbation |
| **Treatment** | Stridor at rest is an EMERGENCY<br>No evidence for humidified $O_2$<br>Dexamethasone: PO 1 dose<br>Racemic epinephrine: nebulized, 1-3 doses, q1-2h<br>Intubation if unresponsive to treatment | Usually requires intubation<br>IV antibiotics | Intubation<br>Antibiotics<br>Prevented with Hib vaccine |

**Croup**
Stridor at rest is an emergency

# Rheumatology

## Growing Pains

### Epidemiology
- age 2-12 yr, M=F

### Clinical Feature
- diagnosis of exclusion
- intermittent, non-articular pain in childhood with normal physical exam findings
- pain at night, often bilateral and limited to the calf, shin, or thigh; typically short-lived
- relieved by heat, massage, mild analgesics
- child is well, asymptomatic during the day, no functional limitation
- possible family history of growing pains

### Management
- lab investigations not necessary if typical presentation; reassurance and supportive management

## Juvenile Idiopathic Arthritis

- a heterogenous group of conditions characterized by persistent arthritis in children <16 yr
- diagnosis: arthritis in ≥1 joint(s); duration ≥6 wk; onset age <16 yr old; exclusion of other causes of arthritis; classification defined by features/number of joints affected in the first 6 mo of onset

### Systemic Arthritis (Still's Disease)
- onset at any age, M=F
- once or twice daily fever spikes (>38.5°C) ≥2 d/wk with temperature returning below baseline; children usually acutely unwell during fever episodes
- extra-articular features: erythematous "salmon-coloured" maculopapular rash, lymphadenopathy, hepatosplenomegaly, leukocytosis, thrombocytosis, anemia, serositis
- arthritis may occur weeks to months later
- high ESR, CRP, WBC, platelet count

### Oligoarticular Arthritis (1-4 joints)
- most common type of JIA
  - onset early childhood (<5 years of age), F>M
- persistent: affects no more than 4 joints during the disease course
- extended: affects more than 4 joints after the first 6 mo
- typically affects large joints: knee most common, elbows, wrists; hip involvement unusual
- ANA positive ~60-80%, RF negative
- screening eye exams for asymptomatic anterior uveitis (occurs in ~30%)
- complications: knee flexion contracture, quadriceps atrophy, leg-length discrepancy, growth disturbances, uveitis

### Polyarticular Arthritis (5 or more joints)
- ANA positive in 50%, uveitis in 10%
- RF negative (usually negative)
  - onset: 2-4 yr and 6-12 yr, F>M
  - symmetrical involvement of large and small joints of hands and feet, TMJ, cervical spine
- RF positive
  - onset: late childhood/early adolescence, F>M
  - similar to the aggressive form of adult rheumatoid arthritis
  - severe, rapidly destructive, symmetrical arthritis of large and small joints
  - may have rheumatoid nodules at pressure points (elbows, knees)
  - unremitting disease, persists into adulthood

### Enthesitis-Related Arthritis
- onset: late childhood/adolescence, M>F
- arthritis and/or enthesitis (inflammation at the site where tendons or ligaments attach to the bone)
- weight bearing joints, especially hip and intertarsal joints
- risk of developing ankylosing spondylitis in adulthood
- asymmetric involvement of lower limb joints, associated with HLA-B27 and development of symptomatic uveitis/ iritis

### Psoriatic Arthritis
- onset: 2-4 yr and 9-11 yr, F>M
- arthritis and psoriasis OR arthritis and at least two of:
  - dactylitis, nail pitting or other abnormalities, or family history of psoriasis in a 1st degree relative
  - asymmetric or symmetric small or large joint involvement
- erythematous, scaly lesions on scalp, post-auricular area, peri-umbilicus or over extensor surfaces of elbows and knees

### Management
- goals of therapy: eliminate inflammation, prevent joint damage, promote normal growth and development as well as normal function, minimize medication toxicity
- exercise (moderate, fitness, flexibility and strengthening exercises) to maintain ROM and muscle strength
- multidisciplinary approach: OT/PT, social work, orthopedics, ophthalmology, rheumatology
- 1st line drug therapy: NSAIDs, intra-articular corticosteroids
- 2nd line drug therapy: DMARDs (methotrexate, sulfasalazine, leflunamide), corticosteroids (acute management of severe arthritis, systemic symptoms of JIA, topical eye drops for uveitis), biologic agents (IL1, IL6 inhibition for systemic arthritis, TNF antagonist for polyarticular JIA)

# Limb Pain

## Evaulation of Limb Pain

**Table 44. Differential Diagnosis of Limb Pain**

| Cause | <3 yr | 3-10 yr | >10 yr |
|---|---|---|---|
| **Trauma** | x | x | x |
| **Infectious** | | | |
| Septic arthritis | x | x | x |
| Osteomyelitis | x | x | x |
| **Inflammatory** | | | |
| Transient synovitis | x | x | |
| JIA | x | x | x |
| Spondyloarthritis | | x | x |
| SLE | | x | x |
| Dermatomyositis | | x | x |
| HSP | | x | x |
| **Anatomic/Orthopedic** | | | |
| Legg-Calvé-Perthes disease | | x | x |
| Slipped capital femoral epiphysis | | | x |
| Osgood-Schlatter disease | | | x |
| **Neoplastic** | | | |
| Leukemia | x | x | x |
| Neuroblastoma | x | x | x |
| Bone tumour | | x | x |
| **Hematologic** | | | |
| Hemophilia (hemarthrosis) | x | x | x |
| Sickle cell anemia | x | x | x |
| **Pain Syndromes** | | | |
| Growing pains | | x | x |
| Fibromyalgia | | x | x |
| Complex regional pain syndrome | | | x |

- must rule out infection, malignancy, and acute orthopedic conditions

### Clinical Feature
- demographics (age, gender)
- pattern of onset and progression of symptoms (including acuity and chronicity)
- morning stiffness, limp/weight-bearing status, night pain
- joint involvement (type, distribution) ± spine (axial) involvement
- extra-articular manifestations and systemic symptoms
- functional status – activities of daily living
- family history (arthritis, IBD, psoriasis, spondyloarthropathies, uveitis, bleeding disorders, sickle cell anemia)
- past medical illness, intercurrent infection, travel, sick contact history, joint injury

### Physical Exam
- growth parameters
- screening examination (pediatric gait, arms, legs, spine exam)
- joint exam: inspection/palpation (swelling, erythema, warmth, tenderness, deformity), ROM
- adjacent structures (bone, tendon, muscle, skin)
- leg length
- neurologic exam

### Investigations
- basic: CBC and differential, blood smear, ESR, CRP, x-ray
- as indicated: blood (ANA, RF, culture, viral/bacterial serology, CK, PTT, sickle cell screen, immunoglobulins, complement), urinalysis, synovial fluid (cell count, Gram stain, culture), TB skin test, imaging, bone marrow aspiration, slit lamp exam

**Red Flags for Limb Pain**
- Fever
- Pinpoint pain/tenderness
- Pain out of proportion to degree of inflammation
- Night pain
- Weight loss
- Erythema
- Unexplained fractures

# Lyme Arthritis

- see Infectious Diseases, ID20
- caused by spirochete *Borrelia burgdorferi*
- incidence highest among 5-10 yr olds
- do not treat children <8 yr old with doxycycline (may cause permanent tooth discolouration)

# Reactive Arthritis

- see Rheumatology, RH24
- arthritis (typically the knee) follows bacterial infection, especially with *Salmonella, Shigella, Yersinia, Campylobacter, Chlamydia,* and most commonly *Streptococcus* (post-streptococcal reactive arthritis)
- typically resolves spontaneously
- may progress to chronic illness or Reiter's syndrome (urethritis, conjunctivitis)

# Septic Arthritis and Osteomyelitis

- **MEDICAL EMERGENCY**: prompt intravenous antibiotics, followed by 4-6 weeks of oral antibiotics
- see Orthopedic Surgery, OR10

**Table 45. Microorganisms and Treatment Involved in Septic Arthritis/Osteomyelitis**

| Age | Pathogens | Treatment |
|---|---|---|
| Neonate | GBS, *S. aureus,* Gram negative bacilli | Cloxacillin + gentamicin OR cloxacillin + cefotaxime |
| Infant (1-3 mo) | *Strep.* spp., *Staph.* spp., *H. influenzae* Pathogens as per neonate | Cloxacillin + cefotaxime OR cefuroxime |
| Child | *S. aureus, S. pneumoniae,* GAS | Cefazolin OR cloxacillin OR clindamycin |
| Adolescent | As above; also *N. gonorrhoeae* | Ceftriaxone OR cefixime + azithromycin |

GAS = group A *Strep*; GBS = group B *Strep* Adapted from Tse SML, Laxer RM. Pediatrics in Review 2006;27:170-179

# Systemic Lupus Erythematosus

- see Rheumatology, RH11
- autoimmune illness affecting multiple organ systems
- incidence 1/1000, more commonly age >10, F:M = 10:1
- childhood-onset SLE vs. adult-onset SLE: children have more active disease, are more likely to have renal disease, and children receive more intensive drug therapy and have a poorer prognosis

# Transient Synovitis of the Hip

- benign, self-limited inflammatory joint disorder, usually occurs after URTI, pharyngitis, AOM
- key is to differentiate from septic arthritis

## Epidemiology

- age 3-10 yr, M>F, more common on right side

## Clinical Feature

- afebrile or low-grade fever, pain typically occurs in hips, knees (referred from hip); painful limp but full ROM (pain not as pronounced as in joint or bone infections), child does not look "toxic"
  - pain is not disabling and gradually worsens over few days, can have sudden onset of symptoms
- symptoms resolve over 7-10 d

## Investigations

- WBC within normal limits; ESR and CRP may be mildly elevated
- joint effusions may be seen on ultrasound
  - aspirate joint and examine synovial fluid if suspicious for septic arthritis
  - MRI if suspicious for osteomyelitis or periarticular pyomyositis
- diagnosis of exclusion

## Treatment

- symptomatic and anti-inflammatory medications
  - usually resolves with 24-48 h

## Complications

- Legg-Calve-Perthes Disease

# Vasculitides

## HENOCH-SCHÖNLEIN PURPURA

- most common vasculitis of childhood, peak incidence 4-10 yr, M:F = 2:1
- vasculitis of small vessels
- often have history of URTI 1-3 wk before onset of symptoms

### Clinical Feature

- clinical triad: 1) palpable purpura, 2) abdominal pain, 3) arthritis
- skin: palpable, non-thrombocytopenic purpura in lower extremities and buttocks, edema, scrotal swelling
- joints: arthritis/arthralgia involving large joints associated with painful edema
- GI: abdominal pain, GI bleeding, intussusception
- renal: microscopic hematuria, IgA nephropathy, proteinuria, HTN, renal failure in <5%

### Investigation

- no routine investigations performed – diagnosis is mainly based on clinical features
- urinalysis (blood, protein creatinine ratio), serum (urea/electrolytes, creatinine, albumin, elevated IgA)
- skin/renal biopsy – IgA deposition
- ultrasound – interssusception/perforation, testicular pain/swelling
- rule out other autoimmune conditions/vasculitides

### Management

- mainly supportive (e.g. elevation for edema)
- anti-inflammatory medications for joint pain, corticosteroids for select patients
- monitor for protein on urinalysis and hypertension every month for 6 mo, checking for renal disease, which may develop late (immunosuppressive therapy if severe)

### Prognosis

- self-limited, resolves within 4 wk
- recurrence in about one-third of patients
- long-term prognosis dependent on severity of nephritis

## KAWASAKI DISEASE

- acute vasculitis of unknown etiology (likely triggered by infection)
- medium-sized vasculitis with predilection for coronary arteries
- most common cause of acquired heart disease in children in developed countries
- peak age: 3 mo-5 yr; Asians > Blacks > Caucasians

**Kawasaki Diagnostic Criteria: "CREAM"**
**C**onjunctival injection
**R**ash
**E**dema of hands and feet
**A**denopathy
**M**ucosal changes

### Diagnostic Criteria

- fever persisting ≥5 d AND ≥4 of the following features
  1. bilateral, non-exudative conjunctival injection
  2. oral mucous membrane changes (fissured lips, strawberry tongue, injected pharynx)
  3. changes of the peripheral extremities
     - acute phase: extremity changes including edema of hands and feet or erythema of palms or soles
     - subacute phase: periungual desquamation
  4. polymorphous rash
  5. cervical lymphadenopathy >1.5 cm in diameter (usually unilateral)
- exclusion of other diseases (e.g. scarlet fever, measles)
- atypical Kawasaki disease: fever persisting ≥5 d and 2-3 of the above criteria
  - further evaluation dictated by CRP, ESR, and supplemental laboratory criteria

### Management

- initial therapy: IVIG (2g/kg) and low (anti-inflammatory) dose of ASA (3-5 mg/kg/d)
- once afebrile >48 h: low (anti-platelet) dose of ASA until platelets normalize, or longer if coronary artery involvement
- IVIg within 10 d of onset reduces risk of coronary aneurysm formation
- baseline 2D-Echo and follow-up periodic 2D-Echo (usually at 2, 6 wk)

### Complications

- coronary artery vasculitis with aneurysm formation occurs in 20-25% of untreated children, <5% if receive IVIg within 10 d of fever
- 50% of aneurysms regress within 2 yr
- anticoagulation for multiple or large coronary aneurysms
- risk factors for coronary disease: male, age <1 or >9 yr, fever >10 d, Asian or Hispanic ethnicity, thrombocytopenia, hyponatremia

# Common Medications

**Table 46. Commonly Used Medications in Pediatrics**

| Drug Name | Dosing Schedule | Indications | Comments |
|---|---|---|---|
| acetaminophen | 10-15 mg/kg/dose PO q4-6h prn | Analgesic, antipyretic | Not to exceed 60 mg/kg/d in neonates or 75 mg/kg/d in older children to a max of 4 g/d<br>Causes hepatotoxicity at high doses |
| amoxicillin | 80-90 mg/kg/d PO divided q8h | Otitis media | |
| dexamethasone | 0.6 mg/kg PO x 1<br>0.6 mg/kg/d PO for 2 d | Croup<br>Acute asthma | |
| fluticasone (Flovent®) | Moderate dose – 250-500 µg/d divided bid<br>High dose – >500 µg/d divided bid | Asthma | |
| ibuprofen | 5-10 mg/kg/dose PO q6-8h | Analgesic, antipyretic | Cautious use in patients with liver impairment, history of GI bleeding or ulcers |
| iron | 6 mg/kg/d elemental iron OD or divided tid | Anemia | SE: dark stool, constipation, dark urine |
| polyethylene glycol 3350 (PEG) | Disimpaction: 1-1.5 g/kg/d x 3 d<br>Maintenance: starting dose at 0.4-1 g/kg | | |
| prednisone/ prednisilone | 1-2 mg/kg/d PO x 5 d<br>3-4 mg/kg/d PO then taper to 1-2 mg/kg/d<br>PO once platelet count >30 x $10^9$/L<br>60 mg/$m^2$/d PO | Asthma<br>ITP<br>Nephrotic syndrome | Oral prednisone is bitter tasting, consider using prednisilone |
| salbutamol (Ventolin®) | 0.01-0.03 mL/kg/dose in 3 mL NS via nebulizer q0.5-4h prn<br>100-200 µg/dose prn, max 4-8 puffs frequency q4h | Acute asthma<br>Maintenance treatment for asthma | Can cause tachycardia, hypokalemia, restlessness |

# Skin Lesions and Masses

## Differential Diagnosis of Skin Lesions/Masses

- for background information and medical management (see Dermatology, D5)
- for biopsy techniques, see *Skin Biopsy Types and Techniques*, PL7

## Surgical Management of Malignant Skin Lesions

- surgical treatment for all malignant skin lesions involve total excision of the primary lesion
- for pathophysiology and diagnosis see Dermatology, D34-37
- excision margin of lesion depends on the type of lesion, the lesion diameter, and (for melanoma) the lesion depth
- for decisions regarding reconstruction using flaps or skin grafts, see *Reconstruction*, PL12

### Precursors of Malignant Lesions

**Table 1. Precursors**

| Basal Cell Carcinoma | Squamous Cell Carcinoma | Malignant Melanoma |
|---|---|---|
| Nevus sebaceous of Jadassohn | Actinic keratosis<br>Bowen's disease<br>Bowenoid papulosis<br>Leukoplakia<br>Erythroplasia | Lentigo maligna<br>Giant congenital nevus<br>Dysplastic nevus |

### Surgical Margins

**Table 2. Surgical Margins for Basal Cell Carcinoma**

| Type of Lesion | Surgical Margins |
|---|---|
| Low Risk | >5 mm* |
| High Risk** | >10 mm |

*3-5 mm margin may be acceptable for aesthetically sensitive areas (e.g. eyelid)
**High risk features include: diameter and location (>20 mm trunk, >6 mm face, hands, and feet), poorly defined borders, recurrent lesion, poor differentiation, and type of lesion (e.g. sclerosing BCC), determined via initial biopsy

**Table 3. Surgical Margins for Squamous Cell Carcinoma**

| Type of Lesion | Surgical Margins |
|---|---|
| Low Risk | >5 mm |
| High Risk* | >10 mm |

*High risk features include: depth >2 mm, facial lesions, poorly defined borders, recurrent lesion, perineural invasion, poor differentiation, and type of lesion (e.g. morpheoform), determined via biopsy

**Table 4. Surgical Margins for Malignant Melanoma**

| Depth of Lesion* | Surgical Margins |
|---|---|
| *In situ* | 0.5 cm |
| <1 mm | 1 cm |
| 1-1.99 mm | 1-2 cm |
| ≥2 mm | 2 cm** |

*Determined via biopsy **Or more as long as it doesn't interfere with reconstruction

# Basic Surgical Techniques

## Sutures and Suturing

### ANESTHESIA

- irrigate before injecting anesthetic, followed by debridement and more vigorous irrigation

**Table 5. Toxic Limit and Duration of Action (1 cc of 1% solution contains 10 mg lidocaine)**

| | Without Epinephrine | With Epinephrine (vasoconstrictor, limits bleeding) |
|---|---|---|
| Lidocaine (Xylocaine®)* | 5 mg/kg, lasts 45-60 min | 7 mg/kg, lasts 2-6 h |
| Bupivicaine (Marcaine®) | 2 mg/kg, lasts 2-4 h | 3 mg/kg, lasts 3-7 h |

* Lidocaine toxicity symptoms include: circumoral numbness, light-headedness, and drowsiness followed by tremors and seizures. Cardiac and respiratory signs are late findings

- for example, when using 1% lidocaine without epinephrine in a 70 kg patient:
  - toxic limit = 5 mg/kg x 70 kg = 350 mg
  - max bolus injection = 350 mg ÷ 10 mg/cc = 35 cc (may add more after 30 min)

### IRRIGATION AND DEBRIDEMENT

- irrigate copiously with a physiologic solution such as Ringer's lactate or normal saline to remove surface clots, foreign material, and bacteria
- debride all obviously devitalized tissue; irregular or ragged wounds must be excised to produce sharp wound edges that will assist healing when approximated
- wounds left unapproximated ≥8 h should be debrided and copiously irrigated to ensure wound edges are optimized for healing
- there is high risk of infection for any wound closed primarily after 8 h

### SUTURES

- use of a particular suture material is dependent on surgeon preference; however, skin should be closed with a non-absorbable, monofilament suture material when traumatic mechanisms are involved to prevent harboring bacteria in suture material

**Table 6. Suture Materials: Absorbable vs. Non-absorbable and Monofilament vs. Multifilament**

| Suture Materials | Uses | Examples | Notes |
|---|---|---|---|
| **Absorbable** | Deep sutures under short-term tension<br>Skin closure in children | Plain gut®, Vicryl®, Polysorb®, Biosyn®, Monocryl®, Caprosyn®, chromic gut, fast absorbing gut | Loses at least 50% of their strength in 4 wk; eventually absorbed |
| **Non-absorbable** | Skin closure<br>Sites of long-term tension | Nylon, polypropylene (Prolene®), stainless steel, silk, Ticron®, Ethibond® | Lower likelihood of wound dehiscence, more difficult to tie, makes track marks |
| **Monofilament** | Everyday use and optimal for contaminated and infected wounds (lower likelihood of bacterial trapping in suture material) | Monosof®, Monocryl®, Biosyn®, Prolene® | Slides through tissue with less friction; more memory/stiffness; more difficult to tie; requires multiple throws (lower knot security) |
| **Multifilament** | AVOID in contaminated wounds (increased likelihood of bacterial trapping) | Vicryl® and silk, Ticron®, Ethibond® | Less memory/stiffness, thus easier to work with (higher knot security) |

### BASIC SUTURING TECHNIQUES

#### Basic Suture Methods

- simple interrupted: can be used in almost all situations
- sub-cuticular: good cosmetic result but weak, used in combination with deep sutures; not used in trauma
- vertical / horizontal mattress: for areas difficult to evert (e.g. volar hand)
- continuous over and over (i.e. "running", "baseball stitch"): time-saving, good for hemostasis
- deep / buried dermal: simple interrupted sutures placed in dermal layer, reduces skin tension for improved healing

#### Other Skin Closure Materials

- tapes: may be indicated for superficial wounds and those with opposable edges; tape cannot be used on actively bleeding wounds; when placed across the incision, will prevent surface marks and can be used as the primary closing material or as additional reinforcement after primary surface sutures have been removed
- skin adhesives: e.g. 2-octyl cyanoacrylate (e.g. Dermabond®) works well on small areas without much tension or shearing; may cause irreversible tattooing if foreign materials are left in the wound
- staples: steel-titanium alloys that incite minimal tissue reaction (healing is comparable to wounds closed by suture)

Traumatic tattoos are permanent discolourations resulting from new skin growth over foreign material or dirt left behind in the dermis. Copious irrigation and debridement should be done ASAP in order to prevent traumatic tattoos, as they are very difficult to treat later

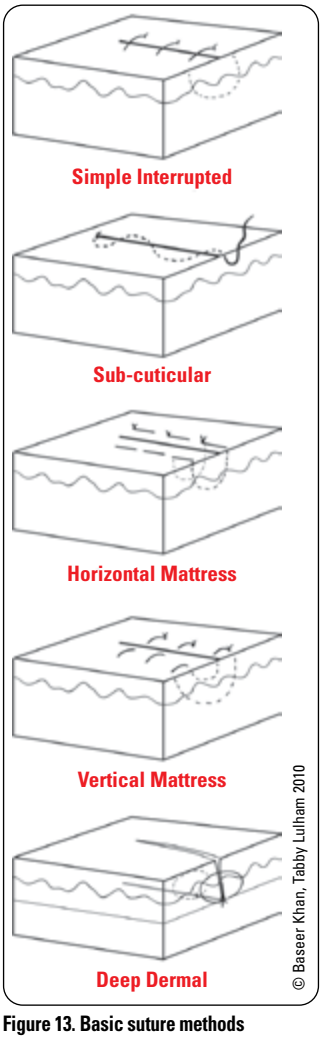

**Figure 13. Basic suture methods**

**Steps to Ensuring Good Suturing Cosmesis**

- Incisions should be made along resting skin tension lines
- Attain close apposition of wound edges
- Minimize tension on skin by closing in layers
- Evert wound edges
- Use appropriately sized suture for skin closure (5-0, 6-0 on face; 3-0, 4-0 elsewhere)
- Ensure equal width and depth of tissue on both sides
- Remove sutures within 5-7 d from the face, 10-14 d from scalp/torso/extremities

# Excision

- plan your incision along resting skin tension lines to minimize appearance of scar
- use elliptical incision to prevent "dog ears" (heaped up skin at end of incision), so the length of the ellipse should be approximately 3x the width
- if needed, undermine skin edges (separate skin from underlying fascia to allow wound edge manipulation and decrease tension)
- use layered closure including deep dermal sutures (decreases tension)

**Resting Skin Tension Lines**
Natural skin/wrinkle lines with minimal linear tension. Placing incisions parallel to resting skin tension lines minimizes widening/hypertrophy and helps to camouflage scars. Resting skin tension lines are usually parallel to any existing wrinkle lines and perpendicular to the orientation of underlying muscle fibres (perpendicular to lines of maximum extensibility)

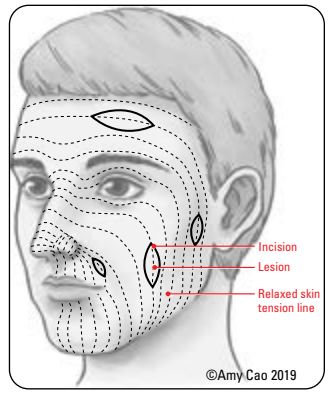

**Figure 14. Incision of lesions along resting skin tension lines**

# Skin Biopsy Types and Techniques

## SHAVE BIOPSY
- used for superficial lesions where sampling of the full thickness of the dermis is not necessary or practical
- most suitable lesions for shave biopsies are benign lesions either elevated above the skin or have pathology confined to the epidermis (e.g. seborrheic or actinic keratoses, skin tags, and warts)
- high risk of recurrence with shave biopsy for any lesions, including actinic or seborrheic keratoses
- rapid, requires little training, and does not require sutures for closure
- heals by secondary intent (moist dressings should be used)
- should not be used for pigmented lesions – an unsuspected melanoma cannot be properly staged if partially removed

## NEEDLE BIOPSY
- 21 G for lymph node biopsy
- Trucut® needle biopsy for breast masses suspected for carcinoma

## INCISIONAL BIOPSY
- can be a punch biopsy, an ellipse within the lesion, or a narrow margin excision of the lesion
- gives pathologists a portion of the lesion and the border with normal skin
- punch biopsies involve the removal of a core-shaped piece of tissue to allow sampling of the deep dermis; performed with round, disposable knives ranging in diameter from 2-10 mm
- punch biopsy wounds can be closed with suture or left to heal by secondary intention. Punches greater than 3 mm may produce scarring and are best closed with one or two sutures

## EXCISIONAL BIOPSY
- performed for lesions that require complete removal for diagnostic purposes
- performed for lesions that cannot be adequately punch biopsied due to size or depth
- for small pigmented lesions and atypical moles; if concerned about melanoma, can do a narrow margin excision for the diagnosis and treatment of small pigmented lesions and atypical moles
- best for small lesions that are easily removed and primarily closed
- requires the greatest amount of expertise and time
- always requires sutures for closure

## TECHNIQUE

### General
- all shave and punch biopsies performed in clinic are done using aseptic technique, but are not sterile
- sterile gloves are indicated for biopsies and excisions in all patients

### Preparing the Site
- common skin antiseptics (Betadine®, chlorhexidine) can be used to prepare the biopsy site
- chlorhexidine is used in concentrations ranging from 0.5-4%. The higher concentration cannot be used on the face, as it could get into the eyes or ears and may burn or cause damage. Most chlorhexidine preps also contain alcohol, which can be flammable, so allow to dry before the biopsy and certainly before using any cautery
- Betadine® (7.5% povidone–iodine) may be safer for the head and neck (as to avoid the above problems with chlorhexidine) and around the eyes and ears
- mark the intended lesion and surgical margins with a surgical marker, since they may be temporarily obliterated following injection of the anesthetic
- for all biopsies, a sterile drape technique is indicated. A fenestrated surgical drape is placed around the biopsy site after the area is cleansed and anesthetized

### Anesthesia
- most commonly used local anesthetic is 1% or 2% lidocaine (with epinephrine)
- small amounts of epinephrine are added to constrict blood vessels, decrease bleeding, prolong anesthesia, and limit lidocaine toxicity. The local with epinephrine can be injected directly into the lesion
- local anesthetics with epinephrine may be used anywhere in the body, including the digits
- vascular compromise is not an abosolute contraindication to epinepherine, but care should be taken when using epinepherine in a small area that has been significantly injured and vascular compromise is suspected (e.g. saw injury involving the digits)
- phentolamine is a reversal agent for epinephrine

# Wounds

- wound: disruption of the normal anatomical relationships of tissue as a result of injury

## Types of Wounds

- laceration: sharply cut tissue
- abrasion: superficial skin layer is removed, variable depth
- contusion: injury caused by forceful blow to the skin and soft tissue; entire outer layer of skin intact, yet injured
- avulsion: skin and soft tissue forcefully separated from deeper structures, potentially compromising blood supply or resulting in full detachment (amputation)
- puncture wounds: cutaneous opening relatively small as compared with depth (e.g. needle), including bite wounds
- crush injuries: caused by compression
- burns: thermal, chemical, electrical
- ulcers

### Principles of Wound Healing

**Table 7. Factors Influencing Wound Healing**

| Local (reversible/controllable) | General (often irreversible) |
|---|---|
| Mechanical (local trauma, significant crush, avulsion, tension) | Age (affects healing rate) |
| Blood supply (ischemia/circulation) | Nutrition |
| Technique and suture materials | Tobacco smoking |
| Retained foreign body | Alcohol consumption |
| Infection | Chronic illness (e.g. DM, cancer, CVD, renal failure) |
| Venous HTN | Immunosuppression (steroids, chemo) |
| Peripheral vascular disease | Tissue irradiation |
| Hematoma/seroma (↑ infection rate) | Genetic predisposition to abnormal healing (e.g. hypertrophic or keloid scarring, collagen vascular disease) |
| | Skin type |

### STAGES OF WOUND HEALING

- growth factors released by tissues play an important role
- scar is mature once it has completed the final stage, usually after 1-2 yr

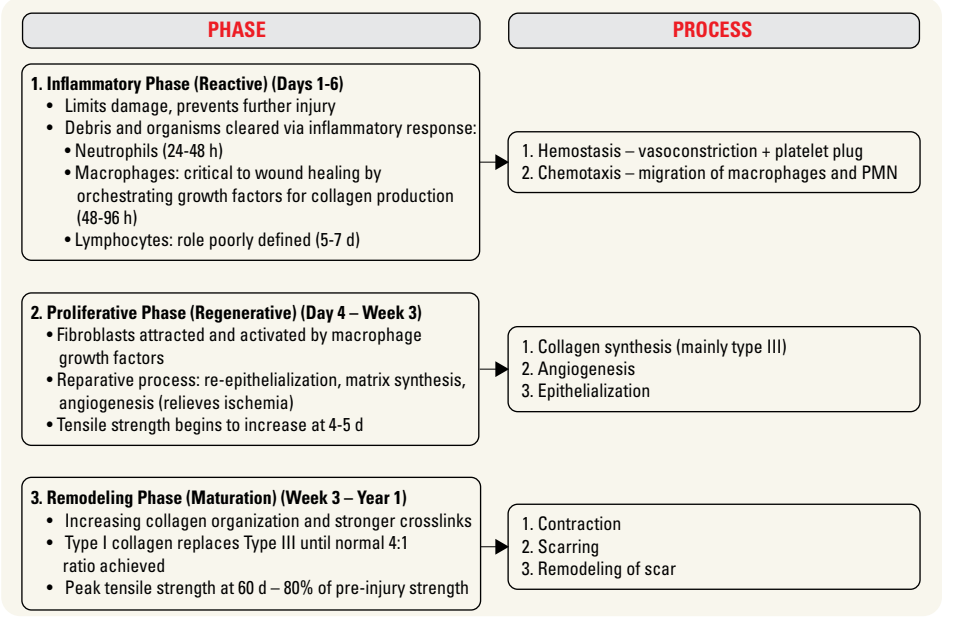

**Figure 15. Stages of wound healing**

## TYPES OF WOUND HEALING

### Primary (1°) Healing (First Intention)
- **definition**: definition: wound closure by direct approximation of edges within hours of wound creation (i.e. with sutures, staples, skin graft, etc.)
- **indication**: recent (<6 h, longer with facial wounds), clean wounds
- **contraindications**: animal/human bites (except on face), crush injuries, infection, long time lapse since injury (>6-8 h), retained foreign body

### Secondary (2°) Healing/Spontaneous Healing (Second Intention)
- **definition**: wound left open to heal spontaneously (epithelialization occurs at 1 mm/d from wound margins in concentric pattern, contraction [myofibroblasts], and granulation) – maintained in inflammatory phase until wound closed; requires dressing changes; inferior cosmetic result
- **indication**: when 1° closure not possible or indicated (see *Primary Healing*)

Myofibroblasts are the cells responsible for wound contraction; they do this at a rate of less than 0.75 mm/d

### Tertiary (3°) Healing/Delayed Primary Healing (Third Intention)
- **definition**: intentionally interrupt healing process (e.g. with packing, sharp debridement), then wound can be closed primarily at 4-10 d post-injury after granulation tissue has formed and there is $<10^5$ bacteria/gram of tissue
- **indication**: contaminated (high bacterial count), long time lapse since initial injury, severe crush component with significant tissue devitalization, closure of fasciotomy wounds
- prolongation of inflammatory phase decreases bacterial count and lessens chance of infection after closure

## ABNORMAL HEALING

### Hypertrophic Scar
- **definition**: scar remains roughly within boundaries of original scar
- red, raised, widened, frequently pruritic
- common sites: back, shoulder, sternum
- **treatment**: scar massage, pressure garments, silicone gel sheeting, corticosteroid injection, surgical excision if other options fail (however, may still recur)
- often improve slowly over time

### Keloid Scar
- **definition**: scar grows outside boundaries of original scar
- red, raised, widened, frequently pruritic
- caused by:
  - genetic factors (highest rates in African Americans, Asians)
  - endocrine factors
  - excess tension on wound or delayed closure (as in burn wounds)
- common sites: central chest, back, shoulders, deltoid, ear, angle of mandible
- **treatment**: multimodal therapy including: pressure garments, silicone gel sheeting, corticosteroid injection, surgical excision with post-surgical management if other options fail (however, there is a high chance of recurrence), fractional carbon dioxide ablative laser, radiation

### Spread Scar
- characterized by having exactly the same order of collagen fibres as normal scars
- clinically, a typical spread scar is flat, wide, and often dented
- treatment: surgical excision and closure

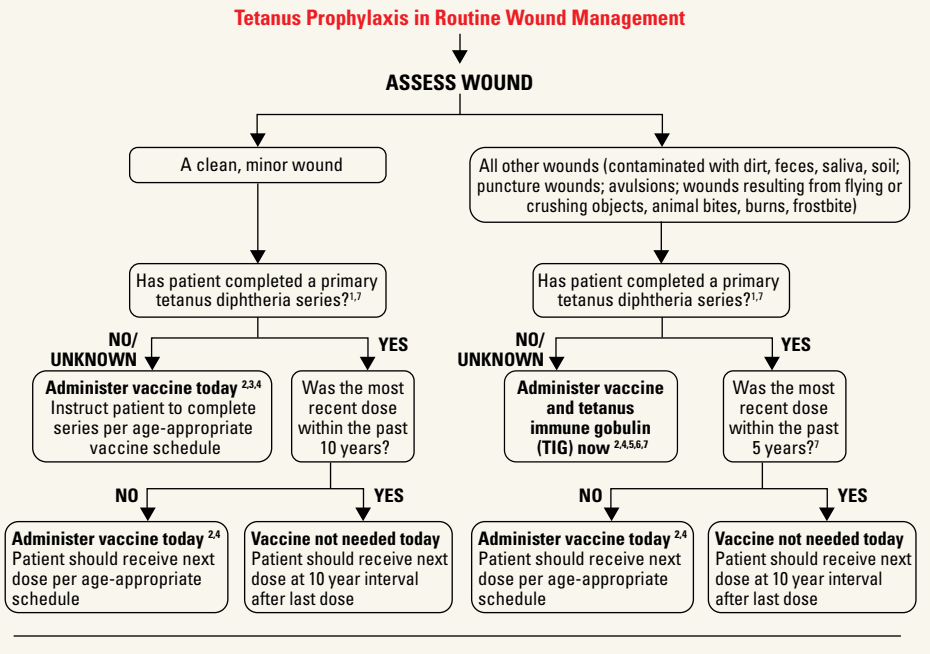
### Chronic Wound
- wound fails to achieve primary wound healing within 4-6 wk
- common chronic wounds include: diabetic, pressure, and venous stasis ulcers
- treatment: may heal with meticulous wound care; may also require surgical intervention
- Marjolin's ulcer: squamous cell carcinoma arising in a chronic wound secondary to genetic changes caused by chronic inflammation → always consider biopsy of chronic wound

# Infected Wounds

### Definitions
- the presence of bacteria within a wound may be divided into 4 categories:
  - contamination: the presence of non-replicating microorganisms within a wound
  - colonization: the presence of replicating microorganisms within a wound
  - critical colonization: increasing bacterial burden; have delayed healing but may not exhibit classic signs of infection
  - infection: the presence of $>10^5$ microorganisms in a wound without intact epithelium or small amounts of a very virulent organism (e.g. GBS); have delayed healing and exhibit classic signs of infection
    - signs of infection: redness, swelling, pain, clinically unwell

**Risk Factors for Infection**
- Virulence of the infecting microorganism
- Amount of bacteria present
- Host resistance
- Immunocompromised host

## Management of Acute Contaminated Wound (<24 h)



- cleanse and irrigate open wound with physiologic solution (NS or RL) using sufficient pressure
- evaluate for injury to underlying structures (vessels, nerve, tendon, and bone)
- control active bleeding; previously closed wounds may require suture removal in order to drain any pus and allow for thorough irrigation and debridement
- debridement: removal of foreign material, devitalized tissue, old blood
  - surgical debridement: blade and irrigation if indicated
- tetanus prophylaxis ± post-exposure treatment of:
  - hepatitis B, HIV, hepatitis C (if titres confirmed at 6 mo)
- re-evaluate in 24-48 h for signs of superficial or deep infection
  - if evidence of infection (i.e. erythema, warmth, pain, discharge), open infected portion of wound by removing sutures, swab sample for culture and sensitivity, irrigate wound and allow healing by secondary intention
  - risk factors for infection include: wound >8 h, severely contaminated, human/animal bites, immunocompromised, involvement of deeper structures (e.g. joints, fractures)
  - use systemic antibiotics if wound cultures are positive and there are signs of infection

## Management of Late Contaminated Wounds (>24 h, including ulcers)

- tetanus prophylaxis
- irrigation and debridement
  - traumatic tattooing can occur if foreign materials left in wound
- systemic antibiotics if wound cultures are positive and there are signs of infection
- closure: final closure via secondary intention (most common), delayed wound closure (3° closure), skin graft, or flap; successful closure depends on bacterial count of ≤$10^5$/$cm^3$ prior to closure and frequent dressing changes

**Wound Exudate Characteristics**

- Serous drainage (plasma): thin; clear or light yellowish
- Sanguineous drainage (fresh blood): bright red
- Serosanguineous drainage (mix of blood and serous fluid): thin and watery; pale red to pink
- Purulent drainage (infection): thick and opaque; white, yellow, or pale green

[1] A primary series consists of a minimum of 3 doses of tetanus- and diphtheria- containing vaccine (DTaP/DTP/Tdap/DT/Td)

[2] Age-appropriate vaccine:
- DTaP for infants and children 6 weeks up to 7 years of age (or DT pediatric if pertussis vaccine is contraindicated);
- Tetanus-diphtheria (Td) toxoid for persons 7-9 years of age; and ≥65 years of age;
- Tdap for persons 10-64 years of age if using Adacel™‡ or ≥10 years of age if using Boostrix™‡, unless the person has received a prior dose of Tdap*

[3] No vaccine or TIG is recommended for infants <6 weeks of age with clean, minor wounds (and no vaccine is licensed for infants <6 weeks of age)

[4] **Tdap*** is preferred for persons 10-64 years of age if using Adacel™‡ or ≥10 years of age if using Boostrix™‡ who have never received Tdap.
Td is preferred to tetanus toxoid (TT) for persons 7-9 years of age, or ≥65 years of age if only Adacel™‡ is available, or those who have received a Tdap previously. If TT is administered, an adsorbed TT product is preferred to fluid TT (all DTaP/DTP/T-dap/DT/Td products contain adsorbed tetanus toxoid)

[5] Give TIG 250 U IM for all ages. It can and should be given simultaneously with the tetanus-containing vaccine

[6] For infants <6 weeks of age, TIG (without vaccine) is recommended for "dirty" wounds (wounds other than clean, minor)

[7] Persons who are HIV positive should receive TIG regardless of tetanus immunization history

* Tdap vaccines:
- Adacel™ (Sanofi) is licensed for persons 10-64 years of age
- Boostrix™ (GSK) is licensed for persons ≥10 years of age

‡ Brand names are used for the purpose of clarifying product characteristics and are not in any way an endorsement of either product

**Figure 16. Tetanus immunization recommendations**

**Table 8. Risks for Tetanus Infection**

| Wound Characteristics | Tetanus-Prone | Not Tetanus-Prone |
|---|---|---|
| **Time since injury** | >6 h | <6 h |
| **Depth of injury** | >1 cm | <1 cm |
| **Mechanism of Injury** | Crush, burn, gunshot, frostbite, puncture through clothing, farming injury | Sharp cut (e.g. clean knife, clean glass) |
| **Devitalized tissue** | Present | Not present |
| **Contamination** (e.g. soil, dirt, saliva, grass) | Yes | No |
| **Retained foreign body** | Yes | No |

### BITES

- see Emergency Medicine, ER47

### Dog and Cat Bites

- pathogens: *Pasteurella multocida, S. aureus, S. viridans*
- **investigations**
  - radiographs prior to therapy to rule out foreign body (e.g. tooth) or fracture
  - culture for aerobic and anaerobic organisms, Gram stain
- **treatment**: Clavulin® (amoxicillin + clavulanic acid) 500 mg PO q8h started immediately
  - consider rabies prophylaxis if animal has symptoms of rabies or unknown animal
    - ± rabies Ig (20 IU/kg around wound, or IM) and 1 of the 3 types of rabies vaccines (1.0 mL IM in deltoid, repeat on days 3, 7, 14, 28)
- aggressive irrigation with debridement
- healing by secondary intention is mainstay of treatment
- only consider primary closure for bite wounds on the face; otherwise primary closure is contraindicated
- contact Public Health if animal status unknown

### Human Bites

- pathogens: *Staphylococcus* > *β-hemolytic Streptococcus* > *Eikenella corrodens* > *Bacteroides*
- mechanism: most commonly over dorsal MCP from a punch in mouth; "fight-bite"
- serious, as mouth has 109 microorganisms/mL, which get trapped in joint space when fist unclenches and overlying skin forms an air-tight covering ideal for anaerobic growth – can lead to septic arthritis
- **investigations**
  - radiographs prior to therapy to rule out foreign body (e.g. tooth) or fracture
  - culture for aerobic and anaerobic organisms, Gram stain
- **treatment**
  - urgent surgical exploration of joint, drainage, and debridement of infected tissue
  - wound must be copiously irrigated
  - Clavulin® 500 mg PO q8h or (if penicillin allergy) clindamycin 300 mg PO q6h + ciprofloxacin 500 mg PO q12h + secondary closure
  - splint

## Dressings

- dressing selection depends on the wound characteristics and surgeon preference
  - as the wound progresses through healing, it will require different types of dressings; therefore, routine inspection is recommended
    - principles of dressing clean vs. infected wounds
      - clean wounds can be dressed with non-adherent dressing (which is non-adhering to epithelializing tissue); requires secondary dressing
      - infected wounds may need debridement, antibiotics, and antimicrobial dressings (i.e. iodine gauze and silver-containing dressings)
    - moist vs. dry wounds
      - purpose of dressings should be to promote moist wound healing i.e. moistening dry wounds or drying (removing excess exudate/blood) wet wounds
    - wide-based vs. cavitary/tunneling wounds
      - cavitary or tunneling wounds (i.e. through a fascial layer) can be packed with dressing materials (see Table 9) such as hydrogels or Betadine®-soaked ribbon gauze (infected)
    - negative pressure wound therapy (e.g. vacuum-assisted closure) uses sealed vacuum dressings that suction wound fluid and promote increased blood flow to enhance the healing process

**Table 9. Recommended Dressings for Wound Type**

| Wound Depth | Exudate Level | Dressing Material |
|---|---|---|
| **Superficial** | Lightly exuding | Films (Opsite®), hydrogels (Intrasite®, Nu-gel®, Duoderm®) |
| | Any exudate level | Contact layers |
| **Deep** | Light to moderately exuding wounds | Amorphous gels, hydrogels, hydrocolloids (Duoderm®, Tegaderm®), collagen, hypertonic saline gauze (Mesalt®) |
| | Moderately to heavily exuding wounds | Foams (Mepilex®, Allevyn®), alginates (Sorbsan®, Kalto-stat®), hypertonic saline gauze, hydrofibre (Aquacel®) |

Adapted from Grabb & Smith's Plastic Surgery, 6th ed. Chapter 3, Table 3.3

# Reconstruction

## RECONSTRUCTION LADDER

### Definition
- an approach to wound management with successively more complex methods of treatment
- surgeons should start with the least complex method and progressively increase in complexity as appropriate

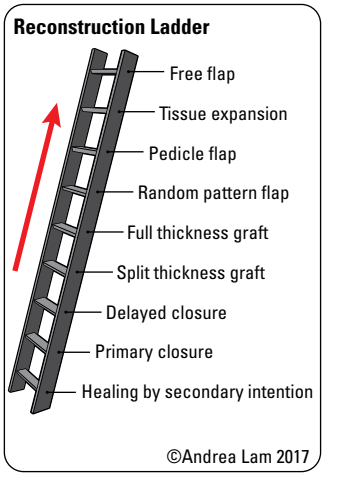


**Figure 17. Reconstructive ladder - in order of increasing complexity**

## SKIN GRAFTS

### Definition
- tissue composed of epidermis and varying degrees of dermis, that does not carry its own blood supply. Survival requires the generation of new blood vessels from the recipient site bed

### Donor Site Selection
- must consider size, hair pattern, texture, thickness of skin, and colour (facial grafts best if taken from "blush zones" - harvest sites above clavicle where colour match for full thickness grafts is optimized e.g. pre/post auricular or neck)
- partial thickness grafts usually taken from inconspicuous areas (e.g. buttocks, lateral thighs, etc.)

### Partial Thickness Skin Graft Survival
- 3 phases of skin graft "take"
  1. plasmatic imbibition: diffusion of nutrition from recipient site (first 48 h)
  2. inosculation: vessels in graft connect with those in recipient bed (d 2-3)
  3. neovascular ingrowth: graft revascularized (d 3-5)
- requirements for graft survival
  - well-vascularized bed (recipient site). Unsuitable beds include: bone, tendon, heavily irradiated, infected wounds, etc.
  - coagulation begins as soon as graft is placed on bed
  - good contact between graft and recipient bed. Staples, sutures, splinting, and pressure dressings are used to prevent movement/ shearing of graft and hematoma or seroma formation
  - fibrin glue used to enhance fixation
  - low bacterial count at recipient site ($<105/cm^3$, to prevent infection)
- common reasons for graft loss: hematoma/seroma, infection, mechanical force (e.g. shearing, pressure)

### Classification of Skin Grafts
1. by species
   - autograft: from same individual
   - allograft (homograft): from same species, different individual
   - xenograft (heterograft): from different species (e.g. porcine)
2. by thickness: see Table 10

**Table 10. Skin Grafts**

| | Split Thickness Skin Graft | Full Thickness Skin Graft |
|---|---|---|
| **Definition** | Epidermis and part of dermis | Epidermis and all of dermis |
| **Donor Site** | More sites | Donor sites limited by the ability to use primary closure |
| **Healing of Donor Site** | Re-epithelialization via dermal appendages in graft and wound edges | Primary closure |
| **Re-Harvesting** | ~10 d (faster on scalp) | N/A |
| **Graft Take** | More reliable and better survival; shorter nutrient diffusion distance | Lower rate of survival (thicker, slower vascularization) |
| **Contraction*** | Less 1° contraction, greater 2° contraction (less with thicker graft) | Greater 1° contraction, less 2° contraction |
| **Aesthetic** | Poor | Good |
| **Comments** | Allows for extravasation of blood/serum | May use on face and fingers |
| **Advantages** | Takes well in less favourable conditions<br>Can cover a larger area<br>Can be meshed for greater area<br>Allows for extravasation of blood/serum<br>Large number of donor sites | Resists contraction, better colour match<br>May use on face and fingers |
| **Disadvantages** | Contracts significantly, abnormal pigmentation, high susceptibility to trauma | Requires well vascularized bed |
| **Uses** | Large areas of skin, granulating tissue beds | Face (colour match), site where thick skin or decreased contracture is desired (e.g. finger) |

*1° contraction: immediate reduction in size upon harvesting; 2° contraction: reduction in size once graft placed on wound bed and healing has occurred

### Meshed Grafts (split thickness grafts can be meshed after harvest by a mesher to a variety of ratios)

- **advantages**
  - prevents accumulation of fluids (e.g. hematoma, seroma)
  - covers a larger area
  - best for contaminated recipient site
- **disadvantages**
  - poor cosmesis ("alligator hide" appearance)
  - has greater secondary contraction than full thickness grafts (see Table 10)

## OTHER GRAFTS

**Table 11. Various Tissue Grafts**

| Graft Type | Use | Preferred Donor Site |
|---|---|---|
| **Bone** | Repair rigid defects | Cranial, rib, iliac, fibula, scapula |
| **Cartilage** | Restore contour of ear and nose | Ear, nasal septum, costal cartilage |
| **Tendon** | Repair or replace a damaged tendon | Palmaris longus, plantaris (present in 85% of population) |
| **Nerve** | Conduit for regeneration across nerve gap | Sural, antebrachial cutaneous, medial brachial cutaneous |
| **Vessel** | Bridge vascular gaps | Forearm or foot vessels for small vessels, saphenous vein for larger vessels |
| **Dermis** | Contour restoration (± fat for bulk) | Thick skin of buttock or abdomen |
| **Fat** | Contour restoration | Abdomen, any area with fat available |
| **Nipple** | To create a new nipple on a reconstructed breast | Nipple |

## FLAPS

- **definition**: tissue of varying composition (skin and fat, muscle and fat, bone and fat, muscle only, etc.), that has a known blood supply (random, pedicled, or named); not dependent on neovascularization, unlike a graft
- may consist of: skin, subcutaneous tissue, fascia, muscle, tendon, bone, other tissue (e.g. omentum)
- **classification**: based on tissue composition, blood supply to skin (random, axial), and location of the donor site (local, regional, distant)
- **indications for flaps**
  - replaces tissue loss due to trauma or surgery (reconstruction)
  - provides skin and temporary soft tissue coverage through which surgery can be carried out later
  - to aid healing or treatment of infection by providing vascularized tissue to a poorly vascularized bed
- **complications**: flap loss due to hematoma, seroma, infection, poor flap design, extrinsic compression (dressing too tight) or vascular failure/thrombosis, fat necrosis (in free and pedicled flaps)

## Random Pattern Flaps

- blood supply by dermal and subdermal plexus to skin and subdermal tissue with random vascular supply
- limited length:width ratio to ensure adequate blood supply (typically 3:1 in the head and neck, 1-2:1 elsewhere)
- flap choice is often a combination of available tissue, type of tissue needed, location of reconstruction site with respect to donor site, blood supply, ability to close the donor site, and surgeon preference
- **types**
  - **rotation**: semicircular tissue rotated around a pivot point for defect closure; commonly used on sacral pressure sores, scalp, and cheek defects
  - **transposition**: tissue is transposed (i.e. lifted up from its native location and brought into the defect) around a pivot point from one location to another; commonly used on certain areas of the face using adjacent areas of excess skin laxity
  - **Z-plasty**: two triangular flaps are repositioned; used to reorient a scar, lengthen the line of a scar, or to break up a scar
  - **advancement flaps (V-Y, Y-V):** defect is closed with uni-directional tissue advancement
    - **single/bipedicle V-Y flaps**: wounds with lax surrounding tissue; the pedicle is the deep tissue underlying the flap

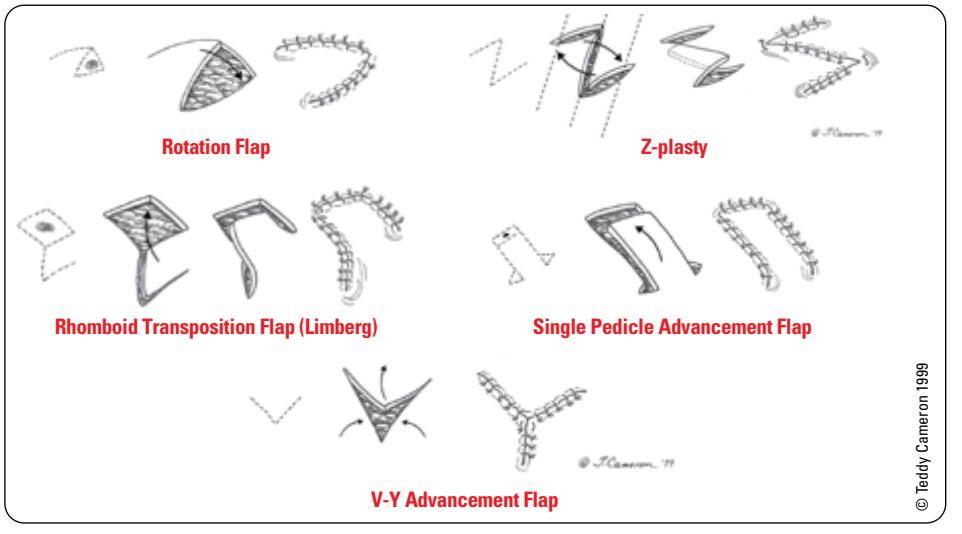

**Figure 18. Wound care flaps – random pattern**

## Axial Pattern Flaps (Arterialized)

- flap contains a well-defined artery and vein
- allows greater length:width ratio (5-6:1)
- **types**
  - **peninsular flap**: skin and vessel intact in pedicle
  - **island flap**: vessel remains intact, but is skeletonized such that the pedicle is better defined
  - **free flap**: segment of tissue with named blood supply (artery and vein) that can be harvested with that blood supply and re-anastomosed in a different anatomical location by microsurgical techniques
- can be sub-classified according to categories such as tissue type, blood supply type, and calibre of vessels
  - e.g. musculocutaneous/myocutaneous (e.g. transverse rectus abdominal myocutaneous) vs. fasciocutaneous

## Free Flaps

- transplanting expendable donor tissue from one part of the body to another by isolating and dividing a dominant artery and vein to a flap, and performing a microsurgical anastomosis between these and the vessels in the recipient wound
- survival rates >95%
- **types**: muscle and skin (common), bone, jejunum, omentum, fascia
- e.g. radial forearm, scapular, latissimus dorsi

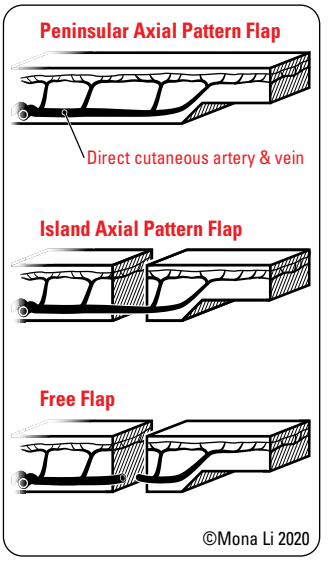

**Figure 19. Axial/arterial pattern skin flaps**

**Table 12. Characteristics of Healthy Free Flap**

| Characteristic | Normal | Arterial Insufficiency | Venous Insufficiency |
|---|---|---|---|
| **Colour** | Pink | Pale | Purple or blue |
| **Temperature** | Warm | Cool | Warm or cool |
| **Arterial Pulse (Doppler)** | + | – | ± |
| **Turgor** | Soft, but with some firmness | Decreased tissue firmness | Increased (tissue firmness with tissue stiffness) |
| **Capillary Refill** | 2-5 s | >5 s | <2 s |

# Soft Tissue Infections

## Erysipelas

### Definition
- acute skin infection of the upper dermis and superficial lymphatics (more superficial than cellulitis)

### Etiology
- typically caused by Group A β-hemolytic *Streptococcus*

### Clinical Features
- intense erythema, induration, and **sharply demarcated borders** (differentiates it from other skin infections)

### Treatment
- penicillin or first-generation cephalosporin (e.g. cefazolin or cephalexin)

## Cellulitis

### Definition
- non-suppurative infection of skin and subcutaneous tissues

### Etiology
- skin flora are most common organisms: *S. aureus*, *β-hemolytic Streptococcus*
- immunocompromised: Gram-negative rods and fungi

### Clinical Features
- source of infection
  - trauma, recent surgery
  - PVD, DM – cracked skin in feet/toes
  - foreign bodies (IV, orthopedic pins)
- systemic symptoms (fever, chills, malaise)
- pain, tenderness, edema, erythema with poorly defined margins, regional lymphadenopathy
- can lead to ascending lymphangitis (visible red streaking in skin proximal to area of cellulitis)

### Investigations
- CBC, blood cultures
- culture and Gram stain a collection/aspirate from wound if open wound
- plain radiographs show soft tissue edema only

### Treatment
- antibiotics: first line – cephalexin 500 mg PO q6h or cloxacillin 500 mg PO q6h x 7 d; if complicated (e.g. lymphangitis, DM, severe infection, oral antibiotic therapy failure), consider IV cefazolin 1-2 g q8h or IV cloxacillin, IV penicillin. All patients should have reassessment in 48 h for resolution if on an oral antibiotic
- outline area of erythema to monitor success of treatment
- immobilize and splint (hands)

## Necrotizing Fasciitis

### Definition
- rapidly spreading, very painful infection of the fascia with necrosis of surrounding tissues
- some bacteria create gas that can be felt as crepitus and can be seen on x-rays
- infection spreads rapidly along deep fascial plane and is limb-and life-threatening

### Etiology
- Type I: polymicrobial (more common in immunocompromised)
- Type II: monomicrobial, usually *β-hemolytic Streptococcus* (more common in healthy patients)

### Risk Factors
- immunocompromised, diabetes mellitus, obesity, IV drug use, age >50 years old

### Clinical Features
- pain out of proportion to clinical findings and beyond border of erythema
- edema, tenderness, ± crepitus (subcutaneous gas from anaerobes), ± flu-like symptoms (e.g. nausea, fever, diarrhea, dizziness, malaise)
- overlying skin changes including blistering and ecchymoses

- patients may look deceptively well at first, but have some physiological abnormalities on intial labs and may rapidly become very sick/toxic
- late findings
  - skin turns dusky blue and black (secondary to thrombosis and necrosis)
  - induration, formation of bullae
  - cutaneous gangrene, subcutaneous emphysema

### Investigations
- a clinical diagnosis
- CT scan only if suspect it is not necrotizing fasciitis (looking for abscess, gas collection, myonecrosis and possible source of infection)
- severely elevated CK: usually means myonecrosis (late sign)
- bedside incision, exploration, and incisional biopsy when ruling out conditions, clinical feature is not supportive, or difficult exam
- during incisional biopsy, often see "dish water pus" (Group A infection) and a hemostat easily passed along fascial plane (fascial biopsy to rule out in equivocal situations)

### Treatment
- vigorous resuscitation (ABCs)
- urgent surgical debridement: remove all necrotic tissue, copious irrigation with plans for repeat surgery in 24-48 h
- IV antibiotics: as appropriate for clinical scenario; consider penicillin 4 million IU IV q4h and clindamycin 900 mg IV q6h until final cultures available (the combination can be synergistic if Group A streptococcus) or vancomycin and clindamycin
- ICU admission and infectious disease consult recommended after urgent surgical debridement by plastic surgery

# Ulcers

## Lower Limb Ulcers

### Traumatic Ulcers (Acute)
- failure of wound to heal, usually due to compromised blood supply and unstable scar, secondary to pressure or bacterial colonization/infection
- usually over bony prominence ± edema ± pigmentation changes ± pain
- treatment: involvement of vascular surgery. Any debridement of ulcer and compromised tissues must be preceded by ABIs and vascular Doppler. Ulcers or compromised tissues left to heal via secondary intention with dressings may need reconstruction with local or distant flap in select cases, vascular status of limb must be assessed clinically and via vascular studies (i.e. ABI, duplex Doppler)

### Non-Traumatic Ulcers (Chronic)

**Table 13. Venous vs. Arterial vs. Diabetic Ulcers**

| Characteristic | Venous (70% of vascular ulcers) | Arterial | Diabetic |
|---|---|---|---|
| **Cause** | Valvular incompetence<br>Venous HTN | 2° to small and/or large vessel disease (be aware of risk factors) | Peripheral neuropathy: decreased sensation<br>Atherosclerosis: microvascular disease |
| **History** | Dependent edema, trauma<br>Rapid onset ± thrombophlebitis, varicosities | Arteriosclerosis, claudication<br>Usually >45 yr<br>Slow progression | DM<br>Peripheral neuropathy<br>Trauma/pressure |
| **Common Distribution** | Medial malleolus ("Gaiter" locations) | Distal locations (e.g. lower limb, feet) | Pressure point distribution (more likely metatarsal heads) |
| **Appearance** | Yellow exudates<br>Granulation tissue<br>Varicose veins<br>Brown discolouration of surrounding skin | Pale/white, necrotic base ± dry eschar covering | Necrotic base |
| **Wound Margins** | Irregular | Even ("punched out") | Irregular or "punched out" or deep |
| **Depth** | Superficial | Deep | Superficial/deep |
| **Surrounding Skin** | Venous stasis discolouration (brown) | Thin, shiny, dry skin; hairless, cool | Thin, dry skin ± hyperkeratotic border<br>Hypersensitive/ischemic |

ABI in diabetics can be falsely normal due to incompressible arteries secondary to plaques/calcification

**Table 13. Venous vs. Arterial vs. Diabetic Ulcers** (continued)

| Characteristic | Venous (70% of vascular ulcers) | Arterial | Diabetic |
|---|---|---|---|
| **Pulses** | Normal distal pulses | Decreased or no distal pulses | Decreased pulses likely (take caution in calcified vessels) |
| **Vascular Exam** | ABI >0.9<br>Doppler; abnormal venous system | ABI <0.9<br>Pallor on elevation, rubor on dependency<br>Delayed venous filling | ABI is inaccurately high (due to PVD)<br>Usually associated with arterial disease (microvascular/ macrovascular disease) |
| **Pain** | Moderately painful<br>Increased with leg dependency, decreased with elevation<br>No rest pain | Extremely painful<br>Decreased with dependency, increased with leg elevation and exercise (claudication)<br>Rest pain | Painless (if neuropathy)<br>No claudication or rest pain<br>Associated paresthesia, anesthesia |
| **Treatment** | Leg elevation, rest<br>Compression at 30 mmHg (stockings or elastic bandages)<br>Moist wound dressings<br>± topical, systemic antibiotics if infected<br>± skin grafts | Rest, no elevation, no compression<br>Moist wound dressing ± topical and/or systemic antibiotics if infected<br>Modify risk factors (smoking, diet, exercise, etc.)<br>Vascular surgical consultation (angioplasty or bypass)<br>Treat underlying conditions (DM, proximal arterial occlusion, etc.) | Control DM<br>Careful wound care<br>Foot care<br>Orthotics, off loading<br>Early intervention for infections (topical and/ or systemic antibiotics if infected)<br>Vascular surgical consultation |

# Pressure Ulcers

### Common Sites
- over bony prominences; 95% on lower body

### Stages of Development
1. hyperemia: disappears 1 h after pressure removed
2. ischemia: follows 2-6 h of pressure
3. necrosis: follows >6 h of pressure
4. ulcer: necrotic area breaks down

### Classification (National Pressure Ulcer Advisory Panel 2014)
- Stage I: non-blanchable erythema present >1 h after pressure relief, skin intact
- Stage II: partial-thickness skin loss
- Stage III: full-thickness skin loss into subcutaneous tissue
- Stage IV: full-thickness skin loss into muscle, bone, tendon, or joint
  - if an eschar is present, must fully debride before staging possible
- Stage X: unstageable ulcer

**A Nutritional Formula Enriched With Arginine, Zinc, And Antioxidants For The Healing Of Pressure Ulcers: A Randomized Trial**
Ann Intern Med 2015;162(3):167-74
Among malnourished patients with pressure ulcers, 8 weeks of supplementation with an oral nutritional formula enriched with arginine, zinc, and antioxidants improves pressure ulcer healing.

### Prevention
- good nursing care (clean dry skin, frequent repositioning), special beds or pressure relief surface, proper nutrition, activity, early identification of individuals at risk (e.g. immobility, incontinence, paraplegia, immunocompromised, DM, etc.)

### Treatment
- depends on individual patient and condition
- 4 main principles:
  - preventative measures (pressure relief, assess for pressure points e.g. wheelchairs; manage continence issues, divert contaminants e.g. urine and feces)
  - treatment of underlying medical issues including nutrition
  - moisture reduction pressure relief
  - wound bed preparation and treatment
- systemic antibiotics for infections
- assess for possible reconstruction

### Complications
- cellulitis, osteomyelitis, sepsis, gangrene

# Burns

## Burn Injuries

### Causal Conditions
- thermal (flame contact, scald)
- chemical
- radiation (UV, medical/therapeutic)
- electrical

### Most Common Etiology
- children: scald burns
- adults: flame burns

**Table 14. Skin Function and Burn Injury**

| Skin Function | Consequence of Burn Injury | Intervention Required |
|---|---|---|
| **Thermoregulation** | Prone to lose body heat | Must keep patient covered and warm |
| **Control of fluid loss** | Loss of large amounts of water and protein from the skin and other body tissues | Adequate fluid resuscitation is imperative |
| **Mechanical barrier to bacterial invasion and immunological organ** | High risk of infection | Antimicrobial dressings (systemic antibiotics if signs of specific infection present)<br>Tetanus prophylaxis if not already administered |

## Pathophysiology of Burn Wounds

- amount of tissue destruction is based on temperature, time of exposure, and specific heat of the causative agent
- zone of hyperemia: vasodilation from inflammation; entirely viable, cells recover within 7 d; contributes to systemic consequences seen with major burns
- zone of stasis (edema): decreased perfusion; microvascular sludging and thrombosis of vessels results in progressive tissue necrosis → cellular death in 24-48 h without proper treatment
  - factors favouring cell survival: moist, aseptic environment, rich blood supply
  - zone where appropriate early intervention has most profound effect in minimizing injury
- zone of coagulation (ischemia): no blood flow to tissue → irreversible cell damage → cellular death/necrosis

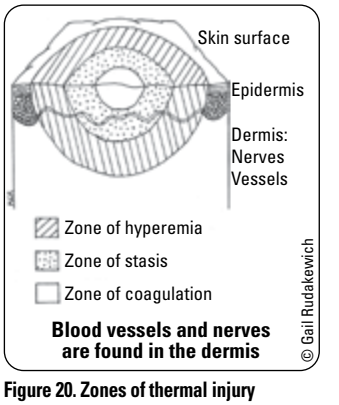

**Figure 20. Zones of thermal injury**

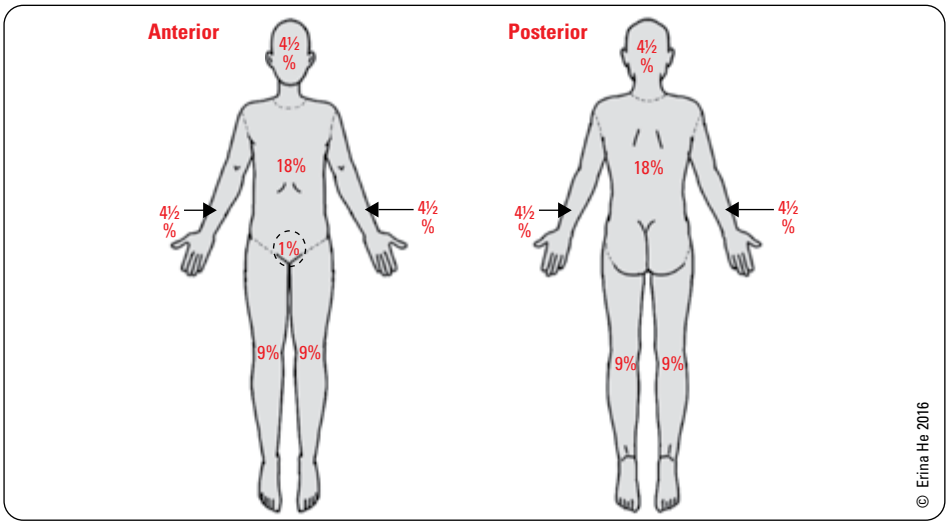
## Diagnosis and Prognosis

- burn size
  - % of TBSA burned: rule of 9s for 2° and 3° burns only (children <10 yr old use Lund-Browder chart)
  - for patchy burns, surface area covered by patient's palm (fingers closed) represents approximately 1% of TBSA
- age: more complications if <3 yr or >60 yr old
- depth: difficult to assess initially – history of etiologic agent and time of exposure helpful (see Table 15)
- location: face and neck, hands, feet, perineum are critical areas requiring special care of a burn unit (see *Indications for Transfer to Burn Centre*, PL20)
- inhalation injury: can severely compromise respiratory system, affect fluid requirement estimation (underestimate), mortality secondary to ARDS
- associated injuries (e.g. fractures)
- comorbid factors (e.g. concurrent disability, alcoholism, seizure disorders, chronic renal failure) can exacerbate extent of injury, other trauma

Prognosis best determined by burn size (TBSA), age of patient, presence/absence of inhalation injury

Circumferential burns can restrict respiratory excursion and/or blood flow to extremities and require escharotomy

TBSA does not include areas with 1° burns



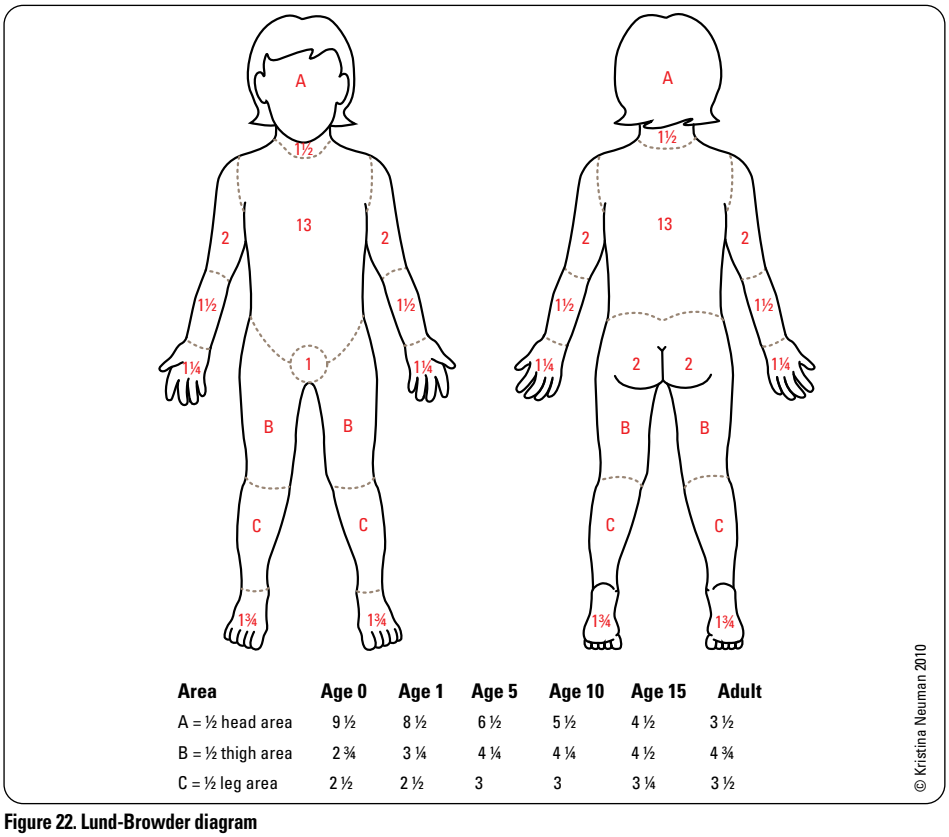


**Figure 21. Rule of 9s for TBSA**

| Area | Age 0 | Age 1 | Age 5 | Age 10 | Age 15 | Adult |
|---|---|---|---|---|---|---|
| A = ½ head area | 9 ½ | 8 ½ | 6 ½ | 5 ½ | 4 ½ | 3 ½ |
| B = ½ thigh area | 2 ¾ | 3 ¼ | 4 ¼ | 4 ¼ | 4 ½ | 4 ¾ |
| C = ½ leg area | 2 ½ | 2 ½ | 3 | 3 | 3 ¼ | 3 ½ |

**Figure 22. Lund-Browder diagram**

**Burn Size And Survival Probability In Pediatric Patients In Modern Burn Care: A Prospective Observational Cohort Study**
Lancet 2012 Mar 17;379(9820):1013-21
**Study**: Single-centre prospective observational cohort study using clinical data for pediatric patients with burns of at least 30% of their total body surface area (TBSA). Patients were stratified by burn size in 10% increments, ranging from 30% to 100% TBSA.
**Results**: 952 severely burned paediatric patients were admitted to the centre between 1998 and 2008. 123 (13%) patients died, 154 (16%) developed multiorgan failure, and 89 (9%) had sepsis. Burn size of 62% TBSA was a crucial threshold for mortality.
**Conclusions**: In a modern pediatric burn care setting, a burn size of roughly 60% TBSA is a crucial threshold for postburn morbidity and mortality. We recommend that pediatric patients with greater than 60% TBSA burns be immediately transferred to a specialised burn centre. Furthermore, patients should be treated with increased vigilance and improved therapies at the burn centre, in view of the increased risk of poor outcome associated with this burn size.

**Table 15. Burn Depth (1st, 2nd, 3rd degree)**

| Nomenclature | Traditional Nomenclature | Depth | Clinical Features |
|---|---|---|---|
| **Erythema/Superficial** | First degree | Epidermis | Painful, sensation intact, erythema, blanchable |
| **Superficial-Partial Thickness** | Second degree | Into superficial dermis | Painful, sensation intact, erythema, blisters with clear fluid, blanchable, hair follicles present |
| **Deep-Partial Thickness** | Second degree | Into deep (reticular) dermis | Insensate, difficult to distinguish from full thickness, does not blanch, some hair follicles still attached, softer than full thickness burn |
| **Full Thickness** | Third degree<br><br>Fourth degree | Through epidermis and dermis<br>Injury to underlying tissue structures (e.g. muscle, bone) | Injury to underlying tissue structures (e.g. muscle, bone) Insensate (nerve endings destroyed), hard leathery eschar that is black, grey, white, or cherry red in colour; hairs do not stay attached, may see thrombosed veins |

# Indications for Transfer to Burn Centre

### American Burn Association Criteria

- patients with partial or full-thickness burns that involve the hands, feet, genitalia, face, eyes, ears, and/or major joints or perineum
- partial thickness burns ≥20% TBSA in patients aged 10-50 yr old
- partial thickness burns ≥10% TBSA in children aged ≤10 or adults aged ≥50 yr old
- full thickness burns ≥5% TBSA in patients of all ages
- electrical burns, including lightning (internal injury underestimated by TBSA), and chemical burns
- inhalation injury (high risk of mortality and may lead to respiratory distress)
- burn injuries in patients with medical comorbidities could complicate management and recovery
- any patient with simultaneous trauma plus burns should be stabilized for trauma first, then triaged appropriately to burn centre
- any patients with burn injury and who will require special emotional, social, and rehabilitation intervention
- children with burns in a hospital not equipped with pediatric care specialists

# Acute Care of Burn Patients

- adhere to ATLS protocol
- resuscitation using Parkland formula to restore plasma volume and cardiac output. Parkland formula is a starting estimate and patients may require more volume. Other formulas exist, but the Parkland formula is predominately used in North America
  - 4 cc/kg x %TBSA (greater than first degree) x wt(kg) (1/2 within first 8 h of sustaining burn, 1/2 in next 16 h)
- extra fluid administration required if:
  - burn >80% TBSA
  - 4° burns
  - associated traumatic injury
  - electrical burn
  - inhalation injury
  - delayed start of resuscitation
  - pediatric burns
- monitor resuscitation
  - urine output is best measure: maintain at >0.5 cc/kg/h (adults) and 1.0 cc/kg/h in children <12 yr
  - maintain a clear sensorium, HR <120/min, MAP >70 mmHg
- burn-specific care
  - relieve respiratory distress: intubation and/or escharotomy
  - escharotomy in circumferential extremity burn, including digits
  - prevent and/or treat burn shock: 2 large bore IVs for fluid resuscitation
  - insert Foley catheter to monitor urine output
  - identify and treat immediate life-threatening conditions (e.g. inhalation injury, CO poisoning)
  - determine TBSA affected first, since depth is difficult to determine initially (easier to determine after 24 h)
- tetanus prophylaxis if needed
  - all patients with burns >10% TBSA, or deeper than superficial-partial thickness, need 0.5 cc tetanus toxoid
  - also give 250 U of tetanus Ig if prior immunization is absent/unclear, or the last booster >10 yr ago
- baseline laboratory studies (Hb, U/A, BUN, CXR, electrolytes, Cr, glucose, CK, ECG, cross-match if traumatic injury, ABG, carboxyhemoglobin)
- cleanse, debride, and treat the burn injury (antimicrobial dressings)
- early excision and grafting important for outcome

### Respiratory Problems

- 3 major causes
  - burn eschar encircling chest
    - distress may be apparent immediately
    - perform escharotomy to relieve constriction
  - CO poisoning
    - may present immediately or later
    - treat with 100% $O_2$ by facemask (decreases half-life of carboxyhemoglobin from 210 to 59 min) until carboxyHb <10%
  - smoke inhalation leading to pulmonary injury
    - chemical injury to alveolar basement membrane and pulmonary edema (insidious onset)
    - risk of pulmonary insufficiency (up to 48 h) and pulmonary edema (48-72 h)
    - watch for secondary bronchopneumonia (3-25 d) leading to progressive pulmonary insufficiency
    - intubate patient with any signs of inhalation injuries

**Inhalation Injuries 101**

**Indicators of Inhalation Injury**

- Injury in a closed space
- Facial burn
- Singed nasal hair/eyebrows
- Soot around nares/oral cavity
- Hoarseness
- Conjunctivitis
- Tachypnea
- Carbon particles in sputum
- Elevated blood CO levels (i.e. brighter red)
- Suspected inhalation injury requires immediate intubation due to impending airway edema; failure to diagnose inhalation injury can result in airway swelling and obstruction, which, if untreated, can lead to death
- Neither CXR or ABG can be used to rule out inhalation injury
- Direct bronchoscopy now used for diagnosis
- Signs of CO poisoning (headache, confusion, coma, arrhythmias)

## Burn Wound Healing

### Table 16. Burn Shock Resuscitation (Parkland Formula)

| | |
|---|---|
| **Hour 0-24** | 4 cc RL/kg/% TBSA with 1/2 of total in first 8 h from time of injury and 1/2 of total in next 16 h from time of injury |
| **Hour 24-30** | 0.35-0.5 cc plasma/kg/%TBSA |
| **>Hour 30** | D5W at rate to maintain normal serum sodium |

*Do not forget to add maintenance fluid to resuscitation

### Table 17. Burn Wound Healing

| Depth | Healing |
|---|---|
| **First degree** | No scarring; complete healing |
| **Second degree (Superficial partial)** | Spontaneously re-epithelialize in 7-14 d from retained epidermal structures<br>± residual skin discolouration<br>Hypertrophic scarring uncommon; grafting rarely required |
| **Deep second degree (Deep partial)** | Re-epithelialize in 14-35 d from retained epidermal structures<br>Hypertrophic scarring frequent<br>Grafting recommended to expedite healing |
| **Third degree (Full thickness)** | Re-epithelialize from the wound edge<br>Grafting/flap necessary to replace dermal integrity, limit hypertrophic scarring |
| **Fourth degree** | Often results in amputations<br>If not requiring amputation, needs flap for coverage after debridement (do not re-epithelialize, cannot graft) |

## Treatment

- 3 stages
  1. assessment: depth determined
  2. management: specific to depth of burn and associated injuries
  3. rehabilitation
- first degree
  - treatment aimed at comfort
  - topical creams (pain control, keep skin moist) ± aloe
  - oral NSAIDs (pain control)
- superficial second degree/partial thickness
  - daily dressing changes with topical antimicrobials (such as Polysporin®); leave blisters intact unless circulation impaired or over joint and inhibiting motion
- deep second degree/deep partial thickness and third degree/full thickness
  - prevent infection and sepsis (significant complication and cause of death in patients with burns)
    - most common organisms: *S. aureus, P. aeruginosa,* and *C. albicans*
      - day 1-3 (rare): Gram-positive
      - day 3-5: Gram-negative (*Proteus, Klebsiella*)
    - topical antimicrobials: treat colonized wounds (from skin flora, gut flora, or caregiver)
  - remove dead tissue
- surgically debride necrotic tissue, excise to viable (bleeding) tissue

**Risk Factors for Infection of Burn Wounds**

**Patient Related**
- Extent >30% TBSA
- Depth: full-thickness and deep partial-thickness
- Patient age (higher risk with very young and very old)
- Comorbidities
- Wound dryness
- Wound temperature
- Secondary impairment of blood flow to wound
- Acidosis

**Microbial Factors**
- Density >$10^5$ organisms per gram of tissue
- Motility
- Virulence and metabolic products (endotoxin, exotoxin, permeability factors, other factors)
- Antimicrobial resistance

### Table 18. Antimicrobial Dressings for Burns

| Antibiotic | Pain with Application | Penetration | Adverse Effects |
|---|---|---|---|
| **Silver nitrate** (0.5% solution) | None | Minimal | May cause methemoglobinemia, stains (black), leaches sodium from wounds |
| **Nanocrystalline silver-coated dressing** (Acticoat®) | None or transient | Medium, does not penetrate eschar | May stain, producing a pseudoeschar or facial discolouration (argyria-like symptoms); raised liver enzymes |
| **Silver sulfadiazine** (cream) (Flamazine®, Silvadene®) | Minimal | Medium, penetrates eschar poorly | Slowed healing, leukopenia, mild inhibition of epithelialization |
| (Sulfamylon®) | Moderate | Well, penetrates eschar; commonly used on ears for deep burns | Mild inhibition of epithelialization, may cause metabolic acidosis with wide application |

- early excision and grafting is the mainstay of treatment for deep/full thickness burns
- initial dressing should decrease bacterial proliferation
- prevention of wound contractures: pressure dressings, joint splints, early physiotherapy

### Other Considerations in Burn Management

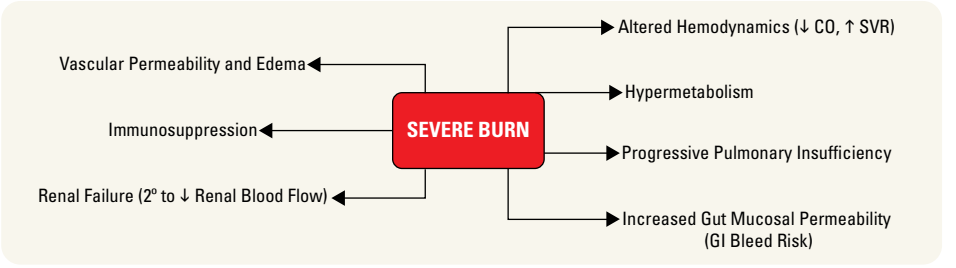

**Figure 23. Systemic effects of severe burns**

- nutrition
  - hypermetabolism: TBSA >40% have BMR 2-2.5x predicted
  - consider nutritional supplementation e.g. calories, vitamin C, vitamin A, $Ca^{2+}$, $Zn^{2+}$, $Fe^{2+}$
- immunosuppression and sepsis
  - must keep bacterial count $<10^5$ bacteria/g of tissue (blood culture may not be positive)
  - signs of sepsis: sudden onset of hyper/hypothermia, unexpected CHF or pulmonary edema, development of ARDS, ileus >48 h post-burn, mental status changes, azotemia, thrombocytopenia, hypofibrinogenemia, hyper/hypoglycemia (especially if burn >40% TBSA)
- GI bleed may occur with burns >40% TBSA (usually subclinical)
  - treatment: tube feeding or NPO if there is a GI bleed, antacids, H2 blockers (preventative)
- renal failure secondary to under resuscitation, drugs, myoglobin, etc.
- progressive pulmonary insufficiency
  - can occur after: smoke inhalation, pneumonia, cardiac decompensation, sepsis
- wound contracture and hypertrophic scarring (outcomes optimized with timely wound closure, splinting, pressure garments) and physiotherapy

# Special Considerations

## CHEMICAL

- major categories: acid burns, alkaline burns, phosphorous burns, chemical injection injuries
- common agents: cement, hydrofluoric acid, phenol, tar
- mechanism of injury: chemical solutions coagulate tissue protein leading to necrosis
  - acids → coagulation necrosis
  - alkalines → saponification followed by liquefactive necrosis
- severity related to: type of chemical (alkali worse than acid), temperature, volume, concentration, contact time, site affected, mechanism of chemical action, degree of tissue penetration
- burns are deeper than they initially appear and may progress with time

### Treatment (General)

- ABCs, monitoring
- remove contaminated clothing and brush off any dry powders before irrigation
- irrigation with water for 1-2 h under low pressure (contraindicated in heavy metal burns, such as sodium, potassium, magnesium, and lithium; in these cases, soak in mineral oil instead)
- inspect eyes, if affected: wash with saline and refer to ophthalmology
- inspect nails, hair, and webspaces
- correct metabolic abnormalities and tetanus prophylaxis if necessary
- contact poison control line if necessary
- local wound care 12 h after initial dilution (debridement)
- wound closure same as for thermal burn
- beware of underestimated fluid resuscitation, renal, liver, and pulmonary damage

**Table 19. Special Burns and Treatments**

| | |
|---|---|
| **Acid Burn** | Water irrigation, followed by dilute solution of sodium bicarbonate |
| **Hydrofluoric Acid** | Water irrigation; clip fingernails to avoid acid trapping; topical calcium gel ± subcutaneous injection of calcium gluconate ± 10% calcium gluconate IV depending on amount of exposure and pain |
| **Sulfuric Acid** | Treat with soap/lime prior to irrigation as direct water exposure produces extreme heat |
| **Tar** | Remove with repeated application of petroleum-based antibiotic ointments (e.g. Polysporin®) |

## ELECTRICAL BURNS

- depth of burn depends on voltage and resistance of the tissue (injury more severe in tissues with high resistance)
- often presents as small punctate burns on skin, with extensive deep tissue damage which requires debridement
- electrical burns require ongoing monitoring, as latent injuries can occur
- watch for system-specific damages and abnormalities
  - abdominal: intraperitoneal damage
  - bone: fractures and dislocations especially of the spine and shoulder
  - cardiopulmonary: anoxia, ventricular fibrillation, arrhythmias
  - muscle: myoglobinuria indicates significant muscle damage → compartment syndrome
  - neurological: seizures and spinal cord damage
  - ophthalmology: cataract formation (late complication)
  - renal: acute tubular necrosis resulting from toxic levels of myoglobin and hemoglobin
  - vascular: vessel thrombosis → tissue necrosis (increased Cr, $K^+$, and acidity), decrease in RBC (beware of hemorrhages/delayed vessel rupture)

**Tissue Resistance to Electrical Current**
nerve < vessel/blood < muscle < skin < tendon < fat < bone

### Treatment

- ABCs, primary and secondary survey, treat associated injuries
- beware of cardiac arrhythmias (continue cardiac monitoring)
- monitor: hemochromogenuria, compartment syndrome, urine output
- wound management: topical agent with good penetrating ability (silver sulfadiazine or mafenide acetate)
- debride nonviable tissue early and repeat prn (every 48 h) to prevent sepsis
- amputations frequently required

## FROSTBITE

- see Emergency Medicine, ER46

# Hand

## Traumatic Hand

**Table 20. Key Features of the History and Physical Exam of the Injured Hand**

| | | |
|---|---|---|
| **HISTORY** | | |
| **Key Questions** | Age | Tetanus status |
| | Hand dominance | Diabetes |
| | Occupation | Smoking status |
| | Time and place of accident | Last oral intake |
| | Mechanism of injury | |
| | Initial treatment received | |
| **PHYSICAL EXAM** | | |
| **Observation** | Position of finger | Abnormal cascade (fingers normally slightly flexed and point towards scaphoid), scissoring |
| | Deformity | Bony protrusions or specific deformities (e.g. mallet, boutonnière, and swan neck deformity) |
| | Bruising or swelling | May indicate underlying skeletal injury |
| | Sweating pattern (usually felt more so than from observation) | May indicate denervation |
| | Anatomical structures beneath | If open laceration, need to explore within wound (under sterile conditions) |
| | **Structure** | **Examination** |
| **Vascular Status** | Radial and ulnar arteries | Palpate pulses<br>Allen's test |
| | Digital arteries | Assess capillary refill (<2-3 s)<br>Doppler ultrasound |
| | Temperature and skin turgor | For each test, need to compare both sides |
| **Sensory** (see Figure 4) | Median nerve | Volar radial tip of index finger |
| | Ulnar nerve | Volar ulnar tip of little finger |
| | Radial nerve | Dorsal web space of the thumb |
| | Digital nerves | 2 point discrimination on both the radial and ulnar side of the DIP creases (static or moving 2 point discrimination) |

**Compartment Syndrome**
Watch out for these signs with a closed or open injury: tense, painful extremity (worse on passive stretch), parasthesia/paralysis, pallor, distal pulselessness (often late in process), and contracture (irreversible ischemia).
Intracompartmental pressures can be measured (normal pressure = up to 12 mmHg, abnormal is 30-40 mmHg), but a clinical diagnosis is an indication for an emergent fasciotomy; if untreated, end result is ischemic contracture of the extremity (Volkmann's contracture).

**Approach to Hand Lacerations**

**TIN AX**
**T**etanus prophylaxis
**I**rrigate with NS (copious irrigation and debridement in a timely manner)
**N**PO (NPO if you are considering replanting or an urgent OR, otherwise most operations are done as elective procedures)
**A**ntibiotic prophylaxis (controversial – most require no antibiotics, mainly needed for animal bites and dirty wounds)
**X**-rays

**Allen's Test**: You need to exsanguinate the hand by having the patient open and close the hand. Then, while patient's hand is firmly closed, occlude both radial and ulnar arteries. Once fist is open, release either artery and assess collateral flow

**Table 20. Key Features of the History and Physical Exam of the Injured Hand** (continued)

| | Structure | Examination |
|---|---|---|
| **Motor Function** | Median nerve | Flex DIP of index finger (to test the anterior interosseus nerve (AIN) branch) |
| | | Touch the tip of the index finger to the thumb trying to break through ("OK sign") (to test the AIN branch) |
| | | Thumb to ceiling with palm up (to test the recurrent motor branch) |
| | | Thumb to tip of 5th digit (to test the recurrent motor branch) |
| | Ulnar nerve | Extrinsic muscles: flex DIP of little finger |
| | | Intrinsic muscles: abduct index finger ("Peace sign") or patient able to hold piece of paper between adducted thumb and index finger and resist pulling ("Froment's sign") |
| | Radial nerve | Extrinsic muscles: extend thumb ("thumb's up") and wrist |
| **Range of Motion** | Tendons, bones, joints, nerves | Assess active and passive range of motion of wrist: extension/flexion/ulnar/radial deviation; finger abduction/adduction/flexion/extension, thumb flexion/extension/abduction/adduction/opposition |
| **Tendons** | FDP | Stabilize PIP in extension, ask patient to flex fingers (at DIP) |
| | FDS | Stabilize non-exam fingers in extension (neutralizes FDP) and ask patient to flex examination finger (at PIP) |
| **Palpation** | Bones | Focal tenderness or abnormal alignment |
| | Joints | Instability may indicate ligamentous injury or dislocation |

# General Management of Hand Injuries

## Nerves

- **test the nerve function BEFORE putting in local anesthesia**
- primary repair for a clean injury within 2 wk and without concurrent major injuries; secondary repair if >2 wk (may require nerve graft)
- epineurial repair of all digital nerves with minimal tension
- post-operative: dress wound, elevate hand, and immobilize
- Tinel's sign (cutaneous percussion over the repaired nerve) produces paresthesias and defines level of nerve regeneration
  - Wallerian degeneration occurs in the first 2 wk, which is why there is no Tinel's sign until after this time period
  - a peripheral nerve regenerates at 1 mm/d
  - paresthesias felt at area of percussion because regrowth of myelin (Schwann cells) is slower than axonal regrowth → percussion on exposed free-end of axon generates paresthesia

## Vessels

- often associated with nerve injury (anatomical proximity)
- control bleeding with direct pressure and hand elevation
- if digit devascularized, optimal repair within 6 h
- close skin, then dress, immobilize, and splint hand with fingertips visible
- monitor colour, capillary refill, skin turgor, fingertip temperature post-revascularization

**Hand Exam**

- Never blindly clamp a bleeding vessel as nerves are often found in close association with vessels
- Never explore any volar hand wound in the ER
- Arterial bleeding from a volar digital laceration is likely associated with a nerve laceration (nerves in digits are superficial to arteries)

## Tendons

- most tendon lacerations require primary repair
- many extensors are repaired in the emergency room, flexors are repaired in the operating room within 1 wk (but 2 wk may still be considered)
- avoid excessive immobilization after repair (specific protocols for flexors to minimize stiffness and facilitate rehabilitation)

## Bones

- see *Fractures and Dislocations*, PL27

## Nailbed

- subungual hematomas >50% of the nail surface area need to be drained (trephination), done under a digital block by puncturing nail plate
- if suspecting greater severity of injury (e.g. distal phalanx displaced fracture, laceration of nail bed), remove nail plate to examine underlying nailbed under digital block anesthesia
- irrigate wound and nail thoroughly
- suture repair of nailbed with chromic suture
- replace cleaned nail, which acts as a splint for any underlying distal phalangeal fracture and prevents adhesion formation between nail fold and nailbed

# Hand Infections

## Principles

- trauma is most common cause
- 5 cardinal signs: rubor (red), calor (hot), tumour (swollen), dolor (painful), and functio laesa (loss of function)
- 90% caused by Gram-positive organisms
- most common organisms (in order) – *S. aureus, S. viridans,* Group A Streptococcus*, S. epidermidis*, and *Bacteroides melaninogenicus* (MRSA is becoming more common)

## TYPES OF INFECTIONS

### Deep Space Infections

- abscess formation in deep spaces of the hand, most commonly thenar or mid-palm space
- uncommon, there are 9 spaces in the hand

### Felon

- **definition**: abscess in the pulp of a fingertip or thumb that occurs following a puncture wound into the pad of the digit; may be associated with osteomyelitis (akin to compartment syndrome and can lead to skin necrosis)
- **treatment**: elevation, warm soaks, cloxacillin 500 mg PO q6h (if in early stage); if obvious abscess or pressure on the overlying skin or failure to resolve with conservative measures, then needs I&D, take cultures/Gram stain and adjust antibiotics to culture results

### Flexor Tendon Sheath Infection

- *Staphylococcus* > *Streptococcus* > Gram-negative rods
- **definition**: abscess within the flexor tendon sheath (flexor tenosynovitis), commonly caused by a penetrating injury and can lead to tendon necrosis and rupture if not treated; it is often suppurative; however, there can be very little pus early on
- **clinical features**: Kanavel's 4 cardinal signs
  1. point tenderness along flexor tendon sheath
  2. severe pain on passive extension of digit
  3. fusiform swelling of entire digit
  4. flexed posture (increased comfort)
- **treatment**
  - non-suppurative: IV antibiotics, resting hand splint and elevation until infection resolves, aggressive hand therapy after
  - suppurative (produces pus): I&D in OR (catheter irrigation is no longer performed because it causes maceration)

### Herpetic Whitlow

- HSV-1, HSV-2
- **definition**: painful vesicle(s) around fingertip or thumb
  - often found in medical/dental personnel and children
- **clinical features**: can be associated with fever, malaise and lymphadenopathy, prodromal phase
  - patient is infectious until lesion has completely healed
- **treatment**: diagnosed clinically, if in doubt confirm with viral culture/PCR or Tzanck smear, usually self-limited, consider oral acyclovir in severe cases; I&D is contraindicated

### Paronychia

- acute = *Staphylococcus*; chronic = *Candida*
- **definition**: infection (granulation tissue) of soft tissue around fingernail (within the paronychium and/or beneath eponychial fold)
- **etiololgy**
  - acute paronychia: a "hangnail", artificial nails, and nail biting
  - chronic paronychia: prolonged exposure to moisture
- **treatment**
  - acute paronychia: warm compresses and oral antibiotics if caught early; if abscess present, drainage with blade (avoid hitting nail bed) and oral/IV antibiotics; if abscess extends to below nail plate, nail plate removal may be required
  - chronic paronychia: anti-fungals, eponychial marsupialization, nail plate removal may be required

# Amputations

## Hand or Finger

- emergency management: injured patient and amputated part requires attention
  - patient: x-rays (stump and amputated part), NPO, clean wound and irrigate with NS, dress stump with nonadherent dressing, cover with dry sterile dressing, tetanus and antibiotic prophylaxis (cephalosporin/erythromycin)
  - **amputated part**: x-rays, gently irrigate with RL, wrap amputated part in a NS/RL soaked sterile gauze and place inside waterproof plastic bag, place in a container, then place container on ice
- **indications for replantation**
  - **age**: children often better results than adults
  - **level of injury**: thumb and multiple digit amputations are higher priority; multiple level amputation is a contraindication to replant
  - **nature of injury**: clean cut injuries have greater success; avulsion and crush injuries are relative contraindications to replant
- if replant contraindicated, manage stump with revision amputation
  - involves debriding stump of wound, trimming back the bone and nerve endings, and gently closing the skin
  - commonly done in the ER under digital block

# Tendons

## Common Extensor Tendon Deformities

**Table 21. Extensor Tendon Deformities**

| Injury | Definition | Zone | Etiology/Clinical Features | Treatment |
|---|---|---|---|---|
| **Mallet Finger** | DIP flexed with loss of active extension | 1 | There are bony and non-bony mallets<br>Bony: Fracture of distal phalanx distal to tendon insertion<br>Non-bony: Forced flexion of the extended DIP leading to extensor tendon rupture at DIP (e.g. sudden blow to tip of the finger) | Splint DIP in extension for 6 wk, followed by 2 wk of night splinting; if inadequate improvement after 6 wk, check splinting routine and recommend 4 more wk of continuous splinting |
| **Boutonnière Deformity** | PIP flexed, DIP hyperextended | 3 | Injury or disease affecting the extensor tendon insertion into the dorsal base of the middle phalanx<br>Associated with RA or trauma (laceration, volar dislocation, acute forceful flexion of PIP) | Splint PIP in extension and allow active DIP motion |
| **Swan Neck Deformity** | PIP hyperextended, DIP flexed | 1,3 | Trauma (PIP volar plate injury)<br>Associated with RA and old, untreated mallet deformity<br>Splint to prevent PIP hyperextension or DIP flexion | Corrective procedures involve tendon rebalancing or arthrodesis/ arthroplasty |

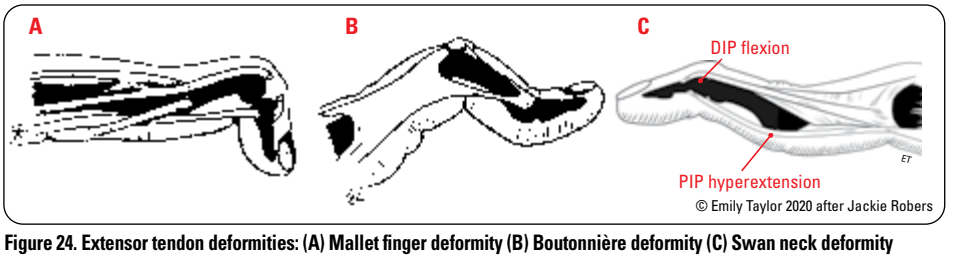

**Figure 24. Extensor tendon deformities: (A) Mallet finger deformity (B) Boutonnière deformity (C) Swan neck deformity**

## De Quervain's Tenosynovitis

- **definition**: tenosynovitis is inflammation of the tendon and/or its sheath. Most common is De Quervain's tenosynovitis (inflammation of the extensor tendons in the 1st dorsal compartment [APL and EPB])
- **clinical features**
  - +ve Finkelstein's test (pain over the radial styloid induced by making fist, with thumb in palm, and ulnar deviation of wrist)
  - pain localized to the 1st extensor compartment
  - tenderness and crepitation over radial styloid may be present
  - differentiate from CMC joint arthritis (CMC joint arthritis will have a positive grind test, whereby crepitus and pain are elicited by axial pressure to the thumb)
- **treatment**
  - mild: NSAIDs, splinting, and steroid injection into the tendon sheath (successful in over 60% of cases)
  - severe: surgery to open 1st dorsal compartment and release stenotic tendon sheaths of APL and EPB

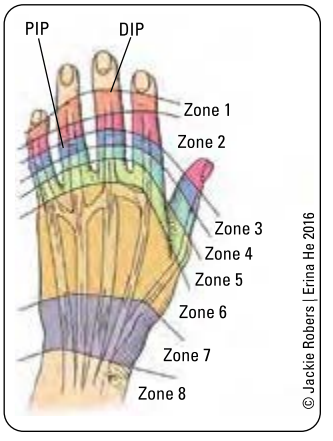

**Figure 25. Zone of extensor tendon injury** (odd numbered zones fall over a joint)

### Ganglion Cyst
- **definition**
  - fluid-filled synovial lining that protrudes between carpal bones or from a tendon sheath; most commonly carpal in origin
  - most common soft tissue tumour of hand and wrist (60% of masses)
- **clinical features**
  - most commonly on the dorsal wrist overlying the scapholunate ligament, followed by the volar surface of the wrist overlying the radioscaphoid or scaphotrapezial joints
  - 3 times more common in women than in men
  - more common in younger individuals (2nd to 4th decades)
  - can be large or small – may drain internally so size may wax and wane
  - often non-tender, although tenderness increased when cyst is smaller (from increased pressure within smaller cyst sac)
- **treatment**
  - conservative treatment: do nothing
  - aspiration (recurrence rate 30-60%)
  - steroid injection if painful (done in combination with aspiration, as results alone are no better than aspiration)
  - consider operative excision of cyst and stalk (recurrence rate 5.9% for dorsal wrist ganglion, 30% for volar)

### Common Flexor Tendon Deformities
- flexor tendon zones (important for prognosis of tendon lacerations)
- "no-man's land" (zone 2) (see Figure 26)
  - between distal palmar crease and mid-middle phalanx
  - zone where superficialis and profundus lie ensheathed together
  - recovery of glide very difficult after injury

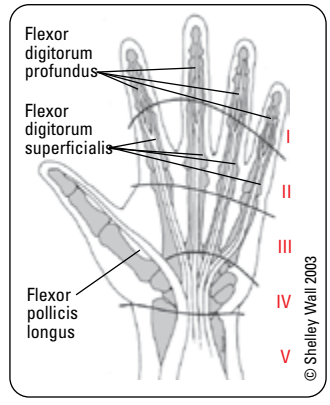

**Figure 26. Zones of the flexor tendons**

### Stenosing Tenosynovitis (trigger finger/thumb)
- **definition**: inflammation and thickening of tendon or tendon sheath/pulley (most commonly at A-1 pulley near MCP), preventing smooth gliding of tendon through the sheath/pulley and resulting in locking of thumb or finger in flexion/extension
- **etiology**: idiopathic or associated with RA, DM, hypothyroidism, gout, and pregnancy
- **clinical features**
  - ring finger is most commonly affected, then long finger and thumb
  - patient complains of catching, snapping, or locking of affected finger
  - tenderness to palpation/nodule at palmar aspect of MCP over A-1 pulley
  - women are 4 times more likely to be affected than men
- **non-surgical treatment**
  - NSAIDs
  - steroid injection; injections less likely to be successful in patients >60 yr, or symptoms greater than 6 mo
  - splint
- **surgical treatment**
  - indicated if no relief of symptoms or minimal relief with steroids
  - incise A-1 flexor pulley to permit unrestricted, full active finger motion

A-2 and A-4 pulleys are most important for function; prevent bowstringing of tendons

## Fractures and Dislocations
- for fracture principles, see Orthopedic Surgery, OR5

### FRACTURES
- about 90% of hand fractures are stable in flexion (splint to prevent extension)
- **position of safety**
  - wrist extension 0-30°
  - MCP flexion 70-90°
  - IP full extension
  - this is done if you want to immobilize a fracture but are not sure whether there are other injuries
- stiffness secondary to immobilization is the most important complication

### Distal Phalanx Fractures
- most commonly fractured bone in the hand
- usual mechanism is crush injury, and thus accompanied by soft tissue injury
- subungual hematoma is common and must be decompressed, especially if there is involvement of >50% of the nail surface area
  - injury involving >50% of the nail surface area often suggests a nail bed laceration, in which the patient would benefit from nail plate removal and nailbed repair surgery
- **treatment**: 3 wk of digital splinting (immobilize the DIP with a STAX™ splint); if intra-articular fracture displaced >30%, then percutaneous pinning (K-wires) and splint

### Proximal and Middle Phalanx Fractures
- check for: rotation, scissoring (overlap of fingers on making a fist), shortening of digit
- non-displaced or minimally displaced: closed reduction (if extra-articular), buddy tape to neighbouring stable digit, elevate hand, motion in guarded fashion early, splinted for 2-3 wk
- displaced, non-reducible, not stable with closed reduction, or rotational or scissoring deformity: percutaneous pinning (K-wires) or ORIF, and splint

### Metacarpal Fractures
- generally accept varying degrees of deviation before reduction required: up to 10° (D2), 20° (D3), 30° (D4), or 40° (D5)
- **Boxer's fracture**: acute angulation of the neck of the 5th metacarpal into palm
  - mechanism: blow on the distal-dorsal aspect of closed fist
  - loss of prominence of metacarpal head, volar displacement of head
  - up to 30-40° angulation may be acceptable
  - if greater angulation, closed reduction should be considered to decrease the angle
  - if stable, ulnar gutter splint for 4-6 wk
- **Bennett's fracture**: two-piece fracture/dislocation of the base of the thumb metacarpal, usually intra-articular
  - unstable fracture
  - APL pulls MC shaft proximally and radially, causing adduction of thumb
  - treat with percutaneous pinning or ORIF, followed by thumb spica for 6 wk
- **Rolando fracture**: T- or Y-shaped fracture of the base of the thumb metacarpal
  - treated like a Bennett's fracture

## DISLOCATIONS
- **treatment**: must be reduced as soon as possible
- dislocation vs. subluxation
  - dislocation: severe injury where articular surfaces of a joint are no longer in contact with one another
  - subluxation: articular surfaces of a joint are partially out of place (i.e. "partial dislocation" – often unstable and requires reduction)

### PIP and DIP Dislocations (PIP more common than DIP)
- usually dorsal dislocation (commonly from hyperextension)
- if closed dislocation: closed reduction and splinting in position of function for 1 wk or buddy taping, and early mobilization (prolonged immobilization causes stiffness)
- open injuries are treated with wound care, irrigation, and debridement, followed by closed or open reduction and antibiotics

### MCP Dislocations (relatively rare)
- dorsal dislocations much more common than volar dislocations
- dorsal dislocation of proximal phalanx on metacarpal head; most commonly index finger (hyperextension)
- two types of dorsal dislocation
  - simple (reducible with manipulation): treat with closed reduction and splinting for 2-4 wk at 60-70° MCP flexion
  - complex (irreducible - most commonly due to volar plate blocking the reduction): treat with open reduction

### Ulnar Collateral Ligament (UCL) Injury
- forced abduction of thumb (e.g. ski pole injury)
- **Skier's thumb**: acute UCL injury – if stable, treated with splint x 6-8 wk; if unstable, patient may have Stener lesion
- **Gamekeeper's thumb**: chronic UCL injury, often requires open repair and tendon graft for stabilization
- **Stener lesion**: the distal portion of the UCL can detach and flip superficial to the adductor aponeurosis and will not appropriately heal – requires open repair
- **evaluation**: radially deviate thumb MCP joint in full extension and at 30° flexion and compare with non-injured hand. UCL rupture is presumed if injured side deviates more than 30° in full extension or more than 15° in flexion

# Dupuytren's Disease

### Definition
- proliferative disorder of the palmar fascia, forming nodules (usually painless), fibrous cords, and flexion contractures at the MCP and interphalangeal joints
- flexor tendons not involved
- Dupuytren's diathesis: male sex, early age of onset, strong family history (autosomal dominant inheritance), involvement of multiple digits, bilateral involvement, and involvement of sites other than palmar aspect of hand, including the plantar fascia (Ledderhose's) and the penis (Peyronie's) – (see Urology, U32)

### Epidemiology
- unusual in patients from African and Asian countries, high incidence in northern Europeans, men > women, often presents in 5th-7th decade of life; associated with but not caused by alcohol use, smoking, and DM

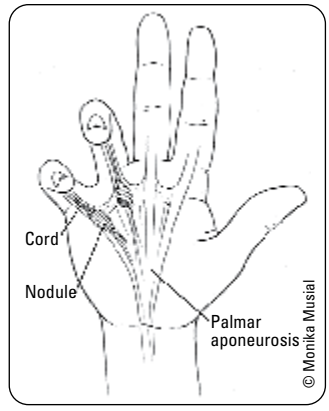

**Figure 27. Dupuytren's disease**

### Clinical Features
- nodules, cords, and contractures of MCP, PIP, and DIP
- order of digit involvement (most common to least common): ring > little > long > thumb > index
- risk of recurrence

### Treatment
- palmar pit or nodule: no surgery (steroid injections for pain)
- palpable band/cord with no limitation of extension (i.e. no contracture) of either MCP or PIP: no surgery
- MCP contracture >30° or PIP contracture of any degree: needle aponeurotomy, collagenase clostridium histolyticum (Xiaflex®) injection, or surgical fasciectomy
- contractures impeding function and/or hygiene: needle aponeurotomy, collagenase injection, or surgical fasciectomy
- MCP joints have better outcomes than PIP joints post-treatment (achievement of near full extension, lower risk of recurrence)

# Carpal Tunnel Syndrome

### Definition
- median nerve compression at the level of the flexor retinaculum/transverse carpal ligament

### Etiology
- median nerve entrapment at wrist
- primary cause is idiopathic
- secondary causes: space occupying lesions (tumours, hypertrophic synovial tissue, fracture callus, and osteophytes); metabolic and physiological (pregnancy, hypothyroidism, acromegaly, and RA); job/hobby related repetitive trauma, especially forced wrist flexion

### Epidemiology
- female:male = 4:1, most common entrapment neuropathy

### Clinical Features
- classically, patient awakened at night with numb/painful hand, relieved by shaking/dangling/rubbing
- on exam, sensory loss in median nerve distribution (see Figure 4), but thenar eminence sensory loss is spared (palmar cutaneous branch given off prior to carpal tunnel)
- decreased light touch and 2-point discrimination at DIP radial and ulnar creases; discriminative touch often lost first
- advanced cases: thenar wasting/weakness due to involvement of the motor branch of the nerve
- ± Tinel's sign (tingling sensation on percussion of nerve)
- ± Phalen's sign (wrist flexion induces symptoms)

### Investigations
- generally a clinical diagnosis
- NCV and EMG studies may be used to objectively confirm the diagnosis if clinical history is atypical

### Treatment
- avoid repetitive wrist and hand motion, wrist splints at night and when repetitive wrist motion required
- conservative: night-time splinting to keep wrist in neutral position
- medical: NSAIDs, local corticosteroids injection (relief from local corticosteroid injections is also diagnostic)
- surgical decompression: transverse carpal ligament incision to decompress median nerve
- indications for surgery: persistent signs and symptoms of median nerve compression not relieved by conservative management or if motor function is compromised

# Brachial Plexus

## Etiology
- common causes of brachial plexus injury: complication of childbirth and trauma
- other causes of injury: compression from tumours, ectopic ribs

## Common Palsies

**Table 22. Named Neonatal Palsies of the Brachial Plexus**

| Palsy | Location of Injury | Mechanism of Injury | Features |
|---|---|---|---|
| **Duchenne-Erb Palsy** | Upper brachial plexus (C5-C6) | Head/shoulder distraction (e.g. motorcycle) | "Waiter's tip deformity" (shoulder internal rotation, elbow extension and pronation, wrist flexion) |
| **Klumpke's Palsy** | Lower brachial plexus (C7-T1) | Traction on abducted arm | "Claw hand"<br>May include Horner's syndrome |

## Differential Diagnosis of Adult-Acquired Brachial Plexus Palsies
- trauma (blunt, penetrating)
- thoracic outlet syndrome
  - associated with large cervical rib, anomalous first rib, strenuous arm work, neck muscle hypertrophy
  - neurogenic: compression of brachial plexus, resulting in upper limb paresthesia, pain, and weakness
  - vascular: compression/thrombosis of subclavian artery/vein, resulting in pain; pallor and Raynaud's if arterial; swelling and cyanosis if venous
- tumour
  - schwannoma: well-defined margins enable total resection
  - neurofibromas: associated with neurofibromatosis type I
  - other: e.g. Pancoast syndrome (apical lung tumour)
- neuropathy (compressive, post-irradiation, viral, diabetic, idiopathic)

## Investigations
- EMG
- MRI: gold standard for identifying soft tissue masses and nerve roots
- CT myelogram: may be more accessible as an alternative to MRI
- closed injuries: if avulsion suspected, then CT myelogram or MRI initially; otherwise, EMG/NCS 12 wk post-injury to assess healing progress
- open injuries: OR for exploration within a few days post-injury (once patient stable)

## Management

**Table 23. Management of Brachial Plexus Injuries***

| | Type | Treatment |
|---|---|---|
| **Closed Injuries** | Concussive/compressive | Usually improves (unless expanding mass, e.g. hematoma) |
| | Traction/stretch | If no continued insult, follow for 3-4 mo for improvement |
| | Obstetric palsy | Surgery if no significant improvement and/or residual paresis at 6 mo of age |
| **Open Injuries** | Sharp or vascular injury | Explore immediately in OR |

*All injuries listed require splinting as well as OT and PT consults to maintain ROM and function in the joint

# Craniofacial Injuries

- low velocity vs. high velocity injuries determine degree of damage
- fractures cause bruising, swelling, and tenderness → loss of function
- management: most can wait ~5 d for swelling to decrease before ORIF required

## Approach to Facial Injuries

- ATLS protocol
- inspect, palpate, clinical assessment for injury to underlying structures (e.g. facial nerve, bony injuries, septal hematoma, ocular involvement, etc.)
- tetanus prophylaxis
- radiological evaluation: CT scan with fine cuts through the orbit
- wound irrigation with NS/RL and remove foreign materials
- conservative debridement of detached or nonviable tissue
- repair at the time of presentation with 4-0 nylon sutures when the patient's general condition allows
- consider intracranial trauma; rule out skull fracture

Patients with major facial injuries are at risk of developing upper airway obstruction (displaced blood clots, teeth, or fracture fragments; swelling of pharynx and larynx; loss of support of hyomandibular complex → retroposition of tongue); also at risk of ocular injury

### Investigations

- CT (gold standard)
  - axial and coronal (specifically request 1.5 mm cuts): for fractures of upper and middle face, as well as mandible
  - indicated for significant head trauma, suspected facial fractures, and pre-operative assessment
- panorex radiograph: shows entire upper and lower jaw; best for isolated mandible fracture, but patient must be able to sit; however, if high clinical suspicion and negative panorex, CT should be done

**Signs of Basal Skull Fracture**
- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF otorrhea/rhinorrhea

### Treatment Goals

- re-establish normal occlusion if occlusion is an issue
- normal eye function (extraocular eye movements and vision)
- restore stability of face and appearance
- consultation when indicated (dentistry, ophthalmology, neurosurgery)

## Mandibular Fractures

- two points of injury since it is a ring structure (includes fractures and dislocations)
- commonly at sites of weakness (condylar neck, angle of mandible)

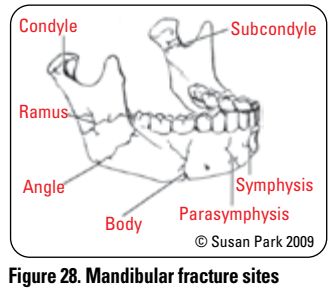

**Figure 28. Mandibular fracture sites**

### Etiology

- anterior force: bilateral fractures
- lateral force: ipsilateral subcondylar and contralateral angle or body fracture
- note: classified as open if fracture into tooth bearing area (alveolus)

### Clinical Features

- pain, swelling, difficulty opening mouth ("trismus")
- malocclusion, asymmetry of dental arch
- damaged, loose, or lost teeth
- palpable "step" along mandible
- numbness in V3 distribution
- intra-oral lacerations or hematoma (sublingual)
- chin deviating toward side of a fractured condyle

### Classification

**Table 24. Mandibular Fracture Classifications by Anatomic Region**

| | Areas/Boundaries |
|---|---|
| **Symphysis** | Midline of the mandible; between the central incisors from the alveolar process through the inferior border of the mandible |
| **Body** | From the symphysis to the distal alveolar border of the third molar |
| **Angle** | Triangular region between the anterior border of the masseter and the posterosuperior insertion of the masseter distal to the third molar |
| **Ramus** | Part of the mandible that extends posteriosuperiorly into the condylar and coronoid processes |
| **Condylar*** | Area of condylar process of mandible |
| **Subcondylar** | Area below the condylar neck (i.e. sigmoid notch) of the mandible |
| **Coronoid Process** | Area of the coronoid process of mandible |

*Most common mandibular fracture type

### Treatment
- maxillary and mandibular arch bars wired together (intramaxillary fixation) or ORIF ideally managed within 48 h as indicated by best current evidence
- antibiotics from initial presentation until at least 3 doses post-operatively; if late presentation, may consider treatment with antibiotics for an extended course

## Maxillary Fractures

**Table 25. Le Fort Classification**

| | Le Fort I | Le Fort II | Le Fort III |
|---|---|---|---|
| **Alternative Name** | Guérin fracture | Pyramidal fracture | Craniofacial dysjunction |
| **Type of Fracture** | Horizontal | Pyramidal | Transverse |
| **Structures Involved** | Piriform aperture | Nasal bones | Nasofrontal suture |
| | Maxillary sinus | Medial orbital wall | Zygomatofrontal suture |
| | Pterygoid plates | Maxilla | Zygomatic arch |
| | | Pterygoid plates | Pterygoid plates |
| **Anatomical Result** | Maxilla divided into 2 segments | Maxillary teeth and midsection of the maxilla separated from upper face | Entire midfacial skeleton detached from cranial base |

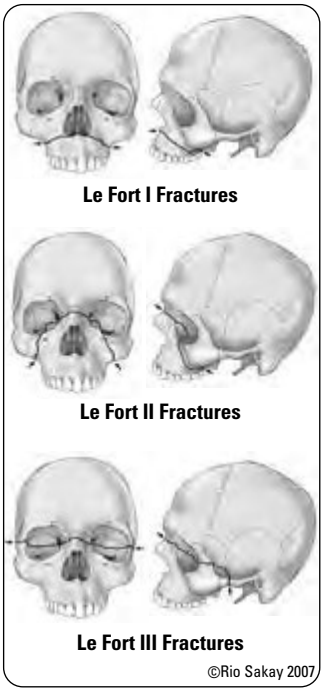

**Figure 29. Le Fort fractures**

## Nasal Fractures

### Etiology
- lateral force → more common, good prognosis
- anterior force → can produce more serious injuries
- most common facial fracture

### Clinical Features
- epistaxis/hemorrhage, deviation/flattening of nose, swelling, periorbital ecchymosis, tenderness over nasal dorsum, crepitus, septal hematoma, respiratory obstruction, subconjunctival hemorrhage

### Treatment
- treated for airway or cosmetic issues
- always inspect for and drain septal hematoma as this is a cause of septal necrosis and perforation – completed in the ER with small incision in the septal mucosa followed by packing
- closed reduction with Asch or Walsham forceps under anesthesia, pack nostrils with petroleum or nonadhesive gauze packing, nasal splint for 7 d
- best reduction immediately (<6 h) or when swelling subsides (5-7 d)
- rhinoplasty may be necessary later for residual deformity (30%)

## Zygomatic Fractures

### Classification
1. fracture restricted to zygomatic arch
2. depressed fracture of zygomatic complex (zygoma)
3. unstable fracture of zygomatic complex (tetrapod fracture) – separations occur at maxilla, frontal bone, temporal bone, and orbital rim

### Clinical Features
- 3 most common features (pathognomonic):
  - subconjunctival hemorrhage
  - periorbital ecchymosis (often associated with fractures of the orbital floor)
  - V2 numbness (infraorbital and superior dental nerves)
- flattening of malar prominence (view from above)
- pain over fractures on palpation
- palpable step deformity in bony orbital rim (especially inferiorly)
- ipsilateral epistaxis; trismus
- ophthalmologic evaluation if suspected globe injury

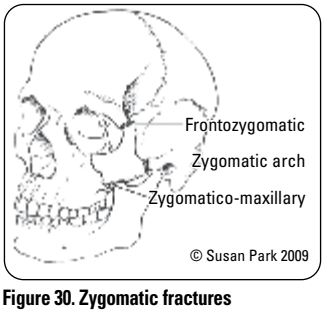

**Figure 30. Zygomatic fractures**

### Treatment
- if undisplaced, stable, and no symptoms, then soft diet; no treatment necessary
- undisplaced zygomatic arch fractures can be elevated using Gillies approach (leverage on the anterior part of the zygomatic arch via a temporal incision) or Keane approach (elevation through upper buccal sulcus incision) only if arch is not comminuted
- if arch is comminuted, ORIF is required
- stabilization often unnecessary
- ORIF for displaced or unstable fractures of zygomatic complex

# Orbital Floor Fractures

• see Ophthalmology, OP40

## Definition
• fracture of floor of orbit: may be a "pure blow-out fracture", which has an intact orbital rim, or can be associated with other fractures (orbital rim fracture and/or zygoma)

## Etiology
• blunt force to eyeball → sudden increase in intraorbital pressure (e.g. baseball or fist)

## Clinical Features
• defects in visual fields, decreased visual acuity, injury to globe
• periorbital edema and bruising, subconjunctival hemorrhage
• ptosis, exophthalmos, exorbitism, enophthalmos, or hypoglobus
• orbital rim step-offs with possible infraorbital nerve anesthesia
• vertical dystopia (abnormal displacement of the entire orbital cone in the vertical plane) – assessed by comparing the symmetry of the two pupils by a horizontal line running through the pupil of the unaffected eye
• orbital entrapment
  ▪ clinical diagnosis that is a surgical emergency
  ▪ diplopia with straight gaze: unable to look up past neutral (entrapment of inferior rectus), limited EOM
  ▪ severe pain or nausea and vomiting with upward globe movement
  ▪ requires urgent ophthalmology evaluation if there are associated visual acuity changes

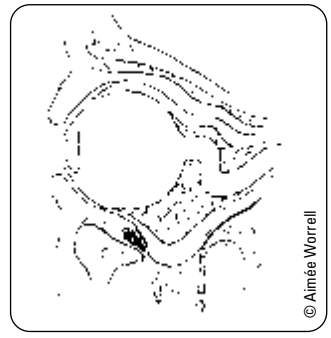

**Figure 31. Blow-out fracture**

## Investigations
• CT (diagnostic): axial and coronal views – with fine cuts through orbit; rounding of inferior rectus is a sign of orbital entrapment
• diagnostic maneuver for entrapment is forced duction test (pulling on inferior rectus muscle with forceps to ensure full ROM) under local anesthesia in the OR

## Treatment
• surgical repair indicated if: entrapment (urgent), any size defect with enophthalmos (if patient is bothered by it) or persistent diplopia (>10 d)
• reconstruction of orbital floor with bone graft or alloplastic material
• after repair, assess for diplopia (may require additional surgery for strabismus)

## Complications
• persistent diplopia
• enophthalmos

## Superior Orbital Fissure Syndrome
• fracture of SOF causing ptosis, proptosis, anesthesia in V1 distribution, and painful ophthalmoplegia (paralysis of CN III, IV, VI)
• uncommon complication seen in Le Fort II and III fractures (1/130)
• recovery time reported as 4.8-23 wk following operative reduction of fractures

## Orbital Apex Syndrome
• fracture through optic canal with involvement of CN II at apex of orbit
• symptoms are the same as SOF syndrome plus vision loss
• treatment is urgent decompression of fracture in optic canal (posterior craniotomy for decompression) or steroids

# Breast

## Anatomy

### Vascular Supply

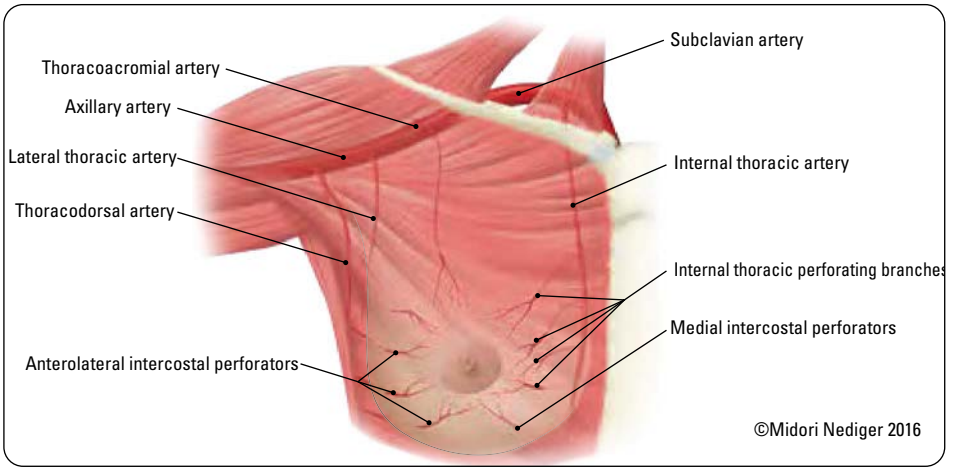

**Figure 32. Breast vasculature**

### Innervation

- innervated in a dermatomal pattern from branches of the thoracic intercostal nerves (T3-6)
  - medially innervated from anterior cutaneous branches of I-VI intercostal nerves
  - lateral innervated from lateral cutaneous nerve branches of II-VII intercostal nerves
- lateral and upper portions of the breast innervated by lower fibres of the cervical plexus (C3, C4)
- nipple areolar complex
  - supplied by anterior and lateral cutaneous branches of intercostal nerve IV
  - additional innervation by cutaneous branches of intercostal nerves III and VI

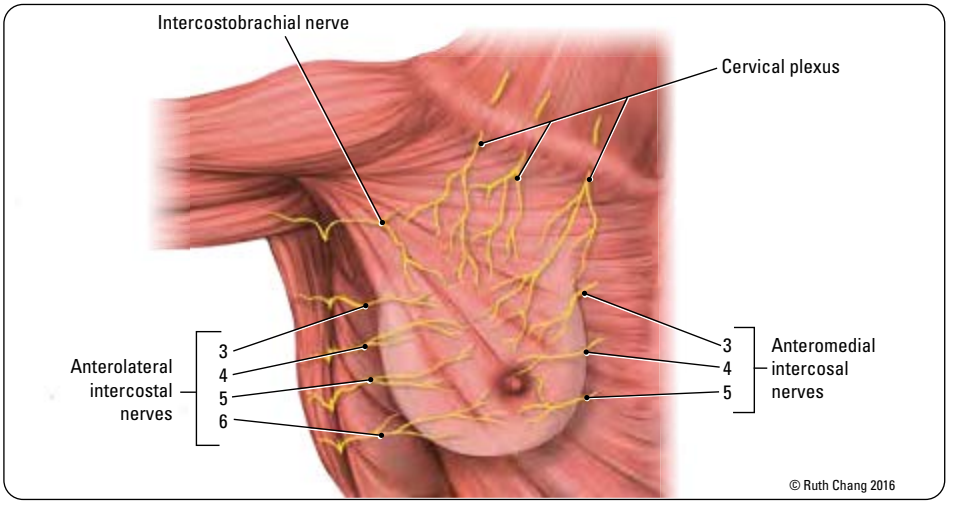

**Figure 33. Innervation of the breast**

# Breast Reduction

## Indications

- symptomatic (general symptoms)
  - musculoskeletal pain (back, strap, neck), chronic headache, paresthesia in upper limb, rashes under the breast, breast discomfort, and physical impairment
- breast reduction methods can be classified based on pedicle (i.e. blood supply to the nipple/areolar complex) and skin resection pattern (i.e. the resultant scar)

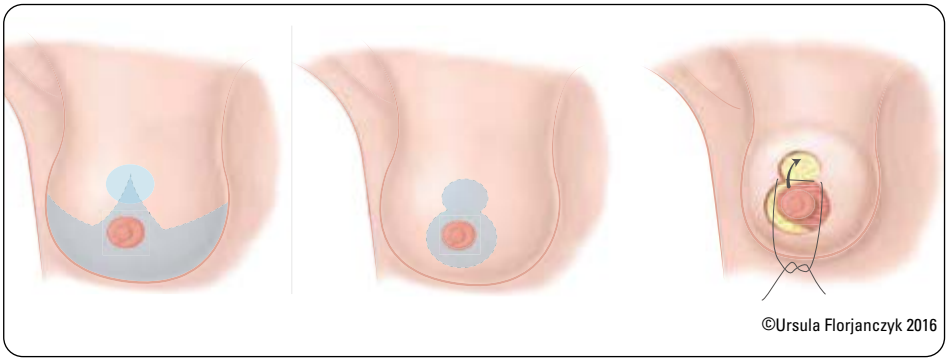

**Figure 34. Three diagrams of inverted T ("Wise") pattern reduction**

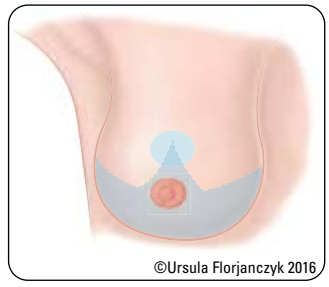

**Figure 35. Inverted T pattern**

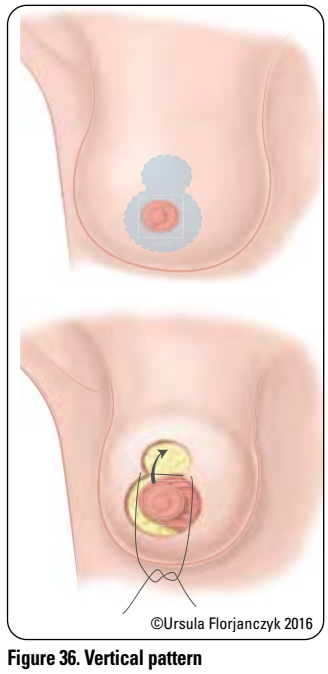

**Figure 36. Vertical pattern**

## Common Types of Pedicles

- inferior pedicle: derived from the fourth, fifth, and sixth intercostal perforators; most commonly used with the inverted T ("Wise") pattern reduction; versatile in small-large breast reduction
  - recommended pedicle width 6-8 cm, 8-10 cm in large breasts
- superior pedicle: derived from the internal mammary perforator of the second intercostal space
- medial pedicle: from horizontal bi-pedicle (Strombeck) techniques
  - blood supplied by internal mammary perforator and third intercostal and potentially fourth intercostal space
- superomedial pedicle: incorporate the descending artery from the second intercostal space as the medial pedicle base extends superolaterally to the breast meridian

**Table 26. Type of Skin Resections/Scar Options**

| | Indications | Description |
|---|---|---|
| **Inverted T Pattern** | Large breasts | Commonly used in association with inferior pedicle |
| | Breasts with poor quality skin that are challenging to remodel | Large portion of skin removed in horizontal and vertical direction |
| | | Skin integrity important to shape and hold breast parenchyma |
| **Vertical Pattern** | Skin must be healthy and easy to remodel | Used in association with superior or medial pedicle |
| | | Parenchyma needed to shape skin |
| | | No horizontal scar |
| | | Small to moderate reductions |

## Complications

- NAC necrosis
- sensory alteration of nipple (may vary with type of reduction pattern)
- unsatisfactory scarring, including hypertrophic or keloid scar
- wound healing complications (1-5% in healthy patients, higher in patients with elevated BMI)
- difficulty breastfeeding (controversial; potential issue in women of childbearing age)
- hematoma
- wound infection

# Mastopexy (Breast Lift)

### Definition
- aesthetic procedure of the breast used to correct for breast ptosis by modifying the contour and size of the breast along with elevating the position of the nipple

### Clinical Grading of Ptosis (Regnault Ptosis Grade Scale)
1. minor ptosis (Grade 1)
   - nipple at inframammary fold
2. moderate ptosis (Grade 2)
   - nipple below inframammary fold, but above lower breast contour
3. severe ptosis (Grade 3)
   - nipple below inframammary fold and at lower breast contour
4. glandular ptosis/pseudoptosis
   - ptosis of the lower pole of the breast where NAC is at or above the inframammary fold

### Choice of Incision
- mastopexy can be performed through the same incisions as breast reductions

# Breast Augmentation

### Definition
- procedure designed to increase the size of the breast

### Choice of Incision
- position of incision individualized since no single incision is best for all
- 3 commonly used types of incision: periareolar, inframammary crease, transaxillary

### Type of Implant
- silicone or saline-filled
- subclassified into various styles of surface and shape

### Location of Implant
- implants are commonly placed in the following positions:
  1. submuscular positions
     - implant placed below pectoralis major muscle
     - most commonly in patients that do not have enough tissue to cover the implant
  2. subglandular position
     - implant placed deep to glandular breast tissue but superficial to muscle
  3. subfascial
     - implant placed below the pectoralis fascia

### Complications
- breast implant-associated anaplastic large cell lymphoma (BiALCL)
  - increased risk of BiALCL with implants (only textured varieties)
  - presents as sudden onset of pain without injury, or as sudden onset of seroma on average of 7-8 yr after use of a textured implant for reconstruction or augmentation purposes
  - etiology: leading theory is that bacteria on implant form biofilm and tumour cells arise in response to the pathogen
  - 1/3000 risk
  - management: complete surgical removal of breast (mastectomy) and implant (including entire breast capsule); secondary management can include radiation therapy or brentuximab
- favourable clinical outcome if detected and treated early

# Gynecomastia

### Definition
- benign enlargement of the male breast due to proliferation of the glandular tissue

### Clinical Classification
- gynecomastia can be further classified into:
  1. idiopathic
  2. physiologic
     - neonatal: circulating maternal estrogens via placenta
     - pubertal: relative excess of plasma estradiol versus testosterone
     - elderly: decreased circulating testosterone, peripheral aromatization of testosterone to estrogen
  3. pathologic
     - endocrinopathies: excess estrogen, androgen deficiency, deficient production or action of testosterone
     - tumours
     - chronic disease: liver cirrhosis, renal
     - congenital/genetic: Klinefelter's syndrome, androgen resistance
  4. pharmacologic
     - drugs that may interefere with estrogen-testosterone balance including:
     - hormones (estrogens, gonadotropins, exogenous steroids)
     - antiandrogens
       - androgen receptor antagonists (steroidal and non-steroidal)
       - androgen synthesis inhibitors (5α-reductase inhibitors)
       - antigonadotropins (GnRH analogs, estrogens)
     - recreational drugs (marijuana, heroin, amphetamines)
     - antihypertensives (spironolactone)
  5. massive weight gain
     - for physical exam, investigations, and medical management (see Endocrinology, E47)

### Surgical Options
- surgery is the accepted management for gynecomastia
- surgery addresses the three components: breast, fat, skin
- often involves a combination of liposuction (to remove the fatty portion) and surgical excision through a small periareolar incision (to remove the glandular component)
- patients with significant skin excess may require skin excision as well

# Breast Reconstruction

- reconstruction of the breast after cancer or trauma to recreate the breast which is similar to the contralateral breast
- reconstruction can be performed immediately (at the same time as mastectomy), or delayed (as a separate surgery months or years after initial surgery)
- there are alloplastic and autogenous methods of reconstruction, each with its advantages and disadvantages

**Table 27. Timing of Immediate Reconstruction vs. Delayed Reconstruction**

| | Advantages | Disadvantages |
|---|---|---|
| **Immediate Reconstruction** | Generally best aesthetic outcome; may possibly preserve nipple if oncologically advisable<br>Does not require creation of additional skin<br>Tissues are not damaged from scarring | Skin viability assessment can be compromised<br>Longer surgical time<br>Less time for patient to consider surgical options |
| **Delayed Reconstruction** | More time for patients to discuss surgical options<br>Best for patients unable or unwilling to have immediate reconstruction<br>For patients who may be getting radiotherapy and undetermined post-surgery oncologic treatment<br>Provides option of contralateral surgery with reconstruction, if required (i.e. contralateral cancer) | Loss of skin, volume, lateral border of breast, and natural landmarks, including inframammary fold (makes surgery more challenging)<br>Resection of irradiated/scarred skin and associated wound healing complications, including risk of reconstructive failure<br>Likely requires more stages than immediate reconstruction for completion |

**Table 28. Alloplastic Reconstruction vs. Autogenous Reconstruction**

| | | Advantages | Disadvantages |
|---|---|---|---|
| **Alloplastic Reconstruction** | Single stage direct to implant (DTI) | Shorter surgery<br>May give a more complete or final result | Size restriction in reconstruction<br>Very few women meet criteria: grade 1 ptosis, small breast, skin-sparing mastectomy |
| | Two stage reconstruction with expander and implant | Less tension on mastectomy flaps compared to single-stage reconstruction with implants<br>Ability to increase skin to create breast and avoid use of flap<br>Some patient control over final outcome | Requires post-surgical procedures (requires patient to come to clinic for inflations)<br>Size of reconstruction limited to size and vascularity of mastectomy flaps |
| | Acellular dermal matrix and implant | Improved symmetry<br>Can cover areas of implant or tissue expander that cannot be covered by muscles | Greater risk of flap necrosis and infection |
| **Autogenous Reconstruction** | Latissimus Dorsi Flap | Reliable pedicle<br>Uses patient's own tissues<br>Provides skin and muscle<br>Possible to do muscle sparing procedure without flap compromise<br>Provides good amount of skin and muscle for reconstruction<br>Good option for delayed reconstruction, larger women, previously failed reconstruction, and to avoid complications of using abdominal wall | May also require implants for adequate volume |
| | TRAM (Transverse Rectus Abdominis Muscle) Flap | Can be done as a:<br>Fascial-sparing technique (Pedicled TRAM)<br>Free tissue transfer (Free TRAM)<br>Patient's own tissue (no implant)<br><br>Provides a good amount of tissue for transfer in most women<br>Provides a well-concealed scar | Second scar with second surgical site<br>Volume depends on patient's donor site<br><br>Pedicled TRAM:<br>Weakness in rectus abdominis with higher bulge rates<br><br>Free TRAM:<br>Similar complications to DIEPs<br>Less muscle used, decreased risk of hernia or bulge |
| | DIEP (Deep Inferior Epigastric Perforator) Flap | Method spares rectus abdominis muscle and fascia and should theoretically preserve innervation and continuity of abdominal wall | Requires microsurgical training for meticulous dissection of flap and appropriate choice of perforator<br>May not always be possible<br>Abdominal scarring and second wound |

# Nipple Areolar Complex Reconstruction

- nipple reconstruction is usually done as the final step when the patient is satisfied with breast mound creation
- reconstruction can be performed with local anesthetic since many women have decreased sensation in the mastectomy or breast flaps
- it can be done by either a flap, graft, or 3D tattoo

**Table 29. Types of Nipple Reconstruction**

| | Description | Advantages | Disadvantages |
|---|---|---|---|
| **Skate Flap** | Pedicle elevated above breast mound<br>Lateral aspects of flap are wrapped around central aspect of flap<br>Defect mainly closed by skin graft | Low complication rates | Donor site morbidity<br>May have loss of projection over time<br>Skin graft required |
| **Cv Flap** | Utilizes C flap and two V flaps for nipple reconstruction<br>Diameter of C flap becomes diameter of reconstructed nipple<br>Width of V flaps dictate projection of reconstructed nipple<br>CV closed with primary closure | No grafts required | Nipple size limited by flap dimensions<br>May have loss of projection over time<br>Tattooing required to match natural areola |
| **Nipple Graft** | Tissue commonly from contralateral nipple (nipple share) or labia<br>Two methods for nipple graft:<br>• Distal aspect of nipple removed transversely and defect closed with purse string suture<br>• Nipple divided in half longitudinally, folded over, and closed with primary closure | Nipple share is an excellent option in patients with contralateral nipple projection >1 cm | Donor site morbidity<br>Decreased contralateral nipple sensation<br><br>Labial graft: may be too dark |

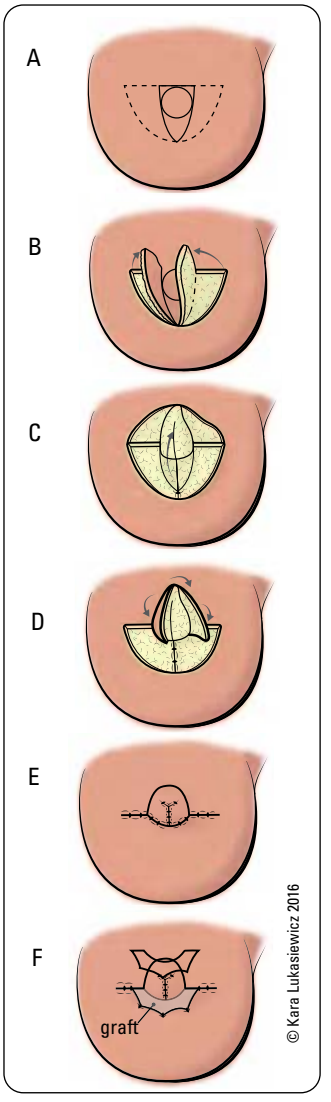

**Figure 37. Skate flap**
**E, skate flap with primary closure of donor site**
**F, with skin graft**

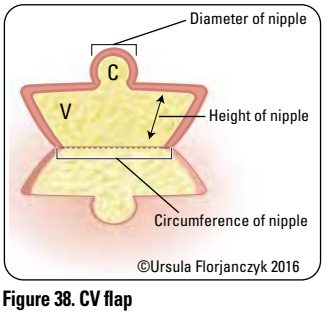

**Figure 38. CV flap**

**Table 30. Types of Areolar Reconstruction**

| | Description | Advantages | Disadvantages |
|---|---|---|---|
| **Tattoo** | Conducted 3-4 mo after nipple reconstruction when most of the projection has stabilized | Can provide more accurate colour matching with limited morbidity | May require touch-ups due to pigment fading over time with skin sloughing |
| **Skin graft** | Full thickness skin grafts, commonly from inner aspect of thigh or opposite areola | Provides texture and pigment resembling a natural areola | Donor site morbidity |

* Tattoo and skin grafting can be used in conjunction

# Aesthetic Surgery

## Aesthetic Procedures

**Table 31. Aesthetic Procedures**

| Location | Procedure | Description |
|---|---|---|
| **Head/Neck** | Hair transplants | Aesthetic improvement of hair growth patterns using hair follicle grafts or flaps |
| | Otoplasty | Surgical correction of protruding ears |
| | Forehead/Brow lift | Surgical procedure to lift the forehead and eyebrows |
| | Rhytidectomy | Surgical procedure to reduce wrinkling and sagging of the face and neck; "face lift" |
| | Blepharoplasty | Surgical procedure to shape or modify the appearance of eyelids by removing excess eyelid skin ± fat pads |
| | Rhinoplasty | Surgical reconstruction of the nose ± nasal airway |
| | Genioplasty | Chin augmentation via osteotomy or synthetic implant to improve contour |
| **Skin** | Chemical peel | Application of one or more exfoliating agents to the skin resulting in destruction of portions of the epidermis and/or dermis with subsequent tissue regeneration |
| | Dermabrasion | Skin resurfacing with a rapidly rotating abrasive tool; often used to reduce scars, irregular skin surfaces, and fine lines |
| | Laser resurfacing | Application of laser to the skin which ultimately results in collagen reconfiguration and subsequent skin shrinking and tightening; often used to reduce scars and wrinkles |
| | Injectable fillers | An injectable substance is used to decrease facial rhytids; can augment lips to create fuller appearance; substances include: collagen, fat, hyaluronic acid, and calcium hydroxyapatite (most common substances include hyaluronic acid and fat) |
| **Other** | Abdominoplasty | Removal of excess skin and repair of rectus muscle laxity (rectus diastasis); "tummy tuck" |
| | Calf augmentation | Augmentation of calf muscle with implants |
| | Liposuction | Surgical removal of adipose tissue for body contouring (not a weight loss procedure) |

# Pediatric Plastic Surgery

## Craniofacial Anomalies

**Table 32. Pediatric Craniofacial Anomalies**

| | Definition | Epidemiology | Clinical Features | Treatment |
|---|---|---|---|---|
| **Cleft Lip** | Failure of fusion of maxillary and medial nasal processes | 1 in 1000 live births (1 in 800 Caucasians, increased in Asians, decreased in Blacks)<br>M:F=2:1 | Classified as incomplete/complete and uni/bilateral; 2/3 cases: unilateral, left-sided, male | Surgery (3 mo): Millard Tennison-Randall, or Fisher (additional corrective surgeries usually required later on - especially for nasal deformity) |
| **Cleft Palate** | Failure of fusion of lateral palatine/median palatine processes and nasal septum | Isolated cleft palate: 0.5 per 1000 (no racial variation)<br>F>M | Classified as incomplete/complete and uni/bilateral<br>Isolated (common in females) or in conjunction with cleft lip (common in males) | Special bottles for feeding<br>Speech pathologist<br>Surgery (6-9 mo):<br>Von Langenbeck or Furlow Z-Plasty<br>ENT consult – often recurrent otitis media, requiring myringotomy tubes |
| **Craniosynostosis** | Premature fusion of ≥1 cranial sutures | 1 in 2000 live newborns;<br>M:F=52:48<br>Syndromes include: Crouzon's, Apert's, Saethre-Chotzen, Carpenter's, Pfeiffer's, Jackson-Weiss, and Boston-type syndromes | Primary (no known cause), or secondary (associated with a known cause or syndrome) | Multidisciplinary team (including neurosurgery, ENT, genetics, dentistry, pediatrics, SLP)<br>The type, timing, and procedure are dependent on which sutures (lambdoid, sagittal, etc.) are involved<br>Early surgery prevents secondary deformities<br>↑ ICP is an indication for emergent surgery |

# Congenital Hand Anomalies

**Table 33. American Society for Surgery of the Hand (ASSH) Classification of Congenital Hand Anomalies**

| Classification | Example | Features | Treatment |
|---|---|---|---|
| **Failure of Formation** | Transverse absence (congenital amputation) | At any level (often below elbow/wrist) | Early prosthesis |
| | Longitudinal absence (phocomelia) | Absent humerus<br>Thalidomide association | |
| | Radial deficiency (radial club hand) | Radial deviation<br>Thumb hypoplasia<br>M>F | Physiotherapy + splinting<br>Soft tissue release if splinting fails<br>Distraction osteogenesis (Ilizarov distraction)<br>± wedge osteotomy<br>Tendon transfer<br>Pollicization |
| | Thumb hypoplasia | Degree ranges from small thumb with all components to complete absence | Depends on degree – may involve no treatment, webspace deepening, tendon transfer, or pollicization of index finger |
| | Ulnar club hand | Rare, compared to radial club hand<br>Stable wrist | Splinting and soft tissue stretching therapies<br>Soft tissue release (if above fails)<br>Correction of angulation (Ilizarov distraction) |
| | Cleft hand | Autosomal dominant<br>Often functionally normal (depending on degree) | First web space syndactyly release<br>Osteotomy/tendon transfer of thumb (if hypoplastic) |
| **Failure of Differentiation/ Separation** | Syndactyly | Fusion of ≥2 digits<br>1/3000 live births<br>M:F=2:1<br>Classified as partial/complete<br>Simple (skin only) vs. complex (osseous or cartilaginous bridges) | Surgical separation before 6-12 mo of age<br>May require a skin graft to cover the fingers<br>Usually good result |
| | Symbrachydactyly | Short fingers with short nails at fingertips | Digital separation<br>Webspace deepening |
| | Camptodactyly | Congenital flexion contracture (usually at PIP, especially 5th digit) | Early splinting<br>Volar release<br>Arthroplasty (rarely) |
| | Clinodactyly | Radial or ulnar deviation<br>Often middle phalanx | None (usually); if severe, osteotomy with grafting |
| **Duplication** | Polydactyly | Congenital duplication of digits<br>May be radial (increased in Aboriginals and Asians) or central or ulnar (increased in Blacks) | Amputation of least functional digit<br>Usually >1 yr of age (when functional status can be assessed) |
| **Overgrowth** | Macrodactyly | Rare | None (if mild)<br>Soft tissue/bony reduction |
| **Undergrowth** | Brachydactyly | Short phalanges | Removal of nonfunctional stumps<br>Osteotomies/tendon transfers<br>Distraction osteogenesis<br>Phalangeal/free toe transfer |
| | Symbrachydactyly | Short webbed fingers | As above + syndactyly release |
| | Brachysyndactyly | | |
| **Constriction Band Syndrome** | i.e. amniotic (annular) band syndrome | Variety of presentations | Urgent release for acute, progressive edema distal to band in newborn<br>Other reconstruction is case specific |
| **Generalized Skeletal Abnormality** | Achondroplasia, Marfan's, Madelung's | Variety of presentations | Treatment depends on etiology |

| CTO | community treatment order | MDE | major depressive episode | PDD | pervasive developmental disorder | | |

# Psychiatric Assessment

## History

### Identifying Data
- necessary: name, age, sex/gender, marital status, occupation/source of financial support, place/type of residency
- adjunct: makeup of household, education, ethnicity, nationality, immigration history (if applicable), religion, current professional supports (GP, psychiatrist, case manager, therapist, etc), referral source, known or unknown to treatment team

### Reliability of Patient as a Historian
- indicate if, and for what content; utilize collateral source (i.e. parent, teacher, partner) if patient unable/unwilling to be interviewed

### Chief Complaint
- in patient's own words, with duration of symptoms

### History of Present Illness
- reason for seeking help (that day) and hopes/expectations for treatment
- current symptoms (onset, duration, fluctuation, progression, and course) and relevant associated symptoms (pertinent positives and negatives)
- potential precipitants for current problem, stressors, supports
- functional status: consider impact of current problems on personal care and survival, family functioning, occupational functioning, and broad social functioning
- safety screen: endangering self or others, dependents at home (i.e. children, pets), ability to drive safely, ability to care for self (i.e. eating, hygiene, taking medications)
- active medical problems

### Psychiatric Functional Inquiry
- mood: depression, mania
- anxiety: worries, panic attacks, phobias, or social anxiety
- history of trauma
- obsessive-compulsive: obsessions, compulsions
- psychosis: hallucinations, delusions
- risk assessment: suicidal ideation, plan, intent, and history of attempts (see Suicide, PS5)
- organic: illness, dementia

### Past Psychiatric History
- all previous psychiatric diagnoses, psychiatric contacts, treatments (pharmacological and non-pharmacological), and hospitalizations
- include past suicide attempts, severity, necessity for medical intervention

### Substance Use History
- smoking, EtOH/drug use or withdrawal
- past treatments, periods of sobriety

### Past Medical/Surgical History
- all medical, surgical, neurological (i.e. head trauma, seizures), and psychosomatic illnesses
- current medications, doses, adherence, allergies

### Family Psychiatric/Medical History
- any past or current psychiatric illnesses and hospitalizations, suicide attempts, and substance abuse
- if relevant: any past medical or genetic illness

**Screening Questions for Major Psychiatric Disorders**
- Have you been feeling down, depressed or hopeless?
- Do you feel anxious or worry about things?
- Has there been a time in your life where you have felt euphoric, extremely talkative, had a lot of energy, and a decreased need for sleep?
- Do you see or hear things that you think other people cannot?
- Have you ever thought of harming yourself or killing yourself?

**Psychiatric Functional Inquiry**

**MOAPS**
**M**ood
**O**rganic (e.g. substances and organic disease)
**A**nxiety
**P**sychosis
**S**afety

**Always Remember to Ask About Abuse**
See Family Medicine, FM26

### Past Personal/Developmental History (as relevant)

- family members: ages, occupations, personalities
- relationships with parents/siblings/partner/friends
- prenatal and perinatal history (desired vs. unwanted pregnancy, maternal and fetal health, domestic violence, maternal substance use and exposures, complications of pregnancy/delivery)
- early childhood to age 3 (developmental milestones, activity/attention level, family stability, or attachment figures)
- middle childhood to age 11 (school performance, peer relationships, behavioural challenges)
- late childhood to adolescence (drugs/alcohol, legal problems, peer and family relationships)
- history of physical or sexual abuse
- adulthood (education, employment, relationships)
- personality before current illness, or recent changes in personality
- psychosexual history (puberty, first sexual encounter, romantic relationships, gender roles, and sexual dysfunction)
- problems/encounters with the legal system

## Mental Status Exam

### General Appearance

- posture, gait, grooming, hygiene, manner of dress, body habitus, facial expression, chronological vs. apparent age, and relaxed or in distress, alertness

### Attitude

- disposition in interview (i.e. uncooperative, suspicious, or hostile)

### Behaviour

- psychomotor activity (agitation, retardation), abnormal movements or lack thereof (tremors, akathisia, tardive dyskinesia, paralysis), attention level and eye contact

### Speech

- rate (i.e. pressured, slowed), rhythm/fluency, volume, tone, articulation, quantity, spontaneity

### Mood and Affect

- mood: subjective emotional state (in patient's own words)
- affect: objective emotional state inferred from emotional responses to stimuli; described in terms of
  - quality (euthymic, depressed, elevated, anxious, irritable)
  - range (full, restricted, flat, blunted)
  - stability (fixed, labile)
  - mood congruence (inferred by comparing the patient's subjective mood with their affect)
  - appropriateness to thought content
- many clinicians use a 0-10 scale (0; worst; 10: best) when rating mood to get a subjective norm for each patient that can help to monitor changes over time and with treatment

### Thought Process/Form

- coherence (coherent, incoherent)
- logic (logical, illogical)
- stream
  - goal-directed: clearly answers questions in a linear, organized, logical fashion
  - circumstantial: speech that is indirect and delayed in reaching its goal; eventually comes back to the point
  - tangential: speech is oblique or irrelevant; does not come back to the original point
  - loosening of associations/derailment: illogical shifting between topics
  - flight of ideas: quickly skipping from one idea to another where the ideas are marginally connected, usually associated with mania
  - word salad: jumble of words lacking meaning or logical coherence
- perseveration: repetition of the same verbal or motor response to stimuli
- echolalia: repetition of phrases or words spoken by someone else
- thought blocking: sudden cessation of flow of thought and speech
- clang associations: speech based on sound such as rhyming or punning
- neologism: use of novel words or of existing words in a novel fashion

### Thought Content

- suicidal ideation/homicidal ideation
  - frequency and pervasiveness of thoughts, formulation of plan, means to plan, intent, active vs. passive, protective factors
- preoccupations, ruminations: reflections/thoughts at length, not fixed or false
- obsession: recurrent and persistent thought, impulse, or image which is intrusive or inappropriate and unwanted
  - cannot be stopped by logic or reason
  - causes marked anxiety and distress
  - common themes: contamination, orderliness, sexual, pathological doubt/worry/guilt

**Mental Status Exam**

**ASEPTIC**
**A**ppearance and behaviour
**S**peech
**E**motion (mood and affect)
**P**erception
**T**hought content and process
**I**nsight and judgment
**C**ognition

The MSE is analogous to the physical exam. It focuses on current signs, affect, behaviour, and cognition

**Spectrum of Affect**
Full > Restricted > Blunted > Flat

There is poor correlation between clinical impression of suicide risk and frequency of attempts

**Cognitive Assessment**
**Use MMSE to assess**
- Orientation (time and place)
- Memory (immediate and delayed recall)
- Attention and concentration
- Language (comprehension, reading, writing, repetition, naming)
- Spatial ability (intersecting pentagons)

Gross screen for cognitive dysfunction: Total score is out of 30; <26 abnormal, 20-26 mild, 10-19 moderate, <10 severe

The key to differentiating obsessions and delusions is that obsessions are usually ego dystonic, meaning unwanted and not fitting in with a person's goals and self-image, while delusions are ego syntonic

**Delusions**
- Persecutory: belief that others are trying to cause harm to you
- Reference: interpreting publicly known events/celebrities as having direct reference to you
- Erotomania: belief that another is in love with you
- Grandiose: belief that he or she has special powers, talents or abilities
- Religious: belief of receiving instructions/powers from a higher being; of being a higher being
- Somatic: belief that you have a physical disorder/defect
- Nihilistic: belief that things do not exist; a sense that everything is unreal

- magical thinking (i.e. superstition, belief that thinking something will make it happen), normal in children and certain cultures
- ideas of reference: similar to delusion of reference, but less fixed (the reality of the belief is questioned)
- overvalued ideas: unusual/odd beliefs that are not of delusional proportions
- first rank symptoms of schizophrenia: thought insertion/withdrawal/broadcasting
- delusion: a fixed false belief that is out of keeping with a person's cultural or religious background and is firmly held despite incontrovertible proof to the contrary

### Perception
- hallucination: sensory perception in the absence of external stimuli that is similar in quality to a true perception
  - auditory (most common), visual, gustatory, olfactory, tactile
- illusion: misperception of a real external stimulus (such as mistaking a coat on a rack as a person late at night)
- depersonalization: change in self-awareness such that the person feels unreal, distant, or detached from his or her body, and/or unable to feel emotion
- derealization: feeling that the world/outer environment is unreal

### Cognition
- level of consciousness (alert, reduced, obtunded)
- orientation: time, place, person
- memory: immediate, recent, or remote
- global evaluation of intellect (below average, average, above average, in keeping with person's education)
- intellectual functions: attention, concentration, calculation, abstraction (proverb interpretation, similarities test), language, communication
- MMSE/MOCA useful as standard screening assessments of cognition

### Insight
- patient's ability to realize that he or she has a physical or mental illness and to understand its implications (none, limited, partial, or full)

### Judgment
- patient's ability to understand relationships between facts and draw conclusions that determine one's actions

**Assessing Insight and Judgment**

**Insight**
- Do you think that you have a mental illness?
- Why are you taking this medication? What would happen if you stopped taking it?
- Why are you in the hospital?

**Judgment**

Can be observed from collected history and patient's appearance and actions
- Is he/she dressed appropriately for the weather?
- Is he/she acting appropriately in the given situation?
- Is he/she taking care of self and/or dependents?

# Assessment and Plan

### Historical Multiaxial Model
- since DSM-5, this model is no longer used for psychiatric diagnosis. Instead, relevant psychiatric and medical diagnoses are simply listed. Nevertheless, we offer it here as a possible framework for psychiatric patient assessment, as many physicians still employ it

### Multiaxial Assessment
- Axis I: DSM-5 diagnoses (preferred and differential)
- Axis II: personality disorders, intellectual disability
- Axis III: medical conditions potentially relevant to understanding/management of the mental disorder
- Axis IV: psychosocial and environmental issues
- Axis V: Global Assessment of Functioning (GAF, 0 to 100) incorporating effects of axes I to IV

### After History and MSE, the assessment and plan is recorded

### Assessment/Problem Formulation
- identify predominant symptom cluster (mood, anxiety, psychosis, organic) causing the most distress/interference, persist when other symptom categories not present (i.e. psychosis in the absence of mood symptoms)
- dominating symptoms will direct differential
- consider current issues as they relate to an individual considering three domains: biological, psychological, and social
- for each category: predisposing, precipitating, perpetuating, and protecting factors are considered

Always rule out substance use and organic causes before considering psychiatric causes

### Approach to Management
- consider short-term and long-term, and three types: biological (i.e. pharmacotherapy, ECT), psychological (i.e. CBT), and social (i.e. supports, finance/employment/return to work, social activity, medication coverage, psychotherapy coverage)

# Suicide

## Importance
- must be screened for in every encounter; part of risk assessment along with violent/homicidal ideation

## Approach
- ask every patient: i.e. "Have you had any thoughts of wanting to harm or kill yourself?"
- classify ideation
  - passive ideation ("death wish"): would rather not be alive but has no active plan for suicide
    - i.e. "I'd rather not wake up" or "I would not mind if a car hit me"
  - active ideation
    - i.e. "I think about killing myself"
- assess risk
  - plan: "Do you have a plan as to how you would end your life?"
  - intent: "Do you think you would actually carry out this plan?" "If not, why not?"
  - past attempts: number, lethality, outcome, medical intervention, while intoxicated?, precipitants
- assess suicidal ideation
  - onset and frequency of thoughts: "When did this start?" or "How often do you have these thoughts?"
  - control over suicidal ideation: "How do you cope when you have these thoughts?" "Could you call someone for help?"
  - intention: "Do you want to end your life?" or "Do you wish to kill yourself?"
  - intended lethality: "What do you think would happen if you actually took those pills?"
  - access to means: "How will you get a gun?" or "Which bridge do you think you would go to?"
  - time and place: "Have you picked a date and place? Is it in an isolated location?"
  - provocative factors: "What makes you feel worse (i.e. being alone)?"
  - protective factors: "What keeps you alive (i.e. friends, family, pets, faith, therapist)?"
  - final arrangements: "Have you written a suicide note? Made a will? Given away your belongings?"
  - practiced suicide or aborted attempts: "Have you ever put the gun to your head?" "Held the medications in your hand?" "Stood at the bridge?"
  - ambivalence: "I wonder if there is a part of you that wants to live, given that you came here for help?"
  - determine level of risk and develop treatment/safety plan

**Suicidal Ideation Assessment**
- Asking patients about suicide will not give them the idea or the incentive to die by suicide
- The best predictor of completed suicide is a history of attempted suicide
- The most common psychiatric disorders associated with completed suicide are mood disorders and alcohol abuse

## Assessment of Suicide Attempt
- setting (isolated vs. others present/chance of discovery)
- planned vs. impulsive attempt, triggers/stressors
- substance use/intoxication
- medical attention (brought in by another person vs. brought in by self to ED)
- time lag from suicide attempt to ED arrival
- expectation of lethality, dying
- reaction to survival (guilt/remorse vs. disappointment/self-blame)
- evidence of escalation in potential lethal means

## Epidemiology
- attempted:completed = 20:1 (100:1 in younger persons; 4:1 in older persons)
- M:F = 1:4 for attempts, 3:1 for completed

## Risk Factors
- epidemiologic factors
  - age: increases after age 14, second most common cause of death for ages 15-24, highest rates of completion in persons >75 yr
  - sex: male
  - race/ethnic background: white or Indigenous Canadians
  - marital status: widowed/divorced
  - living situation: alone; no children <18 yr old in the household
  - other: stressful life events, or access to firearms
- psychiatric factors
  - past suicide attempt(s)
  - eating disorders
  - bipolar disorder
  - major depression
  - mixed drug abuse
  - panic disorder
  - schizophrenia
  - personality disorder
  - alcohol abuse
- psychosocial factors
  - recent, severe stressful life event

**Suicide Risk Factors**

**SAD PERSONS**
**S**ex (male)
**A**ge >60 yr old
**D**epression
**P**revious attempts
**E**thanol abuse
**R**ational thinking loss (delusions, hallucinations, hopelessness)
**S**uicide in family
**O**rganized plan
**N**o spouse (no support systems)
**S**erious illness, intractable pain

- psychiatric disorders
  - mood disorders (15% lifetime risk in depression; higher in bipolar)
  - anxiety disorders (especially panic disorder)
  - schizophrenia (10-15% risk)
  - substance abuse (especially alcohol – 15% lifetime risk)
  - eating disorders (5% lifetime risk)
  - adjustment disorder
  - conduct disorder
  - personality disorders (borderline, antisocial)
- past history
  - prior suicide attempt
  - family history of suicide attempt/completion

## Clinical Feature

- symptoms associated with suicide:
  - hopelessness
  - anhedonia
  - insomnia
  - severe anxiety
  - impaired concentration
  - psychomotor agitation

## Management

- proper documentation of the clinical encounter and rationale for management is essential
- higher risk (patients with a plan and intention to act, have access to lethal means, recent social stressors, and symptoms suggestive of a psychiatric disorder)
  - hospitalization to be strongly considered
  - do not leave patient alone; remove potentially dangerous objects from room
  - if patient refuses to be hospitalized, complete form for involuntary admission (Form 1) and must give patient Form 30 to notify them of their admission
- lower risk (patients who are not actively suicidal, with no active plan or access to lethal means)
  - discuss protective factors and supports in their life, remind them of what they live for, promote survival skills that helped them through previous suicide attempts
  - make a safety plan that could include an agreement that they will:
    - not harm themselves
    - avoid alcohol, drugs, and situations that may trigger suicidal thoughts
    - follow-up with you at a designated time
    - contact a health care worker, call a crisis line, or go to an emergency department if they feel unsafe or if their suicidal feelings return or intensify
- patients with depression: consider hospitalization if symptoms severe or if psychotic features are present; otherwise outpatient treatment with good supports and SSRIs/SNRIs
- patients with alcohol- or substance-related issues: suicidality usually resolves with abstinence for a few days; if not, suspect depression
- patients with personality disorders: crisis intervention, may or may not hospitalize
- patients with schizophrenia/psychosis: hospitalization might be necessary
- patients with parasuicidal behaviours/self-mutilation: long-term psychotherapy with brief crisis intervention when necessary

# Psychotic Disorders

## Definition

- characterized by a significant impairment in reality testing
- positive symptoms
  - delusions or hallucinations (with or without insight into their pathological nature)
  - disorganized behaviours
  - formal thought disorder
- negative symptoms
  - affective flattening
  - anhedonia
  - avolition
  - alogia
  - asociality

# Differential Diagnosis of Psychosis

## Approach

- differentiate among psychotic disorders and distinguish them from other primary diagnoses with psychotic features
- consider symptoms, persistence, and time
- symptoms: the primary diagnosis needs full criteria to be met
  - mood: depressive episodes with psychotic features, manic episodes with psychotic features
  - psychotic: consider symptoms in Criterion A of schizophrenia (see *Criteria for Schizophrenia*)
- persistence: is there a time when certain symptom clusters are present without other clusters?
  - i.e. if there is a period of time with mood symptoms but not psychotic symptoms, consider mood disorder
  - i.e. if two weeks during which psychotic symptoms persist in the absence of mood symptoms, consider schizoaffective disorder
  - i.e. if long periods with psychotic symptoms and brief or rare mood symptoms, consider schizophrenia
- time: how long have the symptoms been present?

**Table 1. Differentiating Psychotic Disorders**

| Disorder | Psychotic Symptoms | Duration |
|---|---|---|
| **Brief Psychotic Disorder** | ≥1 positive symptoms of criterion A | <1 mo |
| **Schizophreniform Disorder** | Criterion A | 1-6 mo |
| **Schizophrenia** | Criterion A | >6 mo |
| **Schizoaffective Disorder** | Criterion A + major mood episode, but ≥2 wk psychotic without mood symptoms | >1 mo |
| **Delusional Disorder** | Non-bizarre delusions (±hallucinations) | >1 mo |
| **Substance-Induced Psychotic Disorder** | Delusions or hallucinations | During intoxication/withdrawal, resolve in less than 1 mo without use |
| **2º to Mood Disorder** | Mood symptoms dominant + delusions/ hallucinations (mood congruent) | Psychosis may be present for the duration of the mood episode |

## Relevant Investigations

- CBC, electrolytes (including extended lytes), creatinine, glucose, urinalysis, urine drug screen, TSH, Vit B12
- LFTs, fasting lipids, HbA1C to obtain baseline levels prior to antipsychotic initiation
- ECG (several antipsychotics affect cardiac conduction)
- If clinically indicated, order infectious work-up, inflammatory markers, brain imaging

**Delusions:** fixed, false beliefs
**Hallucinations:** perceptual experiences without an external stimulus

**Duration of Time Differentiates the following 3 Psychotic Disorders**

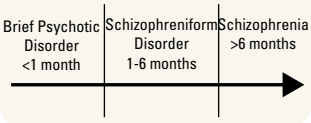

**Figure 1. Differentiating psychotic disorders by duration**

**Ddx for Psychosis**

- Primary psychotic disorders: schizophrenia, schizophreniform, brief psychotic, schizoaffective, delusional disorder
- Mood disorders: major depressive disorder with psychotic features, bipolar disorder (manic or depressive episode with psychotic features)
- Personality disorders: schizotypal, schizoid, borderline, paranoid, obsessive-compulsive (they predispose to psychosis but presence of psychotic symptoms require another diagnosis)
- General medical conditions: tumour, head trauma, dementia, delirium, metabolic, infection, stroke, temporal lobe epilepsy
- Substance-induced psychosis: intoxication or withdrawal, prescribed medications, toxins

**Management of Acute Psychosis and Mania**

- Ensure safety of self, patient, and other patients
- Have an exit strategy
- Decrease stimulation
- Assume a non-threatening stance
- IM medications (benzodiazepine + antipsychotic) often needed as patient may refuse oral medication
- Physical restraints may be necessary
- Do not use antidepressants or stimulants

**Relationship Between Duration of Untreated Psychosis (DUP) and Outcome in First-Episode Schizophrenia**
*Am J Psychiatry* 2005;162:1785-1804
**Purpose**: To review the association between DUP and symptom severity at first treatment contact, and between DUP and treatment outcomes.
**Methods**: Critical review and meta-analysis of studies involving patients with non-affective psychotic disorders at or close to first treatment.
**Results**: 43 studies with 4177 patients were included. Shorter DUP was associated with greater response to antipsychotic treatment, as measured by global psychopathology, positive symptoms, negative symptoms, and functional outcomes. At the time of treatment initiation, longer DUP was associated with the severity of negative symptoms but not with the severity of positive symptoms, global psychopathology, or neurocognitive function.
**Conclusions**: DUP may be a potentially modifiable prognostic factor.

# Schizophrenia

## DSM-5 DIAGNOSTIC CRITERIA FOR SCHIZOPHRENIA

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. two (or more) of the following, each present for a significant portion of time during a 1 mo period (or less if successfully treated). At least one of these must be (1), (2), or (3)
   1. delusions
   2. hallucinations
   3. disorganized speech (i.e. frequent derailment or incoherence)
   4. grossly disorganized or catatonic behaviour
   5. negative symptoms (i.e. diminished emotional expression or avolition)

B. decreased level of function: for a significant portion of time since onset, one or more major areas affected (i.e. work, interpersonal relations, self-care) is markedly decreased (or if childhood/adolescent onset, failure to achieve expected level)

C. at least 6 mo of continuous signs of the disturbance. Must include at least 1 mo of symptoms (or less if successfully treated) that meet Criterion A (i.e. active-phase symptoms) and may include periods of prodromal or residual symptoms, during which, disturbance may manifest by only negative symptoms or by two or more Criterion A symptoms present in an attenuated form (i.e. odd beliefs, unusual perceptual experiences)

D. rule out schizoaffective disorder and depressive or bipolar disorder with psychotic features because either 1) no major depressive or manic episodes have occurred concurrently with the active-phase symptoms, or 2) if mood episodes have occurred during active-phase symptoms, they have been present for a minority of the total duration of the active and residual periods of the illness

E. rule out other causes: GMC, substances (i.e. drug of abuse, medication)

F. if history of autism spectrum disorder or communication disorder of childhood onset, the additional diagnosis of schizophrenia is made only if prominent delusions or hallucinations are also present for at least 1 mo (or less if successfully treated)

- **specifiers**: type of episode (i.e. first episode, multiple episodes, continuous), with catatonia, current severity based on quantitative assessment of primary symptoms of psychosis (in acute episode, in partial remission, in full remission)

### Epidemiology

- prevalence: 0.3-0.7%, M:F = 1:1
- mean age of onset: females late-20s to 40s; males early- to mid-20s (some cases with late onset)
- suicide risk: 10% die by suicide, 30% attempt suicide

### Etiology

- multifactorial: disorder is a result of interaction between both biological and environmental factors
  - genetic: 40% concordance in monozygotic (MZ) twins; 46% if both parents have schizophrenia; 10% of dizygotic (DZ) twins, siblings, children affected; vulnerable genes include Disrupted-in-Schizophrenia 1 (DISC1); neuregulin 1 (NRG 1); dystrobrevin binding protein / dysbindin (DTNBP1); catechol-O-methyltransferase (COMT); d-amino acid oxidase activator (DAOA); metabotropic glutamate receptor 3 (GRM3); and brain-derived neurotrophic factor (BDNF)
  - neurochemistry ("dopamine hypothesis"): excess activity in the mesolimbic dopamine pathway may mediate the positive symptoms of psychosis, while decreased dopamine in the prefrontal cortex may mediate negative and cognitive symptoms. GABA, glutamate, and ACh dysfunction are also thought to be involved
  - neuroanatomy: decreased frontal lobe function; asymmetric temporal/limbic function; decreased basal ganglia function; subtle changes in thalamus, cortex, corpus callosum, and ventricles; cytoarchitectural abnormalities
  - neuroendocrinology: abnormal growth hormone, prolactin, cortisol, and ACTH
  - neuropsychology: global defects seen in attention, language, and memory suggest disrupted connectivity of neural networks
  - environmental: indirect evidence of cannabis use, geographical variance, winter season of birth, obstetrical complications, and prenatal viral exposure

### Pathophysiology

- neurodegenerative theory: natural history may be a rapid or gradual decline in function and ability to communicate
  - glutamate system may mediate progressive degeneration by excitotoxic mechanism which leads to production of free radicals
- neurodevelopmental theory: abnormal development of the brain from prenatal life
  - neurons fail to migrate correctly, make inappropriate connections, and apoptosis in later life

### Comorbidity

- substance-related disorders
- anxiety disorders
- reduced life expectancy secondary to medical comorbidities (i.e. obesity, diabetes, metabolic syndrome, CV/pulmonary disease)

**Disorganized Behaviours in Schizophrenia**

- Catatonic stupor: fully conscious, but mute, and unresponsive, immobile, , maintaining bizarre positions for a long time
- Catatonic excitement: uncontrolled and aimless motor activity, extreme agitation
- Stereotypy: repeated but non-goal-directed movement (i.e. rocking)
- Mannerisms: goal-directed activities that are odd or out of context (i.e. grimacing)
- Echopraxia: imitates movements and gestures of others
- Automatic obedience: carries out simple commands in robot-like fashion
- Negativism: refuses to cooperate with simple requests for no apparent reason
- Inappropriate affect, neglect of self-care, other odd behaviours (random shouting)

**Cannabis Use and Earlier Onset of Psychosis**

Arch Gen Psychiatry 2011;68:555-561

**Purpose**: To examine the extent to which cannabis, alcohol and other psychoactive drugs affect the age of onset of psychosis.

**Method**: A systematic review and meta-analysis. English studies were included that compared two cohorts: patients who used substances versus patients who do not use substance.

**Results**: 83 studies were included. Age of onset in cannabis users was 2.7 years younger than in nonusers. For broadly defined substance use, age of onset of psychosis was 2.0 years earlier than for nonusers. Alcohol use was not associated with significantly earlier age of psychosis.

**Conclusions**: These results provide evidence that cannabis plays a role in earlier onset of psychosis.

### Management of Schizophrenia

- biological / somatic
  - acute treatment and maintenance: antipsychotics (risperidone, aripiprazole, haloperidol, paliperidone; clozapine if resistant); regimens of IM q2-4 wk used in severe cases to improve adherence
  - adjunctive: ± mood stabilizers (for aggression/impulsiveness - lithium, valproate, carbamazepine) ± anxiolytics ± ECT
  - treat for at least 1-2 years after the first episode, at least 5 years after multiple episodes (relapse causes severe deterioration)
- psychosocial
  - psychotherapy (individual, family, group), supportive, CBT (see Table 14, PS41)
  - ACT (Assertive Community Treatment): mobile mental health teams that provide individualized treatment in the community and help patients with medication adherence, basic living skills, social support, job placements, resources
  - social skills training, employment programs, disability benefits
  - housing (group home, boarding home, transitional home)

### Course and Prognosis

- majority of individuals display some type of prodromal phase
- course is variable: some individuals have exacerbations and remissions while others remain chronically ill; accurate prediction of the long-term outcome is not possible
- positive symptoms typically diminish with treatment; negative symptoms may be prominent early in the illness or may become more prominent and more disabling later on
- over time: 1/3 improve, 1/3 remain the same, 1/3 worsen

**Good Prognostic Factors**

- Acute onset
- Shorter duration of prodrome
- Female gender
- Good cognitive functioning
- Good premorbid functioning
- No family history
- Presence of affective symptoms
- Absence of structural brain abnormalities
- Good response to drugs
- Good support system

## Schizophreniform Disorder

### Diagnosis

Adopted/summarized from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- criteria A, D, and E of schizophrenia are met; an episode of the disorder lasts for at least 1 mo but less than 6 mo
- if the symptoms have extended past 6 mo the diagnosis becomes schizophrenia
- specifiers: with/without good prognostic features (i.e. acute onset, confusion, good premorbid functioning, absence of blunt/flat affect), with catatonia, current severity based on quantitative assessment of primary symptoms of psychosis

### Treatment

- similar to acute schizophrenia

### Prognosis

- better than schizophrenia; begins and ends more abruptly; good pre- and post-morbid function

## Brief Psychotic Disorder

### Diagnosis

Adopted/summarized from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- criteria A1-A4, D, and E of schizophrenia are met; an episode of the disorder lasts for at least 1 d, but less than 1 mo with eventual full return to premorbid level of functioning
- specifiers: with/without marked stressors, with postpartum onset, with catatonia, current severity
- can occur after a stressful event or postpartum (see *Postpartum Mood Disorders*, PS14)

### Treatment

- secure environment, antipsychotics, and anxiolytics

### Prognosis

- good, self-limiting, should return to pre-morbid function within 1 mo

## Schizoaffective Disorder

### DSM-5 DIAGNOSTIC CRITERIA FOR SCHIZOAFFECTIVE DISORDER

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. concurrent psychosis (criterion A of schizophrenia) and major mood episode - uninterrupted period of illness
B. delusions or hallucinations for 2 or more wk in the absence of a major mood episode during the lifetime duration of the illness
C. major mood episode symptoms are present for the majority of the total duration of the active and residual periods of the illness
D. the disturbance is not attributable to the effects of a substance or another medical condition

- **specifiers**: bipolar type, depressive type, with catatonia, type of episode, severity

Non-bizarre delusions involve situations that could occur in real life (i.e. being followed, poisoned, loved at a distance) Bizarre delusions involve situations that cannot occur in real life (i.e. being kidnapped by aliens, having one's organs stolen)

### Epidemiology
- one-third as prevalent as schizophrenia; schizoaffective disorder bipolar type more common in young adults, schizoaffective disorder depressive type more common in older adults
- depressive symptoms correlated with higher suicide risk

### Treatment
- antipsychotics, mood stabilizers, and antidepressants

### Prognosis
- between that of schizophrenia and of mood disorder

## Delusional Disorder

### DSM-5 DIAGNOSTIC CRITERIA FOR DELUSIONAL DISORDER
Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. the presence of one (or more) delusions with a duration of 1 mo or longer
B. criterion A for schizophrenia has never been met
   Note: hallucinations, if present, are not prominent and are related to the delusional theme
C. apart from the impact of the delusion(s) or its ramifications, functioning is not markedly impaired, and behaviour is not obviously bizarre or odd
D. if manic or major depressive episodes have occurred, these have been brief relative to the duration of the delusional periods
E. the disturbance is not attributable to the physiological effects of a substance or another medical condition and is not better explained by another mental disorder

- **subtypes**: erotomanic, grandiose, jealous, persecutory, somatic, mixed, unspecified
- **further specify**: bizarre content, type of episode (i.e. first episode, multiple episode), severity

### Treatment
- antipsychotics, psychotherapy, and antidepressants

### Prognosis
- may respond well to antipsychotics but most patients refuse them and have chronic, unremitting course; some maintain a high level of functioning; some progress to schizophrenia

# Mood Disorders

### Definitions
- accurate diagnosis of a mood disorder requires a careful past medical and psychiatric history to detect past mood episodes and to rule out whether these episodes were secondary to substance use, a medical condition, etc
- mood episodes represent a combination of symptoms comprising a predominant mood state that is abnormal in quality or duration (i.e. major depressive, manic, mixed, hypomanic). DSM-5 Criteria for mood episodes are listed below
- types of mood disorders include:
  - depressive (major depressive disorder, persistent depressive disorder)
  - bipolar (bipolar I/II disorder, cyclothymia)
  - induced by or due to ("secondary to") a general medical condition, substance, medication, other psychiatric condition

### Medical Workup of Mood Disorder
- routine screening: physical exam, CBC, extended electrolytes, renal, liver and thyroid function tests, drug screen, medications list
- additional screening: B12 (in older people), neurological consultation, chest X-ray, ECG, head imaging

## Mood Episodes

### DSM-5 DIAGNOSTIC CRITERIA FOR MAJOR DEPRESSIVE EPISODE
Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. ≥5 of the following symptoms have been present during the same 2 wk period and represent a change from previous functioning; at least one of the symptoms is either 1) depressed mood or 2) loss of interest or pleasure (anhedonia)
   **Note**: do not include symptoms that are clearly attributable to another medical condition
   - depressed mood most of the day, nearly every day, as indicated by either subjective report or observation made by others
   - markedly diminished interest or pleasure in all, or almost all, activities most of the day, nearly every day
   - significant and unintentional weight loss/weight gain, or decrease/increase in appetite nearly every day
   - insomnia or hypersomnia nearly every day

**Criteria for Depression (≥5)**

**MSIGECAPS**
**M**ood: depressed
**S**leep: increased/decreased
**I**nterest: decreased
**G**uilt
**E**nergy: decreased
**C**oncentration: decreased
**A**ppetite: increased/decreased
**P**sychomotor: agitation/retardation
**S**uicidal ideation

- psychomotor agitation or retardation nearly every day
- fatigue or loss of energy nearly every day
- feelings of worthlessness or excessive or inappropriate guilt (which may be delusional) nearly every day (not merely self-reproach or guilt about being sick)
- diminished ability to think or concentrate, or indecisiveness, nearly every day
- recurrent thoughts of death (not just fear of dying), recurrent suicidal ideation without a specific plan, or a suicide attempt or a specific plan for committing suicide

B. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
C. the episode is not attributable to the direct physiological effects of a substance or a GMC

## DSM-5 CRITERIA FOR MANIC EPISODE

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. a distinct period of abnormally and persistently elevated, expansive, or irritable mood, and abnormally and persistently increased goal-directed activity or energy, lasting ≥1 wk and present most of the day, nearly every day (or any duration if hospitalization is necessary)
B. during the period of mood disturbance and increased energy or activity, ≥3 of the following symptoms have persisted (4 if the mood is only irritable) have been present to a significant degree and represent a noticeable change from usual behaviour
   - inflated self-esteem or grandiosity
   - decreased need for sleep (i.e. feels rested after only 3 h of sleep)
   - more talkative than usual or pressure to keep talking
   - flight of ideas or subjective experience that thoughts are racing
   - distractibility (i.e. attention too easily drawn to unimportant or irrelevant external stimuli)
   - increase in goal-directed activity (either socially, at work or school, or sexually) or psychomotor agitation
   - excessive involvement in pleasurable activities that have a high potential for painful consequences (i.e. engaging in unrestrained shopping sprees, sexual indiscretions, or foolish business investments)
C. the mood disturbance is sufficiently severe to cause marked impairment in social/occupational functioning or to necessitate hospitalization to prevent harm to self or others, or there are psychotic features
D. the episode is not attributable to the physiological effects of a substance or another medical condition

Note: A full manic episode that emerges during antidepressant treatment but persists at a fully syndromal level beyond the physiological effect of that treatment is sufficient evidence for a manic episode, and therefore, a bipolar I diagnosis

Note: Criteria A-D constitute a manic episode. At least one lifetime manic episode is required for the diagnosis of bipolar I disorder

**Criteria for Mania (≥3)**

**GST PAID**
**G**randiosity
**S**leep (decreased need)
**T**alkative
**P**leasurable activities, Painful consequences
**A**ctivity
**I**deas (flight of)
**D**istractible

### Hypomanic Episode

- criterion A and B of a manic episode is met, but duration is ≥4 d
- episode associated with an uncharacteristic change in functioning that is observable by others but not severe enough to cause marked impairment in social or occupational functioning or to necessitate hospitalization
- absence of psychotic features (if these are present the episode is, by definition, manic)

### Mixed Features

- an episode specifier in bipolar or depression that indicates the presence of both depressive and manic symptoms concurrently, classified by the disorder and primary mood episode component (i.e. bipolar disorder, current episode manic, with mixed features)
- clinical importance due to increased suicide risk and appropriate treatment
- if found in patient diagnosed with major depression, high index of suspicion for bipolar disorder
- while meeting the full criteria for a major depressive episode, the patient has on most days ≥3 of criteria B for a manic episode
- while meeting the full criteria for a manic/hypomanic episode, the patient has on most days ≥3 of criteria A for a depressive episode (the following criterion A cannot count: psychomotor agitation, insomnia, difficulties concentrating, or weight changes)

# Depressive Disorders

## MAJOR DEPRESSIVE DISORDER

### DSM-5 DIAGNOSTIC CRITERIA FOR MAJOR DEPRESSIVE DISORDER (MDD)

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. presence of a MDE
B. the MDE is not better accounted for by schizoaffective disorder and is not superimposed on schizophrenia, schizophreniform disorder, delusional disorder, or psychotic disorder NOS
C. there has never been a manic episode or a hypomanic episode
**Note**: This exclusion does not apply if all of the manic-like, or hypomanic-like episodes are substance or treatment-induced or are due to the direct physiological effects of another medical condition

- **specifiers**: with anxious distress, mixed features, melancholic features, atypical features, mood-congruent psychotic features, mood-incongruent psychotic features, catatonia, peripartum onset, seasonal pattern
- single vs. recurrent is an episode descriptor that carries prognostic significance. Recurrent is classified as the patient having two or more distinct MDE episodes; to be considered separate the patient must have gone 2 consecutive months without meeting criteria

### Epidemiology

- lifetime prevalence: 12%
- peak prevalence age 15-25 yr (M:F = 1:2)

### Etiology

- biological
  - genetic: 65-75% MZ twins; 14-19% DZ twins, 2-4 fold increased risk in first-degree relatives
  - neurotransmitter dysfunction: decreased activity of 5-HT, NE, and DA at neuronal synapse; changes in GABA and glutamate; various changes detectable by fMRI
  - neuroendocrine dysfunction: abnormal HPA axis activity
  - neuroanatomy and neurophysiology: decreased hippocampal volume, increased size of ventricles; decreased REM latency and slow-wave sleep; increased REM length
  - immunologic: increased pro-inflammatory cytokines IL-6 and TNF
  - secondary to medical condition, medication, substance use disorder
- psychosocial
  - cognitive (i.e. distorted schemata, Beck's cognitive triad: negative views of the self, the world, and the future)
  - environmental factors (i.e. job loss, bereavement, history of abuse or neglect, early life adversity)
  - comorbid psychiatric diagnoses (i.e. anxiety, substance abuse, developmental disability, dementia, eating disorder)

### Risk Factors

- sex: F>M, 2:1
- family history: depression, alcohol abuse, suicide attempt or completion
- childhood experiences: loss of parent before age 11, negative home environment (abuse, neglect)
- personality: neuroticism, insecure, dependent, obsessional
- recent stressors: illness, financial, legal, relational, academic
- lack of intimate, confiding relationships or social isolation
- low socioeconomic status

### Clinically-Significant Depressive Symptoms in the Elderly

- affects about 15% of community residents >65 yr old; up to 50% in nursing homes
- high suicide risk due to social isolation, chronic medical illness, decreased independence
- suicide peak: males aged 80-90; females aged 50-65
- low mood or dysphoria may not be a reliable indicator of depression in those >70 yr
- often present with somatic complaints (i.e. changes in weight, sleep, energy; chronic pain) or anxiety symptoms
- may have prominent cognitive changes after onset of mood symptoms (dementia syndrome of depression)
- see Table 3, for a comparison of delirium and dementia

### Treatment

- lifestyle: increased aerobic exercise, mindfulness-based stress reduction
- biological: SSRIs, SNRIs, other antidepressants, somatic therapies (see *Pharmacotherapy*, PS44, and *Somatic Therapies*, PS52)
  - 1st line pharmacotherapy: sertraline, escitalopram, venlafaxine, mirtazapine
  - for partial response, optimize the dose or add augmenting agent (bupropion, quetiapine-XR, aripiprazole, lithium)
  - for non-response, change class of antidepressant
  - typical response to antidepressant treatment: physical symptoms improve at 2 wk, mood/cognition by 4 wk; if no improvement after 4 wk at the highest tolerated therapeutic dosage, alter regimen

**Antidepressants for Depression in Physical Medical Illness**
Cochrane Database Syst Rev 2000;(4):CD001312
**Purpose**: To evaluate whether antidepressants are clinically effective and acceptable for treatment of depression in patients who also have a physical illness.
**Methods**: Systematic review of RCTs comparing any antidepressant drug as defined by the British National Formulary with placebo or no treatment, in patients aged 16 years and over who have been formally diagnosed with depression by any criterion, and have a specified physical disorder. Main outcome measures were number of individuals demonstrating improvement or recovery by the end of the trial, and number completing treatment (as a proxy for treatment acceptability).
**Results**: Eighteen studies with 838 patients having varied physical illnesses were included. Patients treated with antidepressants were significantly more likely to improve than those given placebo (13 studies, OR 0.37, 95% CI 0.27-0.51) or no treatment (1 study, OR 3.45, 11.1-1.10) (number needed to treat relative to placebo = 4.2, 3.2-6.4). Most antidepressants were associated with a small but significant increase in dropouts (OR 1.66, 1.14-2.40; NNH 9.8, 5.4-42.9). Among two studies evaluating impact on function and quality of life, drug was found to be better than no treatment for HIV patients, and drug was not significantly different than placebo in lung disease patients. Tricyclics appeared to be more effective than SSRIs but also more likely to produce dropouts, based on non-randomized comparisons between trials.
**Conclusion**: Antidepressants cause improvements in depression in patients with various physical diseases significantly more frequently than placebo or no treatment. Antidepressants were reasonably acceptable to patients. Tricyclics may be more effective than SSRIs but may also produce more dropouts. As such, antidepressants should at least be considered in those with concomitant physical illness and depression.

  - ECT: currently fastest and most effective treatment for MDD. Consider in severe, psychotic or treatment-resistant cases
  - rTMS: current data support efficacy equivalent to medications (but not to ECT) with good safety and tolerability
  - phototherapy: especially if seasonal component, shift work, sleep dysregulation
- psychological
  - individual therapy (CBT, interpersonal, supportive), group therapy, family therapy
- social: vocational rehabilitation, social skills training
- experimental: magnetic seizure therapy, deep brain stimulation, ketamine

### Prognosis
- one year after diagnosis of MDD without treatment: 40% of individuals still have symptoms that are sufficiently severe to meet criteria for MDD, 20% continue to have some symptoms that no longer meet criteria for MDD, 40% have no symptoms

## PERSISTENT DEPRESSIVE DISORDER

## DSM-5 DIAGNOSTIC CRITERIA FOR PERSISTENT DEPRESSIVE DISORDER
**Note**: in DSM-IV-TR this was referred to as Dysthymia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. depressed mood for most of the day, for more days than not, as indicated either by subjective account or observation by others, for ≥2 yr
   Note: in children and adolescents, mood can be irritable and duration must be at least 1 yr
B. presence, while depressed, of ≥2 of the following:
   - poor appetite or overeating
   - insomnia or hypersomnia
   - low energy or fatigue
   - low self-esteem
   - poor concentration or difficulty making decisions
   - feelings of hopelessness
C. during the 2 yr period (1 yr for children or adolescents) of the disturbance, the person has never been without the symptoms in criteria A and B for more than 2 mo at a time
D. criteria for a major depressive disorder may be continuously present for 2 yr
E. there has never been a manic episode or a hypomanic episode, and criteria have never been met for cyclothymic disorder
F. the disturbance is not better explained by a persistent schizoaffective disorder, schizophrenia, delusional disorder, or other specified or unspecified schizophrenia spectrum and other psychotic disorder
G. the symptoms are not due to the direct physiological effects of a substance or another medical condition
H. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

- **specifiers**:
  - with anxious distress, mixed features, melancholic features, atypical features, mood-congruent psychotic features, mood-incongruent psychotic features, catatonia, peri-partum onset, seasonal pattern
  - partial remission, full remission
  - early onset <21 yr of age), late onset (>21 yr of age)
  - with pure dysthymic syndrome (full criteria for MDE have not been met in at least preceding 2 yr), with persistent MDE (full criteria for MDE have been met throughout preceding 2 yr)
  - •with intermittent MDEs, with current episode: full criteria for a MDE are currently met, but there have been periods of at least 8 weeks in at least the preceding 2 years with symptoms below the threshold for a full MDE
  - with intermittent MDEs, without current episode: full criteria for a MDE are not currently met, but there has been one or more major depressive episodes in at least the preceding 2 years.
  - specify current severity: mild, moderate, severe

### Epidemiology
- lifetime prevalence: 2-3%; M=F

### Treatment
- psychological
  - traditionally, psychotherapy was the principal treatment for persistent depressive disorder; recent evidence suggests some (but generally inferior) benefit for pharmacological treatment. Combinations of the two may be most efficacious
- biological
  - antidepressant therapy: SSRIs (i.e. sertraline, escitalopram), TCAs (i.e. nortiptyline)

# Postpartum Mood Disorders

### Postpartum "Blues"
- transient period of mild depression, mood instability, anxiety, decreased concentration; considered to be normal in response to fluctuating hormonal levels, the stress of childbirth, and the increased responsibilities of motherhood
- occurs in 50-80% of mothers; begins 2-4 d postpartum, usually lasts 48 h, can last up to 10 d
- does not require psychotropic medication
- usually mild or absent: feelings of inadequacy, anhedonia, thoughts of harming baby, suicidal thoughts

### MAJOR DEPRESSIVE DISORDER WITH PERIPARTUM ONSET (POSTPARTUM DEPRESSION)

### Clinical Feature
- MDD with onset during pregnancy or within 4 wk following delivery
- typically lasts 2-6 mo; residual symptoms can last up to 1 yr
- may present with psychosis (rare, 0.2% – more frequent with post-partum mania)
- severe symptoms may include complete disinterest in baby, suicidal and infanticidal ideation

### Epidemiology
- occurs in up to 10% of mothers, risk of recurrence 50%

### Risk Factors
- previous history of a mood disorder (postpartum or otherwise), family history of mood disorder
- psychosocial factors: stressful life events, unemployment, marital conflict, lack of social support, unwanted pregnancy, colicky or sick infant

### Treatment
- psychotherapy (CBT or IPT)
- short-term safety of maternal SSRIs for breastfeeding infants established; long-term effects unknown
- if depression severe or psychotic symptoms present, consider ECT

### Prognosis
- impact on child development: increased risk of cognitive delay, insecure attachment, behavioural disorders
- treatment of mother improves outcome for child at 8 mo through increased mother-child interaction

**Selective Serotonin Reuptake Inhibitors in Pregnancy and Infant Outcomes**
Paediatr Child Health 2011;16:562-563
Canadian Pediatric Society (CPS) clinical practice guideline recommendations: It is important to treat depression in pregnancy. There is no evidence that SSRIs increase the risk of major malformations. There is conflicting evidence concerning the association of paroxetine and cardiac malformations. SSRIs are not contraindicated while breast-feeding.

**Antidepressant Use in Pregnancy and the Risk of Cardiac Defects**
N Engl J Med. 2014 Jun 19;370(25):2397-407
**Background**: It is uncertain whether selective serotonin-reuptake inhibitors (SSRIs) and other antidepressants during pregnancy is associated increased risk of congenital cardiac defects. There are concerns about an association between paroxetine use and right ventricular outflow tract obstruction and between sertraline use and ventricular septal defects.
**Methods**: Cohort study including 949,504 women enrolled in Medicaid for a 7 year period. The risk of major cardiac defects among infants born to women who took antidepressants during the 1st trimester was compared with the risk among infants born to women who did not use antidepressants. An unadjusted analysis was used, possible confounders considered.
**Results**: Overall, the chance of infants not exposed to antidepressants born with a cardiac defect was 72.3 per 10,000 infants, and infants with exposure was 90.1 per 10,000 infants. The relative risks of any cardiac defect with the use of SSRIs were 1.06 (95% CI, 0.93 to 1.22) in the fully adjusted analysis restricted to women with depression. No significant association was found between the use of paroxetine and right ventricular outflow tract obstruction (RR, 1.07) or between the use of sertraline and ventricular septal defects (RR, 1.04).
**Conclusions**: No substantial increase in risk of cardiac malformations attributable to antidepressant use during the 1st trimester.

# Bipolar Disorders

### BIPOLAR I / BIPOLAR II DISORDER

### Definition
- Bipolar I Disorder
  - disorder in which at least one manic episode has occurred
  - if manic symptoms lead to hospitalization, or if there are psychotic symptoms, the diagnosis is BP I
  - commonly accompanied by at least 1 MDE but not required for diagnosis
  - time spent in mood episodes: 53% asymptomatic, 32% depressed, 9% cycling/mixed, 6% hypo/manic
- Bipolar II Disorder
  - disorder in which there is at least 1 MDE, 1 hypomanic episode, and no manic episodes
  - while hypomania is less severe than mania, Bipolar II is not a "milder" form of Bipolar I
  - time spent in mood episodes: 46% asymptomatic, 50% depressed, 1% cycling/mixed, 2% hypo/manic
  - Bipolar II is often missed due to the severity and chronicity of depressive episodes and low rates of spontaneous reporting and recognition of hypomanic episodes

Bipolar II is quite often missed and many patients are symptomatic for up to a decade before accurate diagnosis and treatment

### Classification
- classification of bipolar disorder involves describing the disorder (I or II) and the current or most recent mood episode as either manic, hypomanic, or depressed
- specifiers: with anxious distress, depressed with mixed features, hypo/manic with mixed features, melancholic features, atypical features, mood-congruent or -incongruent psychotic features, catatonia, peripartum onset, seasonal pattern, rapid cycling (4+ mood episodes in 1 yr)

### Epidemiology
- lifetime prevalence: 1% BD I, 1.1% BD II, 2.4% Subthreshold BD; M:F = 1:1
- age of onset: teens to 20s, usually MDE first, manic episode 6-10 years after, average age of first manic episode:32 yr

Patients with bipolar disorder are at higher risk for suicide when they switch from mania to depression, especially as they become aware of consequences of their behaviour during the manic episode

### Risk Factors
- genetic: 60-65% of bipolar patients have family history of a major mood disorder, especially bipolar disorder
- clinical features of MDE history favouring bipolar over unipolar diagnosis: early age of onset (<25 yr), increased number of MDEs, psychotic symptoms, postpartum onset, anxiety disorders (especially separation, panic), antidepressant failure due to early "poop out" or hypomanic symptoms, early impulsivity and aggression, substance abuse, cyclothymic temperament

### Treatment
- lifestyle: psychoeducation regarding cycling nature of illness, ensure regular check ins, develop early warning system, "emergency plan" for manic episodes, promote stable routine (sleep, meals, exercise)
- biological: lithium, anticonvulsants, antipsychotics, ECT (if resistant); monotherapy with antidepressants should be avoided
  - mood stabilizers vary in their ability to "treat" (reduce symptoms acutely) or "stabilize" (prevent relapse and recurrence) manic and depressive symptoms; multi-agent therapy is common
  - treating mania: lithium, divalproex, carbamazepine (2nd line), SGA, ECT, benzodiazepines (for acute agitation)
  - preventing mania: same as above but usually at lower dosages, minus ECT and benzodiazepines
  - treating depression: lithium, lurasidone, quetiapine, lamotrigine, antidepressants (only with mood stabilizer), ECT
  - preventing depression: same as above plus aripiprazole, divalproex (note: quetiapine first line in treating bipolar II depression)
  - mixed episode or rapid cycling: multi-agent therapy: lithium or divalproex + SGA (lurasidone, aripiprazole)
- **psychological**: supportive psychotherapy, CBT, IPT or interpersonal social rhythm therapy, family therapy
- **social**: vocational rehabilitation, consider leave of absence from school/work, assess capacity to manage finances, drug and EtOH cessation, sleep hygiene, social skills training, recruitment and education of family members

### Course and Prognosis
- high suicide rate (15% mortality from suicide), especially in mixed states
- BD I and II are chronic conditions with a relapsing and remitting course featuring alternating manic and depressive episodes; depressive symptoms tend to occur more frequently and last longer than manic symptoms
- can achieve high level of functioning between episodes
- may switch rapidly between depression and mania without any period of euthymia in between
- high recurrence rate for mania – 90% will have a subsequent episode in the next 5 yr
- long term follow-up of BD I – 15% well, 45% well with relapses, 30% partial remission, 10% chronically ill

## CYCLOTHYMIA
Adapted/summarized from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

### Diagnosis
- presence of numerous periods of hypomanic and depressive symptoms (not meeting criteria for full hypomanic episode or MDE) for ≥2 yr; never without symptoms for >2 mo
- never have met criteria for MDE, manic or hypomanic episodes
  - symptoms not better explained by any psychotic disorder (including schizoaffective, schizophrenia, schizophreniform, delusional disorder, or other specified/unspecified)
- symptoms are not due to the direct physiological effects of a substance or GMC
- symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

### Treatment
- similar to Bipolar I: mood stabilizer ± psychotherapy, avoid antidepressant monotherapy, treat any comorbid substance use disorder

Lithium is among few agents with proven efficacy in preventing suicide attempts and completions

Monotherapy with antidepressants should be avoided in patients with bipolar depression as patients can switch from depression into mania

**The 4 L's for Bipolar Depression**
**L**ithium, **L**amotrigine, **L**urasidone, Seroque**L**

**A Randomized Controlled Trial of Cognitive Therapy for Bipolar Disorder: Focus on Long-Term Change**
J Clin Psychiatry 2006;67:277-286
**Purpose**: To evaluate long-term change with cognitive therapy plus emotive techniques for the treatment of bipolar disorder.
**Methods**: Blinded RCT including patients with DSM-IV bipolar I or II disorder allocated to either a 6 mo trial of cognitive therapy (CT) with emotive techniques or treatment as usual. Both groups received mood stabilizers. Main outcomes were relapse rates, dysfunctional attitudes, psychosocial functioning, hopelessness, self-control, and medication adherence. Patients were assessed by independent raters blinded to treatment group.
**Results**: At 6 mo, CT patients experienced fewer depressive symptoms and fewer dysfunctional attitudes. There was a non-significant (p=0.06) trend to greater time to depressive relapse. At 12 mo follow-up, CT patients had lower Young Mania Rating scores and improved behavioural self-control. At 18 mo, CT patients reported less severity of illness.
**Conclusions**: CT appears to provide benefits in the 12 mo after completion of therapy.

# Anxiety Disorders

## Definition

- anxiety is a universal human experience which can serve as an adaptive mechanism to facilitate appropriate reactions to external threat
- anxiety becomes pathological when:
  - fear is greatly out of proportion to risk/severity of threat
  - response continues beyond existence of threat or becomes generalized to other similar or dissimilar situations
  - social or occupational functioning is impaired
  - often comorbid with substance use and depression
- manifestations of anxiety are a result of the activation of the sympathetic nervous system and can be described through;
  - physiology: main brain structure involved is the amygdala ; neurotransmitters involved include 5-HT, cholecystokinin, epinephrine, norepinephrine, and DA
  - psychology: one's thoughts about a given situation or stimulus contribute to the feeling of fear and perception of threat
  - behaviour: anxiety can lead to avoidance which can result in disruption to daily functioning.

## Differential Diagnosis

**Table 2. Differential Diagnosis of Anxiety Disorders**

| | |
|---|---|
| **Cardiovascular** | Post-MI, arrhythmia, congestive heart failure, pulmonary embolus, mitral valve prolapse |
| **Respiratory** | Asthma, COPD, pneumonia |
| **Endocrine** | Hyperthyroidism, pheochromocytoma, hypoglycemia, hyperadrenalism, hyperparathyroidism |
| **Metabolic** | Vitamin B12 deficiency, folate deficiency, porphyria, hypoxemia, hypercalcemia |
| **Neurologic** | Neoplasm, vestibular dysfunction, encephalitis, trauma (contusion or hematoma), MS, temporal lobe epilepsy |
| **Infectious** | Cerebral (meningitis, HIV, syphilis) or systemic |
| **GI** | Gastritis, esophageal spasm |
| **Substance-Induced** | Intoxication (caffeine, amphetamines, cocaine, thyroid replacement, OTC for colds/decongestants), withdrawal (benzodiazepines, alcohol) |

## Medical Workup of Anxiety Disorder

- routine screening: physical exam, CBC, electrolytes, thyroid function test, ECG
- additional screening: extended electrolytes, vitaminB12, folate, chest x-ray, head imaging, neurological consultation, any other tests as per DDx in Table 2

## Risk Factors for the Development of Anxiety Disorders

- biological
  - endocrine disorders (i.e. hyperthyroidism), respiratory conditions (i.e. asthma), CNS conditions (i.e. temporal lobe epilepsy), substances/medications (i.e. excessive stimulant use), chronic medical illness
  - family history
  - personal history of anxiety or mood disorder
  - XX>XY chromosomes
- psychological
  - current stress early childhood trauma, early parental loss

# Panic Disorder

## DSM-5 DIAGNOSTIC CRITERIA FOR PANIC DISORDER

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. recurrent unexpected panic attacks – a panic attack is an abrupt surge of intense fear or intense discomfort that reaches a peak within minutes, and during which time four (or more) of the following symptoms occur
  - palpitations, pounding heart, or accelerated heart rate
  - sweating
  - trembling or shaking
  - sensations of shortness of breath or smothering
  - feelings of choking
  - chest pain or discomfort
  - nausea or abdominal distress
  - feeling dizzy, unsteady, light-headed, or faint
  - chills or heat sensations
  - paresthesias (numbness or tingling sensations)
  - derealization (feelings of unreality) or depersonalization (being detached from oneself)

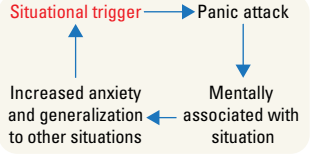

**Figure 2. Mechanism of panic attacks**

- fear of losing control or "going crazy"
- fear of dying

B. 1 mo (or more) of "anxiety about panic attacks" - at least one of the attacks has been followed by one or both of the following:
   - persistent concern or worry about additional panic attacks or their consequences
   - a significant maladaptive change in behaviour related to the attacks
C. the disturbance is not attributable to the physiological effects of a substance or another medical condition
D. the disturbance is not better explained by another mental disorder

### Epidemiology
- lifetime prevalence: 5% (one of the top five most common reasons to see a family doctor); M:F = 1:2-3
- onset: average early-mid 20s, familial pattern

### Treatment
- psychological
  - CBT: interoceptive exposure (deliberate exposure to unpleasant sensations of arousal associated with a panic attack for experiential disconfirmation of their fears); cognitive restructuring (addressing underlying beliefs regarding the panic attacks), relaxation techniques (visualization, box-breathing), psychoeducation
- pharmacological (first line agents)
  - SSRIs: fluoxetine, citalopram, escitalopram, paroxetine, sertraline, fluvoxamine
  - SNRI: venlafaxine XR
  - with SSRI/SNRIs, start with low doses, titrate up as tolerated
  - anxiety disorders often require treatment at higher doses for a longer period of time than depression (i.e. full response may take up to 12 wk)
  - treat for up to 1 year after symptoms resolve to avoid relapse
  - explain expected adverse effects prior to initiation of therapy to prevent non-adherence
  - other antidepressants (mirtazapine, MAOIs)
  - benzodiazepines considered 2nd line (short-term, lowest effective dose, helpful while titrating antidepressant)

### Prognosis
- 6-10 yr post-treatment: 30% well, 40-50% improved, 20-30% no change or worse
- clinical course: chronic, but episodic with psychosocial stressors

**Criteria for Panic Disorder (≥4)**

**STUDENTS FEAR the 3 Cs**
**S**weating
**T**rembling
**U**nsteadiness, dizziness
**D**epersonalization, **D**erealization
**E**xcessive heart rate, palpitations
**N**ausea
**T**ingling
**S**hortness of breath
**Fear** of dying, losing control, going crazy
**3 Cs**: **C**hest pain, **C**hills, **C**hoking

**Panic Attack vs. Panic Disorder**
Panic disorder consists of panic attacks + other criteria

Panic attacks can occur in the context of many different disorders

**Starting Medication for Anxiety**
Start low, go slow, aim high and explain symptoms to expect prior to initiation of therapy to prevent non-adherence due to side effects

# Agoraphobia

### DSM-5 DIAGNOSTIC CRITERIA FOR AGORAPHOBIA
Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. marked fear or anxiety about two (or more) of the following five situations:
   - using public transportation
   - being in open spaces
   - being in enclosed places
   - standing in line or being in a crowd
   - being outside of the home alone
B. the individual fears or avoids these situations because of thoughts that escape might be difficult or help might not be available in the event of developing panic-like symptoms or other incapacitating or embarrassing symptoms
C. the agoraphobic situations almost always provoke fear or anxiety
D. the agoraphobic situations are actively avoided, require the presence of a companion, or are endured with intense fear or anxiety
E. the fear or anxiety is out of proportion to the actual danger posed by the agoraphobic situations and to the sociocultural context
F. the fear, anxiety, or avoidance is persistent, typically lasting ≥6 mo
G. the fear, anxiety, or avoidance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning
H. if another medical condition is present, the fear, anxiety, or avoidance is clearly excessive
I. the fear, anxiety, or avoidance is not better explained by the symptoms of another mental disorder and are not related exclusively to obsessions, perceived defects or flaws in physical appearance, reminders of traumatic events, or fear of separation

**Note**: agoraphobia is diagnosed irrespective of the presence of panic disorder. If an individual's presentation meets criteria for panic disorder and agoraphobia, both diagnoses should be assigned

### Treatment
- as per specific panic disorder

# Generalized Anxiety Disorder

**Criteria for GAD (≥3)**

**C-FIRST**
**C**oncentration issues
**F**atigue
**I**rritability
**R**estlessness
**S**leep disturbance
**T**ension (muscle)

## DSM-5 DIAGNOSTIC CRITERIA FOR GENERALIZED ANXIETY DISORDER

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. excessive anxiety and worry (apprehensive expectation), occurring more days than not for at least 6 mo, about a number of events or activities (i.e. work or school performance)
B. the individual finds it difficult to control the worry
C. the anxiety and worry are associated with three (or more) of the following six symptoms (with at least some symptoms having been present for more days than not for the past 6 mo)
    1. restlessness or feeling keyed up or on edge
    2. being easily fatigued
    3. difficulty concentrating or mind going blank
    4. irritability
    5. muscle tension
    6. sleep disturbance (difficulty falling or staying asleep, or restless, unsatisfying sleep)
D. the anxiety, worry, or physical symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
E. the disturbance is not attributable to the physiological effects of a substance or another medical condition
F. the disturbance is not better explained by another mental disorder

### Epidemiology

- 1 yr prevalence: 1-4%, lifetime prevalence 6%; M:F = 1:2
    - 8% of all who seek primary care treatment (WHO)
- bimodal age of onset: before 20 or middle adulthood

Source: Depression and other common mental disorders: Global health estimates. Geneva: World Health Organization, 2017.

### Treatment

- lifestyle: avoid caffeine and EtOH, sleep hygiene
- psychological: CBT (cognitive restructuring), relaxation techniques, mindfulness
- biological
    - 1st line SSRIs (escitalopram, sertraline, paroxetine), SNRIs (venlafaxine XR, duloxetine), pregabalin
    - benzodiazepines considered 2nd line (short-term, lowest effective dose, helpful while titrating antidepressant)
    - β-blockers not recommended

### Prognosis

- rarely abates over time
- depends on pre-morbid personality functioning, stability of relationships, work, and severity of environmental stress

# Phobic Disorders

Adopted/summarized from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

### Specific Phobia

- definition: marked and persistent (>6 mo) fear that is excessive or unreasonable, cued by presence or anticipation of a specific object or situation
- lifetime prevalence 12-16%; M:F ratio variable
- types: animal/insect, environment (heights, storms), blood/injection/injury, situational (airplane, closed spaces), other (loud noise, clowns)

### Social Phobia (Social Anxiety Disorder)

- definition: marked and persistent (>6 mo) fear of social or performance situations in which one is exposed to unfamiliar people or to possible scrutiny by others; fearing he/she will act in a way that may be humiliating or embarrassing (i.e. public speaking, initiating or maintaining conversation, dating, eating in public)
- 12 mo prevalence rate may be as high as 7%; M:F ratio approximately equal

### Diagnostic Criteria for Phobic Disorders

- exposure to stimulus almost invariably provokes an immediate anxiety response; may present as a panic attack
- person recognizes fear as excessive or unreasonable
- situations are avoided or endured with anxiety/distress
- significant interference with daily routine, occupational/social functioning, and/or marked distress

### Treatment

- psychological
    - cognitive behaviour therapy (focusing on both in vivo and virtual exposure therapy, gradually facing feared situations)
    - behavioural therapy is more efficacious than medication for specific phobia
- biological treatment for social anxiety disorder
    - first line: SSRIs (escitalopram, sertraline, fluvoxamine, paroxetine) SNRI (venlafaxine XR), pregabalin

# Obsessive-Compulsive and Related Disorders

## Obsessive-Compulsive Disorder

### DSM-5 DIAGNOSTIC CRITERIA FOR OBSESSIVE-COMPULSIVE DISORDER

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. presence of obsessions, compulsions, or both
- obsessions are defined by (1) and (2)
  1. recurrent and persistent thoughts, urges, or images that are experienced, at some time during the disturbance, as intrusive and unwanted, and cause marked anxiety or distress in most individuals
  2. the individual attempts to ignore or suppress such thoughts, urges, or images, or to neutralize them with some other thought or action (i.e. by performing a compulsion; see below)
- compulsions are defined by (1) and (2)
  1. repetitive behaviours (i.e. hand washing, ordering, checking) or mental acts (i.e. praying, counting, repeating words silently) that the individual feels driven to perform in response to an obsession or according to rules that must be applied rigidly
  2. behaviours mental acts are aimed at preventing or reducing anxiety or distress, or preventing some dreaded event or situation; however, these behaviours or mental acts are not connected in a realistic way with what they are designed to neutralize or prevent, or are clearly excessive

B. the obsessions or compulsions are time-consuming (i.e. take >1 h/d) or cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

C. the obsessive-compulsive symptoms are not attributable to the physiological effects of a substance or another medical condition

D. the disturbance is not better explained by the symptoms of another mental disorder

- **specifiers**: with good or fair insight, with poor insight, with absent insight/delusional beliefs, tic-related

### Epidemiology

- 12 mo prevalence 1.1-1.8%; females affected at slightly higher rates than males
- rate of OCD in first-degree relatives is higher than in the general population
- common comorbidities: anxiety disorders, depression, obsessive-compulsive PD, tic disorders, body dysmorphic disorder, trichotillomania, and excoriation disorder

### Risk Factors

- genetic: neurological dysfunction, family history
- environmental: adverse childhood experiences (i.e. abuse, behavioural inhibition), exposure to traumatic events, group A streptococcal infection

### Treatment

- CBT: exposure with response prevention (ERP) – involves exposure to feared situations with the addition of preventing the compulsive behaviours; cognitive strategies include challenging underlying beliefs
- pharmacotherapy: SSRIs/SNRIs (12-16 week trials, higher therapeutic dosages than used for depression), clomipramine; adjunctive antipsychotics (risperidone)

### Prognosis

- may be refractory and chronic

## Related Disorders

### Body Dysmorphic Disorder

- preoccupation with ≥1 perceived flaws in physical appearance not observed by others
- repetitive behaviours (i.e. mirror checking, excessive grooming, skin picking, or reassurance seeking) or mental acts (i.e. comparing self to others) related to appearance
- ± muscle dysmorphia
- causes clinically significant distress or functional impairment
- rule out eating disorder

### Hoarding Disorder

- persistent difficulty discarding possessions regardless of actual value
- feels the need to save items, discarding creates distress
- results in possessions cluttering/compromising active living areas (may be uncluttered with 3rd party intervention, i.e. family member, cleaners, authorities)
- causes clinically significant distress or functional impairment
- rule out brain injury, cerebrovascular disease, Prader-Willi syndrome, OCD, MDD (low energy), psychotic disorder (delusions), neurocognitive disorder, ASD (restricted interests)

### Trichotillomania (Hair-Pulling Disorder)
- recurrent pulling out own hair resulting in hair loss
- repeated attempts to stop or decrease hair pulling
- causes clinically significant distress or functional impairment
- rule out dermatological condition, body dysmorphic disorder

### Excoriation (Skin-Picking) Disorder
- recurrent skin picking resulting in lesions
- repeated attempts to stop or decrease skin picking
- causes clinically significant distress or functional impairment
- rule out scabies, substance use (i.e. cocaine), psychotic disorder (delusions, tactile hallucinations), body dysmorphic disorder, stereotypic movement disorder, non-suicidal self-injury

# Trauma- and Stressor-Related Disorders

## Post-Traumatic Stress Disorder

### DSM-5 DIAGNOSTIC CRITERIA FOR POST-TRAUMATIC STRESS DISORDER
Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association.

A. exposure to actual or threatened death, serious injury, or sexual violence in ≥1 of the following ways:
- directly experiencing the traumatic event(s)
- witnessing, in person, the event(s) as it occurred to others
- learning that the traumatic event(s) occurred to a close family member or close friend; in cases of actual or threatened death of a family member or friend, the event(s) must have been violent or accidental
- experiencing repeated or extreme exposure to aversive details of the traumatic event(s) (i.e. first responders collecting human remains, police officers repeatedly exposed to details of child abuse)

B. presence of ≥1 of the following intrusion symptoms associated with the traumatic event(s), beginning after the traumatic event(s) occurred:
- recurrent, involuntary, and intrusive distressing memories of the traumatic event(s)
- recurrent distressing dreams in which the content and/or affect of the dream are related to the traumatic event(s)
- dissociative reactions (i.e. flashbacks) in which the individual feels or acts as if the traumatic event(s) were recurring
- intense or prolonged psychological distress at exposure to internal or external cues that symbolize or resemble an aspect of the traumatic event(s)
- marked physiological reactions to internal or external cues that symbolize or resemble an aspect of the traumatic event(s)

C. persistent avoidance of stimuli associated with the traumatic event(s), beginning after the traumatic event(s) occurred, as evidenced by one or both of the following:
- avoidance of or efforts to avoid distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s)
- avoidance of or efforts to avoid external reminders (people, places, conversations, activities, objects, situations) that arouse distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s)

D. negative alterations in cognitions and mood associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by ≥2 of the following:
- inability to remember an important aspect of the traumatic event(s)
- persistent and exaggerated negative beliefs or expectations about oneself, others, or the world
- persistent, distorted cognitions about the cause or consequences of the traumatic event(s) that lead the individual to blame himself/herself or others
- persistent negative emotional state (i.e. fear, horror, anger, guilt, or shame)
- markedly diminished interest or participation in significant activities
- feelings of detachment or estrangement from others
- persistent inability to experience positive emotions

E. marked alterations in arousal and reactivity associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by ≥2 of the following:
- irritable behaviour and angry outbursts (with little or no provocation) typically expressed as verbal or physical aggression toward people or objects
- reckless or self-destructive behaviour
- hypervigilance
- exaggerated startle response
- problems with concentration
- sleep disturbance (i.e. difficulty falling or staying asleep or restless sleep)

F. duration of the disturbance (criteria B, C, D, and E) is more than 1 mo

G. the disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning

H. the disturbance is not attributable to the physiological effects of a substance or another medical condition

**Criteria for Post-Traumatic Stress Disorder**

**TRAUMA**
**T**raumatic event
**R**e-experience the event
**A**voidance of stimuli associated with the trauma
**U**nable to function
**M**ore than a **M**onth
**A**rousal increased
+ negative alterations in cognition and mood

- **specifiers**:
  - with dissociative symptoms (not attributable to physiologic effects of a substance or a medical condition)
  - depersonalization: persistent or recurrent experiences of feeling detached from, or as if one were an outside observer of one's mental processes or body
  - derealization: persistent or recurrent experiences of unreality of surroundings
  - with delayed expression: the full diagnostic criteria are not met until 6 mo after the event

### Epidemiology
- lifetime prevalence in Canada is 9%
- 75% have another comorbid psychiatric disorder
- high rates of chronic pain, sleep problems, sexual dysfunction, cognitive dysfunction
- twice as high among women versus men

### Treatment
- trauma therapy, CBT
  - ensure safety and stabilize: emotional regulation techniques (i.e. breathing, relaxation)
  - once coping mechanisms established, can explore/mourn trauma, challenge dysfunctional beliefs, etc.
  - reconnect and integrate: exposure therapy, etc.
- biological
  - first line: fluoxetine, paroxetine, sertraline, venlafaxine XR
  - prazosin (for treating disturbing dreams and nightmares)
  - benzodiazepines (for acute anxiety)
  - adjunctive atypical antipsychotics (risperidone, olanzapine)
- eye movement desensitization and reprocessing (EMDR): an experimental method of reprocessing memories of distressing events by recounting them while using a form of dual attention stimulation such as eye movements, bilateral sound, or bilateral tactile stimulation (its use is controversial because of limited evidence)

### Complications
- substance abuse, relationship difficulties, depression, impaired social and occupational functioning disorders, personality disorders

**Acute Stress Disorder**
- May be a precursor to PTSD
- Similar symptoms to PTSD
- Symptoms persist 3 d after a trauma until 1 mo after the exposure

## Adjustment Disorder

### Definition
- a diagnosis encompassing patients who have difficulty coping with a stressful life event or situation and develop acute, often transient, emotional or behavioural symptoms that resemble less severe versions of other psychiatric conditions

### DSM-5 DIAGNOSTIC CRITERIA FOR ADJUSTMENT DISORDER
Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. the development of emotional or behavioural symptoms in response to an identifiable stressor(s) occurring within 3 mo of the onset of the stressor(s)
B. these symptoms or behaviours are clinically significant as evidenced by either of the following:
   - marked distress that is in excess of what would be expected from exposure to the stressor
   - significant impairment in social or occupational functioning
C. the stress-related disturbance does not meet criteria for another mental disorder and is not merely an exacerbation of a pre-existing mental disorder
D. the symptoms do not represent normal bereavement
E. once the stressor (or its consequences) has terminated, the symptoms do not persist for more than an additional 6 mo

- **specifiers**: with depressed mood, with anxiety, with mixed anxiety/depression, with conduct disturbance, with mixed disturbance of conduct/emotions, unspecified

### Classification
- types of stressors
  - single (i.e. termination of romantic relationship)
  - multiple (i.e. marked business difficulties and marital problems)
  - recurrent (i.e. seasonal business crises)
  - continuous (i.e. living in a crime-ridden neighbourhood)
  - developmental events (i.e. going to school, leaving parental home, getting married, becoming a parent, failing to attain occupational goals, retirement)

### Epidemiology
- F:M 2:1, prevalence 2-8% of the population

### Treatment
- brief psychotherapy: individual or group (particularly useful for patients dealing with unique and specific medical issues; i.e. colostomy or renal dialysis groups), crisis intervention
- biological
  - benzodiazepines may be used for those with significant anxiety symptoms (short-term, low-dose, regular schedule)

# Bereavement

### Clinical Feature

- bereavement is a normal psychological and emotional reaction to a significant loss, also called grief or mourning
- length and characteristics of "normal" bereavement vary between individual cultures
- normal response: protest → searching and acute anguish → despair and detachment → reorganization
- presence of the following symptoms may indicate abnormal grief/presence of MDD
  - guilt about things other than actions taken or not taken by the survivor at the time of death
  - thoughts of death other than the survivor feeling that they would be better off dead or should have died with the deceased person; morbid preoccupation with worthlessness
  - marked psychomotor retardation; prolonged and marked functional impairment
  - hallucinatory experiences other than hearing the voice or transiently seeing the image of the deceased person
  - dysphoria that is pervasive and independent of thoughts or triggers of the deceased, absence of mood reactivity
- after 12 mo, if patient continues to yearn/long for the deceased, experience intense sorrow/emotional pain in response to the death, remain preoccupied with the deceased or with their circumstance of death, then may start to consider a diagnosis of "persistent complex bereavement disorder"
- if a patient meets criteria for MDD, even in the context of a loss or bereavement scenario, they are still diagnosed with MDD

### Treatment

- support and watchful waiting should be first line, as well as education and normalization of the grief process
- screen for increased alcohol, cigarette and drug use
- normal grief should not be treated with antidepressant or antianxiety medications, as it is important to allow the person to experience the whole mourning process to achieve resolution
- psychosocial: grief therapy (individual or group) is indicated for those needing additional support, or experiencing complex grief/bereavement, or significant MDD
- pharmacotherapy: if MDD present, past history of mood disorders, severe symptoms

**Risk Factors for Poor Bereavement Outcome**

- Poor social supports
- Unanticipated death or lack of preparation for death
- Highly dependent relationship with deceased
- High initial distress
- Other concurrent stresses and losses
- Death of a child
- Pre-existing psychiatric disorders, especially depression and separation anxiety

Bereavement is associated with a significant increase in morbidity and mortality acutely following the loss, with effects seen up to 1 yr after

Loneliness is the most common symptom that continues to persist in normal bereavement and may last several years

# Neurocognitive Disorders

## Delirium

- see Neurology, N20

### DSM-5 DIAGNOSTIC CRITERIA FOR DELIRIUM

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. attention and awareness: disturbance in attention (i.e. reduced ability to direct, focus, sustain, and shift attention) and awareness (reduced orientation to the environment)
B. acute and fluctuating: disturbance develops over short period of time (usually hours to days), represents a change from baseline attention and awareness, and tends to fluctuate in severity during the course of a day
C. cognitive changes: an additional disturbance in cognition (i.e. memory deficit, disorientation, language, visuospatial ability, or perception)
D. not better explained: disturbances in criteria A and C are not better explained by another neurocognitive disorder (pre-existing, established, or evolving) and do not occur in the context of a severely reduced level of arousal (i.e. coma)
E. direct physiological cause: evidence that disturbance is a direct physiological consequence of another medical condition, substance intoxication or withdrawal (i.e. due to a drug of abuse or medication), toxin, or is due to multiple etiologies

- **Note**: delirium can be described as HYPERactive, HYPOactive, or MIXED presentation. While patients with hyperactive delirium may demonstrate features of restlessness and agitation, as well as experience hallucinations and delusions, those with hypoactive delirium present with lethargy, sedation and respond slowly to questioning

### Clinical Feature and Assessment

- common symptoms
  - distractibility, disorientation (time, place, rarely person)
  - misinterpretations, illusions, hallucinations (visual hallucinations are organic until proven otherwise)
  - speech/language disturbances (dysarthria, dysnomia)
  - affective symptoms (anxiety, fear, depression, irritability, anger, euphoria, apathy)
  - shifts in psychomotor activity (groping/picking at clothes, attempts to get out of bed when unsafe, sudden movements, sluggishness, lethargy)
  - impairment in sleep duration and/or architecture (i.e. sleep-wake reversal)
- Folstein Mini Mental Status Exam or Montreal Cognitive Assessment are helpful to assess baseline of altered mental state (i.e. score will improve as symptoms resolve)

**Confusion Assessment Method (CAM) for Diagnosis of Delirium**

Highly sensitive and specific method to diagnose delirium
- Part 1: an assessment instrument that screens for overall cognitive impairment
- Part 2: includes four features found best able to distinguish delirium from other cognitive impairments

Need (1) + (2) + (3 or 4)
(1) Acute onset and fluctuating course
(2) Inattention
(3) Disorganized thinking
(4) Altered level of consciousness - hyperactive or hypoactive

### Risk Factors
- most common precipitating factors include: polypharmacy (particularly involving psychoactive drugs such as anticholinergics), infection, dehydration, immobility, malnutrition, and use of bladder catheters
- other factors include:
  - hospitalization (incidence 10-56%); frail and surgical patients are at the greatest risk
  - previous delirium
  - nursing home residents (incidence 60%)
  - old age (especially males)
  - severe illness (i.e. cancer, AIDS)
  - recent anesthesia or surgery
  - brain vulnerability: pre-existing neurologic or neurocognitive disorder, substance abuse, past psychiatric illness

**Etiology of Delirium**

**I WATCH DEATH**
- **I**nfectious (encephalitis, meningitis, UTI, pneumonia)
- **W**ithdrawal (alcohol, barbiturates, benzodiazepines)
- **A**cute metabolic disorder (electrolyte imbalance, hepatic or renal failure)
- **T**rauma (head injury, post-operative)
- **C**NS pathology (stroke, hemorrhage, tumour, seizure disorder, Parkinson's)
- **H**ypoxia (anemia, cardiac failure, pulmonary embolus)
- **D**eficiencies (vitamin $B_{12}$, folic acid, thiamine)
- **E**ndocrinopathies (thyroid, glucose, parathyroid, adrenal)
- **A**cute vascular (shock, vasculitis, hypertensive encephalopathy)
- **T**oxins: substance use, sedatives, opioids (especially morphine), anesthetics, anticholinergics, anticonvulsants, dopaminergic agents, steroids, insulin, glyburide, antibiotics (especially quinolones), NSAIDs
- **H**eavy metals (arsenic, lead, mercury)

### Investigations
- standard: CBC and differential, electrolytes (including $Ca^{2+}$, $Mg2^{2+}$, and $PO_4^{3-}$), glucose, BUN, Cr, TSH/T4, LFTs, vitamin B12, folate, albumin; urinalysis, urine C&S
- as indicated: ECG (to assess QT interval when considering treatment with an antipsychotic agent), CXR, head CT or MRI, toxicology/heavy metal screen, VDRL, HIV, LP, blood cultures, EEG (typical finding in delirium is generalized slowing, can also be used to rule out underlying seizures or post-ictal states as etiology)
- indications for CT head: focal neurological deficit, acute change in status, anticoagulant use, acute incontinence, gait abnormality, history of cancer
- MRI may be more useful: it can detect or exclude acute or subacute stroke and multifocal inflammatory lesions in patients with negative head CT

### Management
- identify and manage underlying cause
  - identify and treat underlying cause immediately
  - stop all non-essential medications
  - maintain nutrition, hydration, electrolyte balance, and monitor vitals
- optimize the environment
  - environment: quiet, well-lit, near window for cues regarding time of day
  - optimize hearing and vision
  - room near nursing station for closer observation; constant care if patient jumping out of bed, pulling out lines
  - family member present for reassurance and re-orientation
  - frequent orientation: calendar, clock, reminders
  - avoid frequent changes of assigned nursing staff
- pharmacotherapy
  - low dose, high potency antipsychotics: haloperidol has the most evidence and can be given IV or IM; alternatives include risperidone (less sedating), olanzapine (more sedating, can be anticholinergic itself), quetiapine (if EPS sensitive), aripiprazole (does not prolong QTc)
  - benzodiazepines only used in alcohol/substance withdrawal delirium; otherwise, can worsen delirium (antipsychotics are not useful in EtOH or benzodiazepine withdrawal delirium)
  - try to minimize drugs with anticholinergic effects
- physical restraints to maintain safety only if necessary

### Prognosis
- up to 50% 1yr mortality rate after episode of delirium

## Major Neurocognitive Disorder (Dementia)

- see Neurology, N24

### DSM-5 DIAGNOSTIC CRITERIA FOR MAJOR NEUROCOGNITIVE DISORDER

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. evidence of significant cognitive decline from a previous level of performance in one or more cognitive domains (complex attention, executive function, learning and memory, language, perceptual-motor, or social cognition) based on both:
   1. concern of the individual, a knowledgeable informant, or the clinician that there has been a significant decline in cognitive function;
      and
   2. substantial impairment in cognitive performance, preferably documented by standardized neuropsychological testing or, in its absence, another quantified clinical assessment

B. cognitive deficits interfere with independence in everyday activities (i.e. at a minimum, requiring assistance with complex instrumental activities of daily living such as paying bills or managing medications)
   - **Note**: if deficits do not interfere (as in B) and cognitive impairments are mild-moderate (as in A.2), this is considered "mild neurocognitive disorder"; see Neurology, N21

C. cognitive deficits do not occur exclusively in the context of a delirium

D. cognitive deficits are not better explained by another mental disorder (i.e. major depressive disorder, schizophrenia)

E. in the case of neurodegenerative dementias such as Alzheimer's Disease, disturbances should be of insidious onset and progressive

**The 4 As of Dementia**
**A**mnesia
**A**phasia
**A**praxia
**A**gnosia

**The "Mini Cog" Rapid Assessment**
- 3 word immediate recall
- Clock drawn to "10 past 11"
- 3 word delayed recall

Specify whether due to:

| | | | |
|---|---|---|---|
| Alzheimer's disease | Traumatic brain injury | Prion disease | Multiple etiologies |
| Frontotemporal lobar degeneration | Normal pressure hydrocephalus | Parkinson's disease | Unspecified |
| Lewy body disease | Substance/medication use | Huntington's disease | |
| Vascular disease | HIV infection | Another medical condition | |

## Epidemiology
- prevalence increases with age: 5% in patients >65 yr of age; 35-50% in patients >85 yr of age
- probability of dementia in an older person with reported memory loss is estimated to be 60%
- prevalence is increased in people with Down's syndrome and head trauma
- Alzheimer's disease comprises >50% of cases; vascular causes comprise approximately 15% of cases (other causes of dementia neurocognitive disorder – see Neurology, N21)
- average duration of illness from onset of symptoms to death is 8-10 yr

## Subtypes
- with or without behavioural disturbance (i.e. wandering, agitation)
- early-onset: <65 yr
- late-onset: >65 yr

## Investigations (rule out reversible causes)
- standard "neurocognitive work-up": see *Delirium*, PS22
- as indicated: VDRL, HIV, LP, CXR, EEG, SPECT, head CT, or MRI
- indications for head imaging: same as for delirium, plus: age <60, rapid onset (unexplained decline in cognition or function over 1-2 mo), dementia of relatively short duration (<2 yr), recent significant head trauma, unexplained neurological symptoms (new onset of severe headache/seizures)

## Management
- see Neurology, N21 for further management
- treat underlying medical problems and prevent new ones
- provide orientation cues for patient (i.e. clock, calendar)
- provide education and support for patient and family (i.e. day programs, respite care, support groups, home care)
- consider power of attorney/living will and long-term care plan (nursing home)
- inform Ministry of Transportation about patient's inability to drive safely
- consider pharmacological therapy
  - cholinesterase inhibitors (donepezil [Aricept®], rivastigmine, galantamine) for mild to severe disease
  - NMDA receptor antagonist (memantine) for moderate to severe disease
  - low-dose antipsychotics (i.e. risperidone, aripripazole), escitalopram, or trazodone if behavioural or emotional symptoms prominent – start low and go slow
  - reassess pharmacological therapy every 3 mo

**Flags for Differentiating Most Common Causes of Dementia**

**Alzheimer's disease**: predominantly memory and learning issues
**Frontotemporal degeneration**: language type (early preservation), behavioural type (apathy/disinhibition/self-neglect)
**Lewy body disease**: recurrent, soft visual hallucinations (e.g. rabbits), autonomic impairment (falls, hypotension), EPS, does not respond well to pharmacotherapy, fluctuating degree of cognitive impairment
**Vascular disease**: vascular risk factors, focal neurological signs, abrupt onset, stepwise progression
**Normal pressure hydrocephalus**: abnormal gait, early incontinence, rapidly progressive

**Table 3. Comparison of Dementia, Delirium, and Cognitive Impairment Associated with Depression**

| | Dementia/Major Neurocognitive Disorder | Delirium | Cognitive Impairment Associated with Depression |
|---|---|---|---|
| **Onset** | Gradual/step-wise decline | Acute (hours to days) | Subacute |
| **Duration** | Months-years | Days-weeks | Variable |
| **Natural History** | Progressive<br>Usually irreversible | Fluctuating, reversible High morbidity/ mortality in the elderly | Recurrent<br>Partially reversible |
| **Level of Consciousness** | Normal | Fluctuating (over 24 h) | Normal |
| **Attention** | Not initially affected | Decreased (wandering, easy distraction) | Difficulty concentrating |
| **Orientation** | Intact initially | Impaired (usually to time and place), fluctuates | Intact |
| **Behaviour** | Disinhibition, impairment in ADL/IADL, personality change, loss of social graces | Severe agitation/retardation | Self-harm/suicide |
| **Psychomotor** | Normal | Fluctuates between extremes | Slowing |
| **Sleep Wake Cycle** | Fragmented sleep at night | Reversed sleep wake cycle | Early morning awakening |
| **Mood and Affect** | Labile, anxiety or depression are common in the early stages | Anxious, irritable, fluctuating | Depressed, pervasive |
| **Cognition** | Decreased executive functioning, paucity of thought | Fluctuating | Fluctuating |
| **Memory Loss** | Recent, eventually remote<br>Typically, low insight | Marked recent | Recent<br>More likely to complain |
| **Language** | Agnosia, aphasia, decreased comprehension, repetition, speech (echolalia, palilalia) | Dysnomia, dysgraphia, speech rambling, irrelevant, incoherent, subject changes | Not affected |
| **Delusions** | Compensatory | Nightmarish and poorly formed | Nihilistic, somatic |
| **Hallucinations** | Variable | Visual common | Less common; if present, auditory predominates |
| **Quality of Hallucinations** | Vacuous/bland | Frightening/bizarre | Self-deprecatory |
| **Medical Status** | Variable | Acute illness, drug toxicity | Rule out systemic illness, medications |

# Substance-Related and Addictive Disorders

## Overview

- a neurobiological disorder involving compulsive drug seeking and drug taking, despite adverse consequences, with loss of control over drug use (think issues with the "3 Cs": compulsive, consequences, control)
- dependence is the hallmark of substance use disorders and comes in the following forms:
  - behavioural: substance-seeking activities and pathological use patterns
  - physical: physiologic withdrawal effects without use
  - cognitive: continuous or intermittent cravings for the substance to avoid dysphoria or attain drug state
- abuse: drug use that deviates from the approved social or medical pattern, usually causing impairment or disruption to function in self or others
- these disorders are usually chronic with a relapsing and remitting course
- there are 10 separate classes of substances identified in the DSM-5: alcohol; caffeine; cannabis hallucinogens (phenylcyclidine [or similarly acting arylcyclohexlamines] and other hallucinogens); inhalants; opioids; sedatives, hypnotics, and anxiolytics; stimulants (amphetamine-type substances, cocaine, and other stimulants); tobacco; and other (or unknown) substances

## Epidemiology

- 47% of those with substance abuse have mental health problems
- 29% of those with a mental health disorder have a substance use disorder
- 47% of those with schizophrenia and 25% of those with an anxiety disorder have a substance use disorder

## Etiology

- almost all drugs (and activities) of abuse increase dopamine in the nucleus accumbens, an action that contributes to their euphoric properties and, with repeated use, to their ability to change signaling pathways in the brain's reward system
- substance use disorders arise from multifactorial interactions between genes (personality, neurobiology) and environment (low socioeconomic status, substance-using peers, abuse history, chronic stress)

## Diagnosis

- substance use disorders are measured on a continuum from mild to severe based on the number of criteria met within 12 mo
  - mild: 2-3
  - moderate: 4-5
  - severe: 6 or more
- each specific substance is addressed as a separate use disorder and diagnosed utilizing the same overarching criteria (i.e. a single patient may have moderate alcohol use disorder, and a mild stimulant use disorder)
- testing for illicit drugs is most commonly done on urine or blood samples
  - serum toxicology screen is needed to assess alcohol level
  - toxicology may be helpful in differentiating withdrawal from other mental disorders
- criteria for substance use disorders (**PEC WITH MCAT**)
  - use despite **P**hysical or psychological problem (i.e. alcoholic liver disease or cocaine related nasal problems)
  - failures to fulfill **E**xternal roles at work/school/home
  - **C**raving or a strong desire to use substance
  - **W**ithdrawal
  - continued use despite **I**nterpersonal problems
  - **T**olerance, needing to use more substance to get same effect
  - use in physically **H**azardous situations
  - **M**ore substance used or for longer period than intended
  - unsuccessful attempts to **C**ut down
  - **A**ctivities given up due to substance
  - excessive **T**ime spent on using or finding substance

**Table 4. Substance Symptomatology**

| | Drugs | Symptoms of Intoxication | Symptoms of Withdrawal |
|---|---|---|---|
| **Depressants** | Alcohol, opioids, barbiturates, benzodiazepines, GHB | Euphoria, slurred speech, disinhibition, confusion, poor coordination, coma (severe) | Anxiety, anhedonia, tremor, seizures, insomnia, psychosis, delirium, death |
| **Stimulants** | Amphetamines, methylphenidate, MDMA, cocaine | Euphoria, mania, psychomotor agitation, anxiety, psychosis (especially paranoia), insomnia, cardiovascular complications (stroke, MI, arrhythmias), seizure | 'Crash', craving, dysphoria, suicidality |
| **Hallucinogens** | LSD, mescaline, psilocybin, PCP, ketamine, ibogaine, salvia | Distortion of sensory stimuli and enhancement of feelings, psychosis (++ visual hallucinations), delirium, anxiety (panic), poor coordination | Usually absent |

### General Approach to Assessment

- ask about more socially accepted substances (i.e. nicotine, alcohol) before asking about use of marijuana, misuse of prescription medicines, and about illicit drugs
- obtaining history from family members may be helpful

### General Approach to Treatment

- approach must be appropriate to the patient's current state of change (see Public Health and Preventive Medicine, *Health Promotion Strategies*, PH6)
- patients will only change when the pain of change appears less than the pain of staying the same
- provider can help by providing psychoeducation (emphasize neurobiologic model of addiction), motivation, and hope
- principles of motivational interviewing (see *Psychotherapy*, PS40)
  - non-judgmental stance
  - space for patient to talk and reflect
  - offer accurate empathic reflections back to patient to help frame issue
- encourage and offer referral to evidence based services
  - social: 12-step programs (alcoholics anonymous, narcotics anonymous), family education, and support
  - psychological therapy: addiction counselling, MET, CBT, contingency management, group therapy, family therapy, marital counselling
  - medical management (differs depending on substance): acute detoxification, pharmacologic agents to aid maintenance
- harm reduction whenever possible: safe-sex practices, avoid driving while intoxicated, avoid substances with child care, safe needle practices/exchange, pill-testing kits, reducing tobacco use
- comorbid psychiatric conditions: many will resolve with successful treatment of the substance use disorder but patients who meet full criteria for another disorder should be treated for that disorder with psychological and pharmacologic therapies

**Questions to Characterize Substance Use and Risk Assessment**

- When was the last time you used?
- How long can you go without using?
- By what route (oral ingestion, inhalation (snorting), smoking, IV) do you usually use?
- Are there any triggers that you know will cause you to use?
- How has your substance use affected your work, school, relationships?
- Substances can be very expensive, how do you support your drug use?
- Have you experienced medical or legal consequences of your use?
- Any previous attempts to cut down or quit, and did you experience any withdrawal symptoms?

## Nicotine

- see Family Medicine, FM11

## Alcohol

- see Family Medicine, FM12 and Emergency Medicine, ER54

### History

- Validated screening questionnaire for alcohol use disorders
  - **C** ever felt the need to **C**ut down on your drinking?
  - **A** ever felt **A**nnoyed at criticism of your drinking?
  - **G** ever feel **G**uilty about your drinking?
  - **E** ever need a drink first thing in morning (**E**ye opener)?
  - for men, a score of ≥2 is a positive screen; for women, a score of ≥1 is a positive screen
  - if positive CAGE, then assess further to distinguish between problem drinking and alcohol use disorder

**Confabulations**: the fabrication of imaginary experiences to compensate for memory loss

Make sure to ask about other alcohols: mouthwash, rubbing alcohol, methanol, ethylene glycol, aftershave (may be used as a cheaper alternative)

#### Canada's Low-Risk Alcohol Drinking Guidelines

| Moderate Drinking | | |
|---|---|---|
| Men: 3 or less/d (≤15/wk) | Women: 2 or less/d (≤10/wk) | Elderly: 1 or less/d |

**A "Standard Drink"**
Spirit (40%): 1.5 oz. or 43 mL
Table Wine (12%): 5 oz. or 142 mL
Fortified Wine (18%): 3 oz. or 85 mL
Regular Beer (5%): 12 oz. or 341 mL
OR
1 pint of beer = 1.5 SD
1 bottle of wine = 5 SD
1 "mickey" = 8 SD (375 mL)
"26-er" = 17 SD (750 mL)
"40 oz." = 27 SD

### Alcohol Intoxication

- legal limit for impaired driving is 17 mmol/L (50 mg/dL) reached by 2-3 drinks/h for men and 1-2 drinks/h for women
- coma can occur with >60 mmol/L (non-tolerant drinkers) and 90-120 mmol/L (tolerant drinkers)

### Alcohol Withdrawal

- medical emergency: occurs within 12-48 h after prolonged heavy drinking and can be life-threatening
- ~50% of middle-class, functional individuals with EtOH use disorder have experienced alcohol withdrawal, 80% in hospitalized/homeless individuals
  - alcohol withdrawal can be described as having 4 stages, however not all stages may be experienced:
  - stage 1 (onset 4-12 h after last drink): "the shakes" tremor, sweating, agitation, anorexia, cramps, diarrhea, sleep disturbance, anxiety, insomnia, headache
  - stage 2 (onset 12-24 h): alcoholic hallucinosis: visual, auditory, olfactory or tactile hallucinations
  - stage 3 (onset 24-48 h): alcohol withdrawal seizures, usually tonic-clonic, non-focal, and brief
  - stage 4 (onset 48-72 h): delirium tremens, confusion, delusions, hallucinations, agitation, tremors, autonomic hyperactivity (fever, tachycardia, HTN)
- course: almost completely reversible in young; elderly often left with cognitive deficits
- mortality rate 20% if untreated

**Delirium Tremens (alcohol withdrawal delirium)**

- Autonomic hyperactivity (diaphoresis, tachycardia, increased respiration)
- Hand tremor
- Insomnia
- Psychomotor agitation
- Anxiety
- Nausea or vomiting
- Tonic-clonic seizures
- Visual/tactile/auditory hallucinations
- Persecutory delusions

## Management of Alcohol Withdrawal

- monitor using the Clinical Institute Withdrawal Assessment for Alcohol (CIWA-A) scoring system
  - areas of assessment include:
    - physical (5): nausea and vomiting, tremor, agitation, paroxysmal sweats, headache/fullness in head
    - psychological/cognitive (2): anxiety, orientation/clouding of sensorium
    - perceptual (3): tactile disturbances, auditory disturbances, visual disturbances
    - all categories are scored from 0-7 (except: orientation/sensorium 0-4), maximum score of 67 mild <10, moderate 10-20, severe >20

**Table 5. CIWA-A Scale Treatment Protocol for Alcohol Withdrawal**

| | |
|---|---|
| **Basic Protocol** | Diazepam 20 mg PO q1-2h prn until CIWA-A <10 points |
| | Observe 1-2 h after last dose and re-assess on CIWA-A scale |
| | Thiamine 100 mg IM then 100 mg PO OD for 3 d |
| | Supportive care (hydration and nutrition) |
| **History of Withdrawal Seizures** | Diazepam 20 mg PO q1h for minimum of three doses regardless of subsequent CIWA scores |
| **If age >65 or patient has severe liver disease, severe asthma or respiratory failure** | Use a short acting benzodiazepine<br>Lorazepam PO/SL/IM 1-4 mg q1-2h |
| **If Hallucinations are present** | Haloperidol 2-5 mg IM/PO q1-4h – max 5 doses/d or atypical antipsychotics (olanzapine, risperidone) |
| | Diazepam 20 mg x 3 doses as seizure prophylaxis (haloperidol lowers seizure threshold) |
| **Admit to Hospital if** | Still in withdrawal after >80 mg of diazepam |
| | Delirium tremens, recurrent arrhythmias, or multiple seizures |
| | Medically ill or unsafe to discharge home |

## Wernicke-Korsakoff Syndrome

- alcohol-induced amnestic disorders due to thiamine deficiency (poor nutrition or malabsorption)
- necrotic lesions: mammillary bodies, thalamus, brainstem
- Wernicke's encephalopathy (acute and reversible): triad of oculomotor dysfunction such as nystagmus (CN VI palsy), gait ataxia, and confusion
- Korsakoff's syndrome (chronic and only 20% reversible with treatment): anterograde amnesia and confabulation; cannot occur during an acute delirium or dementia and must persist beyond usual duration of intoxication/withdrawal
- management
  - Wernicke's preventative treatment (any patient in withdrawal): thiamine 100-250mg IM/IV x 1 dose
  - Wernicke's acute treatment: thiamine 500 mg IV BID/TID x 72,h then reassess
  - Korsakoff's: IV treatment as for Wernicke's followed by thiamine 100 mg PO TID x 3-12 mo

## Treatment of Alcohol Use Disorder

- non-pharmacological
  - see *General Approach to Treatment*
- pharmacological
  - naltrexone (Revia®): opioid antagonist, shown to be successful in reducing the "high" associated with alcohol, moderately effective in reducing cravings, frequency or intensity of alcohol binges; can be started if still consuming alcohol or abstinent
  - acamprosate (Campral®): NMDA glutamate receptor antagonist; useful in maintaining abstinence and decreasing cravings
  - disulfiram (Antabuse®): prevents oxidation of alcohol (blocks acetaldehyde dehydrogenase); with alcohol consumption, acetaldehyde accumulates to cause a toxic reaction (vomiting, tachycardia, death); if patient relapses, must wait 48 h before restarting Antabuse®; prescribed only when treatment goal is abstinence; RCT evidence is generally poor or negative
  - some evidence for the use of gabapentin, topiramate and ondansetron as anti-craving agents, but not Health Canada approved for this indication

# Opioids

- types of opioids: heroin, morphine, oxycodone, Tylenol #3® (codeine), hydromorphone, fentanyl
- major risks associated with the use of contaminated needles: increased risk of hepatitis B and C, bacterial endocarditis, and HIV/AIDS
- recent considerations of inadvertent overdose secondary to contamination with fentanyl in the drug supply "opioid crisis" leading to 9000 deaths in Canada between January 2016 and June 2018

## Acute Intoxication

- direct effect on receptors in CNS resulting in decreased pain perception, sedation, decreased sex drive, nausea/vomiting, decreased GI motility (constipation and anorexia), and respiratory depression

## Toxic Reaction

- medical emergency: typical syndrome includes shallow respirations, miosis, bradycardia, hypothermia, decreased level of consciousness
- management
  - ABCs
  - IV glucose
  - naloxone hydrochloride (Narcan®): 0.4 mg up to 2 mg IV for diagnosis
  - treatment: intubation and mechanical ventilation, ± naloxone drip, until patient alert without naloxone (up to >48 h with long-acting opioids)
- caution: opioids have a longer half-life than naloxone; may need to observe for toxic reaction for at least 24 h

## Withdrawal

- symptoms: dysphoric mood, insomnia, drug-craving, myalgias, nausea or vomiting, yawning, chills, lacrimation, rhinorrhea, pupillary dilation, piloerection, sweating, diarrhea, fever
- onset: 6-12 h (depending on half-life of opioid used); duration: 5-10 d
- complications: loss of tolerance (overdose on relapse), miscarriage, premature labour
- management: long-acting oral opioids (methadone, buprenorphine), α-adrenergic agonists (clonidine)

## Treatment of Opioid Use Disorder

- see *General Approach to Treatment*, PS26
- long-term treatment may include maintenance treatment with methadone (opioid agonist) or buprenorphine (mixed agonist-antagonist)
- Suboxone® formulation includes naloxone in addition to buprenorphine, in an effort to prevent injection of the drug. When naloxone is injected, it will precipitate opiate withdrawal and block the opiate effect of buprenorphine; however, it will not have this antagonist action when taken sublingually
- decreasing risk of overdose: patients with opiate use disorder should be encouraged to carry a naloxone kit and educated on ways to limit overdose risk (i.e. use with a friend, avoid mixing drugs)

**Opioid Antagonists**
**Naltrexone vs. Naloxone**

Naltrexone (Revia®)
- Can be used for EtOH dependence (although not routinely used)
- Long half life (h)

Naloxone (Narcan®)
- Used for life-threatening CNS/respiratory depression in opioid overdose
- Short half life (<1 h)
- Very fast acting (min)
- High affinity for opioid receptor
- Induces opioid withdrawal symptoms

**Maintenance Medication for Opiate Addiction: The Foundation of Recovery**
*J Addict Dis* 2012;31:207-225
Maintenance treatment of opioid addiction with methadone or buprenorphine is associated with retention in treatment, reduction in illicit opiate use, decreased craving, and improved social function. Recently, studies showing extended release naltrexone injections have showed some promise.

# Cocaine

- street names: blow, C, coke, crack, flake, freebase, rock, snow
- alkaloid extracted from leaves of the coca plant; blocks presynaptic uptake of serotonin (causing euphoria), dopamine (linked to its addictive effect), norepinephrine and epinephrine (causing vasospasm, HTN)
- sodium channel blockade: cocaine slows or blocks nerve conduction and acts as a local anesthetic by altering recovery of neuronal $Na^+$ channels; it has a similar effect on cardiac $Na^+$ channels and in overdose can manifest on ECG as prolongation of the QRS complex
- self-administered by inhalation (90% bioavailability), insufflation (i.e. intranasal; 80% bioavailability), or intravenous route
- onset and duration of action: onset within seconds if inhaled, lasting 15-30 min; onset in 3-5 min if insufflated, blood levels peak at 10-20 min with effects beginning to fade after 45-60 min; cocaine has a biologic half-life of 1 h, thus repeated self-administration is common among users to maintain an effect

## Intoxication

- elation, euphoria, pressured speech, restlessness, sympathetic stimulation (i.e. tachycardia, mydriasis, sweating, pupillary dilatation, hypertension)
- prolonged use may result in paranoia and psychosis

## Overdose

- medical emergency: HTN, tachycardia, tonic-clonic seizures, dyspnea, and ventricular arrhythmias
- treatment with IV diazepam to control seizures
- beta-blockers (incl. labetalol or propranolol) are not recommended because of risk from unopposed alpha-adrenergic stimulation

## Withdrawal

- initial "crash" (1-48 h): increased sleep, increased appetite, dysphoria
- withdrawal (1-10 wk): dysphoric mood plus fatigue, irritability, vivid unpleasant dreams, insomnia or hypersomnia, psychomotor agitation or retardation
- complications: relapse, suicide (significant increase in suicide during withdrawal period)
- management: supportive management

**Common Presentations of Drug Use**

| System | Findings |
|---|---|
| **General** | Weight loss (especially cocaine, heroin)<br>Injected conjunctiva (cannabis)<br>Pinpoint pupils (opioids)<br>Track marks (injection drugs) |
| **MSK** | Trauma |
| **GI** | Viral hepatitis (injection drugs)<br>Unexplained elevations in ALT (injection drugs) |
| **Behavioural** | Missed appointments<br>Non-compliance<br>Drug-seeking (especially benzodiazepines, opioids) |
| **Psychological** | Insomnia<br>Fatigue<br>Depression<br>Flat affect (benzodiazepines, barbiturates)<br>Paranoia (cocaine)<br>Psychosis (cocaine, cannabis, hallucinogens) |
| **Social** | Marital discord<br>Family violence<br>Work/school<br>Absenteeism and poor performance |

### Treatment of Cocaine Use Disorder
- see *General Approach to Treatment*, PS26
- no pharmacologic agents have widespread evidence or acceptance of use

### Complications
- cardiovascular: arrhythmias, MI, CVA, ruptured AAA, chest pain (accounts for 40% of all cocaine-related ED visits)
- neurologic: seizures
- psychiatric: psychosis, delirium, suicidal ideation
- other: nasal septal deterioration, acute/chronic lung injury "crack lung", possible increased risk of connective tissue disease

## Amphetamines

- includes prescription medications for ADHD such as Ritalin® and Adderall® and street drugs such as crystal meth
- intoxication characterized by euphoria, improved concentration, sympathetic and behavioural hyperactivity, and at high doses. can mimic symptoms of psychosis or mania; can eventually cause coma
- chronic use can produce psychosis which can resemble schizophrenia with agitation, paranoia, delusions. and hallucinations
- withdrawal symptoms include dysphoria, fatigue, and restlessness
- treatment of amphetamine induced psychosis: antipsychotics for acute presentation, benzodiazepines for agitation, β-blockers for tachycardia, hypertension

## Cannabis

- cannabis (marijuana) is the most commonly used recreational drug
- psychoactive substance: delta-9-tetrahydrocannabinol (Δ9-THC)
- general clinical manifestations: intoxication characterized by tachycardia, conjunctival vascular engorgement, dry mouth, altered sensorium, increased appetite, and muscle relaxation
- neuropsychiatric effects:
  - altered mood, perception, and thought content: increased sense of well-being, euphoria/laughter
  - impaired cognitive and psychomotor performance: reduced reaction time, impaired attention, concentration, and short-term memory. It may also impair motor coordination required to complete complex tasks requiring divided attention. Notably, psychomotor impairments may interfere with one's ability to operate heavy machinery such as automobiles
- inhaled marijuana: onset of psychoactive effects occurs rapidly with peak effects felt 15-30 min after intake and lasting up to 4 h
  - acute exacerbation in patients with asthma may be a complication with inhalation
- ingested marijuana: following oral ingestion, psychotrophic effects set in with a delay of 30-90 min, reach their maximum after 2-3 h and last for about 4-12 h depending on dose
- high doses can cause depersonalization, paranoia, anxiety and may trigger psychosis and schizophrenia if predisposed
- chronic use is associated with tolerance and an apathetic, amotivational state
- assessment: standard urine drug screens
- treatment of cannabis use disorder: see General Approach to Treatment, PS23
- cessation following heavy use produces a significant withdrawal syndrome: irritability, anxiety, insomnia, decreased food intake

## Hallucinogens

- types of hallucinogens by primary action
  - 5-HT2A agonists: LSD, mescaline (peyote), psilocybin mushrooms, DMT (ayahuasca)
  - NMDA antagonists: PCP, ketamine
  - κ-opioid agonists: salvia divinorum, ibogaine
- 5-HT2A agonists are most commonly used; intoxication characterized by tachycardia, HTN, mydriasis, tremor, hyperpyrexia, and a variety of perceptual, mood and cognitive changes (rarely, if ever, deadly; treat vitals symptomatically)
- psychological effects of high doses: depersonalization, derealization, paranoia, and anxiety (panic with agoraphobia)
- tolerance develops rapidly (hours-days) to most hallucinogens so physical dependency is virtually impossible, although psychological dependency and problematic usage patterns can still occur
- no specific withdrawal syndrome characterized
- management of acute intoxication: support, reassurance, diminished stimulation; benzodiazepines or high potency antipsychotics seldom required (if used, use small doses), minimize use of restraints
- long term adverse effects: controversial role in triggering psychiatric disorders, particularly mood or psychosis, thought to be chiefly in individuals with genetic or other risk factors
- Hallucinogen Persisting Perception Disorder: DSM-5 diagnosis characterized by long lasting, spontaneous, intermittent recurrences of visual perceptual changes reminiscent of those experienced with hallucinogen exposure

**Cannabinoid Hyperemesis Syndrome**
An interesting and relatively new clinical phenomenon associated with chronic cannabis use characterized by cyclical, recurrent severe nausea, vomiting, and colicky pain. Possibly due to increased potency of available THC products. Patients often present to ED in acute distress with no evidence of specific GI pathology. Many patients will successfully self-medicate with hot baths or showers

**Medical Uses of Marijuana**
- Anorexia-cachexia (AIDS, cancer)
- Spasticity, muscle spasms (multiple sclerosis, spinal cord injury)
- Levodopa-induced dyskinesia (Parkinson's Disease)
- Controlling tics and obsessive-compulsive behaviour (Tourette's syndrome)
- Reducing intra-ocular pressure (glaucoma)

**Cannabis Use and Risk of Psychotic or Affective Mental Health Outcomes: A Systematic Review**
The Lancet 2007;370:319-328
**Purpose**: To review the evidence for cannabis use and occurrence of psychotic or affective mental health outcomes.
**Study Characteristics**: A meta-analysis of 35 population-based longitudinal studies, or case-control studies nested within longitudinal designs.
**Results**: There was an increased risk of any psychotic outcome in individuals who had ever used cannabis (pooled adjusted odds ratio =1.41, 95% CI 1.20-1.65). Findings were consistent with a dose-response effect, with greater risk in people who used cannabis more frequently (2.09, 95% CI, 1.54-2.84). Findings for depression, suicidal thoughts, and anxiety outcomes were less consistent. In both cases (psychotic and affective outcomes), a substantial confounding effect was present.
**Conclusions**: The findings are consistent with the view that cannabis increases risk of psychotic outcomes independent of transient intoxication effects, although evidence is less strong for affective outcomes. Although cannabis use and the development of psychosis are strongly associated, it is difficult to determine causality and it is possible that the association results from confounding factors or bias. The authors did conclude that there is sufficient evidence to warn young people that using cannabis could increase their risk of developing a psychotic illness later in life.

# "Club Drugs"

**Table 6. The Mechanism and Effects of Common "Club Drugs"**

| Drug | Mechanism | Effect | Adverse Effects |
|---|---|---|---|
| **MDMA ("Ecstasy", "X", "E", "M", "Molly")** | Acts on serotonergic and dopaminergic pathways, properties of a hallucinogen and stimulant | Enhanced sensorium; feelings of well-being, empathy | Diaphoresis, tachycardia, fatigue, muscle spasms (especially jaw clenching), ataxia, hyperthermia, arrhythmias, DIC, rhabdomyolysis, renal failure, seizures, death |
| **Gamma Hydroxybutyrate (GHB, "G", "Liquid Ecstasy")** | Biphasic dopamine response (inhibition then release) and releases opiate-like substance | Euphoric effects, increased aggression, impaired judgment | Diaphoresis, tachycardia, fatigue, muscle spasms (especially jaw clenching), ataxia, severe withdrawal from abrupt cessation of high doses: tremor, seizures, psychosis |
| **Flunitrazepam (Rohypnol®, "Roofies", "Rope", "The Forget Pill")** | Potent benzodiazepine, rapid oral absorption | Sedation, psychomotor impairment, amnestic effects, decreased sexual inhibition | CNS depression with EtOH |
| **Ketamine ("Special K", "Kit-Kat")** | NMDA receptor antagonist, rapid-acting general anesthetic used in pediatrics and by veterinarians | "Dissociative" state, profound amnesia/ analgesia, hallucinations and sympathomimetic effects | Psychological distress, accidents due to intensity of experience and lack of bodily control<br>In overdose: decreased LOC, respiratory depression, catatonia |
| **Methamphetamine ("speed", "meth", "chalk", "ice", "crystal")** | Amphetamine stimulant, induces norepinephrine, dopamine, and serotonin release | Rush begins in min, effects last 6-8 h, increased activity, decreased appetite, general sense of well-being, tolerance occurs quickly, users often binge and crash | Short-term use: high agitation, rage, violent behaviour, occasionally hyperthermia and convulsions<br>Long-term use: addiction, anxiety, confusion, insomnia, paranoia, auditory and tactile hallucinations (especially formication), delusions, mood disturbance, suicidal and homicidal thoughts, stroke<br>May be contaminated with lead, and IV users may present with acute lead poisoning |
| **Phencyclidine ("PCP", "angel dust")** | Not understood, used by veterinarians to immobilize large animals | Amnestic, euphoric, hallucinatory state | Horizontal/vertical nystagmus, myoclonus, ataxia, autonomic instability (treat with diazepam IV), prolonged agitated psychosis (treat with haloperidol); high risk for suicide; violence towards others<br>High dose can cause coma |

**Date Rape Drugs**
- GHB
- Flunitrazepam (Rohypnol®)
- Ketamine

**Formication**
Tactile hallucination that insects or snakes are crawling over or under the skin (especially associated with crystal meth use)

**Emerging Medical Uses of Hallucinogens**
Many hallucinogens are currently under investigation for therapeutic benefit; LSD & Psilocybin for end of life anxiety, MDMA for PTSD, Ketamine for rapid treatment of depression, ibogaine derivatives for addiction

# Somatic Symptom and Related Disorders

## General Characteristics

- physical signs and symptoms lacking objective medical support in the presence of psychological factors that are judged to be important in the initiation, exacerbation, or maintenance of the disturbance
- cause significant distress or impairment in functioning
- symptoms are produced unconsciously and are not the result of malingering or factitious disorder, which are disorders of voluntary presentation of symptoms (or intentionally inducing, i.e. injecting feces) for secondary gain
- primary gain: somatic symptom represents a symbolic resolution of an unconscious psychological conflict; serves to reduce anxiety and conflict with no external incentive
- secondary gain: the sick role; external benefits obtained or unpleasant duties avoided (i.e. work)

## Management of Somatic Symptom and Related Disorders

- brief, regular scheduled visits with GP to facilitate therapeutic relationship and help patient feel supported
- good, clear communication among all involved care providers
- limit number of physicians involved in care, minimize medical investigations, coordinate necessary investigations
- emphasis on what the patient can change and control; the psychosocial coping skills, not their physical symptoms (functional recovery > explanation of symptoms)
- focus on functional improvement (physiotherapy, occupational therapy), provide psychoeducation to validate suffering in the face of medically unexplained symptoms
- psychotherapy: CBT, mindfulness interventions, biofeedback
- minimize psychotropic drugs: anxiolytics in short-term only, antidepressants for comorbid depression and anxiety

**Malingering**: intentional production of false or grossly exaggerated physical or psychological symptoms, motivated by secondary gain/external reward (i.e. avoiding work, obtaining financial compensation, or obtaining drugs)

**Factitious Disorder**: intentional production or feigning of physical or psychological signs or symptoms. Unlike malingering patients are not motivated by secondary gain but rather may seek sympathy, nurturance, and attention

# Somatic Symptom Disorder

### DSM-5 DIAGNOSTIC CRITERIA FOR SOMATIC SYMPTOM DISORDER

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. one or more somatic symptoms that are distressing or result in significant disruption of daily life
B. excessive thoughts, feelings, or behaviours related to the somatic symptoms or associated health concerns as manifested by at least one of the following:
   1. disproportionate and persistent thoughts about the seriousness of one's symptoms
   2. persistently high level of anxiety about health or symptoms
   3. excessive time and energy devoted to these symptoms or health concerns
C. although any one somatic symptom may not be continuously present, the state of being symptomatic is persistent (typically >6 mo)

- **somatic symptom disorder with predominant pain** (previously pain disorder) for those whose somatic symptom is primarily pain
- patients have physical symptoms and believe these symptoms represent the manifestation of a serious illness
- persistent belief despite negative medical investigations and may develop different symptoms over time
- lifetime prevalence may be around 5-7% in the general adult population
- females tend to report more somatic symptoms than males do, cultural factors may influence sex ratio
- complications: anxiety and depression commonly comorbid (up to 80%), unnecessary medications, or surgery
- often a misdiagnosis for an insidious illness so rule out all organic illnesses (i.e. multiple sclerosis)

# Illness Anxiety Disorder

- preoccupation with fear of having, or the idea that one has, a serious disease, to the point of causing significant impairment
- convictions persist despite negative investigations and medical reassurance
- somatic symptoms are mild or not present
- there is a high level of anxiety about health and the individual is easily alarmed about personal health status
- person engages in maladaptive behaviour such as excessive physical checking or total healthcare avoidance
- duration is ≥6 mo; onset in 3rd-4th decade of life
- a new diagnostic entity so epidemiology is not well known; however, it is likely less common than somatic symptom disorder
- possible role for SSRIs due to generally high level of anxiety
- specifiers: care-seeking type or care-avoidant type

# Conversion Disorder (Functional Neurological Symptom Disorder)

- ≥1 symptoms or deficits affecting voluntary motor or sensory function that mimic a neurological or GMC (i.e. impaired coordination, local paralysis, double vision, seizures, or convulsions)
- does not need to be preceded by a psychological event as per previous DSM criteria, however this is still worth exploring as many patients will present after such an event or related to a medical diagnosis in a first-degree relative
- 2-5/100,000 in general population; 5% of referrals to neurology clinics
- more common in rural populations and in individuals with little medical knowledge
- spontaneous remission in 95% of acute cases, 50% of chronic cases (>6 mo)
- incompatible findings detected from specific neurological testing can help differentiate between functional and neurological origin (i.e. Hoover's sign and dermatome testing)
- specifiers: acute episode (<6 mo symptom duration), chronic episode (>6 mo symptom duration), with psychological stressor, without psychological stressor

**La belle indifference**: an inappropriately cavalier patient attitude in the face of serious symptoms; classically associated with conversion disorder

**Table 7. Differential of Somatic Symptom and Related Disorders**

| | Somatic Symptom Disorder | Illness Anxiety Disorder | Conversion Disorder | Factitious Disorder | Malingering |
|---|---|---|---|---|---|
| **Somatic Symptoms** | Present | Mild or absent | Neurologic, voluntary motor or sensory | Psychological or physical | Psychological or physical |
| **Symptoms Produced** | Unconsciously | Unconsciously | Unconsciously | Consciously | Consciously |
| **Physical Findings** | Absent | Absent | Incompatible | Possible, attempts to falsify | Possible, attempts to falsify |

# Dissociative Disorders

### Definition
- severe dissociation resulting in breakdown of integrated functions of consciousness and perception of self
- differential diagnosis: PTSD, acute stress disorder, borderline personality disorder, somatic symptom disorder, substance abuse, GMC (various neurologic disorders including complex/partial seizures, migraine, Cotard syndrome)

## Dissociative Identity Disorder

- disruption of identity characterized by ≥2 distinct personality states or an experience of possession
- can manifest as sudden alterations in sense of self and agency (ego-dystonic emotions, behaviours, speech)
- features recurrent episodes of amnesia (declarative or procedural)

## Dissociative Amnesia

- inability to recall important autobiographical information, usually of a traumatic or stressful nature, that is inconsistent with normal forgetting and not attributable to a psychiatric disorder or medical illness
- localized/selective amnesia: failure to recall all/some events during a prescribed period of time
- generalized amnesia: (more rare) complete loss of memory for one's life history, ± procedural knowledge, ± semantic knowledge; usually sudden onset; often presents with perplexity, disorientation, and aimless wandering

**Fugue**
Purposeful travel or bewildered wandering while in amnesic state

## Depersonalization/Derealization Disorder

- persistent or recurrent episodes of one or both of:
  - depersonalization: experiences of detachment from oneself, feelings of unreality, or being an outside observer to one's thoughts, feelings, speech, and actions (can feature distortions in perception including time, as well as emotional and physical numbing)
  - derealization: experiences of unreality or detachment with respect to the surroundings (i.e. feeling as if in a dream, or that the world is not real; external visual world is foggy or distorted)
- transient (s-h) experiences of this nature are quite common in the general population
- episodes can range from h-yr, patients are often quite distressed and verbalize concern of "going crazy"

During depersonalization or derealization, patients usually have intact reality testing, which adds to their alarming nature

# Sleep Disorders

- for more information regarding normal sleep cycles and the illnesses described, see Neurology, *Sleep Disorders*, N46

### Overview
- adequate sleep is essential to normal functioning; deprivation can lead to cognitive impairment and increased mortality
- circadian rhythms help regulate mood and cognitive performance
- neurotransmitters commonly implicated in psychiatric illnesses also regulate sleep
  - acetylcholine activity and decreased activity of monoamine neurotransmitters is associated with greater REM sleep
  - decreased adrenergic and cholinergic activity are associated with NREM sleep
- depression is associated with decreased Δ (deep, slow-wave) sleep, decreased REM latency, and increased REM density
- criteria
  - must cause significant distress or impairment in normal functioning
  - not due to a GMC or medications/drugs (unless specified)

### Management
- pharmacological treatments are illness-specific
  - non-benzodiazepines preferable (i.e. trazodone, zoplicone, quetiapine), but benzodiazepines a short term option
  - medication should not be prescribed without having first made a diagnosis and considering major psychiatric illnesses (major depression and alcohol use disorders are common etiologies)
- sleep hygiene is a simple, effective, but often underutilized method for addressing sleep disturbances; recommendations include:
  - waking up and going to bed at same time every day, including on weekends
  - avoiding long periods of wakefulness in bed
  - not using bed for non-sleep activities (reading, TV, work)
  - avoiding screens, especially smartphones and ipads in the hour before bed
  - avoiding napping
  - discontinuing or reducing consumption of alcohol, caffeine, drugs
  - exercising at least 3-4x per week (but not in the evening, if this interferes with sleep)
- Cognitive Behavioural Therapy for insomnia (CBTi)

**Table 8. Major DSM-5 Sleep-Wake Disorders**

Note: For more information regarding specific disorders, see: Neurology, *Sleep Disorders*, N46; Family Medicine, *Sleep Disorders*, FM44; and Respirology, *Sleep Apnea*, R28

| Category | Disorder | Description |
|---|---|---|
| **(Uncategorized)** | **Insomnia disorder** | Difficulty sleeping |
| | **Hypersomnolence disorder** | Feeling sleepy throughout the day |
| | **Narcolepsy** | Recurrent attacks of irrepressible need to sleep |
| | **Circadian rhythm sleep-wake disorders** | Insomnia or excessive sleepiness due to misalignment or alteration in endogenous circadian rhythm |
| | **Restless legs syndrome** | Uncomfortable, frequent urge to move legs at night |
| | **Substance/medication-induced sleep disorder** | Disturbance in sleep (insomnia or daytime sleepiness) caused by substance/medication intoxication or withdrawal |
| **Breathing-Related Sleep Disorders** | **Obstructive sleep apnea hypopnea** | Breathing issues due to obstruction |
| | **Central sleep apnea** | Breathing issues due to aberrant brain signaling |
| | **Sleep-related hypoventilation** | Breathing issues due to decreased responsiveness to carbon dioxide levels |
| **Parasomnias** | **Non-rapid eye movement sleep arousal disorders** | Incomplete awakening from sleep, complex motor behaviour without conscious awareness; amnesia regarding episodes; includes symptoms of: |
| | | **Sleepwalking**: rising from bed and walking about, blank face, unresponsive, awakened with difficulty |
| | | **Sleep terrors**: recurrent episodes of abrupt terror arousals from sleep, usually beginning with a panicky scream, intense fear and autonomic arousal, relative unresponsiveness to comfort during episodes |
| | | **Specifiers**: sleep-related sexual behaviour (sexsomnia) and sleep-related eating |
| | **Nightmare disorder** | Repeated extended, extremely dysphoric, often very vivid, well-remembered dreams that usually involve significant threats; rapid orientation and alertness on awakening with autonomic arousal |
| | **Rapid eye movement sleep behaviour disorder** | Arousal during sleep, associated with vocalization and/or complex motor behaviours; can cause violent injuries; rapid orientation and alertness on awakening |

# Sexuality and Gender

## Gender Dysphoria

### Definition
- the distress that may coincide with conflict between one's experienced/expressed gender and one's assigned gender

### Typical Presentation
- strong and persistent cross-gender identification
- desire to be rid of current primary/secondary sex characteristics and to gain the primary/secondary sex characteristics of their identified gender
- repeated stated desire or insistence that one is of the opposite sex
- preference for cross-dressing, cross-gender roles in make-believe play
- strong desire to participate in the stereotypical games and pastimes of the opposite sex
- strong preference for playmates of the opposite sex
- significant distress or impairment in functioning and persistent discomfort with his or her sex or gender role

### Treatment
- psychotherapy
- hormonal therapy
- gender affirming surgery (old term: sexual reassignment surgery)

## Paraphilic Disorders

### Definition
- intense and persistent sexual arousal that is elicited by something other than genital stimulation or preparatory fondling with phenotypically normal, physically mature, consenting human partners
- paraphilic disorder: paraphilia that causes distress or functional impairment to the individual, or a paraphilia whose realization entails personal harm, or risk of harming others
- subtypes: voyeuristic, exhibitionistic, frotteuristic, sexual masochism, sexual sadism, pedophilic, fetishistic, transvestic, other specified paraphilic disorder, unspecified paraphilic disorder
- rarely self-referred; come to medical attention through interpersonal or legal conflict

- person usually has more than one paraphilia; 5% of paraphilias attributed to women
- typical presentation: begins in childhood or early adolescence; increasing complexity and stability with age
- chronic, decreases with advancing age but may increase with stress

### Treatment
- anti-androgen drugs
- behaviour modification
- psychotherapy

### SEXUAL DYSFUNCTION
- see Gynecology, GY32 and Urology, U33

# Eating Disorders

### Definition
- eating disorders are characterized by a persistent disturbance of eating that impairs psychosocial functioning or health
- disorders include: anorexia nervosa, avoidant/restrictive food intake disorder, binge eating disorder, bulimia nervosa, pica, and rumination disorder

### Epidemiology
- anorexia nervosa (AN): 1% of adolescent and young adult females; onset 13-20 yr old
- bulimia nervosa (BN): 2-4% of adolescent and young adult females; onset 16-18 yr old
- F:M=10:1; mortality 5-10%

### Etiology
- multifactorial: psychological, sociological, and biological associations
- individual: perfectionism, lack of control in other life areas, history of sexual abuse
- personality: obsessive-compulsive, histrionic, borderline
- familial: maintenance of weight equilibrium and control in dysfunctional family
- cultural factors: prevalent in industrialized societies, idealization of thinness in the media
- genetic factors
  - AN: 6% prevalence in siblings, with one study of twin pairs finding concordance in 9 of 12 monozygotic pairs versus concordance in 1 of 14 dizygotic pairs
  - BN: higher familial incidence of affective disorders than the general population

### Risk Factors
- physical factors: obesity, chronic medical illness (i.e. DM)
- psychological factors: individuals who by career choice are expected to be thin, family history (mood disorders, eating disorders, substance abuse), history of sexual abuse (especially for BN), homosexual males, competitive athletes, concurrent associated mental illness (depression, OCD, anxiety disorder [especially panic and agoraphobia], substance abuse [specifically for BN])

**Eating Disorder Screening**
Method to identify patients with eating disorders. A "Yes" to two or more questions is associated with a sensitivity and specificity of 78 and 88 percent, respectively

**SCOFF**
- Do you make yourself **S**ick because you feel uncomfortably full?
- Do you worry you have lost **C**ontrol over how much you eat?
- Have you recently lost more than **O**ne stone (14 pounds or 6.35 kg) in a 3 mo period?
- Do you believe yourself to be **F**at when others say you are too thin?
- Would you say that **F**ood dominates your life?

# Anorexia Nervosa

### DSM-5 DIAGNOSTIC CRITERIA FOR ANOREXIA NERVOSA
Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. intake and weight: restriction of energy intake relative to requirements, leading to a significantly low body weight in the context of age, sex, developmental trajectory, and physical health; significantly low weight is defined as a weight that is less than minimally normal or, for children and adolescents, less than that minimally expected
B. fear or behaviour: intense fear of gaining weight or of becoming fat, or persistent behaviour that interferes with weight gain, even though at a significantly low weight
C. perception: disturbance in the way in which one's body weight or shape is experienced, undue influence of body weight or shape on self-evaluation, or persistent lack of recognition of the seriousness of the current low body weight
- **specifiers**: partial remission, full remission, severity based on BMI (mild = BMI >17 kg/m$^2$, moderate = BMI 16-16.99 kg/m$^2$, severe = BMI 15-15.99 kg/m$^2$, extreme = BMI <15 kg/m$^2$), type (restricting = during last 3 mo no episodes of binge-eating or purging vs. binge-eating/purging type = in last 3 mo have participated in recurrent episodes of binge-eating/purging)

**Athletic Triad**
- Disordered eating
- Amenorrhea
- Osteoporosis

Some patients with insulin-dependent DM may stop their insulin in order to lose weight

### Management
- psychotherapy: individual, group, family: address food and body perception, coping mechanisms, health effects
- medications of little value
- outpatient and inpatient programs are available
- inpatient hospitalization for treatment of eating disorders is rarely on an acute basis (unless there is a concurrent psychiatric reason for emergent admission i.e. suicide risk)
- criteria to admit to medical ward for hospitalization: <65% of standard body weight (<85% of standard body weight for adolescents), hypovolemia requiring intravenous fluid, heart rate <40 bpm, abnormal serum chemistry, or if actively suicidal
- agree on target body weight on admission and reassure this weight will not be surpassed

- monitor for complications of AN (see Table 9)
- monitor for refeeding syndrome
  - potentially life-threatening metabolic response to refeeding in severely malnourished patients resulting in severe shifts in fluid and electrolyte levels
  - complications include hypophosphatemia, congestive heart failure, cardiac arrhythmias, delirium, and death
  - prevention: slow refeeding, gradual increase in nutrition, supplemental phosphorus, and close monitoring of electrolytes and cardiac status

### Prognosis
- early intervention much more effective (adolescent onset has much better prognosis than adult onset)
- 1 in 10 adolescents continue to have AN as adults
- with treatment, 70% resume a weight of at least 85% of expected levels and about 50% resume normal menstrual function
- eating peculiarities and associated psychiatric symptoms are common and persistent
- long-term mortality: 10-20% of patients hospitalized will die in next 10-30 yr (secondary to severe and chronic starvation, metabolic or cardiac catastrophes, with a significant proportion committing suicide)

## Bulimia Nervosa

### DSM-5 DIAGNOSTIC CRITERIA FOR BULIMIA NERVOSA

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

A. recurrent episodes of binge-eating; an episode of binge-eating is characterized by both of the following
  - eating, in a discrete period of time, an amount of food that is definitely larger than what most individuals would eat during a similar period of time and under similar circumstances
  - a sense of lack of control over eating during the episode

B. recurrent inappropriate compensatory behaviour in order to prevent weight gain, such as self-induced vomiting, misuse of laxatives, diuretics, enemas, or other medications, fasting, or excessive exercise

C. the binge-eating and inappropriate compensatory behaviours both occur, on average, at least once a week for 3 mo

D. self-evaluation is unduly influenced by body shape and weight

E. the disturbance does not occur exclusively during episodes of AN

- **specifiers**: partial remission, full remission, severity (measured in # of inappropriate compensatory behaviours/wk: mild = 1-3, moderate = 4-7, severe = 8-13, extreme = 14+)

### Associated Features
- fatigue and muscle weakness due to repetitive vomiting and fluid/electrolyte imbalance
- tooth decay
- swollen appearance around angle of jaw and puffiness of eye sockets due to fluid retention
- reddened knuckles, Russell's sign (knuckle callus from self-induced vomiting)
- trouble concentrating
- weight fluctuation over time

### Management
- admission for significant electrolyte abnormalities
- biological: treatment of starvation effects, SSRIs (fluoxetine most evidence) as adjunct
- psychological: develop trusting relationship with therapist to explore personal etiology and triggers, CBT, family therapy, recognition of health risks
- social: challenge destructive societal views of women, use of hospital environment to provide external patterning for normative eating behaviour

### Prognosis
- relapsing/remitting disease
- good prognostic factors: onset before age 15, achieving a healthy weight within 2 yr of treatment
- poor prognostic factors: later age of onset, previous hospitalizations, individual and familial disturbance
- 60% good treatment outcome, 30% intermediate outcome, 10% poor outcome

## Binge-Eating Disorder

### Definition
- recurrent episodes of binge-eating (as defined by criteria A of BN) that are associated with eating much more rapidly than normal, eating until feeling uncomfortably full, eating large amounts when not physically hungry, eating alone because embarrassed by how much one is eating, feeling disgusted with self/depressed, very guilty afterwards at least once/wk x 3 mo
- not associated with any compensatory behaviours
- dieting usually follows binge-eating (vs. BN where dysfunctional dieting typically precedes binge-eating)
- associated with health consequences (i.e. increased risk of weight gain, obesity)

### Epidemiology
- F:M = 2:1
- begins in adolescence or young-adulthood

### Treatment
- CBT

# Avoidant/Restrictive Food Intake Disorder

## Definition

- eating/feeding disturbance to the extent of persistent failure to meet appropriate nutritional and/or energy needs, resulting in significant weight loss/growth failure and nutritional deficiencies; patients experience disturbances in psychosocial functioning and may become dependent on enteral feeding/oral nutritional supplementation
  - does not occur during an episode of AN or BN
  - no evidence of distress in the way in which one's body weight or shape is experienced

## Risk Factors

- temperament (i.e. anxiety disorders), environment (i.e. familial anxiety), genetic (i.e. history of GI conditions)
- begins in infancy and can persist into adulthood

## Treatment

- psychoeducation
- behaviour modification
- psychotherapy

**Points for Differentiating Between Eating Disorders**

- AN of binge-eating/purging type (significantly low body weight) takes priority over a BN diagnosis (body weight not in criteria)
- BN requires compensatory behaviours
- Binge eating disorder does not involve compensatory behaviours
- Avoidant/restrictive food intake disorder does not involve disturbances in body image

**Table 9. Physiologic Complications of Eating Disorders**

| System | Starvation/Restriction | Binge-Purge |
|---|---|---|
| **General** | Low BP, low HR, significant orthostatic changes ± syncopal episodes, low temperature, vitamin deficiencies | Russell's sign (knuckle callus)<br>Parotid gland enlargement<br>Perioral skin irritation<br>Periocular and palatal petechiae<br>Loss of dental enamel and caries<br>Aspiration pneumonia<br>Metabolic alkalosis secondary to hypokalemia and loss of acid |
| **Endocrine** | Primary or secondary amenorrhea, decreased $T_3/T_4$ | |
| **Neurologic** | Seizure (decreased $Ca^{2+}$, $Mg^{2+}$, $PO_4^{3-}$) | |
| **Cutaneous** | Dry skin, lanugo hair, hair loss or thinning, brittle nails, yellow skin from high carotene | |
| **GI** | Constipation, GERD, delayed gastric emptying | Acute gastric dilation/rupture, pancreatitis, GERD, hematemesis secondary to Mallory-Weiss tear |
| **CVS** | Arrhythmias, CHF | Arrhythmias, cardiomyopathy (from use of ipecac), sudden cardiac death (decreased $K^+$) |
| **MSK** | Osteoporosis secondary to hypogonadism | Muscle wasting |
| **Renal** | Pre-renal failure (hypovolemia), renal calculi | Renal failure (electrolyte disturbances) |
| **Extremities** | Pedal edema (decreased albumin) | Pedal edema (decreased albumin) |
| **Lab Values** | Starvation: decreased RBCs, decreased WBCs, decreased LH, decreased FSH, decreased estrogen, decreased testosterone, increased growth hormone, increased cholesterol<br>Dehydration: increased BUN | Vomiting: decreased $Na^+$, decreased $K^+$, decreased $Cl^-$, decreased $H^+$, increased amylase; hypokalemia with metabolic alkalosis<br>Laxatives: decreased $Na^+$, decreased $K^+$, decreased $Cl^-$, increased $H^+$; metabolic acidosis |

Important electrolytes in eating disorders: KPMg (potassium, phosphate, magnesium)

# Personality Disorders

- in the literature, personality and its disorders are better understood using a trait-based dimensional approach (i.e. 5 major traits such as extraversion, agreeableness, conscientiousness, neuroticism, and openness to experiences rated on a continuum of dysfunctional effects) rather than discrete categories; however, the discrete categories still remain in the current DSM and will be referenced here

## General Information

- an enduring pattern of inner experience and behaviour that deviates markedly from the expectations of the individual's culture; manifested in two or more of: cognition, affect, interpersonal functioning, impulse control
- inflexible and pervasive across a range of situations
- pattern is stable and well established by adolescence or early adulthood (vs. a sudden onset)
- associated with many complications, such as depression, suicide, violence, brief psychotic episodes, multiple drug use, and treatment resistance
- relationship building and establishing boundaries are important; focus should be placed on validating, finding things to be truly empathetic about, and speaking to the patient's strengths
- mainstay of treatment is psychotherapy, add pharmacotherapy to treat associated psychiatric disorders (i.e. depression, anxiety, substance abuse)

A flag for personality disorders in clinical setting is the reaction that a patient is eliciting in you

## Classification

- personality disorders are divided into three clusters (A, B, and C), with shared features among disorders within each

Personality disorders with familial associations: Schizotypal, Antisocial, and Borderline

## Table 10. Description and Diagnosis of Personality Disorders

**Cluster A "Mad" Personality Disorders**
- Patients seem odd, eccentric, withdrawn
- Familial association with psychotic disorders
- Common defense mechanisms: intellectualization, projection, magical thinking

**Paranoid Personality Disorder (0.5-3%)**
Pervasive distrust and suspiciousness of others, interpret motives as malevolent
Blame problems on others and seem angry and hostile
Diagnosis requires 4+ of: **SUSPECT**
1. **S**uspicious that others are exploiting or deceiving them
2. **U**nforgiving (bears grudges)
3. **S**pousal infidelity suspected without justification
4. **P**erceive attacks on character, counterattacks quickly
5. **E**nemies or friends? Preoccupied with acquaintance trustworthiness
6. **C**onfiding in others is feared
7. **T**hreats interpreted in benign remarks

**Schizotypal Personality Disorder (3-5.6%)**
Pattern of eccentric behaviours, peculiar thought patterns
Diagnosis requires 5+ of: **ME PECULIAR**
1. **M**agical thinking
2. **E**xperiences unusual perceptions (including body illusions)
3. **P**aranoid ideation
4. **E**ccentric behaviour or appearance
5. **C**onstricted or inappropriate affect
6. **U**nusual thinking/speech (e.g. vague, stereotyped)
7. **L**acks close friends
8. **I**deas of reference
9. **A**nxiety in social situations
(Note: Rule out psychotic/pervasive developmental disorders - this is not part of the criteria)

**Schizoid Personality Disorder**
Neither desires nor enjoys close relationships including being a part of a family; prefers to be alone. Lifelong pattern of social withdrawal. Seen as eccentric and reclusive with restricted affect
Diagnosis requires 4 of: **DISTANT**
1. **D**etached/flat affect, emotionally cold
2. **I**ndifferent to praise or criticism
3. **S**exual experiences of little interest
4. **T**asks done solitarily
5. **A**bsence of close friends (other than first-degree relatives)
6. **N**either desires nor enjoys close relationships (including family)
7. **T**akes pleasure in few (if any) activities

**Cluster B "Bad" Personality Disorders**
- Patients seem dramatic, emotional, inconsistent
- Familial association with mood disorders
- Common defense mechanisms: denial, acting out, regression (histrionic PD), splitting (borderline PD), projective identification, idealization/devaluation

**Borderline Personality Disorder (2-4%)**
Unstable moods and behaviour, feel alone in the world, problems with self-image. History of repeated suicide attempts, self-harm behaviours. Inpatients commonly report history of sexual abuse. Tends to fizzle out as patients age. DBT is the principal treatment (see *Psychotherapy*)
**10% suicide rate**
Diagnosis requires 5+ of: **IMPULSIVE**
1. **I**mpulsive (min. 2 self-damaging ways, e.g. sex/drugs/spending)
2. **M**ood/affect instability
3. **P**aranoia or dissociation under stress
4. **U**nstable self-image
5. **L**abile intense relationships
6. **S**uicidal gestures / self-harm
7. **I**nappropriate anger
8. a**V**oiding abandonment (real or imagined, frantic efforts to)
9. **E**mptiness (feelings of)

**Narcissistic Personality Disorder (2%)**
Sense of superiority, needs constant admiration, lacks empathy, but with fragile sense of self. Consider themselves "special" and will exploit others for personal gain
Diagnosis requires 5+ of: **GRANDIOSE**
1. **G**randiose
2. **R**equires excessive admiration
3. **A**rrogant
4. **N**eeds to be special (and associate with other specials)
5. **D**reams of success, power, beauty, love
6. **I**nterpersonally exploitative
7. **O**thers (lacks empathy, unable to recognize feelings/needs of)
8. **S**ense of entitlement
9. **E**nvious (or believes others are envious)

**Antisocial Personality Disorder (M: 3%, F: 1%)**
Lack of remorse for actions, manipulative and deceitful, often violate the law. May appear charming on first impression. Pattern of disregard for others and violation of others' rights must be present before age 15; however, for the diagnosis of ASPD patients must be at least 18. Strong association with Conduct Disorder, history of trauma/abuse common (see *Child Psychiatry*)
Diagnosis requires 3+ of: **CORRUPT**
1. **C**annot conform to law
2. **O**bligations ignored (irresponsible)
3. **R**eckless disregard for safety
4. **R**emorseless
5. **U**nderhanded (deceitful)
6. **P**lanning insufficient (impulsive)
7. **T**emper (irritable and aggressive)

**Histrionic Personality Disorder (1.3-3%)**
Attention-seeking behaviour and excessively emotional. Are dramatic, flamboyant, and extroverted. Cannot form meaningful relationships. Often sexually inappropriate
Diagnosis requires 5+ of: **ACTRESSS**
1. **A**ppearance used to attract attention
2. **C**entre of attention (else uncomfortable)
3. **T**heatrical
4. **R**elationships (believed to be more intimate than they are)
5. **E**asily influenced
6. **S**eductive behaviour
7. **S**hallow expression of emotions (which rapidly shift)
8. **S**peech (impressionistic and vague)

**Cluster C "Sad" Personality Disorders**
- Patients seem anxious, fearful
- Familial association with anxiety disorder
- Common defense mechanisms: isolation, avoidance, hypochondriasis

**Avoidant Personality Disorder (0.5-1.6%)**
Timid and socially awkward with a pervasive sense of inadequacy and fear of criticism. Fear of embarrassing or humiliating themselves in social situations so remain withdrawn and socially inhibited
Diagnosis requires 4+ of: **CRINGES**
1. **C**riticism or rejection preoccupies thoughts in social situations
2. **R**estraint in relationships due to fear of being shamed
3. **I**nhibited in new relationships due to fear of inadequacy
4. **N**eeds to be sure of being liked before engaging socially
5. **G**ets around occupational activities requiring interpersonal contact
6. **E**mbarrassment prevents new activity or taking risks
7. **S**elf-viewed as unappealing or inferior

**Obsessive-Compulsive Personality Disorder (3-10%)**
Preoccupation with orderliness, perfectionism, and mental and interpersonal control. Is inflexible, closed-off, and inefficient
Diagnosis requires 4+ of: **SCRIMPER**
1. **S**tubborn
2. **C**annot discard worthless objects
3. **R**ule/detail obsessed (to point of activity lost)
4. **I**nflexible in matters of morality, ethics, values
5. **M**iserly
6. **P**erfectionistic
7. **E**xcludes leisure due to devotion to work
8. **R**eluctant to delegate to others

**Dependent Personality Disorder (1.6-6.7%)**
Pervasive and excessive need to be taken care of, excessive fear of separation, clinging and submissive behaviours. Difficulty making everyday decisions. Useful to set regulated treatment schedule (regular, brief visits) and being firm about in between issues. Encourage patient to do more for themselves, engage in own problem-solving
Diagnosis requires 5 of: **RELIANCE**
1. **R**eassurance required for everyday decisions
2. **E**xpressing disagreement difficult
3. **L**ife responsibilities assumed by others
4. **I**nitiating projects difficult (because no confidence)
5. **A**lone (feels helpless and uncomfortable when alone)
6. **N**urturance (goes to excessive lengths to obtain)
7. **C**ompanionship sought urgently
8. **E**xaggerated fears of being left to care for self

**Table 11. Key Differences Among Schizoid, Schizotypal, and Schizophrenia**

| | Schizoid | Schizotypal | Schizophrenia |
|---|---|---|---|
| **Thought Form** | Organized | Organized, but vague and circumstantial | Disorganized, tangential, loosening of associations |
| **Thought Content** | No psychosis | No psychosis, may have ideas of reference, paranoid ideation, odd beliefs and magical thinking | Psychosis, hallucinations |
| **Relationships** | Solitary, NO desire for social relationships | Lacks close relationships, INTERESTED in relationships but socially inept | Socially marginalized, but not by choice |

**OCPD vs. OCD**

| | OCPD | OCD |
|---|---|---|
| **Ego-Syntonic or Ego-Dystonic** | Ego-syntonic | Ego-dystonic |
| **Thought Content** | Obsessional thinking, no compulsions, strict routine and rigidity in day-to-day matters, more perfectionistic and rigid | Obsessions and compulsions, rituals, anxiety provoking unwanted intrusive thoughts |

# Child Psychiatry

## Developmental Concepts

- temperament: a child's innate psycho-physiological and behavioural characteristics (i.e. emotionality, activity, and sociability); spectrum from "difficult" to "slow-to-warm-up" to "easy temperament"
- parental fit: the congruence between parenting style (authoritative, permissive) and child's temperament
- attachment: special relationship between child and primary caretaker(s); develops during first year, the caretaker's attachment style is the best predictor of their child's attachment style, refer to Table 12
- separation anxiety (normal between 10-18 mo): where separation from attachment figure results in distress

Consider speaking to children alone. Always consider child abuse in your ddx.
See Pediatrics, P15

**Table 12. Attachment Models**

| Parent/Caregiver | Attachment Type | Features in Child |
|---|---|---|
| Loving, consistently available, sensitive, and receptive | Secure | Freely explores and engages with strangers well (as long as mother in close proximity), upset with caregiver's departure, happy with return |
| Rejecting, unavailable psychologically, insensitive responses | Insecure (avoidant) | Ignores caregiver, shows little emotion with arrival or departure, little exploration |
| Inconsistent, insensitive responses, role reversal | Insecure (ambivalent/ resistant) | Clingy but inconsolable, often displays anger or helplessness, little exploration |
| Frightening, dissociated, sexualized, or atypical<br>Often history of trauma or loss | Disorganized | Simultaneous approach/avoidance and stress related straining behaviour |

**Tips for the Child Interview**
- Use language the child will understand (i.e. don't ask about feeling of worthlessness, ask about whether they feel like they're a bad kid)
- Children in some cultures are taught to be quiet and avoid eye contact with adults who are authority figures (do not mistake with depression)
- Use developmentally-appropriate questions (i.e. don't ask about lack of interest in activities, ask children whether they feel bored)

## Mood Disorders

### MAJOR DEPRESSIVE DISORDER

#### Epidemiology
- lifetime prevalence for pre-pubertal 1-2% (F:M = 1:1); adolescents 8-18% (F:M = 2:1)

#### Clinical Feature
- only difference in diagnostic criteria is that irritable mood may replace depressed mood
- physical features: insomnia (children), hypersomnia (adolescents), somatic complaints, substance abuse, decreased hygiene
- psychological features: irritability, boredom, anhedonia, low self-esteem, deterioration in academic performance, social withdrawal, lack of motivation, listlessness
- common comorbid diagnoses: anxiety, ADHD, ODD, conduct disorder,, and eating disorders

**HEEADSSS Interview**
**H**ome environment
**E**ducation/**E**mployment
**A**ctivities
**D**rugs/**D**iet
**S**ex
**S**afety
**S**uicide/depression

#### Treatment
- majority never seek treatment
- individual (CBT, IPT), family therapy and education, modified school program
- SSRIs: 1st line fluoxetine; 2nd line escitalopram, sertraline
- close follow-up for adolescents starting SSRIs to monitor for increased suicidal ideation or behaviour
- in severe depression, best evidence for combined pharmacotherapy and psychotherapy
- ECT: only in adolescents who have severe illness, psychotic features, catatonic features, persistently suicidal
- internet based psychotherapy, light therapy, self-help books and applications

#### Prognosis
- prolonged episodes, up to 1-2 yr = poor prognosis
- adolescent onset predicts chronic mood disorder; up to 2/3 will have another depressive episode within 5 yr
- complications: negative impact on family and peer relationships, school failure, significantly increased risk of suicide attempt (10%) or completion (however, suicide risk low for pre-pubertal children), substance abuse

### DISRUPTIVE MOOD DYSREGULATION DISORDER

#### Clinical Feature
- severe, developmentally inappropriate, recurrent verbal or behavioural temper outbursts at least 3x/wk with persistently irritable mood in between
- symptom onset before age 10, occurring for ≥ 12 mo, in ≥ 2 settings, with no more than 3 consecutive mo free from symptoms
- diagnosis should be made between 6 and 18 years of age
- criteria not met for intermittent explosive disorder, bipolar disorder (no mania/hypomania)
- supersedes diagnosis of ODD if criteria for both are met
- common comorbidities: ADHD, anxiety disorders, depressive disorders

### BIPOLAR DISORDER

#### Clinical Feature
- mixed presentation and psychotic symptoms (hallucinations and delusions) more common in adolescent population than adult population
- unipolar depression may be an early sign of adult bipolar disorder
- ~30% of psychotic depressed adolescents receive a bipolar diagnosis within 2 yr of presentation
- associated with rapid onset of depression, psychomotor retardation, mood-congruent psychosis, affective illness in family, and pharmacologically-induced mania

#### Treatment
- pharmacotherapy: mood stabilizers (lithium, anticonvulsants) and/or antipsychotics (risperidone, olanzapine, quetiapine, aripiprazole)
- psychotherapy: CBT, Family Focused Therapy

## Anxiety Disorders

- lifetime prevalence 10-20%; F:M = 2:1

#### Clinical Feature
- children and adolescents rarely vocalize their anxiety but instead exhibit behavioural manifestations
- associated with school problems, recurrent physical symptoms (abdominal pain, headaches) especially in mornings, social and relationship problems, social withdrawal and isolation, family conflict, difficulty with sleep initiation, temper tantrums, irritability and mood symptoms, alcohol and drug use in adolescents

#### Differential Diagnosis
- depressive disorders, ODD, truancy
- persistence and impairment to daily functioning differentiates anxiety disorder from normal anxiety
- for school avoidance, differentiate fear of general performance and humiliation
- consider anxiety about separation, and rule out bullying and school refusal due to learning disorder

#### Course and Prognosis
- better prognosis with later age of onset, fewer co-morbidities, early initiation of treatment, ability to maintain school attendance and peer relationships, and absence of social anxiety disorder
- with treatment, up to 80% of children will not meet criteria for their anxiety disorder at 3 yr follow-up, but up to 30% will meet criteria for another psychiatric disorder

#### Treatment
- similar principles for most childhood anxiety disorders due to overlapping symptomatology and frequent comorbidity
- family psychotherapy, predictive, and supportive environment
- CBT: child and parental education, relaxation techniques (i.e. deep breathing), exposure/desensitization, recognizing and correcting anxious thoughts
- pharmacotherapy: SSRIs (i.e. sertraline, fluoxetine)

### SEPARATION ANXIETY DISORDER
- excessive and developmentally inappropriate anxiety on real, threatened, or imagined separation from attachment figures or home, with physical or emotional distress for at least 4 wk
- persistent worry about losing attachment figures or experiencing an untoward event to self; reluctance to go places, be alone, or sleep alone; nightmares involving separation; physical symptoms when separated
- school refusal (75%) and comorbid major depression common (2/3)

### SOCIAL ANXIETY DISORDER (SOCIAL PHOBIA)
- anxiety, fear, and/or avoidance provoked by situations where child feels under the scrutiny of others
- must distinguish between shy child, child with issues functioning socially (i.e. autism), and child with social anxiety
  - diagnosis only if anxiety interferes significantly with daily routine, social life, academic functioning, or if markedly distressed. Must occur in settings with peers, not just adults
- features: crying, tantrums, freezing, clinging behaviour, mutism, excessively timid, stays on periphery, refuses to be involved in group play
- significant implication for future quality of life if untreated; lower levels of satisfaction in leisure activities, higher rates of school dropout, poor workplace performance, increased rates of remaining single

Attachment type can be assessed in infants 10-18 mo of age using the Strange Situation test, in which the child is stressed by the caregiver being removed from the situation and the stranger staying. Attachment style is measured by the child's behaviour during the reunion with the caregiver

Attachment problems may present as a child who is difficult to soothe, has difficulty sleeping, problems feeding, tantrums, or behavioural problems

The shy child is quiet and reluctant to participate but slowly 'warms up'

### SELECTIVE MUTISM
- consistent failure to speak in specific social situations where speaking is expected, despite speaking in other situations for ≥ 1 mo
- the disturbance interferes with educational or occupational achievement or with social communication
- not due to lack of knowledge of language or communication disorder

### GENERALIZED ANXIETY DISORDER
- diagnostic criteria same as adults (note: only 1 item is required in children for Criteria C)
- often redo tasks, show dissatisfaction with their work, and tend to be perfectionistic
- often fearful in multiple settings and expect more negative outcomes when faced with academic or social challenges, and require reassurance and support to take on new tasks

### SPECIFIC PHOBIA
- common phobias in childhood: fear of heights, small animals, doctors, dentists, darkness, loud noises, thunder, lightning

### OCD
- diagnostic criteria same as adults
- note: young children may not be able to articulate the aims of these behaviours or mental acts, i.e. compulsions

# Neurodevelopmental Disorders

## Autism Spectrum Disorder

### Diagnosis
- persistent deficits in social communication and interaction, manifested in three areas:
  - **social-emotional reciprocity**: abnormal social approach and failure of normal back-and-forth conversation; reduced sharing of interests, emotions, or affect; failure to initiate or respond to social interactions
  - **nonverbal communicative behaviours**: poorly integrated verbal and nonverbal communication; abnormalities in eye contact and body language or deficits in understanding and use of gestures; total lack of facial expressions and nonverbal communication
  - **developing, maintaining, and understanding relationships**: difficulties adjusting behaviour to suit various social contexts; difficulties in sharing imaginative play or in making friends; absence of interest in peers
- restricted, repetitive patterns of behaviour, interests, or activities: manifested by ≥2 of: stereotyped or repetitive motor movements, insistence on sameness, highly restricted fixated interests, hyper-/hypo-reactivity to sensory input
- symptoms must be present in early developmental period
- symptoms cause clinically significant impairment in social, occupational, or other important areas of current functioning
- not better explained by intellectual disability or global developmental delay
- specifiers
  - current severity: requiring very substantial support, requiring substantial support, requiring support
  - ± language impairment, ± intellectual impairment, ± catatonia
  - associated with known medical or genetic condition or environmental factor

### Differential Diagnosis
- neurodevelopmental: global delay, intellectual disability, language disorder, social communication disorder, learning disorder, developmental coordination disorder, stereotypic movement disorder
- mental and behavioural: ADHD, mood disorder, anxiety disorder, selective mutism, attachment disorder, ODD, conduct disorder, OCD, childhood schizophrenia,
- conditions with developmental regression: Rett syndrome, epileptic encephalopathy (Landau-Kleffner)
- other: hearing/visual impairment, abuse

### Treatment
- team-based: school, psychologist, occupational therapist, physiotherapist, speech language therapy, pediatrics, psychiatry
- psychosocial: family education and support, school programming, behavioural therapy, social skills training
- treat concomitant disorders such as ADHD, tics, OCD, anxiety, depression, and seizure disorder
- adjunctive pharmacotherapy (does not treat ASD itself): atypical antipsychotics (for irritability, aggression, agitation, self-mutilation, tics), SSRIs (for anxiety, depression), stimulants (for associated inattention and hyperactivity)

### Prognosis
- variable, but improves with early intervention
- better if IQ >60 and able to communicate

**Fluoxetine, Cognitive-Behavioural Therapy and Their Combination for Adolescents with Depression: Treatment for Adolescents with Depression Study (TADS) Randomized Controlled Trial**
JAMA 2004;292:807-820
**Purpose**: To evaluate effectiveness of fluoxetine alone, cognitive behavioural therapy (CBT) alone, CBT with fluoxetine and placebo among adolescents with major depressive disorder (MDD).
**Methods**: Randomized controlled trial at 13 US academic and community clinics between spring 2000-summer 2003, including patients aged 12-17 with a primary DSM IV diagnosis of MDD assigned to one of the aforementioned four treatment arms. The primary outcome was the Children's Depression Rating Scale-Revised (CDRSR) total score.
**Results**: Fluoxetine with CBT had a statistically significant CDRSR score as compared to placebo (p=0.001) with a 71% response rate. This combination was greater than fluoxetine alone (p=0.02), and CBT alone (p=0.01). Fluoxetine alone was greater than CBT alone (p=0.01).
**Conclusion**: Combination of fluoxetine with CBT offered the most favourable benefit-risk tradeoff for adolescents with MDD.

**Efficacy and Safety of Selective Serotonin Reuptake Inhibitors, Serotonin-Norepinephrine Reuptake Inhibitors, and Placebo for Common Psychiatric Disorders Among Children and Adolescents: A Systematic Review and Meta-Analysis**
JAMA Psychiatry. 2017 Oct 1;74(10):1011-1020
**Purpose**: Examine the relative efficacy and safety of SSRIs, SNRIs, and placebo for the treatment of depressive disorders (DDs), anxiety disorders (ADs), obsessive-compulsive disorder (OCD), and posttraumatic stress disorder (PTSD) in children and adolescents.
**Methods**: Meta-analysis of RCTs regarding use of SSRIs or SNRIs in youths with DD, AD, OCD, or PTSD. Effect sizes, calculated as standardized mean differences (Hedges g) and risk ratios (RRs) for adverse events, were assessed in a random-effects model.
**Results**: Thirty-six trials were eligible and analysis showed that SSRIs and SNRIs were more beneficial compared with placebo (g = 0.32; 95% CI, 0.25-0.40; P < .001). ADs (g = 0.56; 95% CI, 0.40-0.72; P < .001) had larger between-group effect sizes than DDs (g = 0.20; 95% CI, 0.13-0.27; P < .001). Patients with DDs exhibited significantly larger placebo responses (g = 1.57; 95% CI, 1.36-1.78; P < .001) compared with those with ADs (g = 1.03; 95% CI, 0.84-1.21; P < .001). The SSRIs produced a relatively large effect size for ADs (g = 0.71; 95% CI, 0.45-0.97; P < .001). Patients receiving an antidepressant versus a placebo reported significantly more treatment-emergent adverse events (RR, 1.07; 95% CI, 1.01-1.12; P = .01 or RR, 1.49; 95% CI, 1.22-1.82; P < .001, depending on the reporting method), severe adverse events (RR, 1.76; 95% CI, 1.34-2.32; P < .001), and study discontinuation due to adverse events (RR, 1.79; 95% CI, 1.38-2.32; P < .001).
**Conclusion**: Compared with placebo, SSRIs and SNRIs are more beneficial than placebo in children and adolescents; however, the benefit is small and disorder specific, yielding a larger drug-placebo difference for AD than for other conditions. Response to placebo is large, especially in DD. Severe adverse events are significantly more common with SSRIs and SNRIs than placebo.

# Attention Deficit Hyperactivity Disorder

- prevalence: 5-12% of school-aged children; M:F = 4:1, although girls may be under-diagnosed
- girls tend to have inattentive symptoms; boys tend to have impulsive/hyperactive symptoms

## Etiology

- genetic: 75% heritability, dopamine candidate genes DAT1, DRD4
- neurobiology: decreased catecholamine transmission, low prefrontal cortex (PFC) activity, increased beta activity on EEG
- cognitive: developmental disability, poor inhibitory control, and other errors of executive function

## Diagnosis

- diagnosis requires: onset before age 12, persistent symptoms ≥6 mo, symptoms present in ≥2 settings (i.e. home, school, work), interferes with academic, family, and social functioning, and is divided into 3 subtypes
  - combined type: ≥6 symptoms of inattention and ≥6 symptoms of hyperactivity-impulsivity
  - predominantly inattentive type: ≥6 symptoms of inattention
  - predominantly hyperactive-impulsive type: ≥6 symptoms of hyperactivity-impulsivity
  - for older adolescents and adults (≥ age 17), ≥5 symptoms required
- does not occur exclusively during the course of another psychiatric disorder
- differential: learning disorders, hearing/visual defects, thyroid, atopic conditions, congenital problems (fetal alcohol syndrome, Fragile X), lead poisoning, history of head injury, traumatic life events abuse)
- specify current severity (mild/moderate/severe); if in partial remission (past dx, has not met full criteria >6 mo, still functional impairment present)

**Observe child for "ATENTION" features**
**A**nnoying
**T**emperamental
**E**nergetic
**N**oisy
**T**ask incompletion
**I**nattentive
**O**ppositional
**N**egativism

**Table 13. Core Symptoms of ADHD (DSM-5)**

| Inattention | Hyperactivity | Impulsivity |
|---|---|---|
| Careless mistakes | Fidgets, squirms in seat | Blurts out answers before questions completed |
| Cannot sustain attention in tasks or play | Leaves seat when expected to remain seated | Difficulty awaiting turn |
| Does not listen when spoken to directly | Runs and climbs excessively | Interrupts/intrudes on others |
| Fails to complete tasks | Cannot play quietly | |
| Disorganized | "On the go", driven by a motor | |
| Avoids, dislikes tasks that require sustained mental effort | Talks excessively | |
| Loses things necessary for tasks or activities | | |
| Distractible | | |
| Forgetful | | |

**Comparative Efficacy and Tolerability of Medications for Attention-Deficit Hyperactivity Disorder in Children, Adolescents, and Adults: A Systematic Review and Network Meta-Analysis**
Lancet 2018;5:727-738.
**Objective**: Estimate the comparative efficacy and tolerability of oral medications for ADHD in children, adolescents, and adults.
**Methods**: Review of double-blind RCTs comparing amphetamines, atomoxetine, bupropion, clonidine, guanfacine, methylphenidate, and modafinil with each other or placebo.
**Conclusions**: Taking into account both efficacy and safety, evidence from this meta-analysis supports methylphenidate in children and adolescents, and amphetamines in adults, as preferred first-choice medications for the short-term treatment of ADHD.

## Features

- difficult to differentiate from highly variable normative behaviour before age 4, but often identified upon school entry
- rule out developmental delay, sensory impairments, genetic syndromes, encephalopathies or toxins (alcohol, lead)
- increased risk of substance abuse, depression, anxiety, academic failure, poor social skills, comorbid CD and/or ODD, adult ASPD
- associated with family history of ADHD, difficult temperamental characteristics

Treatment with stimulant medications of ADHD in childhood does not increase the likelihood of substance abuse later in life, contrary to the concerns of many parents and health care providers

## Treatment

- non-pharmacological: psychoeducation, behavioural management i.e. parent training, classroom management, social skills training
- pharmacological: 1st line stimulants (methylphenidate, amphetamines); 2nd line atomoxetine; 3rd line/adjunct nonstimulants (guanfacine, clonidine, buproprion)
- for comorbid symptoms: antidepressants, antipsychotics

## Prognosis

- 70-80% continue into adolescence, but hyperactive symptoms usually abate
- 65% continue into adulthood; secondary personality disorders and compensatory anxiety disorders are identifiable

# Disruptive, Impulse Control, and Conduct Disorder

## Oppositional Defiant Disorder

- prevalence: 2-16%, M=F after puberty

### Diagnosis

- pattern of negativistic/hostile and defiant behaviour for ≥6 mo, with ≥ 1 non-sibling, with ≥4 symptoms manifested in 3 areas of:
  - **angry/irritable mood**: easily loses temper, touchy or easily annoyed, often angry and resentful
  - **argumentative/defiant**: argues with adults/authority figure, defies requests/rules, deliberately annoys, blames others for their own mistakes or misbehaviour
  - **vindictiveness**: spiteful or vindictive twice in past 6 mo
  - note: difference between normal behaviour and ODD is frequency of symptoms (most days if age <5 yr, weekly if age ≥5 yr) exceeds what is normative for one's age gender, culture
- behaviour causes significant distress or impairment in social, academic, or occupational functioning
- behaviours do not occur exclusively during the course of a psychotic, substance use, or mood disorder
- diagnosis of disruptive mood dysregulation disorder supersedes ODD if criteria for both are met
- severity (mild/moderate/severe) according to number of settings in which symptoms are present

**ODD kids "ARE BRATS"**
**A**nnoying
**R**esentful
**E**asily annoyed
**B**lames others
**R**ule breaker
**A**rgues with adults
**T**emper
**S**piteful/vindictive

### Features

- first symptoms usually appear during preschool and rarely later than early adolescence
- associated with poor school performance, few friends, strained parent/child relationships, risk of developing mood disorders later on, often precedes CD

### Treatment

- parent: parent management training, psychoeducation for parents and family
- behavioural therapy: to teach, practice, and reinforce prosocial behaviour
- social: school/day-care interventions
- pharmacotherapy for comorbid disorders

## Conduct Disorder

- prevalence: 1.5-3.4% (M:F = 4-12:1)

**Conduct Disorder Diagnosis**

**TRAP**
**T**heft: breaking and entering, deceiving, non-confrontational stealing
**R**ule breaking: running away, skipping school, out late
**A**ggression: people, animals, weapons, forced sex
**P**roperty destruction

### Etiology

- parental/familial factors: parental psychopathology (i.e. ASPD, substance abuse), child-rearing practices (i.e. child abuse, discipline), low socioeconomic status (SES), family violence
- child factors: difficult temperament, ODD, learning problems, neurobiology

### Diagnosis

- pattern of behaviour that violates rights of others and age appropriate social norms with ≥3 criteria noted in past 12 mo and ≥1 in past 6 mo:
  - aggression to people and animals: bullying, initiating physical fights, use of weapons, forced sex, cruel to people and/or animals, stealing while confronting a person (i.e. armed robbery)
  - destruction of property: arson, deliberately destroying others' property
  - deceitfulness or theft: breaking and entering, conning others, stealing nontrivial items without confrontation
  - violation of rules: out all night before age 13, often truant from school before age 13, runaway ≥2 times at least overnight or for long periods of time
  - disturbance causes clinically significant impairment in social, academic, or occupational functioning
  - if ≥18 yr, criteria not met for ASPD
- diagnostic types
  - childhood-onset ( ≥1 criterion prior to age 10)
  - adolescent-onset (no criteria until age 10)
  - unspecified- onset (insufficient information)
  - mild, moderate, severe
- differential: ADHD, depression, head injury, substance abuse

### Treatment

- early intervention necessary and more effective; long-term follow-up required
- psychosocial: parent management training, anger replacement training, CBT, family therapy, education/employment programs, social skills training
- pharmacotherapy for comorbid disorders

### Prognosis

- poor prognostic indicators include: early-age onset, high frequency, variety of behaviours, pervasiveness (i.e. in home, school, community), comorbid ADHD, early sexual activity, substance abuse
- 50% of CD children become adult ASPD

# Intermittent Explosive Disorder

## Diagnosis

- recurrent behavioural outbursts representing a failure to control aggressive impulses in children age ≥6, manifested as either
  - verbal or physical aggression that does not damage others or property, occurring ≥2 times per wk for 3 mo
  - 3 outbursts involving physical damage to another person, animal or piece of property in the last 12 mo
- outbursts are out of proportion to triggers are not premeditated or for primary gain
- outbursts cause clinically significant distress or impairment in occupation or interpersonal functioning, or financial/legal consequences

## See Neurology

- *Tic Disorders,* N33
- *Tourette's Syndrome,* N34

# Psychotherapy

- treatment in which a person with mental or physical difficulties aims to achieve symptomatic relief through interactions with another person
- psychotherapy is delivered by a trained counsellor, social worker, nurse, psychologist, general practitioner, or psychiatrist
- various types of therapy exist based on diverse theories of human psychology and mental illness etiology

**Freudian Psyche**
**id:** instinctual drives, unconscious
**superego:** person's conscience, formed by societal/parental norms
**ego:** latin "I", sense of self, conscious actions, attempts to satisfy drives of id within confines of reality and demands of superego

## Common Factors of Psychotherapy

- good evidence that effective psychotherapy creates observable changes in brain circuitry and connectivity, but these changes are different from those observed with successful pharmacologic and other treatment modalities
- studies suggest that up to 60-90% of therapy outcome is due to common factors with only 10-40% due to specific factors
- common factors are: warmth (unconditional positive regard), accurate empathy, genuineness, goodness of fit, relationship with provider predicts positive outcomes

**Table 14. Summary of Psychotherapeutic Modalities**

| Type | Indications | Approach, Technique and Theory | Ideal Candidates | Duration |
|---|---|---|---|---|
| **Psychoanalytic/ Psychodynamic** | Anxiety, obsessional thinking, conversion disorder, sexual dysfunction, depression | Theory: Exploration of meaning of early experiences and how they affect emotions and patterns of behaviour<br>Recollection (remembering), repetition (reliving with the therapist), working through (gaining insight)<br>Techniques: free association, dream interpretation, transference analysis | Psychologically minded, highly motivated, wish to understand selves and not just relieve symptoms<br>Able to withstand difficult emotions without fleeing or self-destructive acts<br>High level of function | Time intensive:<br>Psychoanalysis: 4-5 times/wk for 3-7 yr<br>Psychodynamically oriented therapy: 2-3 times/wk for fewer years |
| **Supportive** | Adjustment disorders, somatic symptoms and related disorders, severe psychotic or personality disorders | Ameliorate symptoms through behavioural or environmental restructuring to aid adaptation and facilitate coping<br>Help patients feel safe, secure, and encouraged | Individuals in crisis or with severe symptoms in acute or chronic settings<br>Low insight, low motivation, "weak" ego systems | Variable (single session to years, though often short-intermittent) |
| **Interpersonal** | Mood disorders | Focuses on how interpersonal relationships impact symptoms<br>4 key problem areas addressed: 1 grief and loss, 2. role transitions, 3. conflict, 4. interpersonal deficits<br>Break the interpersonal cycle: depression, self-esteem, social withdrawal | Individuals with depression or bipolar disorder with some insight and difficult social functioning<br>Absence of severe psychotic process, personality disorder, or comorbid substance abuse | Weekly sessions, 12-20 sessions |
| **Behavioural** | Most mental health disorders benefit from specific application of behavioural therapy (i.e. behavioural activation for depression; exposure therapy for phobias; contingency management for anorexia nervosa and substance use disorder) | Systematic Desensitization: mastering anxiety-provoking situations by approaching them gradually and in a relaxed state that limits anxiety<br>Flooding: confronting feared stimulus for prolonged periods until it is no longer frightening<br>Positive Reinforcement: strengthening behaviour and causing it to occur more frequently by rewarding it<br>Negative Reinforcement: causing behaviour to occur more frequently by removing a noxious stimulus when desired behaviour occurs<br>Extinction: causing a behaviour to diminish by not rewarding it<br>Punishment (aversion therapy): causing a behaviour to diminish by applying a noxious stimulus | Individuals with motivation to change and specific symptoms that are amenable to change<br>Absence of global areas of dysfunction such as personality disorder | Usually short term (weeks-months) |

**Table 14. Summary of Psychotherapeutic Modalities** (continued)

| Type | Indications | Approach, Technique and Theory | Ideal Candidates | Duration |
|---|---|---|---|---|
| **Cognitive Therapy** | Depression, anxiety, panic disorder, personality disorders, and somatoform disorders | Moods/emotions are influenced by one's thoughts and psychiatric disturbances are often caused by habitual errors in thinking<br>Therapy helps patient make explicit their inaccurate automatic thoughts and correct assumptions with a more balanced perspective<br>Uses thought records (often charts with column headings including "situation," "feeling," "thought," "cognitive distortion") to help monitor thoughts, the situations they occur in, and the feelings they might provoke due to underlying cognitive errors | Motivated individuals who will comply with homework, openness to changing core beliefs | First course - weekly or twice weekly sessions, 12-20 sessions<br>Maintenance therapy can be carried out over years |
| **Cognitive Behavioural Therapy** | Most mental health disorders including; mood, anxiety, OCD, personality, eating, substance use, psychotic disorders | Combines theory and method from Cognitive and Behavioural therapies to teach the patient to change connections between thinking patterns, habitual behaviours, and mood/anxiety problems | Individuals with motivation to change and are able to participate in homework | Typically weekly or twice weekly sessions, 12-20 sessions<br>Maintenance therapy can be carried out over years |
| **Dialectical Behavioural Therapy** | Borderline Personality Disorder | Therapy that combines CBT techniques with Buddhist Zen mindfulness practices and dialectical philosophy<br>Focuses on 4 types of skills: mindfulness, emotion regulation, interpersonal effectiveness, and distress tolerance<br>Involves 4 components: individual therapy, group skills training, phone consultations, and a consultation team | Individuals with borderline personality disorder or borderline personality trait and severe problems of emotional dysregulation, impulsivity, or self-harm | Typically 1 yr<br>Weekly individual and group therapy |
| **Motivational Interviewing (MI) and Motivational Enhancement Therapy (MET)** | Substance use disorders<br>Techniques can be applied to facilitate behavioural change in most psychological problems | Spirit of MI (CAPE): Compassion, Acceptance, Partnership, Evocation<br>Principles of MI (RULE): Resist "righting reflex", Understand client and their reasons for change, Listen, Empower by conveying hope and supporting autonomy<br>Techniques of MI (OARS): Open-ended questions, Affirmations to validate client, Reflections (the skill of accurate empathy), Summaries to help client organize self | Individuals with problematic substance use, maladaptive behaviour patterns (therapy disengagement, medication noncompliance, poor health habits) | Brief interventions (efficacy with as little as 15 min, single session), better result with more sessions<br>Addiction is a chronic condition, often need boosters over time<br><br>MET = 4 sessions |

## Other Therapies

- group psychotherapy
  - aims to promote self-understanding, acceptance, social skills
- family therapy
  - family system considered more influential than individual, especially for children
  - focus on here and now, re-establishing parental authority, strengthening normal boundaries, and rearranging alliances
- mindfulness-based cognitive therapy (MBCT)/stress reduction (MBSR)
  - derived from Buddhist meditative and philosophical practices; aims to help people attend to thoughts, behaviours, and emotions in the moment and non-judgmentally using guided breathing exercises. Emerging evidence for treating adjustment disorder, MDD, anxiety, pain disorders, insomnia, substance relapse prevention
- narrative psychotherapy
  - an integrative approach that attempts to understand the patient's experience as a whole
- hypnosis
  - mixed evidence for treatment of pain, phobias, anxiety, and smoking cessation

# Pharmacotherapy

## Antipsychotics

- "antipsychotics" used to be called "neuroleptics"
- overall mechanism of action: block, to varying degrees, DA activity in target brain pathways
- primarily indicated for psychotic symptoms in: schizophrenia and related disorders, manic episodes, depressive episodes, substance use, medical conditions (i.e. neoplasm)
- other uses: treatment-resistant MDD, severe GAD, complex PTSD, severe OCD, borderline PD, behavioural symptoms of dementia, delirium, Tourette Syndrome, substance abuse in dual diagnosis, Huntington's disease, ASD, impulse control disorders
  - adjunctive management of agitation, aggression, severe anxiety, severe sleep difficulties when sedative-hypnotics are contraindicated
- onset: rapid calming effect and decrease in agitation; thought disorder responds in 1-4 wk
- rational use
  - no reason to combine two or more antipsychotics
  - all antipsychotics are equally effective, except for clozapine (considered to be most effective in treatment-refractory psychosis)

**Dopamine Pathways Affected by Antipsychotics**

| Pathway | Effects | Associated Pathology |
|---|---|---|
| Mesolimbic | Emotion origination, reward | HIGH dopamine causes positive symptoms of schizophrenia (delusions, hallucinations) |
| Mesocortical | Cognition, executive function | LOW dopamine causes negative symptoms of schizophrenia |
| Nigrostriatal | Movement | LOW dopamine causes EPS |
| Tuberoinfundibular | Prolactin hormone release | LOW dopamine causes hyperprolactinemia |

  - atypical antipsychotics (second generation) are as effective as typical (first generation) antipsychotics but are thought to have better adverse effect profiles; main difference is lower risk of EPS and TD (see sidebar)
  - choose a drug to which the patient has responded to in the past or that was used successfully in a family member
- route: PO, short-acting or long-acting depot IM injections, sublingual
- if no response in 4-6 wk, switch drugs
- duration: minimum 6 mo and usually for life in most patients with primary psychotic disorders; variable for other indications

### Long-Acting Preparations
- antipsychotics formulated in oil for IM injection
- received on an outpatient basis
- indications: individuals with schizophrenia or other chronic psychosis who relapse because of non-adherence
- should have been exposed to oral form prior to first injection
- dosing: start at low dosages, then titrate every 2-4 wk to maximize safety and minimize side effects
- side effects: risk of EPS, parkinsonism, increased risk of NMS

### Canadian Guidelines for the Treatment of Acute Psychosis in the Emergency Setting
- haloperidol 5 mg IM ± lorazepam 2 mg IM
- loxapine PO 25 mg ± lorazepam 2 mg IM
- olanzapine 2.5-10 mg (PO, IM, quick dissolve)
- risperidone 2 mg (M-tab, liquid)

**Table 15. Common Antipsychotic Agents**

| | Starting Dose | Maintenance | Maximum | Relative Potency (mg) |
|---|---|---|---|---|
| **Typicals** (in order of potency from high to low) | | | | |
| Haloperidol (Haldol®) | 2-5 mg IM q4-8h<br>0.5-5 mg PO b/tid<br>0.2 mg/kg/d PO | Based on clinical effect | 20 mg/d PO | 2 |
| | Based on clinical effect | 20 mg/d PO | 2 | |
| Fluphenazine enanthate (Moditen®, Modecate® for IM formulation) | 2.5-10 mg/d PO | 1-5 mg PO qhs<br>25 mg IM/SC q1-3wk | 20 mg/d PO | 2 |
| Zuclopenthixol HCl (Clopixol®) | 20-30 mg/d PO | 20-40 mg/d PO | 100 mg/d PO | 4 |
| Zuclopenthixol acetate (Acuphase®) | 50-150 mg IM q48-72h | | 400 mg IM (q2wk) | |
| Zuclopenthixol decanoate (Cloxipol Depot®) | 100 mg IM q1-4wk | 150-300 mg IM q2wk | 600 mg IM/wk | |
| Perphenazine (Trilafon®) | 8-16 mg PO b/tid | 4-8 mg PO t/qid | 64 mg/d PO | 10 |
| Loxapine HCl (Loxitane®) | 10 mg PO tid<br>12.5-50 mg IM q4-6h | 60-100 mg/d PO | 250 mg/d PO | 10 |
| Chlorpromazine (Largactil®) | 10-25 mg PO b/t/qid | 400 mg/d PO | 1000 mg/d PO | 100 |
| **Atypicals** (in order of potency from high to low) | | | | |
| Risperidone (Risperdal®, Risperdal Consta® for IM long acting preparation, Risperdal® M-Tab for melting form – placed on tongue) | 1-2 mg OD/bid | 4-8 mg/d PO<br>25 mg IM q2wk | 8 mg/d PO | 2 |
| Paliperidone (Invega®) | 3 mg/d PO | 3-12 mg /d PO | 12 mg/d PO | 4 |
| Olanzapine (Zyprexa®, Zyprexa Zydis® for melting form – placed on tongue, Zyprexa Intramuscular®) | 5 mg/d PO | 10-20 mg/d PO | 30 mg/d PO | 5 |
| Asenapine (Saphris®) | 5 mg SL bid | 5-10 mg SL bid | 10 mg bid | 5 |
| Ziprasidone (Zeldox®) | 20 mg bid PO | 40-80 mg bid PO | 160 mg/d PO | 6 |
| Aripiprazole (Abililfy®) | 10-15 mg/d PO | 10-15 mg/d PO | 30 mg/d PO | 7.5 |
| Quetiapine (Seroquel®, Seroquel XR® for extended release®) | 25 mg PO bid | 400-800 mg/d PO | 800 mg/d PO | 75 |
| Clozapine (Clozaril®) | 25 mg PO bid | 300-600 mg/d PO | 600 mg/d PO | 100 |

**Typical (First Generation) vs. Atypical (Second Generation) Antipsychotics**

| | Typical | Atypical |
|---|---|---|
| **Mechanism** | Block postsynaptic dopamine receptors (D2) | Block postsynaptic dopamine receptors (D2)<br>Block serotonin receptors (5-HT2) on presynaptic dopaminergic terminals, triggering DA release, and reversing DA blockade in some pathways |
| **Pros** | Inexpensive<br>Plenty of injectable forms available | Fewer EPS<br>Low risk of tardive syndromes<br>Mood stabilizing effects |
| **Cons** | More EPS<br>Tardive syndromes in long-term<br>Not mood stabilizing | Expensive<br>Few injectable forms available<br>Metabolic side effects (weight gain, hyperglycemia, lipid abnormalities, metabolic syndrome)<br>Exacerbation (or new onset) of obsessive behaviour |

**Effectiveness of Antipsychotic Drugs in Patients with Chronic Schizophrenia**
New Engl J Med 2005;353:1209-23
**Purpose**: To compare perphenazine with several newer drugs (olanzapine, quetiapine, risperidone, ziprasidone) in patients with chronic schizophrenia.
**Methods**: Randomized, double-blind, active-control trial with median follow-up of 6 mo, involving patients with a diagnosis of schizophrenia (as per DSM-IV criteria) and able to take antipsychotic medications (as determined by study doctors). Patients were assigned to receive 1-4 capsules daily of olanzapine (20.1 mg), quetiapine (543.4 mg), risperidone (3.9 mg), perphenazine (20.8 mg), or ziprasidone (112.8 mg), with dosage at the discretion of the study doctor. Main outcome was discontinuation of treatment for any cause.
**Results**: 1432 patients were included. The olanzapine group had statistically significant lower rate of discontinuation for any cause (64%) from all others (quetiapine – 82%, risperidone – 74%, perphenazine – 75%, ziprasidone – 79%). There were no significant differences in time until discontinuation due to intolerable side effects; however, olanzapine was associated with a significantly higher rate of metabolic side effects.
**Conclusion**: The majority of patients in each group discontinued treatment due to inefficacy and intolerable side-effects, or for other reasons. Olanzapine was most effective in terms of lowest rates of discontinuation. Efficacy of conventional antipsychotic agent perphenazine was similar to quetiapine, risperidone and ziprasidone.

Note: high potency antipsychotics (i.e. haloperidol) have low doses, while low potency antipsychotics (i.e. chlorpromazine) have high doses

**Anticholinergic Effects**

| | | |
|---|---|---|
| **Red** | as a | beet |
| **Hot** | as a | hare |
| **Dry** | as a | bone |
| **Blind** | as a | bat |
| **Mad** | as a | hatter |

**Table 16. Commonly Used Atypical Antipsychotics**

| | Risperidone (Risperdal®) | Olanzapine (Zyprexa®, Zydis®) | Quetiapine (Seroquel®) | Clozapine (Clozaril®) | Aripiprazole (Abilify®) |
|---|---|---|---|---|---|
| **Advantages** | Lower incidence of EPS than typical antipsychotics at lower doses (<8 mg)<br>Associated with less weight gain compared to clozapine and olanzapine | Better overall efficacy compared to haloperidol<br>Well tolerated<br>Low incidence of EPS and TD | Associated with less weight gain compared to clozapine and olanzapine<br>Mood stabilizing | Most effective for treatment-resistant schizophrenia<br>Does not worsen tardive symptoms; may treat them<br>Approximately 50% of patients benefit, especially paranoid patients and those with onset after 20 yr | Less weight gain and risk of metabolic syndrome compared to olanzapine and a lower incidence of EPS compared to haloperidol<br>mood stabilizing |
| **Disadvantages relative to other SGAs** | Highest risk of EPS/TD among SGAs – avoid if high risk for EPS or existing movement disorder or elderly<br>Elevated prolactin - sexual dysfunction, galactorrhea, gynecomastia, menstrual disturbance, infertility | Weight gain and metabolic effects – avoid in DM<br>Sedating – avoid if high risk for falls or fracture | Sedating/ortho hypotension – avoid if high risk for falls or fracture<br>QT prolongation in high doses – caution if cardiac risk | Weight gain and metabolic effects- avoid in DM<br>Sedating/ortho hypotension - avoid if high risk for falls or fracture<br>Potentially severe constipation - avoid if risk of fecal impaction or bowel perforation<br>Cardiomyopathy – caution if existing heart disease<br>Seizures – caution if seizure disorder<br>Agranulocytosis (1%) – avoid in existing leukopenia/ neutropenia | Insomnia, akathisia |
| **Comments** | Quick dissolve (M-tabs), and long-acting (Consta®) formulations available | Quick dissolve formulation (Zydis®) used commonly in ER setting for better compliance<br>IM form available | | Weekly blood counts for 6 mo, then q2wk<br>Do not use with other drugs that may cause bone marrow suppression due to risk of agranulocytosis | |

Note: Risk of weight gain: Clozapine > Olanzapine > Quetiapine > Risperidone

**Metabolic and Cardiovascular Adverse Effects Associated with Antipsychotic Drugs**
Nat Rev Endocrinol 2012;8:114-126
All antipsychotics can cause cardiovascular and metabolic side effects, such as obesity, dyslipidemia, hyperglycermia and metabolic syndrome. Olanzapine and clozapine are most likely to cause these adverse effects. The mechanism that underlies the metabolic and cardiovascular effects is not fully understood, however, the histamine, dopamine, serotonin, and muscarinic receptors are implicated.

QTc prolongation is an important adverse effect of all antipsychotics; consider getting ECG prior to and after initiating new medication and to monitor QTc
**Typicals**: chlorpromazine and haloperidol warrant systematic baseline and follow-up ECG
**Atypicals**: ziprasidone has the highest risk among atypicals, clozapine also warrants systematic baseline and follow-up ECG

**Table 17. Side Effects of Antipsychotics**

| System | Side Effects |
|---|---|
| **Anticholinergic** | Dry mouth, urinary retention, constipation, blurred vision, confusional states |
| **β-adrenergic Blockade** | Orthostatic hypotension, erectile dysfunction, failure to ejaculate |
| **Dopaminergic Blockade** | Extrapyramidal syndromes, galactorrhea, amenorrhea, erectile dysfunction, weight gain |
| **Anti-histamine** | Sedation, weight gain |
| **Hematologic** | Agranulocytosis (clozapine) |
| **Hypersensitivity Reactions** | Liver dysfunction, blood dyscrasias, skin rashes, neuroleptic malignant syndrome, altered temperature regulation (hypothermia or hyperthermia) |
| **Endocrine** | Metabolic syndrome |

## Neuroleptic Malignant Syndrome

- psychiatric emergency
  - due to strong DA blockade; increased incidence with high potency and depot antipsychotics
- risk factors
  - medication factors: sudden increase in dosage, starting a new drug
  - patient factors: medical illness, dehydration, exhaustion, poor nutrition, external heat load, male, young adults
- clinical feature
  - tetrad: mental status changes (usually occur first), fever, rigidity, autonomic instability
  - develops over 24-72 h
  - labs: increased creatine phosphokinase, leukocytosis, myoglobinuria
- treatment: supportive - discontinue antipsychotic drug, hydration, cooling blankets, dantrolene (hydrantoin derivative, used as a muscle relaxant), bromocriptine (DA agonist)
- mortality: 5%

## Extrapyramidal Symptoms

- incidence related to increased dose and potency
- acute (early-onset; reversible) vs. tardive (late-onset; often irreversible)

**Table 18. Extrapyramidal Symptoms**

| | Dystonia | Akathisia | Pseudoparkinsonism | Dyskinesia |
|---|---|---|---|---|
| **Acute or Tardive** | Both | Both | Acute | Tardive |
| **High Risk Groups** | Acute: Young Asian and Black males | Older females | Older females | Older patients |
| **Presentation** | Sustained abnormal posture; torsions, twisting, contraction of muscle groups; muscle spasms (i.e. oculogyric crisis, laryngospasm, torticollis) | Motor restlessness; crawling sensation in legs relieved by walking; very distressing, increased risk of suicide and poor adherence | Tremor; rigidity (cogwheeling); akinesia; postural instability (decreased/absent arm-swing, stooped posture, shuffling gait, difficulty pivoting) | Purposeless, constant movements, involving facial and mouth musculature; less commonly – the limbs; rarely, the diaphragm ("hiccups") |
| **Onset** | Acute: within 5 d Tardive: >90 d | Acute: within 10 d Tardive: >90 d | Acute: within 30 d | Tardive: >90 d |
| **Treatment** | Acute: benztropine or diphenhydramine | Acute: lorazepam, propranolol, or diphenhydramine; reduce dose or change antipsychotic to lower potency | Acute: benztropine; reduce dosage or change antipsychotic to low potency atypical antipsychotic | Tardive: no good treatment; may try clozapine; discontinue drug or reduce dosage |

### Anticholinergic Agents

- types
  - benztropine (Cogentin®) 2 mg PO, IM, or IV OD (1-6 mg)
  - diphenhydramine (Benadryl®) 25-50 mg PO/IM qid
- do not routinely prescribe with antipsychotics
  - give anticholinergic agents only if at high risk for acute EPS or if acute EPS develops
- do not give these for tardive syndromes because they worsen the condition

## Antidepressants

- onset of effect
  - relief of neuro-vegetative/physical symptoms: 1-3 wk
  - relief of emotional/cognitive symptoms: 2-6 wk
- tapering of most antidepressants is usually required to avoid withdrawal reactions; speed of taper is based on the medication's half-life and the patient's individual sensitivity (i.e. fluoxetine does not require a taper due to its long half-life; paroxetine and venlafaxine require a slower taper than sertraline or citalopram)
- must be vigilant over the first 2 wk of therapy; neuro-vegetative symptoms may start to resolve while emotional and cognitive symptoms may not (patients may be at risk for suicidal behaviour during this time in particular children/adolescents)
- treatment of bipolar depression
  - patients with bipolar disorder should only be treated with an antidepressant if combined with a mood stabilizer or antipsychotic; monotherapy with antidepressants is not advisable as the depression can switch to mania

**Comparative Efficacy and Acceptability of 21 Antidepressant Drugs for the Acute Treatment of Adults with Major Depressive Disorder: A Systematic Review and Network Meta-Analysis**
Lancet 2018 Feb 20. pii: S0140-6736(17)32802-7
**Purpose**: Update of literature to compare and rank antidepressants for the acute treatment of adults with unipolar major depressive disorder (MDD).
**Methods**: Systematic review and network meta-analysis of RCTs.
**Results**: 522 trials were identified comprising 116 477 participants. All antidepressants were more effective than placebo, with ORs ranging between 2.13 (95% credible interval [CrI] 1.89-2.41) for amitriptyline and 1.37 (1.16-1.63) for reboxetine. For acceptability, only agomelatine (OR 0.84, 95% CrI 0.72-0.97) and fluoxetine (0.88, 0.80-0.96) were associated with fewer dropouts than placebo, whereas clomipramine was worse than placebo (1.30, 1.01-1.68). When all trials were considered, differences in ORs between antidepressants ranged from 1.15 to 1.55 for efficacy and from 0.64 to 0.83 for acceptability. In head-to-head studies, agomelatine, amitriptyline, escitalopram, mirtazapine, paroxetine, venlafaxine, and vortioxetine were more effective than other antidepressants (range of ORs 1.19-1.96), whereas fluoxetine, fluvoxamine, reboxetine, and trazodone were the least efficacious drugs (0.51-0.84). For acceptability, agomelatine, citalopram, escitalopram, fluoxetine, sertraline, and vortioxetine were more tolerable than other antidepressants (range of ORs 0.43-0.77), whereas amitriptyline, clomipramine, duloxetine, fluvoxamine, reboxetine, trazodone, and venlafaxine had the highest dropout rates (1.30-2.32), 46 (9%).
**Conclusion**: All antidepressants were more efficacious than placebo in adults with MDD. Smaller differences between active drugs were found when placebo-controlled trials were included in the analysis.

**Table 19. Common Antidepressants**

| Class | Drug | Daily Starting Dose (mg) | Therapeutic Dose (mg) | Comments |
|---|---|---|---|---|
| **SSRI** | fluoxetine (Prozac®)<br>fluvoxamine (Luvox®)<br>paroxetine (Paxil®)<br>sertraline (Zoloft®)<br>citalopram (Celexa®)<br>escitalopram (Cipralex®) | 20<br>50-100<br>10<br>50<br>20<br>10 | 20-80<br>150-300<br>20-60<br>50-200<br>20-40<br>10-20 | Useful for typical and atypical depression, seasonal depression, anxiety disorders, OCD, eating disorders<br>All SSRIs have similar effectiveness but consider side effect profiles and half-lives<br>Citalopram, and escitalopram have the fewest drug-interactions and are sleep-wake neutral<br>Sertraline is the safest SSRI in pregnancy and breastfeeding<br>Fluoxetine is the most activating SSRI (recommend taking in the AM)<br>Fluoxetine does not require a taper due to long half-life and is the most used in children as it has most evidence<br>Fluvoxamine is sedating (should be taken in PM) and can be involved in many drug-drug interactions |
| **SNRI** | venlafaxine (Effexor®)<br>Desvenlafaxine (Pristiq®)<br>duloxetine (Cymbalta®) | 37.5-75<br>50<br>30 | 75-225<br>50-100<br>30-60 | Useful for depression, anxiety disorders, neuropathic pain |
| **NDRI** | bupropion (Wellbutrin®) | 100 | 300-450 | Useful for depression, seasonal depression; not recommended for anxiety disorder treatment because of stimulating effects<br>Causes less sexual dysfunction (may reverse effects of SSRIs/SNRIs), weight gain, and sedation<br>Increased risk of seizures at higher doses<br>Contraindicated with history of seizure, stroke, brain tumour, brain injury, closed head injury<br>Important to specify formulation, as available in IR, SR, XL (longest) |
| **TCA (3º Amines)** | amitriptyline (Elavil®)<br>imipramine (Tofranil®) | 75-100<br>75-100 | 150-300<br>150-300 | Useful for OCD (clomipramine), melancholic depression; requires ECG monitoring; check blood levels if using higher dosage; highly lethal in overdose |
| **TCA (2º Amines)** | nortriptyline (Aventyl®)<br>desipramine (Norpramin®) | 75-100<br>100-200 | 75-150<br>150-300 | Preferred to tertiary amines because of lower propensity for anticholinergic adverse effects, requires ECG monitoring; check blood levels if using higher dosage; highly lethal in overdose |
| **MAOI** | phenelzine (Nardil®)<br>tranylcypromine (Parnate®) | 45<br>30 | 60-90<br>10-60 | Useful for moderate/severe depression that does not respond to other antidepressants, atypical depression; requires strict adherence to MAOI diet |
| **RIMA** | moclobemide (Manerix®) | 300 | 300-600 | Useful for depression that does not respond to other antidepressants |
| **NASSA** | mirtazapine (Remeron®) | 15 | 15-45 | Useful in depression with prominent features of insomnia, agitation, or cachexia |

MAOI = monoamine oxidase inhibitors; NASSA = noradrenergic and specific serotonin antagonists; NDRI = norepinephrine and dopamine reuptake inhibitors;
RIMA = reversible inhibition of MAO-A; SNRI = serotonin and norepinephrine reuptake inhibitors; SSRI = selective serotonin reuptake inhibitors; TCA = tricyclic antidepressants

## Treatment Approach for Depression

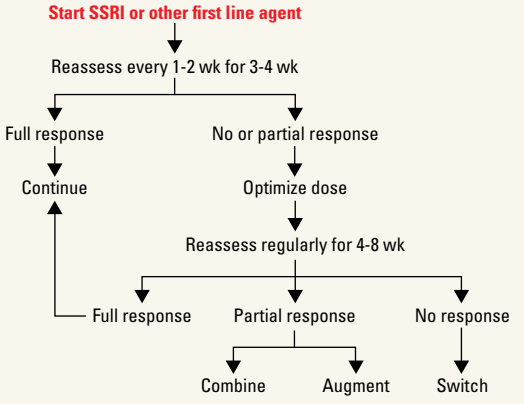

**Figure 3. Depression Treatment Algorithm**

- **optimization**: increase dosage to maximum tolerated or highest therapeutic dosage
- **augmentation**: the addition of a medication that is not considered an antidepressant to an antidepressant regimen (i.e. thyroid hormone, lithium, atypical antipsychotics [aripiprazole, quetiapine, olanzapine, risperidone])
- **combination**: the addition of another antidepressant to an existing treatment regimen (i.e. the addition of bupropion or mirtazapine to an SSRI or SNRI)
- switch: change of the primary antidepressant (within or outside a class)
- note: it is important to fully treat depression symptoms (i.e. to remission) to decrease relapse rates

**Psychopharmacology of SSRIs**

| Post-Synaptic Serotonin Receptor Stimulated | Effect/Side Effect |
|---|---|
| 5HT1A centrally | • Relief of depression<br>• Anxiolytic effect |
| 5HT2A in spinal cord | • Sexual dysfunction: delayed ejaculation, anorgasmia, decreased interest/ libido |
| 5HT2C/5HT2A in brain | • Activation: anxiety, insomnia<br>• Worst with fluoxetine, paroxetine<br>• Warn patients anxiety may worsen in first 1-2 wk of treatment |
| 5HT3A in gut | • GI upset: nausea, vomiting, bloating<br>• Take with food |

**Table 20. Features of Commonly Used Antidepressant Classes**

| | SSRI | SNRI | TCA | MAOI | NDRI | RIMA | NASSA |
|---|---|---|---|---|---|---|---|
| **Examples** | Fluoxetine, Sertraline, Citalopram | Venlafaxine, Duloxetine | Amitriptyline, Clomipramine | Phenelzine | Buproprion | Moclobemide | Mirtazapine |
| **Mode of Action** | Block serotonin reuptake only | Block norepinephrine and serotonin reuptake | Block norepinephrine reuptake (clomipramine also blocks serotonin reuptake) | Irreversible inhibition of monoamine oxidase A and B increases duration that NE and 5HT are in the synaptic cleft by preventing their degradation | Block norepinephrine and dopamine reuptake | Reversible inhibitor of monoamine oxidase A leads to increased duration NE and 5HT are in the synaptic cleft by preventing their degradation | Enhance central noradrenergic and serotonergic activity by inhibiting presynaptic α-2 adrenergic receptors |
| **Side Effects** | Fewer than TCA, therefore increased compliance<br>CNS: restlessness, tremor, insomnia, headache, drowsiness<br>GI: N/V, diarrhea, abdominal cramps, Weight gain<br>Sexual dysfunction: erectile dysfunction, anorgasmia<br>CVS: increased HR, Serotonin syndrome<br>SIADH, EPS | ow dose side effects similar to SSRIs (serotonergic)<br>Higher dose side effects: tremors, tachycardia, sweating, insomnia, orthostatic hypotension, increase in BP (noradrenergic)<br>SIADH | Anticholinergic effects: (see Table 17, PS46)<br>Noradrenergic effects: tremors, tachycardia, sweating α-1 adrenergic effects: orthostatic hypotension, falls<br>QRS prolongation | Antihistamine effects: sedation, weight gain<br>CVS: orthostatic hypotension, hypertensive crises with tyramine rich foods (i.e. wine, cheese):, headache, flushes, reflex tachycardia, postural hypotension, sedation, insomnia, weight gain<br>Minimal anticholinergic and antihistamine effects | CNS: dizziness, headache, tremor, insomnia<br>CVS: dysrhythmia, HTN<br>GI: dry mouth, N/V, constipation, decreased appetite<br>Other: agitation, anxiety | CNS: dizziness, headache, tremor, insomnia<br>CVS: dysrhythmia, hypotension<br>GI: dry mouth, N/V, diarrhea, abdominal pain, dyspepsia<br>GU: delayed ejaculation<br>Other: diaphoresis | CNS: sedation, dizziness<br>Endocrine: increase in cholesterol, triglycerides. weight gain<br>GI: constipation, ALT |
| **Risk in Overdose** | Relatively safe in OD | Tachycardia and N/V seen in acute overdose | Toxic in OD<br>3 times therapeutic dose may be lethal<br>Presentation: anticholinergic effects, CNS stimulation, then depression and seizures<br>ECG: prolonged QRS and QTc (reflect severity)<br>Treatment: activated charcoal, cathartics, supportive treatment, IV diazepam for seizure, physostigmine salicylate for coma<br>Do not give ipecac, as can cause rapid neurologic deterioration and seizures | Toxic in OD, but wider margin of safety than TCA | Tremors and seizures seen in overdose | Risk of fatal overdose when combined with SSRIs, SNRIs or clomipramine | Relatively safe in OD |
| **Drug Interactions** | MAOI, SNRI<br>Some SSRIs (fluoxetine, fluvoxamine, paroxetine) strongly inhibit cytochrome P450 enzymes, therefore will affect levels of drugs metabolized by P450 system | MAOI, SSRI<br>Low inhibition of cytochrome P450 compounds | MAOI, SSRI<br>EtOH | Hypertensive crises with noradrenergic medications (i.e. TCA, decongestants, amphetamines)<br>Serotonin syndrome with serotonergic drugs (i.e. SSRI, SNRI, tryptophan, dextromethorphan) | MAOI<br>Drugs that reduce seizure threshold: antipsychotics, systemic steroids, quinolone antibiotics, antimalarial drugs | MAOI, paroxetine<br>Opioids | MAOI, RIMA |

### Serotonin Syndrome
- thought to be due to over-stimulation of the serotonergic system
- can result from medication combinations such as SSRI+SNRI, SSRI or SNRI +MAOI, SSRI+tryptophan, MAOI+meperidine, MAOI+tryptophan
- rare but potentially life-threatening adverse reaction to SSRIs and SNRIs
- symptoms include: nausea, diarrhea, palpitations, chills, diaphoresis, restlessness, confusion, and lethargy but can progress to myoclonus, hyperthermia, rigor, and hypertonicity
- treatment: discontinue medication and administer emergency medical care as needed
- important to distinguish from NMS

### Discontinuation Syndrome
- caused by the abrupt cessation of some antidepressants; most commonly with paroxetine, fluvoxamine, and venlafaxine (drugs with shortest half-lives)
- symptoms usually begin within 1-3 d and include: anxiety, insomnia, irritability, mood lability, nausea/vomiting, dizziness, headache, dystonia, tremor, chills, fatigue, lethargy, and myalgia ("flu-like symptoms")
- treatment: symptoms may last between 1-3 wk, but can be relieved within 24 h by restarting antidepressant at the same dosage the patient was taking and initiating a slower taper over several weeks
- consider avoiding drugs with a short half-life

**Symptoms of Antidepressant Discontinuation**

**FINISH**
**F**lu-like symptoms
**I**nsomnia
**N**ausea
**I**mbalance
**S**ensory disturbances
**H**yperarousal (anxiety/agitation)

## Mood Stabilizers

### General Prescribing Information
- examples: lithium, divalproex, lamotrigine, carbamazepine
- used as first-line monotherapy or in conjunction with atypical antipsychotics for acute episodes of bipolar disorder - depression, mania – or for long-term stabilization
- vary in their ability to "treat" (reduce symptoms acutely) or "stabilize" (prevent relapse and recurrence) manic and depressive symptoms; multi-agent therapy can be avoided in many patients but it is common
- before initiating, get baseline: CBC with diff and platelets, ECG (if patient >45 yr old or cardiovascular risk), BUN, Cr, electrolytes, TSH
- Also: screen for pregnancy, thyroid disease, neurological, renal, liver, cardiovascular diseases
- full effects may take 2-4 wk, thus may need acute coverage with benzodiazepines or antipsychotics

### Specific Prescribing Information
- detailed pharmacological guidelines available online from the Canadian Network for Mood and Anxiety Treatments (CANMAT) and International Society for Bipolar Disorders (ISBD)
- for clinical information for treating bipolar disorder (see *Mood Disorders*, PS10)

**Table 21. Commonly Used Mood Stabilizers**

| | Lithium | Lamotrigine (Lamictal®) | Divalproex (Epival®) | Carbamazepine (Tegretol®) |
|---|---|---|---|---|
| **Indications** | **1st line**<br>Acute mania (monotherapy or with adjunct SGA)<br>Bipolar I depression (monotherapy or in combination with divalproex, SSRI, or bupropion)<br>Bipolar disorder maintenance (monotherapy or with adjunct SGA)<br><br>**Other uses**<br>Bipolar II depression<br>Augmentation of antidepressants in MDD and OCD<br>Schizoaffective disorder<br>Chronic aggression, antisocial behaviour<br>Recurrent depression | **1st line**<br>Bipolar I depression (monotherapy)<br>Bipolar disorder maintenance (limited efficacy in preventing mania, more effective when combined with lithium)<br><br>**Other uses**<br>Bipolar II depression<br><br>Not recommended for acute mania as monotherapy | **1st line**<br>Acute mania (monotherapy or with adjunct SGA)<br>Bipolar I depression (combination with lithium or SSRI)<br>Bipolar disorder maintenance (monotherapy or with adjunct SGA)<br><br>**Other uses**<br>Bipolar II depression<br>Rapid cycling bipolar disorder<br>Mixed phase/dysphoric mania | **2nd line**<br>Acute mania (monotherapy)<br>Bipolar disorder maintenance (monotherapy or in combination with lithium)<br><br>**Other uses**<br>Rapid cycling bipolar disorder |
| **Mode of Action** | Unknown<br>Therapeutic response within 7-14 d | May inhibit 5-HT3 receptors<br>May potentiate DA activity | Depresses synaptic transmission<br>Raises seizure threshold | Depresses synaptic transmission<br>Raises seizure threshold |
| **Dosage** | Adult: 600-1500 mg/d<br>Geriatric: 150-600 mg/d<br>Usually daily dosing | Note: very slow titration required due to risk of Stevens-Johnson Syndrome<br>Dose adjusted in patients taking other anticonvulsants<br>Daily dose: 100-200 mg/d | 750-2500 mg/d<br>Usually daily dosing with ER preparation | 400-1600 mg/d<br>Usually bid or tid dosing |
| **Therapeutic Level** | Adult: 0.8-1.0 mmol/L (1.0-1.25 mmol/L for acute mania)<br>Geriatric: 0.6-0.8 mmol/L | Therapeutic plasma level not established<br>Dosing based on therapeutic response | 17-50 mmol/L<br>Same therapeutic levels as used for seizure prophylaxis | 350-700 µmol/L<br>Same therapeutic levels as used for seizure prophylaxis |
| **Monitoring** | Monitor serum levels every 5-7 d until therapeutic (always wait 12 h after dose)<br>Then monitor monthly, then q2-3mo<br>Monitor thyroid function, creatinine q6mo, urinalysis q1yr | Monitor for skin rash and suicidality, when initiating treatment | Monitor serum levels every 5-7 d until therapeutic<br>LFTs weekly x 1 mo, then monthly, then q2-3mo due to risk of liver dysfunction<br>Watch for signs of liver dysfunction: nausea, edema, malaise<br>Check platelets and monitor levels to adjust dosage and confirm adherence | Monitor serum levels every 5-7 d until therapeutic<br>Weekly blood counts for 1st mo, due to risk of agranulocytosis<br>Watch for signs of blood dyscrasias: fever, rash, sore throat, easy bruising |
| **Side Effects** | GI: N/V, diarrhea, stomach pain<br>GU: polyuria, polydipsia, nephrogenic DI, GN, renal failure,<br>CNS: fine tremor, headache, fatigue, lethargy<br>Hematologic: reversible benign leukocytosis<br>Other: teratogenic (Ebstein's anomaly), hypothyroidism, weight gain, edema, psoriasis, muscle weakness, bradycardia, ECG changes | Skin: rash (consider discontinuing due to risk of Steven-Johnson syndrome), slow dose titration to reduce risk<br>Otherwise, usually well tolerated (GI: N/V, diarrhea<br>CNS: ataxia, dizziness, diplopia, headache, somnolence<br>Other: anxiety) | GI: liver dysfunction, N/V, diarrhea<br>CNS: ataxia, drowsiness, tremor, sedation, cognitive blurring<br>Other: hair loss, weight gain, thrombocytopenia, neural tube defects when used in pregnancy | GI: N/V, diarrhea, hepatic toxicity<br>CNS: ataxia, dizziness, slurred speech, drowsiness, confusion, nystagmus, diplopia<br>Hematologic: transient leukopenia (10%), rare agranulocytosis, aplastic anemia<br>Skin: rash (5% risk; consider discontinuing drug because of risk of Stevens-Johnson syndrome)<br>Other: neural tube defects when used in pregnancy |
| **Interactions** | NSAIDs, thiazides, ACE inhibitors, and metronidazole decrease clearance, risk for lithium toxicity | | OCP | OCP |

## Lithium Toxicity

- clinical diagnosis as toxicity can occur at therapeutic levels
- **common causes**: overdose, sodium/fluid loss, concurrent medical illness or initiation of NSAIDs or diuretics
- **clinical feature**
  - GI: severe nausea/vomiting and diarrhea
  - cerebellar: ataxia, slurred speech, lack of coordination
  - cerebral: drowsiness, myoclonus, tremor, upper motor neuron signs, seizures, delirium, coma
- **management**
  - discontinue lithium for several days and begin again at a lower dose when lithium level has fallen to a non-toxic range
  - monitor serum lithium levels, BUN, electrolytes
  - IV saline
  - hemodialysis if lithium >2 mmol/L, coma, shock, severe dehydration, failure to respond to treatment after 24 h, or deterioration

Long-term lithium use can lead to a nephropathy and diabetes insipidus in some patients

# Anxiolytics

- anxiolytics mask or alleviate symptoms
- **indications**
  - short-term treatment of anxiety disorders, insomnia, alcohol withdrawal (especially delirium tremens), barbiturate withdrawal, akathisia due to antipsychotics, seizure disorders, musculoskeletal disorders, agitation or aggression associated with acute mania, or psychosis (i.e. ED, ICU)
- **relative contraindications**
  - major depression (except as an adjunct to other treatment), history of drug/alcohol abuse, caution in pregnancy/breastfeeding
- **mechanism of action**
  - benzodiazepines: potentiate binding of GABA to its receptors; results in decreased neuronal activity
  - buspirone: partial agonist of 5-HT1A receptors

## Benzodiazepines

- should be used for limited periods (i.e. days-weeks) to avoid tolerance and dependence
- all benzodiazepines are sedating, decrease respiratory drive, and increase risk for falls, confusion, and MVAs; be wary with use in the elderly
- have similar efficacy, so choice depends on half-life, metabolites, and route or schedule of administration
- taper slowly over weeks-months because they can cause withdrawal reactions (see below)
- avoid alcohol because of potentiation of CNS depression; caution with drinking and driving/machinery use
- **side effects**
  - CNS: drowsiness, cognitive impairment, reduced motor coordination (falls), memory impairment
  - physical dependence, tolerance
- **withdrawal**
  - low dose withdrawal symptoms: tachycardia, HTN, panic, rebound insomnia, anxiety, impaired memory and concentration, perceptual disturbances
  - high dose or rapid withdrawal symptoms: hyperpyrexia, seizures, death
  - onset: 1-2 d (short-acting), 2-4 d (long-acting)
  - duration: days-weeks
  - complication with above 50 mg diazepam/day or abrupt withdrawal: autonomic hyperactivity, seizures, delirium, arrhythmias
  - management: taper slowly, may need to switch to a long-acting benzodiazepine
  - similar to but less severe than alcohol withdrawal; can be fatal
- **overdose**
  - overdose is common but rarely fatal unless combined with other substances
  - more dangerous or potentially fatal when combined with alcohol, other CNS depressants, opioids, or TCAs

**Benzodiazepine Antagonist – Flumazenil (Anexate®)**
- Use for suspected benzodiazepine overdose
- Specific antagonist at the benzodiazepine receptor site

## Buspirone (Buspar®)

- primary use: GAD
- may be preferred over benzodiazepines because it is non-sedating, has no interaction with alcohol, does not alter seizure threshold, not prone to abuse
- onset of action: 2 wk
- side effects: dizziness, drowsiness, nausea, headache, nervousness, EPS

**Table 22. Dosing and Indications for Common Anxiolytics**

| Class | Drug | Dose Range (mg/d) | $t_{1/2}$ (h) | Appropriate Use |
|---|---|---|---|---|
| **Benzodiazepines** | | | | |
| Long-acting | clonazepam (Rivotril®) | 0.25-4 | 18-50 | Seizure prevention, akathisia, generalized anxiety disorder, panic disorder |
| | diazepam (Valium®) | 2-40 | 30-100 | Seizure prevention, muscle relaxant, alcohol withdrawal, generalized anxiety |
| | chlordiazepoxide (Librium®) | 5-300 | 30-100 | Alcohol withdrawal |
| | flurazepam (Dalmane®) | 15-30 | 50-160 | Should be avoided |
| Short-acting | alprazolam (Xanax®) | 0.25-4.0 | 6-20 | Should be avoided due to high dependency rate |
| | lorazepam (Ativan®) | 0.5-6.0 | 10-20 | Alcohol withdrawal (no first-pass liver metabolism), akathisia, short-term sedation for anxiety during procedures (i.e. CT or MRI), generalized anxiety; sublingual or IM for rapid action |
| | oxazepam (Serax®) | 10-120 | 8-12 | Alcohol withdrawal (no first-pass liver metabolism), generalized anxiety disorder |
| | temazepam (Restoril®) | 7.5-30 | 8-20 | Should be avoided |
| | triazolam (Halcion®) | 0.125-0.5 | 1.5-5 | Shortest $t_{1/2}$, rapid sleep without daytime sedation (i.e. overnight plane travel), but risk of rebound insomnia |
| **Azapirones** | | | | |
| | zopiclone (Imovane®) | 5-7.5 | 3.8-6.5 | Sleep (confusion less likely than with benzodiazepines) |

**Benzodiazepines**

**LOT**
**L**orazepam
**O**xazepam
**T**emazepam
Safe for patients with impaired liver function because not metabolized by liver

# Somatic Therapies

## Electroconvulsive Therapy

- various methodological improvements have been made since the first treatment in 1938 to reduce adverse effects
- modern ECT: induction of a generalized seizure using an electrical pulse through scalp electrodes while the patient is under general anesthesia with a muscle relaxant
- considerations: unilateral vs. bilateral electrode placement, pulse rate, energy, number, and spacing of treatments
- usual course is 6-12 treatments, 2-3 treatments per wk
- **indications**
  - depression: poor response to antidepressant (unipolar, bipolar I, bipolar II), psychotic features, catatonic features, when medications may be unsafe or rapid response is needed (i.e. cachexia, severe dehydration, frail elderly, high suicide risk)
  - catatonia: refractory, severe, or life-threatening
  - schizophrenia: acute symptoms with poor response to antipsychotics, catatonia, history of NMS
  - mania: refractory, severe or life-threatening situation
  - personal or family history of good response to ECT
  - inconclusive evidence for OCD
- **adverse effects**: risk of anesthesia (equal to risk of ECT), memory loss (may be retrograde and/or anterograde, tends to resolve by 6-9 mo, permanent impairment controversial), headaches, myalgias
- unilateral ECT causes less memory loss than bilateral but may not be as effective
- **contraindications**: no absolute contraindications; relative contraindications: increased intracranial pressure, recent (<4 wk) hemorrhagic stroke, recent (<2 wk) MI, requires special monitoring

**ECT in Society**
Prior to the 1940's, ECT was performed without the use of muscle relaxants, resulting in seizures with full-scale convulsions and rare but serious complications such as vertebral and long-bone fractures. This practice may have led to negative societal perceptions of ECT, further perpetuated by negative depictions in popular culture. Despite ongoing stigmatization, ECT as it is practiced today is an effective and safe option for patients with severe mental illness

**Electroconvulsive Therapy for Treatment Resistant Schizophrenia**
Cochrane DB Syst Rev 2019:CD011847.
**Objectives**: Assess benefits and harms of ECT for people with treatment-resistant schizophrenia.
**Outcomes**: Moderate-quality evidence indicates that relative to standard care, ECT has a positive effect on medium-term clinical response for people with treatment-resistant schizophrenia. However, there is no clear and convincing advantage or disadvantage for adding ECT to standard care for other outcomes.

## Repetitive Transcranial Magnetic Stimulation (rTMS)

- noninvasive production of focal electrical currents in select brain circuits using magnetic induction
- indications: strong evidence for treatment-resistant depression, pain disorders; possibly efficacious for anxiety disorders, eating disorders, substance use disorders
- adverse effects: common – transient local discomfort, hearing issues, or cognitive changes; rare - seizure, syncope, mania induction

## Magnetic Seizure Therapy (Experimental)

- generalized seizure induction using strong magnetic current
- early studies demonstrate efficacy for depression as well as anxiety, with reduced memory effects vs. ECT

## Neurosurgical Treatments

### Ablative/Lesion Procedures
- used for MDD or OCD unresponsive to all other forms of treatment; efficacy ranges from 25-75% depending on procedure
- adverse effects: related to lesion location and size, high risk of suicide in those who are not helped by surgery

### Deep Brain Stimulation (Experimental)
- placement of small electrode leads in specific brain areas to alter neuronal signaling, usually for MDD unresponsive to all other forms of treatment
- response rates (>50% symptom reduction) of 40-70%, adverse effects related to surgical risks and poor treatment response

### Vagus Nerve Stimulation
- direct, intermittent electrical stimulation of left cervical vagus nerve via implanted pulse generator
- used for chronic, recurrent MDD with poor response to previous therapy and ECT; slow onset, approximately 30% response rate after 1 yr

## Other Therapy Modalities

### Phototherapy (Light Box Therapy)
- bright light source exposure (usually 10,000 lux) for 30-60 min; best if done daily in the morning
- proposed mechanisms: reverses pathological alterations in circadian rhythm through action on suprachiasmatic nucleus
- indications: seasonal affective disorder (SAD), non-seasonal depression (as augmentation), some sleep disorders
- adverse effects: mania induction, reaction with photosensitizing drug or photosensitive eye or skin conditions

### Aerobic Exercise

- moderate-intense aerobic exercise is associated with acute increased release of serotonin, phenethylamine, brain-derived neurotrophic factor, endogenous opioids, and cannabinoids (likely this combination is what contributes to the "runner's high")
- long term increases grey matter in multiple areas, as well as improvements in cognition, memory, and stress tolerance
- indications: monotherapy for mild-moderate MDD; adjunctive therapy for moderate-severe MDD; research suggests 30 min of supervised moderate-intensity exercise at least 3 times weekly for a minimum of 9 wk is as effective as psychotherapy or antidepressant medications
- may be helpful in PTSD, schizophrenia

# Canadian Legal Issues

## Common Forms

**Table 23. Common Forms Under the Mental Health Act (in Ontario)**

| Form | Who Signs | When | Expiration Date | Right of Patient to Review Board Hearing | Options Before Form Expires |
|---|---|---|---|---|---|
| **Form 1:** Application by physician to hospitalize a patient for psychiatric assessment against his/her will in a schedule 1 facility (Form 42 given to patient) | Any MD | Within 7 d after having examined the patient | 72 h after hospitalization<br>Void if not implemented within 7 d | No | Form 3 and 30 or voluntary admission or send home ± follow-up |
| **Form 2:** Order by Justice of the Peace to bring patient to a hospital for a psychiatric assessment against his/her will | Justice of the Peace | No statutory time restriction | 7 d from when completed<br>Purpose of form is complete once patient brought to hospital | No | Form 1 and 42 or send home ± follow-up |
| **Form 3:** Certificate of involuntary admission to a schedule 1 facility (Form 30 given to patient, notice to rights advisor) | Any MD other than MD who completed Form 1 | Before expiration of Form 1<br>Any time to change status of a voluntary inpatient | 14 d | Yes | Form 4 and 30 or Voluntary admission (Form 5) |
| **Form 4:** Certificate of renewal of involuntary admission to a schedule 1 facility (original Form 30 given to patient, notice to rights advisor) | Attending MD following patient on Form 3 | Prior to expiration of Form 3 | First: 1 mo<br>Second: 2 mo<br>Third: 3 mo (max) | Yes | Form 4 and 30 or Voluntary admission (Form 5) |
| **Form 5:** Change to informal/voluntary status | Attending MD following patient on Form 3/4 | Whenever deemed appropriate | N/A | N/A | N/A |
| **Form 30:** Notice to patient that they are now under involuntary admission on either Form 3 or 4. Original to the patient, copy to chart | Attending MD | Whenever Form 3 or Form 4 filled | N/A | Yes | N/A |
| **Form 33:** Notice to patient that patient is incapable of consenting to treatment, and/or management of property and/or disclosure of health information (original copy to patient) | Attending MD | Whenever deemed appropriate | N/A | Yes | N/A |

* Schedule 1 Facilities: Able to provide intensive inpatient and outpatient care

**Form 1: Application for Psychiatric Assessment**

- Filled out when patients are thought to be in imminent danger to harm themselves (suicide) or others (homicide) or when they are incapable of self-care (i.e. not dressed for freezing weather) and are suffering from an apparent mental disorder
- Based on any combination of the physician's own observations and facts communicated by others
- Box A or Box B completed
- **Box A**: Serious Harm Test
- The Past/Present Test assesses current behaviours/threats/attempts
- The Future Test assesses the likelihood of serious harm occurring as a result of the presenting mental disorder. In this section, one should document evidence of the mental disorder and concerning behaviour/thoughts
- **Box B**: Patients with a known mental disorder, who are incapable of consenting to treatment (substitute decision-maker needed), have previously received treatment and improved, and are currently at risk of serious harm due to the same mental disorder

## Consent

- see Ethical, Legal, and Organizational Medicine, ELOM7

# Community Treatment Order (CTO)

- purpose: a CTO orders a person suffering from a serious mental disorder to receive treatment and supervision in the community. Based on a comprehensive plan outlining medications, appointments, and other care believed necessary to allow the person to live in the community (vs. in a psychiatric facility, where conditions are more restrictive)
- intended for those who:
  - due to their serious mental disorder, experience a pattern of admission to a psychiatric facility where condition is usually stabilized
  - after being released, these patients often lack supervision and stop treatment, leading to destabilization
  - due to the destabilization of their condition, these patients usually require re-admission to hospital
  - if CTO violated (i.e. treatment not taken), patient brought in by police to hospital for treatment as per CTO
- criteria for a physician to issue a CTO
  - patient with a prior history of hospitalization
  - a community treatment plan for the person has been made
  - examination by a physician within the previous 72 h before entering into the CTO plan
  - ability of the person subject to the CTO to comply with it
  - consultation with a rights advisor and consent of the person or the person's substitute decision maker
- CTOs are valid for 6 mo unless they are renewed or terminated at an earlier date such as
  - where the person fails to comply with the CTO
  - when the person or his/her substitute decision-maker withdraws consent to the community treatment plan
- CTO process is consent-based and all statutory protections governing informed consent apply
- the rights of a person subject to a CTO include
  - the right to a review by the Consent and Capacity Board with appeal to the courts each time a CTO is issued or renewed
  - a mandatory review by the Consent and Capacity Board every second time a CTO is renewed
  - the right to request a re-examination by the issuing physician to determine if the CTO is still necessary for the person to live in the community
  - the right to review findings of incapacity to consent to treatment
  - provisions for rights advice

**CTO Legislature**
- Ontario passed CTO legislature on December 1, 2000 (known as "Brian's Law")
- Similar CTOs have been implemented in Saskatchewan (1995), Manitoba (1997), and British Columbia (1999)

# Public Health Context

- see Ethical, Legal, and Organizational Medicine, ELOM2 *Overview of Canadian Healthcare System* for the organization of health care in Canada including the legal foundation and historical context

### Definitions

- **population health**
  - refers to the health of defined groups of people, their health determinants, trends in health, and health inequalities
  - influenced by: physical, biological, social, environmental, and economic factors; personal health behaviours; health care services
  - broader scope compared to public health; accounts for socioeconomic, policy, historical issues
- **public health**
  - an organized activity of society to promote, protect, improve, and when necessary, restore the health of individuals, specified groups, or the entire population
  - a combination of sciences, skills, and values that function through collective societal activities and involve programs, services, and institutions aimed at protecting and improving the health of all people
  - public health services in many provinces (e.g. Ontario) are administered, funded and delivered entirely separately from health care services
- **epidemiology**
  - "study of the distribution […] of determinants of disease, health-related states, and events in populations"
- **public health and preventive medicine** (formerly called community medicine)
  - the medical specialty that focuses on population rather than individuals' health through health protection and illness and injury prevention
  - works with diverse populations to address social determinants of health and promotes health equity
  - 5 year Royal College training in medical skills and knowledge, epidemiology, statistics, social sciences, public administration, policy development, program management, and leadership

Sources: Shah, CP. Chapter 2 Measurement and Investigation. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003
Shah, CP. Chapter 15 Community Health Services. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003

**Preparing for the LMCC**
The AFMC Primer on Population Health is the core text for the LMCC and is available as an online resource on the AFMC website (http://phprimer.afmc.ca)
For the LMCC exam, it is recommended that you also read Chapter 15 in Shah CP. Public health and preventive medicine in Canada, 5th ed. Toronto: Elsevier, 2003

**Historical Perspective**
Over the last century, Public Health has evolved through three main epidemiological phases:
- Infectious diseases: controlled in the more developed countries but an issue in less developed countries (e.g. polio, malaria)
- Chronic diseases: have increased morbidity and mortality (e.g. heart disease and cancer due to risk factors and/or exposures)
- Re-emerging infectious diseases: emerge due to unfamiliar or new pathogens, inefficient or inappropriate antibiotic use, travel, and global warming (e.g. HIV, drug resistant TB, and malaria)

# Public Health in Canada

The Public Health System in Canada is composed of various agencies at the Federal (Public Health Agency of Canada), Provincial (Public Health Ontario) and Municipal/Local levels (local public health units). The organization of the public health system in each province varies widely and is usually separate from the health care system.

**Mission of the Public Health Agency of Canada (federal only):** to promote and protect the health of Canadians through leadership, partnership, innovation, and action in public health

- local public health units and services within regional health authorities (in most provinces except Ontario, where local public health units are either autonomous or within local government) provide programs and activities for health protection, promotion, and disease prevention at local and regional levels
- catchment-area populations range widely (100s-1,000,000s), covering areas of 15 $km^2$ to 1.5 million $km^2$
- the "core functions" of public health include six essential activities

(The Organization of Health Services in Canada. AFMC Primer on Population Health, Accessed: March 25 2016)

1. **health protection**: measures taken to address potential risks to health at the population level through regulation and advising government (e.g. safe water and food supply)
2. **health surveillance**: monitoring and predicting health outcomes and determinants with systematic, longitudinal data collection
3. **disease and injury prevention**: address infectious disease through preventive (e.g. vaccination, droplet protection) and control (e.g. quarantine) measures; reduce morbidity through lifestyle improvement
4. **population health assessment**: studying and engaging with a community to understand their needs and improve policies and services

**Chief Public Health Officer (CPHO) of Canada**
- Responsible for the Public Health Agency of Canada (PHAC) and reports to the Minister of Health
- As the federal government's lead public health professional, provides advice to the Minister of Health and Government of Canada and collaborates with other governments, jurisdictions, agencies, organizations, and countries on health matters
- Communicates public health information to health professionals, stakeholders, and the public
- In an emergency, such as an outbreak or natural disaster, directs PHAC staff, including medical professionals, scientists, and epidemiologists, to coordinate emergency response

Source: Public Health Agency of Canada. http://www.phac-aspc.gc.ca/cpho-acsp/cpho-acsp-role-eng.ph

5. **health promotion**: advocate for improved health through broad community and government measures (e.g. policy, interventions, community organizations)
6. **emergency preparedness and response**: developing protocols and infrastructure for natural (e.g. hurricane) and man-made (e.g. opioid crisis) disasters. In many types of health-related disasters, public health leads the disaster response

Sources: Shah, CP. Chapter 15 Community Health Services. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003
The Association of Faculties of Medicine of Canada Public Health Educators' Network. The Organization of Health Services in Canada. AFMC Primer on Population Health

# Legislation and Public Health in Canada

**Table 1. Legislation and Public Health in Canada**

| Federal | Provincial | Municipal (Ontario) |
|---|---|---|
| **Health Canada**<br>• Provides health services to Indigenous peoples, the Canadian military, and veterans<br>• Approves new drugs and medical devices<br>• Food Guide<br>**Public Health Agency of Canada** (main Government of Canada agency responsible for public health)<br>• An independent body created post-SARS to strengthen public health capacity and response<br>• Focuses on preventing chronic diseases, preventing injuries, and responding to public health emergencies and infectious disease outbreaks<br>• Activities include CTFPHC guideline secretariat, knowledge brokers<br>• Oversees immigration screening, protects Canadian borders (e.g. airport health inspection)<br>• Liaises with the World Health Organization (WHO) on global health issues<br>**Canadian Food Inspection Agency**<br>• Regulates food labeling<br>• Deals with animal-related infections<br>**Canadian Institutes of Health Research (CIHR)**<br>• Formed in 2000 to support research to improve health and the healthcare system | Each province has its own Public Health Act or equivalent (e.g. the *Health Protection and Promotion Act* in Ontario) and agencies (e.g. Public Health Ontario)<br>• Designates the creation of geographic areas for the provision of public health services<br>• Gives powers to the Chief Medical Officer of Health to control public health hazards<br>• Specifies diseases to be reported to public health units by physicians, laboratories, and hospitals (see *Appendix*, PH26)<br>• Mandate programs that address public health issues, environmental health, and chronic disease prevention | Local public health units (e.g. Middlesex-London Health Unit) deliver programs mandated by provincial, municipal or regional legislation and are responsible for the delivery of most public health services, such as:<br>• Infectious disease control, including the follow-up of reported diseases and management of local outbreaks<br>• Inspection of food premises including those in hospitals, nursing homes, and restaurants<br>• Family health services including pre-conception, preschool, school-aged, and adult health programs<br>• Tobacco control legislation enforcement<br>• Assessment and management of local environmental health risks<br>• Collection and dissemination of local health status reports<br>• Oral health<br>• By-laws may be approved by municipal governments to facilitate public health issues |

**Example of a Municipal Health Unit: The Middlesex-London Health Unit**
- Serves 450,000 people living, working, visiting, and studying in the city of London and Middlesex county
- 275 full-time staff including medical officers of health (physicians), public health nurses, epidemiologists, health promotion educators, dental hygiene managers, etc.
- Services include infectious disease control, ensuring environmental health standards, health promotion, and providing family health programs

**Medical Officer of Health (MOH) (Ontario)**
- May be called "Medical Health Officer" (MHO) in other provinces
- Appointed to each public health unit by the board of health
- Held by a Public Health and Preventive Medicine specialist physician
- Responsibilities include oversight of a multidisciplinary team who:
  - Collect and analyze epidemiological data
  - Provide occupational and environmental health surveillance
  - Implement health programs, including tobacco use prevention inspections (restaurants, doctor's offices, tattoo parlors) and prenatal courses
  - The Medical Officer of Health, by law, can require an individual/premise/agency or a person to take or refrain from any action due to a public health hazard. (Section 13 and 22 of the HPPA)

# Determinants of Health

## Concepts of Health

- **wellness**: "state of dynamic physical, mental, social, and spiritual well-being that enables a person to achieve full potential and have an enjoyable life"
- **disease**: "abnormal, medically-defined changes in the structure or function of the human body"
- **illness**: "an individual's experience or subjective perception of a lack of physical or mental well-being and consequent inability to function normally in social roles"
- **illness behaviour**: an individual's actions resulting from and responding to their illness, including their interactions or avoidance of the health care system
- **sickness**: views the individual and their society hold towards a health condition, affecting their thoughts and actions
- **impairment**: "any loss or abnormality of psychological, physiological, or anatomical structure or function"
- **disability**: "any restriction or lack of ability to perform an activity within the range considered normal for a human being"
- **handicap**: a disadvantage for an individual arising from impairment or disability
  - "limits or prevents the fulfillment of an individual's normal role as determined by society and depends on age, sex, social, and cultural factors"
- **health equity**: when all people have "the opportunity to attain their full health potential" and no one is "disadvantaged from achieving this potential because of their social position or other socially determined circumstance." Health inequities are systematic differences in the health of individuals/groups which are considered unjust
- **health equality**: defined as where populations have equal or similar health status. Health inequalities are systematic differences in the health of groups that do not necessarily carry a moral judgement

**Definitions of Health**
- First multidimensional definition of health, as defined by the WHO in 1948: "state of complete physical, mental and social well-being and not merely the absence of disease or infirmity"
- WHO updated the definition (socio-ecological definition) of health in 1986: "The ability to identify and to realize aspirations, to satisfy needs, and to change or cope with the environment. Health is therefore a resource for everyday life, not the objective of living. Health is a positive concept emphasizing social and personal resources, as well as physical capacities" (Ottawa Charter for Health Promotion)
- Other definitions of health have since been proposed that incorporate other dimensions of health (e.g. "Health is a social, economic, and political issue and above all a fundamental human right" – The People's Charter for Health)

## Determinants of Health

- 1974: the Honourable Marc Lalonde, federal Minister of Health, publishes *A New Perspective on the Health of Canadians* which outlines four factors that determine health: "human biology, environment, lifestyle, and health care organizations." The idea of determinants of health has since been expanded and refined to include many additional factors

Sources: Shah, CP. Concepts, Determinants, and Promotion of Health. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003
The Association of Faculties of Medicine of Canada Public Health Educators' Network. Concepts of Health and Illness. AFMC Primer on Population Health

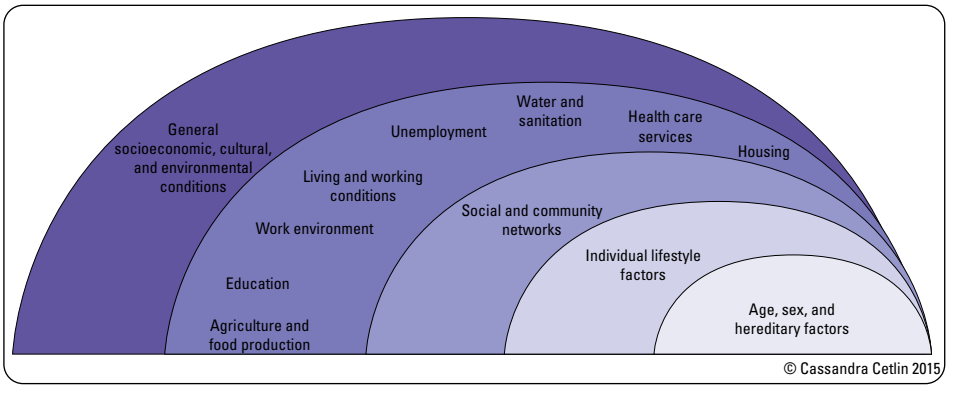

**Figure 1. Population health model**
Adapted from Dahlgreen G, Whitehead M. European strategies for tackling social inequities in health: Leveling up Part 2. World Health Organization, 2006

**Determinants of Health**
- Income and social status
- Social support networks
- Education and literacy
- Employment and working conditions
- Social and work environments
- Physical environment
- Personal health practices and coping skills
- Healthy child development
- Biology, genetics, and epigenetics
- Health services
- Gender
- Culture
- Racism

Source: Public Health Agency of Canada www.phac-aspc.gc.ca/ph-sp/determinants/determinants-eng.php

**Ottawa Charter for Health Promotion (1986)**
- Health promotion: the process of enabling people to increase control over and improve their health
- The charter states that governments and health care providers should be involved in a health promotion process that includes:
  1. Building healthy public policy
  2. Creating supportive environments
  3. Strengthening community action
  4. Developing personal skills
  5. Re-orienting health services

- **cultural safety**: "interactions with people from different cultures that treat them respectfully in a manner that acknowledges relevant differences but does not create a sense of discrimination"
- **cultural sensitivity**: "being aware of (and understanding) the characteristic values and perceptions of your own culture and the way in which this may shape your approach to patients from other cultures"

# Vulnerable Populations

**Table 2. Health Determinants of Vulnerable Populations**

| | Definition | Physical | Environment | Personal Risk Factors | Population-Specific Interventions |
|---|---|---|---|---|---|
| **Indigenous Peoples** | Four specific groups: First Nations Status Indians (registered under the *Indian Act*), non-status Indians, Métis, and Inuit | Colonization<br>Systemic racism<br>Low income<br>Family violence<br>Low education status<br>Unemployment<br>Homelessness<br>Longer length of disability | Crowded housing<br>Inefficient ventilation<br>Environmental toxins (botulism)<br>TB declining but prevalence higher than rest of population | Smoking<br>Substance misuse<br>Gambling<br>Poor nutrition<br>Sedentary lifestyle<br>High BMI<br>Higher risk of suicide | Mental health awareness<br>Indigenous-specific DM initiatives<br>Substance abuse treatment programs<br>Cultural continuity |
| **Black Population** | Sub-Saharan African Ancestry, diverse cultures and histories but socially classified as 'Black'<br>3rd largest "visible minority" group in Canada<br>43% Canadian-born | Systemic racism<br>Low income<br><br>The Nova Scotian Black population has been in Canada for centuries; historically displaced into rural settings<br>Newer immigrants tend to live in urban centres | Variable, depending on socioeconomic status and immigrant status/ history in Canada | High BMI<br>Higher risk DM and hypertension<br><br>(poor data quality for identifying disparities in Canada due to lack of collection of race-based data) | Culturally-specific and safe practices<br><br>Anti-Racist approaches to care, policy, programming |
| **Isolated Seniors** | Individuals >65 yr | Elder abuse<br>Lack of emotional support<br>Isolation | Low hazard tolerance<br>Institutionalization<br>Mobility issues | Inactivity<br>Polypharmacy<br>Medical comorbidities | Aging in place of choice<br>Falls and injury prevention<br>Mental health promotion<br>Preventing abuse and neglect |

**Ottawa Charter for Health Promotion (1986)**
- Health promotion: the process of enabling people to increase control over and improve their health
- Some health promotion can be achieved through clinical interactions with patients, but most health promotion is done at the population level by public health professionals and agencies by engaging stakeholders, formilating policy and influencing in upstream factors, the Ottawa Charter is a framework for thinking about health promotion
- The Ottawa charter states that governments and health care providers should be involved in a health promotion process that includes:
  1. Building healthy public policy
  2. Creating supportive environments
  3. Strengthening community action
  4. Developing personal skills
  5. Re-orienting health services

**Table 2. Health Determinants of Vulnerable Populations** (continued)

| | Definition | Physical | Environment | Personal Risk Factors | Population-Specific Interventions |
|---|---|---|---|---|---|
| **Children in Poverty** | Based on Low Income Cut Offs (LICO)<br>LICO is an income threshold below which a family will likely devote a larger share of its income on the necessities of food, shelter, and clothing than the average family | Low income<br>Family dysfunction<br>Lack of educational opportunities | Housing availability<br>Unsafe housing<br>Lack of recreational space | Poor supervision<br>Food insecurity<br>High risk behaviours | Improvements in family income most significant<br>Early childhood education |
| **People with Disabilities** | Includes impairments, activity limitations, and participation restrictions | Low income<br>Low education status<br>Discrimination<br>Stigma | Institutionalization<br>Barriers to access<br>Transportation challenges | Substance misuse<br>Poor nutrition<br>Inactivity<br>Dependency for ADLs | Transportation support<br>Multidisciplinary care<br>Unique support for individuals with specific disabilities (e.g. Trisomy 21) |
| **New Immigrants** | Person born outside of Canada who has been granted the right to live in Canada permanently by immigration authorities | Access to community services<br>Cultural perspectives (including reliance on alternative health practices) | Exposure to diseases and conditions in country of origin (e.g. smoke from wood fires, incidence of TB, etc.) | Employment ESL<br>Healthy Newcomer Effect (health worsens over time to match that of the general population)<br>Cultural or religious expectations | Women's health<br>Mental health<br>Infectious diseases (syphilis blood test, CXR, HIV)<br>Dental and vision screening<br>Vaccinations<br>Cancer screening |
| **Homeless Persons** | An individual who lacks permanent housing | Low income<br>Food insecurity<br>Mental illness | Exposure to temperature extremes<br>Infections such as West Nile Virus | Substance misuse<br>Violence | Safe housing<br>Addictions support<br>Mental health |
| **Refugee Health** | Forced to flee country of origin because of a well-founded fear of persecution and given protection by the Government of Canada<br><br>Refugee claimant: Arrive in Canada and ask to be considered refugee | Post-traumatic stress disorders<br>Depression<br>Adjustment problems<br><br>Partial health coverage via Interim Federal Health Program | Diseases and conditions in country of origin (e.g. malaria, TB, onchocerciasis, etc.)<br>Direct and indirect effects of war | Employment<br>ESL<br>Longstanding prior lack of access to health care (chronically neglected problems)<br>Cultural or religious expectations | Vaccinations<br>Women's health<br>Mental health<br>Infectious diseases<br>Dental and vision screening<br>Political advocacy |

Note: this chart delineates the major challenges faced by each group, but the issues listed are not unique to each population.
Sources: Shah, CP. The Health of Vulnerable Groups. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003.

**New Immigrants to Canada**

- Mandatory medical exams on entry to Canada by a designated medical practitioner
- Complete medical examination for all persons of all ages
- Chest x-ray and report for persons ≥11 yr
- Urinalysis for persons ≥5 yr
- Syphilis serology for persons ≥15 yr
- HIV testing for applicants ≥15 yr, as well as for those children who have received blood or blood products, have a known HIV-positive mother, or have an identified risk. An ELISA HIV screening test should be done for HIV 1 and HIV 2
- Serum creatinine if the applicant has hypertension (resting blood pressure greater than 140/90 mmHg), a history of treated hypertension, DM, autoimmune disorder, persistent proteinuria, or kidney disorder

Citizenship and Immigration Canada Handbook
http://www.cic.gc.ca/english/resources/publications/dmp-handbook/

# Indigenous Health in Canada

## Definitions

- Indigenous peoples represent approximately 4.9% of the total population of Canada in 2016 and speak over 70 Indigenous languages
- 3 broad categories: First Nations (status and non-status), Metis, and Inuit
  - First Nations: includes over 600 diverse communities in Canada; status vs. non-status refers to the registration of First Nations peoples under the *Indian Act* (1876), which was originally established by the government to remove self-governing, residential, and traditional practice rights
  - Metis: descendants of the First Nations and European settlers; nearly 2/3 residing in cities, greatest percentage in Ontario
  - Inuit: roughly 75% of this population of 70,000 resides in the 4 Canadian Regions known as Inuit Nunangat, the Inuit Homeland. These include: Nunavut, Nunavik (N. Quebec) and Nunatsiavut (Labrador), and Inuvialuit (Northwest Territories)

## Young and Growing Populations

- between 2006-2016 the Indigenous populations have increased by 42.5%, 4x that of non-Indigenous Canadian population growth
- 32.1 is the average age of the Indigenous population, about 8 years younger than the non-Indigenous Canadian population
- but the aging Indigenous population is also growing, with anticipated doubling of >65 age group by 2036

## The Impact of Colonialism

- **colonialism**: subjugation of Indigenous peoples by the Europeans, leading to the loss of lands, cultural practices, and self-government
- **residential schools (1870s-1996):** placement of children from Indigenous groups in church-run, government-funded schools for the purpose of assimilation, resulting in loss of identity, alienation, and abuse, with long-lasting consequences of higher rates of addictions, abusive relationships, and suicide

- **Truth and Reconciliation Commission (2015):** mandated document created by the Canadian government and residential school survivors that preserves in writing the truth of residential schools and delineates recommendations for reconciliation. Many TRC recommendations pertain directly to health and healthcare providers
- **treaties and land claims:** inadequate services for those living on reserves leading to poverty and poor quality infrastructure, reflected in disproportionate burden of infectious diseases (e.g. pertussis, chlamydia, hepatitis, shigellosis)

### Traditional Approaches to Healing

- restoring balance in the four realms of spiritual, emotional, mental, and physical health of a person acting as an individual, as well as a member of a family, community, and nation
  - ideas represented by medicine wheel of First Nations peoples, the Learning Blanket of Inuit peoples, and the Metis tree model of Holistic Lifelong Learning
  - contrast to Western medicine focus of treating illness, leading to challenges for practitioners of Western medicine to meet Indigenous patients' needs
  - National Indigenous Health Organization (NIHO) offers 8 guidelines on practicing culturally safe health care for Indigenous patients including the need to allow Indigenous patients to access ceremony, song, and prayer; the need for information and for family support; guidelines for the appropriate disposal of body parts and for handling death

# Disease Prevention

### Natural History of Disease

- course of a disease from onset to resolution
  1. pathological onset
  2. presymptomatic stage: from onset to first appearance of symptoms/signs
  3. clinical manifestation of disease: may regress spontaneously, be subject to remissions and relapses, or progress to death

### Surveillance

- the continuous, systematic collection, analysis and interpretation of health-related data needed for the planning, implementation, and evaluation of public health practice

Sources: World Health Organization. Public Health Surveillance. Accessed from: https://www.who.int/topics/public_health_surveillance/en/. 2019.

- **Types of Surveillance**
  - **passive surveillance**: reporting of disease data by all institutions that see patients, relying solely on the cooperation of health-care providers (laboratories, hospitals, health facilities, and private practitioners)
    - most common, least expensive, but difficult to ensure completeness and timeliness of data
  - **active surveillance**: regular visits to health facilities for reviewing medical records to identify suspected cases of disease under surveillance
    - resource-intensive, used when a disease is targeted for eradication where every possible case must be investigated, or for outbreak investigations
  - **sentinel surveillance**: selective reporting of disease data from a limited network of carefully selected reporting sites with a high probability of seeing cases in question,
    - well-designed system can be used to signal trends, identify outbreaks, and monitor the burden of disease in a community in a timely and cost-effective manner compared to other kinds of surveillance, although may be not as effective in identifying rare diseases, or diseases that occur outside the catchment area of sentinel sites

Sources: World Health Organization. Public Health Surveillance. Accessed from: https://www.who.int/immunization/monitoring_surveillance/burden/vpd/surveillance_type/passive/en/; https://www.who.int/immunization/monitoring_surveillance/burden/vpd/surveillance_type/active/en/; https://www.who.int/immunization/monitoring_surveillance/burden/vpd/surveillance_type/sentinel/en/

### Disease Prevention Strategies

- measures aimed at preventing the occurrence, interrupting through early detection and treatment, or slowing the progression of disease/mitigating the sequelae

**Table 3. Levels of Disease Prevention**

| Level of Prevention | Goal | Examples |
|---|---|---|
| **Primordial** | Preventing the development of risk factors | Education that begins in childhood about behaviour that can harm health<br>Programs that encourage physical activity |
| **Primary** | Protect health and prevent disease onset<br>Reducing exposure to risk factors | Immunization programs (e.g. measles, diphtheria, pertussis, tetanus, polio, see Pediatrics, P4)<br>Smoking cessation<br>Seatbelt use |
| **Secondary** | Early detection of (subclinical) disease to minimize morbidity and mortality | Mammography<br>Routine Pap smears |
| **Tertiary** | Treatment and rehabilitation of disease to prevent progression, permanent disability, and future disease | DM monitoring with HbA1c, eye exams, foot exams<br>Medication |

Basic Concepts in Prevention, Surveillance, and Health Promotion. AFMC Primer on Population Health (http://phprimer.afmc.ca/Part1-TheoryThinkingAboutHealthChapter4BasicConceptsInPreventionSurveillanceAndHealthPromotion/Thestagesofprevention)

**Passive Prevention**
Measures that operate without the person's active involvement (e.g. airbags in cars) are more effective than active prevention, measures that a person must do on their own (e.g. wearing a seatbelt)

**Example of Primary Prevention**
**HPV 9-Valent Vaccine and Its Efficacy in the Prevention of Cervical Cancer**
This is a nonavalent HPV vaccine covering strains 6, 11, 16, 18, 31, 33, 45, 52, and 58. The efficacy of this vaccine was studied in 4 randomized, double-blind, placebo-controlled trials on females between 11 and 26 yr of age and was found to prevent nearly 100% of precancerous cervical changes for up to 4 yr after vaccination

**Does Evidence Support Supervised Injection Sites?**
Can Fam Physician 2017 Nov;63(11):866
**Clinical question**: Do supervised injection sites (SISs) reduce mortality, hospitalizations, ambulance calls, or disease transmission?
**Bottom line**: Best evidence from cohort and modelling studies suggests that SISs are associated with lower overdose mortality (88 fewer overdose deaths per 100,000 person-years [PYs]), 67% fewer ambulance calls for treating overdoses, and a decrease in HIV infections. Effects on hospitalizations are unknown

## Screening (Secondary Prevention)

- "screening is a strategy used in a population to identify the possible presence of an as-yet-undiagnosed disease in individuals without signs or symptoms"
  - screening vs. case finding: screening tests are not diagnostic tests
  - the primary purpose of screening tests is to detect early disease or risk factors for disease in large numbers of apparently healthy individuals. The purpose of a diagnostic test is to establish the presence (or absence) of disease as a basis for treatment decisions in symptomatic or screen positive individuals (confirmatory test). Both screening and case finding seek to risk stratify for further investigation
  - to minimize biases and harms, and maximize benefits, screening is best done at the population level, not the individual clinical level, as part of a screening program (e.g. Provincial breast cancer screening program vs. screening by primary care/family physicians)
- **types of screening**
  - **universal screening**: screening all members of a population for a disease (e.g. phenylketonuria (PKU) and hypothyroidism in all newborns)
  - **selective screening**: screening of targeted subgroups of the population at risk for a disease (e.g. mammography in women >50 yr old)
  - **multiphasic screening**: the use of many measurements and investigations to look for many disease entities (e.g. periodic health exam)
- **types of bias in screening**
  - **lead-time bias**: overestimation of survival time 'from diagnosis' when the estimate is made from the time of screening, instead of the later time when the disease would have been diagnosed without screening
  - **length-time bias**: overestimation of the survival time due to screening at one time point including more stable cases than aggressive cases of disease, who may have shorter survival times

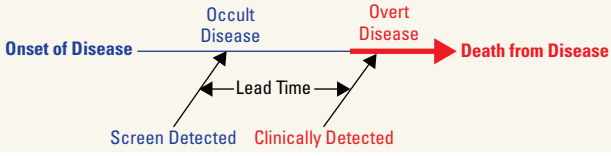

**Figure 2. Lead-time bias**

### Table 4. Ideal Criteria for Screening Tests

| Disease | Test | Health Care System |
|---|---|---|
| Causes significant suffering and/or death<br>Natural history must be understood<br>Must have an asymptomatic stage that can be detected by a test<br>Early detection and intervention must result in improved outcomes | High sensitivity<br>Safe, rapid, easy, relatively inexpensive<br>Acceptable to providers and the population<br>Continuously utilized | Adequate capacity for reporting, follow-up, and treatment of positive screens<br>Cost effective<br>Sustainable program<br>Clear policy guidelines on who to treat |

Adapted from: Shah CP. Public Health and Preventive Medicine in Canada, 5th ed. Toronto: Elsevier, 2003

## Health Promotion Strategies

### Table 5. Disease Prevention vs. Health Promotion Approach

| Disease Prevention | Health Promotion |
|---|---|
| Health = absence of disease | Health = positive and multidimensional concept |
| Medical model (passive role) | Participatory model of health |
| Aimed mainly at high-risk groups in the population | Aimed at the population in its total environment |
| One-shot strategy, aimed at a specific pathology | Diverse and complementary strategies aimed at a network of issues/determinants |
| Directive and persuasive strategies enforced in target groups | Facilitating and enabling approaches by incentives offered to the population |
| Focused mostly on individuals | Focused on a person's health status and environment |
| Led by professional groups from health disciplines | Led by non-professional organizations, civic groups, local, municipal, regional, and national governments |

Source: Shah CP. Public Health and Preventive Medicine in Canada, 5th ed. Toronto: Elsevier, 2003

## Healthy Public Policy

- purpose: to create a supportive environment to enable people to lead healthy lives, thereby making healthy choices easier for citizens
- governments and non-governmental agencies need to consider the cost and acceptability of proposed public health interventions (i.e. more invasive or costly measures should be justified by the extent of beneficial impacts on people's lives)
- the Nuffield Intervention Ladder provides one way of ranking the level of intrusion and hence a need for proportionate benefit of health promotion interventions at a population level

**Electronic Cigarettes for Smoking Cessation**
Cochrane Database of Systematic Reviews 2016;13:9
There is evidence from two trials that ECs help smokers to stop smoking in the long term compared with placebo ECs. However, the small number of trials, low event rates and wide confidence intervals around the estimates mean that our confidence in the result is rated 'low' by GRADE standards. The lack of difference between the effect of ECs compared with nicotine patches found in one trial is uncertain for similar reasons. None of the included studies (short- to mid-term, up to two years) detected serious adverse events considered possibly related to EC use. The most commonly reported adverse effects were irritation of the mouth and throat. The long-term safety of ECs is unknown. In this update, we found a further 15 ongoing RCTs which appear eligible for this review.

**A Snapshot Of The Opioid Crisis In Canada**
Canada is experiencing a crisis of opioid-related overdose and death. The rate of opioid-related death in Ontario nearly tripled between 2000 and 2015, reaching a peak rate of 53.1 deaths per million Ontarians in 2015. Individuals aged 25 to 34 years old are at the greatest risk of overdose death (1 in 6 deaths), but rates have increased for all adult ages. Deaths are most commonly unintentional. Heroin, fentanyl, and hydromorphone are most commonly involved. The highest rates of opioid-related overdose and death are found in British Columbia. An estimated 300 per million British Columbians died in relation to opioid use in 2017. More died from opioids than homicide, motor vehicle accidents, and suicide combined. In 2017, deaths from opioids in Ontario ~1250, deaths from motor vehicle accidents ~450. Fentanyl or a fentanyl analogue was involved in more than 70% of cases, increased from 55% in 2016.
Sources: J Addict Med. Measuring the Burden of Opioid-related Mortality in Ontario, Canada. Latest Trends in Opioid-Related Deaths in Ontario: 1991 to 2015, Toronto: Ontario Drug Policy Research Network. Health Canada. March 2018.

- methods
  - fiscal: imposing additional costs (e.g. taxes on tobacco and alcohol)
  - legislative: implementing legal deterrents (e.g. smoking bans, legal alcohol drinking age)
  - social: improving health beyond providing universally funded health care (e.g. providing affordable housing)

Source: International Conference on Health Promotion, Adelaide, South Australia (1998)

## Behaviour Change

- behaviour is a result of three factors
  1. predisposing factors: knowledge, attitude, beliefs, values, intentions
  2. enabling factors: skills, supports
  3. reinforcing factors: health care professionals and the social context of family and community
- health education serves to: increase knowledge and skills and promote healthy behaviours

## Health Belief Model (1975)

- a psychological model adapted over time to explain and predict individual short- and long-term health behaviours based on one's beliefs and attitudes
- based on the assumption that one will adopt a beneficial health behaviour if 3 beliefs are present:
  - the negative health outcome is avoidable
  - expects that the health outcome can be prevented if the recommended health behaviour is adopted
  - the individual can be successful in adopting the health behaviour
- six concepts:
  - four concepts influencing one's "readiness to act" – perceived susceptibility, perceived severity, perceived benefits, perceived barriers
  - cues to action: stimuli that can trigger health action
  - self-efficacy: confidence in one's ability to take a health action

## Stages of Change Model

- provides a framework in which the Health Belief Model is applied to facilitating behaviour change (e.g. quitting smoking)

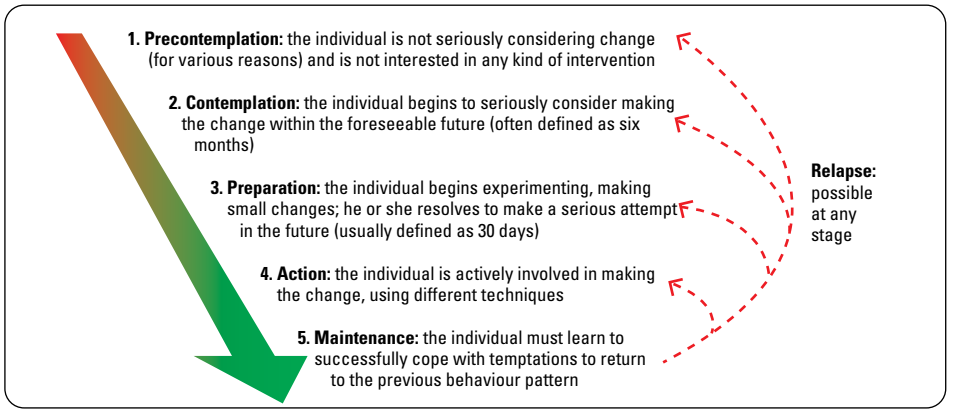

**Figure 3. Stages of change model**

Source: Prochaska JO, DiClemente CC, and Norcross JC. In Search of How People Change. Applications to Addictive Behaviours. Am Psychol 1992;47:1102-1114

## Risk Reduction Strategies

- risk reduction: lower the risk to health without eliminating it (e.g. avoiding sun to lower risk of skin cancer)
- harm reduction: a set of strategies aimed to reduce the negative consequences of drug use and other risky behaviours (e.g. needle exchange programs)

Source: Shah, CP. Concepts, Determinants, and Promotion of Health. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003

## Community Needs Assessment

- a community needs assessment studies a community's health gaps and pairs identification of that community's existing resources and strengths to find solutions to address those gaps. This assessment strongly values interviewing community members to gather their concerns and proposed solutions. Steps include:
  1. define the community and understand its history and demographic characteristics to formulate context for subsequent data collection
  2. understand what matters to community stakeholders, (i.e. interviews, surveys, focus groups)
  3. using evidence (e.g. mortality rate, feasibility), prioritize each concern
  4. identify barriers that may prevent a concern from being addressed and propose solutions using resources available to the community

# Measurements of Health and Disease in a Population

## MEASURES OF DISEASE OCCURRENCE

### Rates, Ratios, and Proportions
- a rate measures the frequency of an event in a defined population over a specific period of time (e.g. number of opioid overdoses in Canada in one year)
- a ratio compares the magnitude of one quantity to another (e.g. ratio of women to with lupus)
- a proportion is a ratio where the numerator is a part of the denominator (e.g. proportion of deliveries complicated by placental abruption)

### Incidence Rate
- number of new cases in a population over a specific period of time

### Prevalence
- total number of cases in a population over a defined period of time
- two forms of prevalence
  - point prevalence: assessed at one point in time
  - period prevalence: assessed over a period of time, therefore including new cases and excluding cases that terminate (cure or death)
- a function of the incidence rate and disease duration from onset to termination
- favours the inclusion of chronic over acute cases and may underestimate disease burden if those with short disease duration are missed
- prevalence estimates are useful for measuring disease burden and therefore help in the planning of facilities and services

### Age Standardized Rate
- adjustment of the crude rate of a health-related event using a "standard" population
- standard population is one with a known number of persons in each age and sex group
- standardization prevents bias which could be made by comparing crude rates from two dissimilar populations (e.g. crude death rates over a number of decades are not comparable as the population age distribution has changed with time)
- this allows for the calculation of a Standardized Mortality Ratio (SMR), where SMR = (observed number of deaths)/(expected number of deaths)

**Top 5 Causes of DALYs in Canada, 2010**
1. Ischemic Heart Disease
2. Low Back Pain
3. Lung Cancer
4. Major Depressive Disorder
5. Other Musculoskeletal

## MEASURES OF MORTALITY

### Life Expectancy
- the expected number of years to be lived by a newborn based on age-specific mortality rates at a selected time

### Crude Death Rate
- mortality from all causes of death per 1000 in the population

### Infant Mortality Rate (IMR)
- number of reported deaths among children <1 yr of age during a given time period divided by the number of reported live births during the same time period and expressed as per 1000 live births per year

### Maternal Mortality Rate (MMR)
- "number of deaths of women during pregnancy and due to puerperal causes […] per 1000 live births in the same year"

**Principles of Standardization**
- When comparing a health measure (e.g. mortality) between two populations (or the same population at different time points) that differ in characteristics known to influence that outcome (e.g. age), standardization is used to control for the effect of that factor
- Standardization is either direct or indirect
- Indirect standardization is expressed as standardized outcome ratio. For example, Standardized Mortality Ratio (SMR) is calculated using age specific rates for a reference population, as well as age structure and total cases for a sample/known population. (e.g. an SMR of 100 signifies that deaths are at the expected level, a SMR of 110 indicates a death rate 10% higher than expected)
- Direct standardization is expressed as a rate (i.e. using age specific rates in a known/sample population against a standard population)

## MEASURES OF DISEASE BURDEN

### Potential Years of Life Lost (PYLL)
- calculated for a population using the difference between the actual age at death and a standard/expected age at death
- increased weighting of mortality at a younger age

### Disability Adjusted Life Year (DALY)
- life expectancy weighted by amount of disability experienced, where 0 = perfect health and 1= death
- both premature death and time spent with disability accounted for; these disabilities can be physical or mental
- used to assess burden of diseases in a population

### Quality Adjusted Life Year (QALY)

- years of life weighted by quality (utility is a proxy for quality), ranging from 0 (= death) to 1 (= perfect health). Weights are assigned based on large studies that assessed the effect of various conditions on quality of life (e.g. blindness = 0.3)
- it is possible to have "states worse than death" for example QALY <0 for extremely serious conditions
- usually used as an economic measure to assess the value for money of medical interventions

For additional rate calculations see *Steps to Control an Outbreak*, PH21
Consult the Public Health Agency of Canada for examples and latest statistics
http://www.phac-aspc.gc.ca/cphorsphc-respcacsp/2008/fr-rc/cphorsphc-respcacsp06b-eng.php

# Epidemiology

### Population

- a defined collection of individuals/regions/institutions/etc. (e.g. individuals defined by geographic region, sex, age)

### Sample

- a selection of individuals from a population
- types
  - random: all members are equally likely to be selected
  - systematic: an algorithm is used to select a subset
  - stratified: population is divided into subgroups that are each sampled
  - cluster: grouped in space/time to reduce costs
  - convenience: non-random inclusion, for populations that are difficult to reach (e.g. people with precarious living conditions)

**SPIN**: use a **SP**ecific test to rule **IN** a hypothesis. Note that specific tests have very few false positives. If you get a positive test, it is likely a true positive
**SNOUT**: use a **SEN**sitive test to rule **OUT** a hypothesis. Note that sensitive tests have very few false negatives. If you get a negative test, it is likely a true negative

### Sample Size

- increasing the sample size increases the statistical precision of the observed estimate, resulting in more narrow confidence intervals
- increasing the sample size decreases the probability of type I and type II errors
- increasing sample size does not alter the risk of bias/confounding

### Bias

- systematic error leading to an incorrect estimate of the true association between exposure and outcome
- can occur at several points in study execution (e.g. collection, analysis, interpretation, publication, or review of data)
  - **selection bias**: a systematic error in the recruitment or retention of study participants
- **Berkson's bias** occurs in a case-control study using hospitalized controls, as they may not be a representative sample of the population due to the complexity that led to their hospital admission
- **non-response bias** occurs when participants differ from non-participants in a study, in that those who volunteer may be more healthy
- **loss to follow-up bias** occurs when dropout rates differ between study groups and patients who dropped out are different from those who did not
  - information bias: the way in which information is collected about study participants is inadequate
- **recall bias** occurs when individuals with disease may be more likely to incorrectly recall/believe they were exposed to a possible risk factor than those who are free of disease
- **interviewer bias** occurs when interviewers are unblinded to outcome status and this knowledge biases their behaviour
  - outcome identification bias
- **observer bias** occurs when knowledge of exposure status (e.g., race, gender) biases the observer towards a diagnosis; this occurs more commonly with subjective diagnoses like those found in psychiatry

### Confounder

- a variable that is related to both the exposure and outcome but is not a mediator in the exposure-outcome relationship
- distorts the estimated effect of an exposure if not accounted for in the study design/analysis (e.g. late maternal age could be a confounder in an investigation of birth order >4 and risk of developing Trisomy 21)
- randomization, stratification, matching, and regression modelling can help minimize confounding effects

Source: The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health

# Interpreting Test Results

TP = True positive TN = True negative FP = False positive FN = False negative

| | | Disease | |
|---|---|---|---|
| | | Present | Negative |
| Test Result | Positive | TP | FP |
| | Negative | FN | TN |

Sensitivity = TP/(TP+FN)
Specificity = TN/(TN+FP)

**Likelihood Ratio (LR)**
- Likelihood that a given test result would be expected in a patient with disease compared with the likelihood that the same result would be expected in a patient without disease
- LR+ indicates how much the probability of disease increases if the test is positive
- LR- indicates how much the probability of disease decreases if the test is negative

$$\textbf{LR+} = \frac{\text{Sensitivity}}{1 - \text{Specificity}} = \frac{[TP/(TP+FN)]}{[FP/(TN+FP)]} \qquad \textbf{LR–} = \frac{1 - \text{Sensitivity}}{\text{Specificity}} = \frac{[FN/(TP+FN)]}{[TN/(TN+FP)]}$$

**Positive Predictive Value (PPV)**
- Proportion of people with a positive test who have the disease

$$\textbf{PPV} = \frac{TP}{TP + FP}$$

**Negative Predictive Value (NPV)**
- Proportion of people with a negative test who are free of disease

$$\textbf{NPV} = \frac{TN}{TN + FN}$$

| | | Advanced Neoplasia | |
|---|---|---|---|
| | | Present | Negative |
| Test Result | Positive | 68 | 147 |
| | Negative | 216 | 2234 |
| | Total | 284 | 2381 |

**Sensitivity** = 68/284 = 23.9%
**Specificity** = 2234/2381 = 93.8%

$$\textbf{LR+} = \frac{0.239}{1 - 0.938} = 3.85$$

$$\textbf{LR–} = \frac{1 - 0.239}{0.938} = 0.81$$

$$\textbf{PPV} = \frac{68}{(68+147)} = 31.6\%$$

$$\textbf{NPV} = \frac{2234}{(2234+216)} = 91.2\%$$

**Figure 4. Interpreting test results: Practical example using FOBT testing in advanced colon cancer**
Source: Numbers from Collins J, Lieberman D, Durbin T, et al. Accuracy of screening for fecal occult blood on a single stool sample obtained by digital rectal examination: a comparison with recommended sampling practice. Ann Intern Med 2005;142:81-85

## Sensitivity
- proportion of people with disease who have a positive test

## Specificity
- proportion of people without disease who have a negative test

## Pre-Test Probability
- the probability a particular patient has a given disease before a test/assessment results are known

## Post-Test Probability
- a revision of the probability of disease after a patient has been interviewed/examined/tested
- calculation process can be explicit using results from epidemiologic studies, knowledge of the accuracy of tests, and a nomogram/Bayes' theorem
- the post-test probability from clinical examination is the basis of consideration when ordering diagnostic tests or imaging studies
  - after each iteration the resultant post-test probability becomes the pre-test probability when considering new investigations

**Figure 5. Understanding sensitivity and specificity**

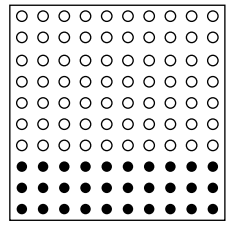

**Figure 5a. Hypothetical population**

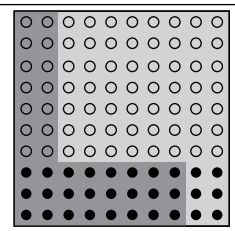

**Figure 5b. Results of diagnostic test on hypothetical population**

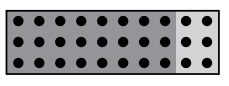

**Figure 5c. Sensitivity of test (e.g. 24/30 = 80% sensitive)**

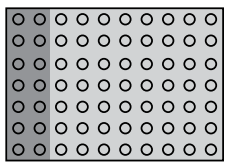

**Figure 5d. Specificity of test (e.g. 56/70 = 80% specific)**

Source: Loong TW. Understanding sensitivity and specificity with the right side of the brain *BMJ* 2003;327:716-719

Sensitivity and specificity are characteristics of the test
LR depends on the test characteristics, not the prevalence
PPV and NPV depend on the prevalence of the disease in the population

# Effectiveness of Interventions

## Effectiveness, Efficacy, Efficiency

- three measurements indicating the relative value (beneficial effects vs. harmful effects) of an intervention
  - efficacy: the extent to which a specific intervention produces a beneficial result under ideal conditions (e.g. RCT)
- ideal conditions include adherence, close monitoring, access to health resources, etc.
  - effectiveness: measures the benefit of an intervention under usual conditions of clinical care
- considers both the efficacy of an intervention and its actual impact on the real world, taking into account access to the intervention, whether it is offered to those who can benefit from it, its proper administration, acceptance of intervention, and degree of adherence to intervention
  - efficiency: a measure of economy of an intervention with known effectiveness
- considers the optimal use of resources (e.g. money, time, personnel, equipment, etc.)

**Disease** (e.g. lung cancer)

| **Exposure** (e.g. smoking) | **Present** | **Absent** | **Total** |
|---|---|---|---|
| **Present** | A | B | A + B |
| **Absent** | C | D | C + D |
| **Total** | A + C | B + D | A + B + C + D |

**Case-Control Study**

$$\text{odds ratio (OR)}^* = \frac{A}{C} \div \frac{B}{D} = \frac{A \times D}{B \times C}$$

**Cohort Study**

$\frac{A}{A+B}$ = incidence rate of health outcome in exposed $\frac{C}{C+D}$ = incidence rate of health outcome in non-exposed

$$\text{relative risk (RR)}^{**} = \frac{A}{A+B} \div \frac{C}{C+D} \qquad \text{attributable risk (AR)}^{***} = \frac{A}{A+B} - \frac{C}{C+D}$$

*Ratio of the odds in favour of the health outcome among the exposed to the odds in favour among the unexposed
**Ratio of the risk of a health outcome among exposed to the risk among the unexposed
***Rate of health outcome in exposed individuals that can be attributed to the exposure

**Figure 7. Measures of effect by study type**

## Number Needed to Treat (NNT)

- number of patients who need to be treated to achieve one additional favourable outcome
- only one of many factors that should be taken into account in clinical or health system decision making (e.g. must take into account cost, ease, feasibility of intervention)
  - a condition with death as a potential outcome can have a higher NNT (and be acceptable), as compared to an intervention to prevent an outcome with low morbidity, in which a low NNT would be necessary

## Number Needed to Harm (NNH)

- number of patients who, if they received the experimental treatment, would lead to one additional patient being harmed, compared with patients who received the control treatment

## Adherence (formerly compliance)

- degree to which a patient's behaviour and lifestyle concords with the recommendations of healthcare providers (e.g. the extent to which a patient takes medications as directed)

## Coverage

- extent to which the services rendered cover the potential need for these services in a community

The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health

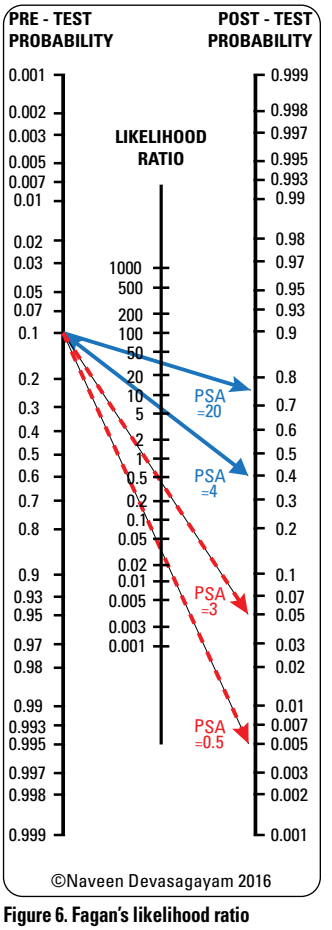

**Figure 6. Fagan's likelihood ratio nomogram: Practical example using PSA levels to calculate post-test probability of prostate cancer**

Source: Modified from Holmstrom B, Johansson M, Bergh A, et al. Prostate specific antigen for early detection of prostate cancer: longitudinal study. *BMJ* 2009;339:b3537

**Equations to Assess Effectiveness**
CER = control group event rate
EER = experimental group event rate
RR = EER/CER
ARR = CER – EER
NNT = 1/ARR

**Beware**
Do not be swayed by a large RR or odds ratio, as it may appear to be large if event rate is small to begin with. In these cases AR is more important (e.g. a drug which lowers an event which occurs in 0.1% of a population to 0.05% can boast a RR of 50%, and yet the AR is only 0.05%, which is not nearly as impressive)

**NNT**
Consult http://www.thennt.com for quick summaries of evidence-based medicine (includes NNT, LR, and risk assessments)

# Types of Study Design

## Qualitative vs. Quantitative

**Table 6. Qualitative vs. Quantitative Study Designs**

| Qualitative | Quantitative |
|---|---|
| Often used to generate hypothesis (Why? What does it mean?) | Often tests hypothesis (What? How much/many?) |
| "Bottom up" approach | "Top down" approach |
| Observation → pattern → tentative hypothesis → theory | Theory → hypothesis → observation → confirmation |
| Sampling approach to obtain representative coverage of ideas, concepts, or experiences | Sampling approach to obtain representative coverage of people in the population |
| Narrative: rich, contextual, and detailed information from a small number of participants | Numeric: frequency, severity, and associations from a large number of participants |

Source: Adapted from http://phprimer.afmc.ca
Source: The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health

### Quantitative Research Methods

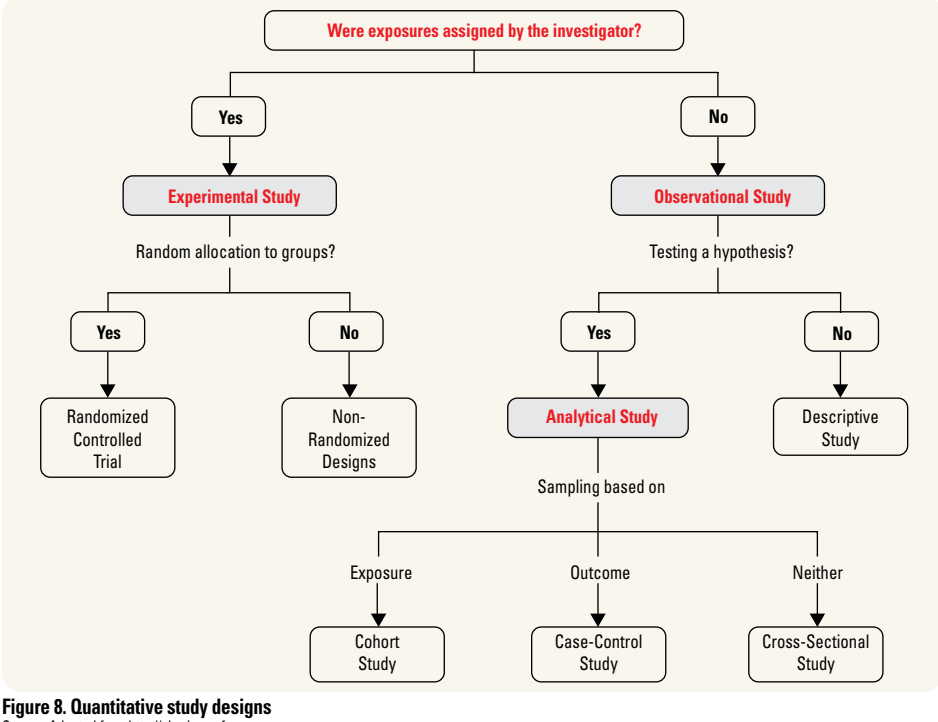

**Figure 8. Quantitative study designs**
Source: Adapted from http://phprimer.afmc.ca

**Formulating a Research Question**

**PICO**
**P**opulation/**P**atient Characteristics
**I**ntervention/Exposure of Interest
**C**omparison Group or Control Group
**O**utcome that you are trying to prevent or achieve

## Observational Study Designs

- observational studies involve neither the manipulation of the exposure of interest nor randomization of the study participants
- there are two main subtypes of observational studies: descriptive and analytic studies

### Descriptive Studies

- describe the events and rates of disease with respect to person, place, and time; estimates disease frequency and time trends
- can be used to generate an etiologic hypothesis and for policy planning

### Analytic Studies

- observational studies used to test a specific hypothesis
- includes ecological studies, cohort studies, case-control studies, and cross-sectional studies

An ecological fallacy is an erroneous conclusion made when extrapolating population level data to explain phenomena occurring in individuals. An example of an ecological fallacy would be concluding that red wine drinking leads to lower risk of death from CVS disease based on an ecological study showing that countries with a higher rate of red wine consumption have a lower rate of death from CVS causes

**Table 7. Observational Study Designs**

| Type of Study | Ecological | Cross-Sectional | Case-Control | Cohort |
|---|---|---|---|---|
| **Definition** | Units of analysis are populations or groups of people, rather than individuals | Use individual data on exposures and outcomes gathered at the same time | Samples a group of people who already have a particular outcome (cases) and compares them to a similar sample group without that outcome (controls) | Subjects are sampled and, as a group, classified on the basis of presence or absence of exposure to a particular risk factor |
| **Subjects** | Aggregated groups (e.g. cities) | Sample of a population | Two or more samples of individuals with and without the outcome(s) of interest (i.e. cases and controls) | One or more cohorts<br>Cohort: group of people with common characteristics (e.g. year of birth, region of residence)<br>Divided into measured exposed vs. non-exposed groups |
| **Methods** | Descriptions of the average exposure or risk of disease for a population<br>Can use regression models to test associations between area-level predictors and aggregate outcomes | Collect information from each person at one particular time<br>Tabulate the numbers in groups (e.g. by presence or absence of disease/factor of interest)<br>Make tables and compare groups<br>Estimate prevalence<br>Use regression models to test associations between predictors and outcomes of interest | Select sample of cases of a specific disease during a specific time frame<br>Representative of spectrum of clinical disease<br>Select control(s)<br>Represent the general population<br>To minimize risk of bias, may select more than one control group and/or match controls to cases (e.g. age, gender)<br>Assess past exposures (e.g. EMR, questionnaire)<br>Association can be concluded between the risk factor and the disease (odds ratio) | Collect information on factors from all persons at the beginning of the study<br>Subjects are followed for a specific period of time to determine development of disease in each exposure group<br>Prospective: measuring from the exposure at present to the future outcomes<br>Retrospective: measuring forward in time from exposures in the past to later outcomes<br>Use statistical models to test associations between exposures and disease or other measured outcomes<br>Provides estimates of incidence, relative risk, attributable risk |
| **Advantages** | Quick, easy to do<br>Uses readily available data<br>Generates hypothesis | Determines association between variables<br>Quick and uses fewer resources<br>Surveys with validated questions allows comparison between studies | Often used when disease in population is rare (less than 10% of population) due to increased efficiency or when time to develop disease is long<br>Less costly and time consuming | Shows an association between risk factor(s) and outcome(s)<br>Stronger evidence for causation<br>Can consider a variety of exposures and outcomes |
| **Disadvantages** | Poor generalizability to individual level (not direct assessment of causal relationship)<br>Ecological fallacy: an incorrect inference from groups to individuals<br>Confounding | Does not allow for assessment of temporal relationship or offer strong evidence for causation between variables<br>Confounding<br>Selection bias<br>Recall bias<br>(see *Bias*, PH10) | Recall bias<br>(see *Bias*, PH10)<br>Confounding<br>Selection bias for cases and controls<br>Only one outcome can be measured | Confounding may occur due to individuals self-selecting the exposure, or unknown/unmeasured factors are associated with the measured exposure and outcome<br>Cost and duration of time needed to follow cohort<br>Selection bias |
| **Examples** | A study looking at the association between smoking rates and lung cancer rates in different countries at the population level without individual data on both factors | A study that examines the distribution of BMI by age in Ontario at a particular point in time | A famous case control study published by Sir Richard Doll demonstrated the link between tobacco smoking exposure and lung cancer cases at the individual level | A famous cohort study is the Framingham Heart Study, which assessed the long-term cardiovascular risks of diet, exercise, medications such as ASA, etc. |

# Experimental Study Designs

- not discussed here are non-randomized control trials (e.g. allocation by clinic or other non-random basis – performed when randomization is not possible)

## RANDOMIZED CONTROLLED TRIAL (RCT)

### Definition
- participants are assigned by random allocation to two or more groups, one of which is the control group, the other group(s) receive(s) an intervention

### Participants
- individuals are selected using explicit inclusion/exclusion criteria and recruitment targets are guided by sample size calculations

### Methods
- random allocation of individuals into two or more treatment groups through a centralized concealed process
- method of assessment to reduce bias
  - single-blind: participant does not know group assignment (intervention or placebo)
  - double-blind: participant and observer both unaware of group assignment
  - triple-blind: participant, observer, and analyst unaware of group assignment
- control group receives standard of care or placebo if no standard of care exists
- one or more groups receive(s) the intervention(s) under study
- baseline covariates and outcome(s) are measured and the groups are compared
- all other conditions are kept the same between groups

### Advantages
- "gold standard" of studies, upon which the practice of EBM is founded
- provides the strongest evidence for effectiveness of intervention
- threats to validity are minimized with sufficient sample size and appropriate randomization
- randomization is one of few methods that can eliminate confounding (including unmeasured confounders) and self-selection bias
- allows prospective assessment of the effects of intervention

### Disadvantages
- some exposures are not amenable to randomization (e.g. cannot randomize participants to poverty/wealth or to harmful exposures such as smoking) due to ethical or feasibility concerns
- can be difficult to randomly allocate groups (e.g. communities, neighbourhoods)
- difficult to study rare events, since RCTs would require extremely large sample sizes
- contamination, co-intervention, and loss to follow-up can all limit causal inferences
- can have poor generalizability (e.g. when trial participants are healthier than the average patient population)
- costly

Sources: Shah, CP. Measurement and Investigation. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003
The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health

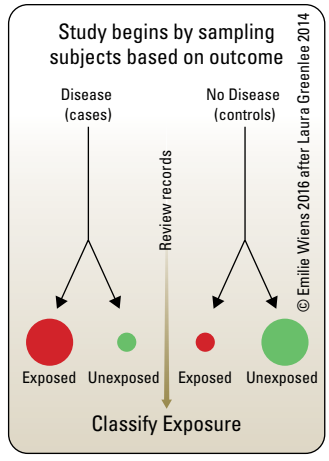

**Figure 9. Case-control study**
Adapted from http://phprimer.afmc.ca

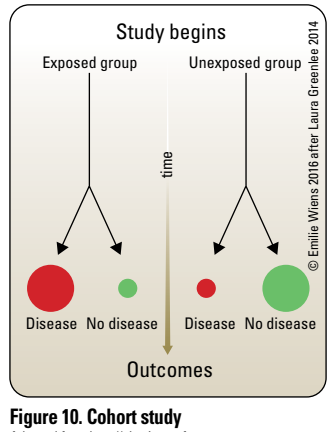

**Figure 10. Cohort study**
Adapted from http://phprimer.afmc.ca

**Analysis**
**Per-Protocol Analysis (PP)**
Strategy of analysis in which only patients who complete the entire study are counted towards the results

**Intention-to-Treat Analysis (ITT)**
When groups are analyzed exactly as they existed upon randomization (i.e. using data from all patients, including those who did not complete the study)

An example of an RCT is the SPARCL trial, which demonstrated intense lipid-lowering with atorvastatin reduces the risk of cerebro- and cardiovascular events in patients with and without carotid stenosis when compared to placebo

An example of a meta-analysis is one that compares the effects of ACE inhibitors, CCBs, and other antihypertensive agents on mortality and major cardiovascular events by compiling and analyzing data from a full set of reported RCTs

# Summary Study Designs

## META-ANALYSIS

### Definition
- a form of statistical analysis that aggregates all relevant studies addressing the same research question in order to increase statistical precision

### Participants
- all the studies identified through a systematic literature review

### Methods
- selection of relevant studies from the published literature which meet quality criteria
- statistical models used to combine the results of each independent study
- provides a summary statistic of overall results as well as graphic representation of included studies (forest plot)

### Advantages
- attempts to overcome the problem of reduced power due to small sample sizes of individual studies
- can address questions (e.g. subgroup analyses) that the original studies were not powered to answer

### Disadvantages
- studies may be heterogenous and therefore inappropriate to combine (e.g. different patient populations, exposure classification/measurement, outcome assessment)
- reliance on published studies may increase the potential conclusion of an effect as it can be difficult to publish studies that show no significant results (publication bias)

Sources: Shah, CP. Measurement and Investigation. Public Health and Preventive Medicine in Canada, 5e. Toronto: Elsevier, 2003
The Association of Faculties of Medicine of Canada Public Health Educators' Network. Assessing Evidence and Information. AFMC Primer on Population Health

# Methods of Analysis

## Distributions

- a distribution describes the frequency at which each value (or category) occurs in a study population
- distributions can take characteristic shapes. i.e., normal (Gaussian) or non-normal (binomial, gamma, skewed, etc.)
- characteristics of the normal distribution
  - mean = median = mode
  - 67% of observations fall within one standard deviation of the mean
  - 95% of observations fall within two standard deviations of the mean
- measures of central tendency
  - **mean**: sum of each observation's data (e.g. ages) divided by total number of observations
  - **median**: value of the 50th percentile; a better reflection of the central tendency for a skewed distribution
  - **mode**: most frequently observed value in a series
- measures of dispersion
  - **range**: the largest value minus the smallest value
  - **variance**: a measure of the spread of data
  - **standard deviation**: the average distance of data points from the mean (the positive square root of variance)
- given the mean and standard deviation of a normal or binomial distribution curve, a description of the entire distribution of data is obtained

## Data Analysis

### Statistical Hypotheses

- null (Ho)
  - the default hypothesis; often states there is no relationship between two variables
- alternative (H1)
  - the hypothesis that we are interested in; often states there is a relationship between two variables
  - we can find evidence against Ho but we can never 'prove' H1

### Type I Error (α Error)

- the null hypothesis is falsely rejected (i.e. concluding an intervention X is effective when it is not, or declaring an observed difference to be real rather than by chance)
- the probability of this error is denoted by the p-value
- studies tend to be designed to minimize this type of error, since a type I error can have larger clinical significance than a type II error

### Type II Error (β Error)

- the null hypothesis is falsely accepted (i.e. stating intervention X is not effective when it is, or declaring an observed difference/effect to have occurred by chance when it is present)
- by convention a higher level of error is often accepted for most studies
- can also be used to calculate statistical power

### Power

- probability of correctly rejecting a null hypothesis when it is in fact false (i.e. the probability of finding a specified difference to be statistically significant at a given p-value)
- power increases with an increase in sample size
- power = 1 – β, and is therefore equal to the probability of a true positive result

### Statistical Significance

- the probability that the statistical association found between variables is due to random chance alone (i.e. there is no association)
- the preset probability is set sufficiently low that one would act on the result; frequently $p<0.05$
- when statistical tests result in a probability less than the preset limit, the results are said to be statistically significant (denoted by the α-value)

### Clinical Significance

- measure of clinical usefulness (e.g. 1 mmHg BP reduction may be statistically significant, but may not be clinically significant)
- depends on factors such as cost, availability, patient adherence, and side effects in addition to statistical significance

### Confidence Interval (CI)

- provides a range of values within which the true population result (e.g. the mean) lies, bounded by the upper and lower confidence limits
- frequently reported as 95% CI (i.e. if this study were repeated 100 times, estimates would fall within the 95% CI 95 out of 100 times)

Consult the Cochrane Library of Systematic Reviews (http://www.cochranelibrary.com) for high-quality systematic reviews and meta-analyses

**Example Calculation**
Data set: 17, 14, 17, 10, 7
Mean = (17 + 14 + 17 + 10 + 7) ÷ 5 = 13
Median (write the list in order, median is the number in the middle)
= 7, 10, 14, 17, 17 = 14
Mode (number repeated more often) = 17
Range = 17- 7 = 10
Variance = $[(17-13)^2 + (14-13)^2 + (17-13)^2 + (10-13)^2 + (7-13)^2] \div 5 = 19.5$
Standard Deviation = √variance = √19.5 = 4.42

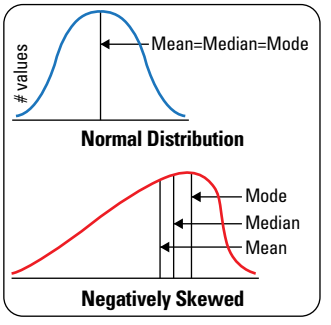

**Figure 11. Distribution curves**

**Type I (α) Error**
"**T**here **I**s **A**n **E**ffect" where in reality there is none

A wider confidence interval implies more variance than a tighter confidence interval given the same critical value

### Data
- information collected from a sample of a population
- there are 4 overall levels of measurement for quantitative data
  - categorical (e.g. blood type, marital status)
  - ordinal (e.g. low, medium, high)
  - interval (e.g. °C, time of day)
  - ratio (e.g. serum cholesterol, hemoglobin, age)

### Validity/Accuracy (of a measurement tool)
- how closely a measurement reflects the entity it claims to measure

### Reliability/Precision
- how consistent multiple measurements are when the underlying subject of measurement has not changed
- may be assessed by different observers at the same time (inter-rater reliability) or by the same observer under different conditions (test-retest reliability)

### Internal Validity
- degree to which the findings of the sample truly represent the findings in the study population
- dependent on the reliability, accuracy, and absence of other biases

### External Validity (i.e. Generalizability)
- degree to which the results of the study can be generalized to other situations or populations

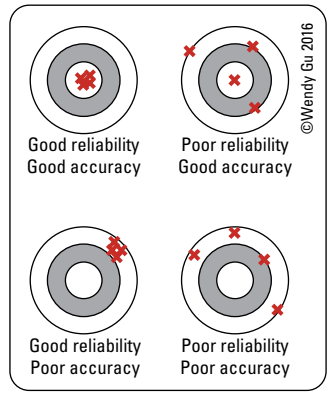

**Figure 12. Validity vs. reliability**

## Common Statistical Tests

**Table 8. Statistical Tests**

| | Two-sample Z-Test | Analysis of Variance (ANOVA) | Chi-Squared Test ($\chi^2$) | Linear Regression | Logistic Regression | Pearson product-moment correlation (Pearson's r) |
|---|---|---|---|---|---|---|
| **What are you trying to show?** | | | | | | |
| | Compare the mean values of an outcome variable between two groups (e.g. difference in average BP between men and women) | Compare the mean values of an outcome variable between two or more groups (e.g. difference in average BP between persons in three towns) | Test the correspondence between a theoretical frequency distribution and an observed frequency distribution (e.g. if one sample of 20 patients is 30% hypertensive and another comparison group of 25 patients is 60% hypertensive, a chi-squared test determines if this variation is more than expected due to chance alone) | Looks at associations between two or more variables (e.g. age and blood pressure) | Shows how a change in one explanatory variable affects the status (e.g. ill vs. non-ill) of the outcome variable | Assesses the strength of the linear relationship between two variables. Ranges from -1 (negative association, i.e. increases in one variable are associated with decreases in another) to 1 (positive association, increases in one variable are associated with increases in the other). A correlation of 0 indicates no relationship |
| **What kind of variables do you measure?** | | | | | | |
| **Dependent Variable** | Continuous data | Continuous data | Categorical (2 or more)/ordinal | Continuous | Categorical (outcomes usually dichotomous) | Continuous |
| **Independent Variable** | Dichotomous | Categorical/ Ordinal (2 or more) | Categorical/Ordinal (2 or more) | Continuous/ Ordinal/ Categorical | Continuous/ Ordinal/ Categorical | Continuous |
| **Assumptions** | Data follow a normal/t-distribution<br>Equal variances<br>Data are independent | "Normal" distribution of dependent variable's error term<br>Data are independent | Expected counts must be at least 5 for all cells in n by n table<br>Data are independent | Dependent variable's error term has "normal" distribution<br>Linear relationship between variables<br>Homoskedasticity<br>No influential values<br>Data are independent | Linearity (on logit scale)<br>No influential values<br>Model has adequate goodness-of-fit<br>Data are independent | Underlying relationship is linear<br>Data for both variables are normally distributed<br>Data are independent |

**What's the difference between Pearson and Spearman correlation?**
Different types of correlation are used for different levels of measurement. Pearson is for continuous and Normal data, Spearman is for ordinal or non-Normal data. There are other forms of correlation for other levels of measurement (e.g. Tetrachoric/polychoric)

# Causation

### Criteria for Causation (Bradford Hill Criteria)

1. **strength of association**: the frequency with which the factor is found in the disease, and the frequency with which it occurs in the absence of disease
2. **consistency**: is the same relationship seen with different populations or study design?
3. **specificity**: is the association particular to your intervention and measured outcome?
4. **temporal relationship**: did the exposure occur before the onset of the disease?
5. **biological gradient**: finding a dose response relationship between the exposure-outcome
6. **biological plausibility**: does the association/causation make biological sense?
7. **coherence**: can the relationship be explained/accounted for based on what we know about science, logic, etc.?
8. **experimental evidence**: does experimental evidence support the association (e.g. is there improvement?)
9. **analogy**: do other established associations provide a model for this type of the relationship?

**Note**: Not all criteria must be fulfilled to establish scientific causation, and the modern practice of EBM emphasizes 'experimental evidence' as superior to other criteria for experimental causation review. However, many causation questions in health cannot be answered with experimental methods.

Source: Bradford Hill A. The environment and disease: association or causation. Proc R Soc Med 1965; 58(5): 295-300.

# Assessing Evidence

- critical appraisal is the process of systematically examining research evidence to assess validity, results, and relevance before using it to inform a decision

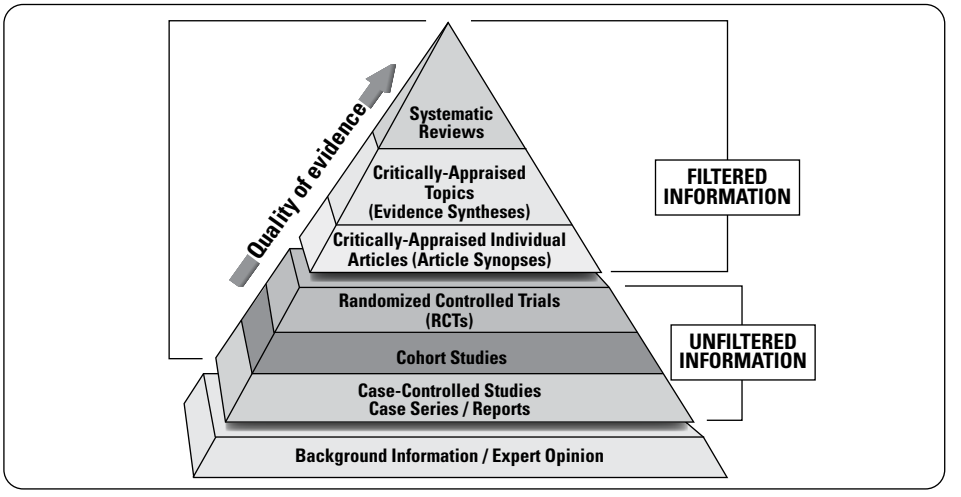

**Figure 13. Pyramid of pre-appraised evidence**

© Copyright 2006. Trustees of Dartmouth College & Yale University. All rights reserved. Produced by Glover J., Izzo D., Odato K., and Wang L

**A. Are the results of the study valid?**

- see below for classifications of evidence that has already been assessed; see sidebar for assessing primary studies

**B. What are the results?**

- what was the impact of the treatment effect?
- how precise was the estimate of treatment effect?
- what were the confidence intervals and power of the study?

**C. Will the results help me in caring for my patients?**

- are the results clinically significant?
- can I apply the results to my patient population?
- were all clinically important outcomes considered?
- are the likely treatment benefits worth the potential harm and costs?

**Levels of Evidence: Classifications Cited in Guidelines/Consensus Statements**

Level I evidence: based on RCTs (or meta-analysis of RCTs) big enough to have low risk of incorporating FP or FN results

Level II evidence: based on RCTs too small to provide Level I evidence; may show positive trends that are non-significant, or have a high risk of FN results

Level III evidence: based on non-randomized, controlled or cohort studies; case series; case-controlled; or cross-sectional studies

Level IV evidence: based on opinion of respected authorities or expert committees, as published consensus conferences/guidelines

Level V evidence: opinions of the individuals who have written/reviewed the guidelines (i.e. Level IV evidence), based on experience/knowledge of literature/peer discussion

Notes: These 5 levels of evidence are not direct evaluations of evidence quality or credibility; they reflect the nature of the evidence. While RCTs tend to be most credible (with <III), level III evidence gains credibility when multiple studies from different locations and/or time periods report consistent findings. Level IV and V evidence reflects decision-making that is necessary but in the absence of published evidence.

**Figure 14. Levels of evidence classifications**
Note: This is only one method of classifying evidence. Various systems exist, but operate within the same premise that certain types of evidence carry more weight than others

# Health System Planning and Quality

## Continuous Quality Improvement

### Quality Improvement (QI)
- a means of evaluating and improving processes; focusing more on systems and systematic biases, which are thought to cause variation in quality
- measures to increase efficiency of action with the purpose of achieving optimal quality

### Quality Assurance
- process to guarantee the quality of health care through improvement and attainment of set standards
- **"five-stage process of quality assurance"** (Public Health and Preventative Medicine in Canada, Shah)
  1. formulation of working goals
  2. procedural changes to implement those goals
  3. regular comparison of current performance with original goals
  4. development of solutions to bring performance closer to goals
  5. documentation of quality assurance activities

### Quality Control
- a process of surveying the quality of all factors involved in the process to maintain standards

### Continuous Quality Improvement
- the process of ongoing service/product refinement via the vigilant review of expectant issues detrimental to the system and regular incorporation of improvements

### Quality Management
- combination of several processes (assurance, control, improvement) to maintain consistent quality

### Total Quality Management
- management principle for advancing quality while minimizing additional expenditures
- focuses on the entire system rather than discrete elements

### Audit
- methodical analysis of a quality system by quality auditors
- to determine whether quality processes and results comply with goals, and whether processes have been implemented effectively

### Systems Analyses Tools
1. **5 Whys**: brainstorming to simplify the process of change; continue asking 'why' until the root of the problem is discovered
2. **Ishikawa Diagrams** (i.e. Fishbone Diagrams): identify generic categories of problems that have an overall contribution on the effect
3. **Defect check sheets**: consider all defects and tally up the number of times the defect occurs
4. **Pareto Chart**: x vs. y chart; x-axis = defect categories, y-axis = frequency; plot cumulative frequency on the right y-axis; purpose is to highlight most important among large set of factors contributing to defects/poor quality

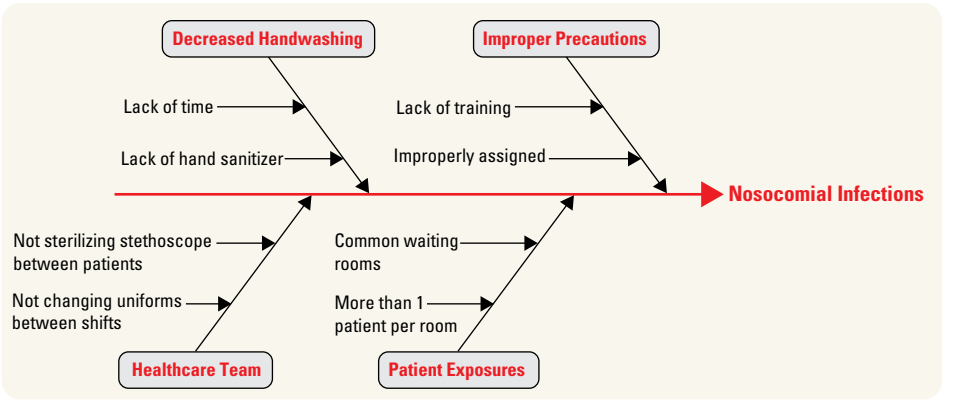

**Figure 15. Ishikawa diagram**

### Precede-Proceed Model
- tool for designing, implementing, and evaluating health interventions/programs

**Table 9. Precede-Proceed Model**

| PRECEDE Phase | PROCEED Phase |
|---|---|
| Phase 1 – Identify the ultimate desired result | Phase 5 – Implementation (design and conduct the intervention) |
| Phase 2 – Identify health issues and their behavioural and environmental determinants. Set priorities among them | Phase 6 – Process Evaluation (determine if the program is implemented as planned) |
| Phase 3 – Identify the predisposing, enabling, and reinforcing factors that affect the behaviours and environmental determinants | Phase 7 – Impact Evaluation (measure intermediate effects on the target population) |
| Phase 4 – Identify the administrative and policy factors that influence what can be implemented | Phase 8 – Outcome Evaluation (determine whether the original desired result was achieved) |

### Planning Cycles/Models
1. **APIE Planning Model**: *Assessment, Planning, Implementation, Evaluation*
2. **PDSA Planning Cycle**: *Plan, Do, Study, Act*

## Cost Analysis

### Cost Benefit Analysis (CBA)
- an analysis which compares the total expected costs with the total expected benefits of actions in order to choose the most profitable or beneficial options
- costs are controlled for inflation and market changes so that the effect of the change is evaluated over a consistent, preset financial value

### Cost Effectiveness Analysis (CEA)
- ratio of the change in cost (numerator) to change in effect (denominator) in response to a new strategy or practice
  - the numerator highlights the cost of the health gain
  - some examples of changes in effect (denominator) could be years of life gained or sight-years gained
  - the most commonly used outcome measure is quality-adjusted life years (QALY) (see *Quality Adjusted Life Year*, PH10)
- can be used where an extensive cost benefit analysis is not applicable or appropriate

# Managing Disease Outbreaks

## Definitions

### Outbreak
- incidence of new cases beyond the usual frequency of disease in a population or community in a given time

### Endemic
- consistent existence of infectious agent or disease in a given population or area (i.e. usual rate of disease)

### Epidemic
- an increase, often sudden, in cases of a disease above what is usually expected in a particular population (e.g. SARS epidemic)
- can occur due to a recent increase in the virulence or amount of an agent, introduction of a new agent to an area, enhanced mode of transmission of the agent, altered host response, and/or increased host susceptibility through more exposure or portals of entry

### Pandemic
- epidemic that has spread across international or intercontinental boundaries, affecting a large number of people

### Attack Rate
- proportion of an initially disease-free population that develops the disease over a specified time period
- = [(# of new cases of disease) / (initial population size)] * 100%

### Secondary Attack Rate
- the proportion of individuals who develop disease as a result of exposure to primary contacts during the incubation period
- = [(total # of cases - initial # of cases) / (# of susceptible individuals - initial # of cases)] * 100%
- measure of infectiousness, which reflects the ease of disease transmission

### Virulence
- measure of an infectious agent to cause significant sickness
- = (# of cases that are severely ill or died) / (total # of cases)

### Case-Fatality Rate (CFR)
- proportion of individuals with the disease who died as a result of the illness
- must be clearly differentiated from the mortality rate

### Mortality Rate
- proportion of the population that died from any cause during a specified time period
- crude mortality rate: unadjusted for age

### Basic Reproductive Number
- the average # of secondary infections that arise from one infection
- in a susceptible population

**Infection Control Precautions**
**Contact (impetigo, warts)**
- Wash hands
- Gloves
- Gown
- Wipe equipment after use

**Airborne (TB)**
- Contact precautions PLUS
- N95 mask (fit tested)
- Negative pressure room

**Droplet (influenza, mumps, pneumonia)**
- Contact precautions PLUS
- Goggles/face shield
- Surgical mask

## Steps to Control an Outbreak

**Table 10. Ten-Step Approach**

| | Details |
|---|---|
| 1. Identify the investigation team and resources | Local public health units, e.g. Toronto Public Health |
| | Federal level, e.g. PHAC |
| 2. Establish existence of an outbreak | e.g. Receiving a report of a vomiting baseball team after a team dinner at a restaurant |
| 3. Verify the diagnosis | Obtain medical records and lab reports |
| | Conduct further clinical testing as needed |
| 4. Define a case | 3 components: Person, Place, Time |
| | e.g. "Diagnosis A: Person with XYZ signs and symptoms… Occurred after visiting X… During months/year" |
| 5. Find cases systemically and create a line listing | A line list should include clinical information (signs/symptoms, onset times/dates), demographic information, exposure information |
| 6. Perform descriptive epidemiology and develop hypotheses | Create epidemic curves (see Figure 16) |
| 7. Evaluate hypotheses and conduct additional studies as needed | Case-control studies: useful when not everyone exposed can be found and included in the study |
| | Cohort studies: useful when all persons exposed can be included in the study |
| 8. Implement control measures | Can occur at any stage in an outbreak |
| | e.g. Isolation |
| 9. Communicate findings | Involve the media to address public concerns and call for public action |
| 10. Continue surveillance | To determine when the outbreak is over |
| | Document the effectiveness of control measures |

Source: Adapted from Moore Z. Outbreak Investigations: The 10-Step Approach. Available at epi.publichealth.nc.gov/

For specific examples, see "Communicable Diseases" section in: Shah CP. Public Health and Preventive Medicine in Canada Toronto: Elsevier, 5th edition, 2003

**Active Surveillance**
Outreach such as visits or phone calls by the public health/surveillance authority to detect unreported cases (e.g. an infection control nurse goes to the ward and reviews temperature charts to see if any patient has a nosocomial infection)

**Passive Surveillance**
A surveillance system where the public health/surveillance authority depends on others to submit standardized forms or other means of reporting cases (e.g. ward staff notify infection control when new cases of nosocomial infections are discovered)

# Infection Control Targets

- interventions should target host, agent, environment, and their interactions

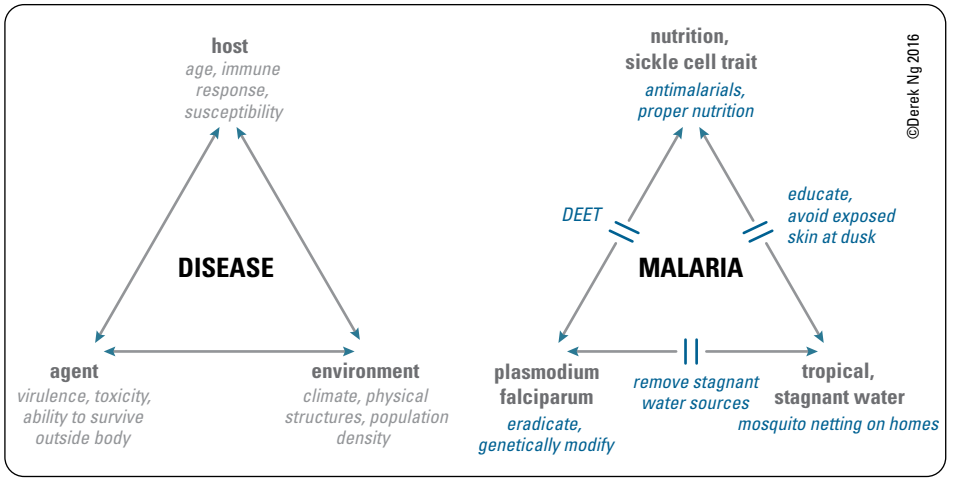

**Figure 16. Epidemiology triad as framework for infection control interventions: Practical example using malaria**

### The International Health Regulations (IHR)

- an international agreement involving 196 nations to prevent, protect against, control, and provide a public health response to pandemics
- a public health emergency of international concern (PHEIC) is "an extraordinary event which is determined to constitute a public health risk to other States through the international spread of disease and to potentially require a coordinated international response"
- the IHR Emergency Committee provides the WHO Director-General with temporary recommendations on PHEIC events

# Environmental Health

### Definition

- study of the association between environmental factors, both constructed and natural, and health
- environmental exposures
  - four common hazards: chemical, biological, physical, and radiation
  - four main reservoirs: air, food, water, and soil
  - three main routes: inhalation, ingestion, or absorption (skin)
- usually divided into two main settings:
  - workplace (including schools): may see high level exposure in healthy individuals (see *Occupational Health*, PH25)
  - non-workplace: lower levels of exposure over longer period of time. Affects vulnerable populations more severely, such as at extremes of age, immuno-suppressed. May be teratogenic
- health impacts of the environment also include factors such as urban planning and how individuals interact with the built environment (e.g. safe pedestrian and bicycle paths can facilitate more active lifestyles)

**Table 11. Environmental Health Jurisdiction**

| | |
|---|---|
| **Public Health Unit** | Enforcement of water and food safety regulations (including restaurant food safety)<br>Assessment of local environmental risks<br>Monitoring and follow-up of reportable diseases<br>Investigation of environmental contamination, clusters of disease |
| **Municipal Government** | Waste disposal, recycling, water and sewage treatment/collection/distribution |
| **Provincial and Territorial Government** | Water and air quality standards<br>Industrial emission regulation<br>Toxic waste disposal |
| **Federal Government** | Designating and regulating toxic substances<br>Regulating food products (e.g. Health Canada (drugs), CFIA)<br>Setting policy for pollutants that can travel across provincial boundaries |
| **International** | Multilateral agreements (e.g. Kyoto Protocol, UN Convention on Climate Change, International Joint Commission) |

### Source-Path-Receiver Model

- to prevent workplace injuries, strategies can be implemented to improve the safety profile of the source, modify the path, and/or protect the receiver

**Figure 17. Epidemic curves**

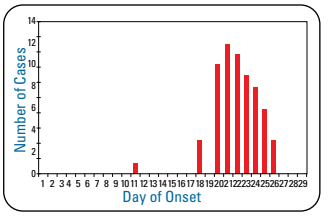

**Figure 17a. Point source epidemic curve**

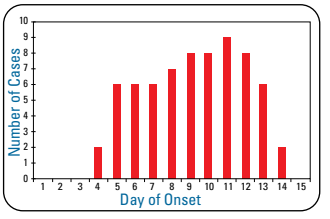

**Figure 17b. Extended continuous source epidemic curve**

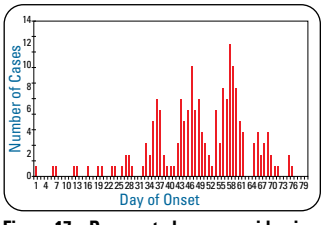

**Figure 17c. Propagated source epidemic curve**

**Environmental Health Jurisdiction - Taking an Environmental Health History**
CMAJ 2002 Apr 16;166(8):1049-1055

**$CH_2OPD_2$**
**C**ommunity
**H**ome
**H**obbies
**O**ccupation
**P**ersonal habits
**D**iet
**D**rugs

**BPA, The Toxin Concern of 2009**
Bisphenol A (BPA) is a chemical compound found in some hard, clear, lightweight plastics and resins. According to the NIH, animal studies suggest that ingested BPA may imitate estrogen and other hormones. In October 2008, Canada became the first country in the world to ban the import and sale of polycarbonate baby bottles containing BPA, stating that although exposure levels are below levels that cause negative effects, current safety margins need to be higher. The US FDA does not consider normal exposure to BPA to be a hazard, however the NIH has some concern that fetuses, infants, and children exposed to BPA may be at increased risk for early-onset puberty, prostate, and breast cancer

# Environmental Risk Assessment

### HIRA

### Hazard Identification
- what is the hazard involved?
- assess potential hazards by taking environmental health history

### Risk Characterization
- is the identified agent likely to elicit the patient's current symptoms?
- review known health impacts of the hazard and identify specific properties that contribute to or diminish adverse effects (e.g. evaluate threshold levels)

### Exposure Assessment
- is the patient's exposure to the environmental agent sufficient to have caused the current symptoms?
- quantify exposure through direct measurement or by reviewing frequency and nature of contact with hazard

Adapted from p.250, Sixth Edition of A Dictionary of Epidemiology by Miquel Porta

# Air

### Biological Hazards
- moulds thrive in moist areas; 10-15% of the population is allergic
- bacteria survive as spores and aerosols, can be distributed through ventilation systems (e.g. Legionella)
- dust mites (year-round) and pollens (seasonal) can trigger upper and lower-airway symptoms

### Chemical Hazards
- ground-level ozone
  - main component of smog with levels increasing in major cities
  - worsens asthma, irritates upper airway
- carbon monoxide (fossil fuel-related, common byproduct of combustion)
  - aggravates cardiac disease at low levels
  - headache, nausea, dizziness at moderate levels
  - fatal at high levels
- sulphur dioxide (fossil fuel-related), nitrogen oxides
  - contribute to acid rain and exacerbate breathing difficulties
- organic compounds at high levels (e.g. benzene, methylene chloride, tetrachloroethylene)
  - tend to be fat-soluble, easily absorbed through skin and difficult to excrete
- heavy metal emissions (e.g. nickel, cadmium, chromium)
  - variety of health effects: upper airway disease, asthma, decreased lung function
- second-hand tobacco smoke
  - respiratory problems, increase risk of lung cancer
  - particulates associated with decreased lung function, asthma, upper airway irritation

### Radiation Hazards
- sound waves
- ionizing radiation
  - radon is naturally produced by soil containing uranium or radium, can contaminate indoor air and is associated with ~20% of lung cancers
- ultraviolet radiation is increasing due to ozone layer destruction and increases risk of skin cancer
- non-ionizing radiation
  - visible light, infrared, microwave

# Water

### Biological Hazards
- mostly due to human and animal waste
- Indigenous Canadians, rural Canadians at higher risk
- bacteria: *Escherichia coli* (e.g. Walkerton, ON), *Salmonella, Pseudomonas, Shigella*
- protozoa: *Giardia, Cryptosporidium* (e.g. North Battleford, SK)

### Chemical/Industrial Hazards
- chlorination by-products (e.g. chlorinated water can cause cancer at high levels)
- volatile organic compounds, heavy metals, pesticides, and other industrial waste products can be present in groundwater
- mercury from fish (exposure during pregnancy can be neurotoxic for the fetus)
- asbestos (e.g. from old buildings)
- lead (can be found in paint, older buildings, and traditional medicines in dangerous quantities)

**Cannabis Legalization and Driving Under the Unfluence of Cannabis (DUIC)**
Source: Public Health Ontario. Evidence Brief-Driving Under the Influence of Cannabis, 2017
Since the Government of Canada stated its commitment to legalize cannabis via the Cannabis Act (Bill C-45) on April 13, 2017, the Canadian Task Force on Cannabis Legalization and Regulation specifically noted driving impairment as an important consideration. Higher cannabis use, cannabis-dependence, lower perceived risk from DUIC and normative beliefs about DUIC were identified as risk factors. As such, an act to amend the Criminal Code Bill C-46) was simultaneously introduced to enable the police the request an oral fluid sample for roadside drug screening and to implement THC per se whole blood limits (>2 ng/mL punishable). Public health was also advised to devise population-based interventions such as 6 hour waiting period recommendations before driving, as well as preventative strategies through addiction services, mass-media campaigns, and school-based instructional programs.

**Particulate Matter Air Pollution and Cardiovascular Disease: An Update to the Scientific Statement from the American Heart Association**
Circulation 2010 Jun 1;121(21):2331-78
A scientific statement by the American Heart Association in 2004 reported that exposure to particulate matter air pollution contributes to cardiovascular morbidity and mortality. An updated American Heart Association statement in 2010 confirmed a causal relationship between particulate matter exposure and cardiovascular morbidity and mortality. The statement reported that such an exposure over several hours to weeks may trigger cardiovascular disease-related mortality and non-fatal events, whereas longer exposures over several years may further increase cardiovascular mortality risk and reduce life expectancy within highly-exposed populations by several months to years.

**The Walkerton Tragedy**
In May 2000, the drinking water system in the town of Walkerton, ON, became contaminated with Escherichia coli O157:H7 and Campylobacter jejuni.
Over 2300 individuals became ill; 27 people developed hemolytic uremic syndrome and 7 individuals died in the outbreak.
Source: Ministry of the Attorney General. Report of the Walkerton inquiry. Ontario, 2002

**Water Fluoridation**
Water fluoridation, and the resulting decrease in dental caries and reduction in health inequities is one of the greatest public health achievements of the 20th century. At the recommended concentration of 0.7 mg/L, fluoride reduces cavities by 18-40%. Small but vocal groups opposed to fluoridation have claimed that fluoride intake is not easily controlled, and that children may be more susceptible to health problems. These claims have been widely debunked but still persist and have led to some communities opting not fluoridate their water, resulting in increased dental caries (eg: Calgary). Fluoride concentrations in municipal water should be 0.7 ppm

# Soil

## Biological Hazards
- biological contamination: tetanus, *Pseudomonas*

## Chemical Hazards
- contamination sources: rupture of underground storage tanks, use of pesticides and herbicides, percolation of contaminated water runoffs, leaching of wastes from landfills, dust from smelting and coal burning power plants, residue of industrial waste/development (e.g. urban agriculture), lead deposition, leakage of transformers
- most common chemicals: petroleum hydrocarbons, solvents, lead, pesticides, motor oil, other industrial waste products
- infants and toddlers at highest risk of exposure due to hand-mouth behaviours
- effects dependent on contaminant: leukemia, kidney damage, liver toxicity, neuromuscular blockade, developmental damage to the brain and nervous system, skin rash, eye irritation, headache, nausea, fatigue

# Food

## Biological Hazards

**Table 12. Comparison of Select Biological Contaminants of Food and Effects on Human Health**

| | Source | Effects |
|---|---|---|
| ***Salmonella*** | Raw eggs, poultry, meat | GI symptoms |
| ***Campylobacter*** | Raw poultry, raw milk | Joint pain, GI symptoms |
| ***Escherichia coli*** | Various including meat, sprouts<br>Primarily undercooked hamburger meat | Watery or bloody diarrhea<br>Hemolytic uremic syndrome (especially children) |
| ***Listeria monocytogenes*** | Unpasteurized cheeses, prepared salads, cold cuts | Listeriosis: nausea, vomiting, fever, headache, rarely meningitis or encephalitis |
| ***Clostridium botulinum*** | Unpasteurized honey, canned foods | Dizziness, weakness, respiratory failure<br>GI symptoms: thirst, nausea, constipation |
| **Prion (BSE*)** | Beef and beef products | Variant Creutzfeldt-Jakob disease |

*BSE = bovine spongiform encephalopathy

- other biological food contaminants include:
  - viruses, mould toxins (e.g. aflatoxin has been associated with liver cancer), parasites (e.g. *Toxoplasmi gondii*, tapeworm), paralytic shellfish poisoning (rare), genetically modified organisms (controversial as to health risks/benefits)

## Chemical Hazards
- many persistent organic pollutants are fat-soluble and undergo bioamplification
- drugs (antibiotics, hormones)
- inadequately prepared herbal medications
- food additives and preservatives
  - nitrites highest in cured meats; can be converted to carcinogenic nitrosamines
  - sulphites commonly used as preservatives; associated with sulphite allergy (hives, nausea, shock)
- pesticide residues
  - older pesticides (e.g. DDT) have considerable human health effects
- polychlorinated biphenyls (PCBs)
  - effects (severe acne, numbness, muscle spasm, bronchitis) much more likely to be seen in occupationally exposed individuals than in the general population
- dioxins and furans
  - levels highest in fish and marine mammals, also present in breast milk
  - can cause immunosuppression, liver disease, respiratory disease

**Organic Foods**
- Foods designated as "organic" in Canada must conform to the Organic Products Regulations enforced by the Canadian Food Inspection Agency
- Organic foods are not free of synthetic pesticide residues but typically contain smaller amounts compared to conventionally grown foods
- Currently, there has not been strong evidence to suggest that eating organic foods is safer or more nutritious compared to eating conventionally grown food

Source: Organic foods. Ann Intern Med 2012;157:348-66. Health Canada. Pesticides and food, 2011. UpToDate. Organic foods and children, 2009

# Occupational Health

- a field involved in the prevention of illness or injury and the promotion of health in the work environment
- services encompass recognizing and controlling exposure to hazards (primary prevention), occupational health surveillance and screening (secondary prevention) and treatment and rehabilitation (tertiary prevention)
- occupational disease often looks clinically the same as non-occupational disease, and without a thorough occupational health history may go unrecognized as distinct

## Taking an Occupational Health History

- current and previous duties at place of employment
- exposures
  - identification: screen for chemical, metal, dust, biological, and physical hazards as well as psychological stressors - workers may bring Safety Data Sheets (formerly MSDSs) that provide information about hazards of exposure
  - assessment: duration, concentration, route, exposure controls (e.g. ventilation and other environmental controls, personal protective equipment)
- temporal relationship: changes in symptoms in relationship to work environment, latency between first exposure and current symptoms
- presence of similar symptoms in co-workers
- non-work exposures to hazardous agents: home, neighbourhood, hobbies
- additional assessment may be required (e.g. chest radiography, ultrasound, PFT)

**Taking an Occupational Health Hx WHACS**
What do you do?
How do you do it?
Are you concerned about any particular exposures on or off the job?
Co-workers or others with similar problems?
Satisfied with your job?
J Occup Environ Med 1998;40:680-684

## Occupational Hazards

**Table 13. Occupational Hazards**

| Physical | Chemical | Biological | Psychosocial | Ergonomic / Safety |
|---|---|---|---|---|
| Noise (e.g. hearing loss)<br>Temperature<br>Heat cramps, heat exhaustion, heat stroke<br>Hypothermia, frostbite<br>Air pressure (barotrauma, decompression sickness)<br>Radiation<br>Non-ionizing: visible light, infrared<br>Ionizing: UV, x-rays, γ rays<br>Vibration-related disorders (secondary Raynaud's, whole body vibration) | Organic solvents (e.g. benzene, methyl alcohol; most toxic is carbon tetrachloride)<br>Mineral dusts (e.g. silica leads to silicosis and predisposition to TB, asbestos leads to diffuse fibrosis and mesothelioma, coal leads to pneumoconiosis)<br>Heavy metals (e.g. nickel, cadmium, mercury, lead)<br>Gases (e.g. halogen gases, sulphur dioxide, carbon monoxide, nitrogen oxides)<br>Second-hand smoke (causal factor for lung cancer, lung disease, heart disease, asthma exacerbations; may be linked to miscarriage)<br>Skin diseases (major portion of compensations, e.g. contact dermatitis, occupational acne, pigmentation disorders) | Exposure to bacteria, viruses, fungi, protozoa, Rickettsia<br>Exposure to biological proteins, endotoxins, enzymes, animal excreta<br>Blood should be considered a potentially toxic substance due to blood-borne infectious diseases (e.g. HIV, hepatitis B)<br>Consider exposure to disease in endemic countries, travellers from endemic countries, or recent travel history in the setting of acute onset of symptoms (e.g. malaria, SARS, TB) | Workload stressors<br>Responsibility<br>Fear of job loss<br>Geographical isolation<br>Shift work<br>Bullying<br>Harassment (sexual/non-sexual)<br>Incurs high cost from absenteeism, poor productivity, mental illness (e.g. post-traumatic stress disorder)<br>Workplace violence (involving staff, clients, the general public) | Ergonomic<br>Repetitive use/overuse injuries, excessive force, awkward postures, poorly designed physical work environment<br>Tenosynovitis, bursitis, carpal tunnel syndrome<br><br>Traumatic Injury Risks<br>Electrical contact<br>Slips, trips and falls, including falls from heights<br>Struck-by/pinning by equipment or objects<br>Contact with machinery/ moving parts<br>Fires and explosions |

## Workplace Legislation

- universal across Canada for corporate responsibility in the workplace: reasonable precautions to ensure a safe workplace, application of Workplace Hazardous Materials Information System (WHMIS), existence of joint health and safety committees in the workplace with representatives from workers and management
- jurisdiction in Canada is provincial (90% of Canadian workers), except for 16 federally regulated industries (e.g. airports, banks, highway transport) under the *Canada Labour Code*
- Ontario's *Occupational Health and Safety Act*
  - sets out rights of workers and duties of employers, procedures for workplace hazards, and law enforcement
  - workers have the right to:
    - know (e.g. be trained and have information about workplace hazards)
    - participate (e.g. have representatives on joint health and safety committees) refuse work (e.g. workers can decline tasks they feel are overly dangerous)
    - note: for some occupations, this right is restricted if, for example, danger/risk is normal part of work or refusal would endanger others (e.g. police, firefighters, some health care workers)

**Occupational Health Statistics**
- 1 in 68 employed workers in 2010 received workers compensation due to injury or harm on the job
- 4405 fatal work injuries in the United States in 2013; rate = 3.2/100,000 workers

Source: Employment and Social Development Canada. Work-related injuries, 2015
U.S. Bureau of Labour Statistics. Census of Fatal Occupational Injuries Charts, 1992-2013, 2014

Information about worker's compensation at: http://www.awcbc.org/en/index.asp

- stop work (e.g. 'certified' workers can halt work they feel is dangerous to other workers)
- enforced by Ministry of Labour via inspectors

- *Health Protection and Promotion Act* (HPPA) (Ontario)
  - Medical Officer of Health has right to investigate and manage health hazards where workplace exposures may impact non-workers (e.g. community members living close to the work site)

## Workplace Primary Prevention

- proactive efforts to reduce workplace illness or injury
- achieved through anticipating, recognizing, evaluating and controlling workplace hazards
- hierarchy of controls (see Figure 18) is followed to minimize exposure – elimination/substitution of hazards is most superior, followed by isolation (engineering controls), training and behavioural efforts (administrative controls), and lastly personal protective equipment

## Workplace Health Promotion

- a strategy for addressing the health and well-being of workers in the workplace, not legislated
- may include education, event planning, information campaigns, workplace supports to promote personal worker health and a healthy workforce

## Workplace Secondary Prevention

- for workers who are exposed to workplace hazards, goal is to identify earliest signs of overexposure or disease through medical surveillance (periodic examinations to identify early changes in a single worker or multiple workers). Some examples include:
  - whole blood lead testing to identify effectiveness of controls, need to remove workers from exposure
  - PFT for asthma (e.g. occupational dust exposure)
  - audiograms for hearing loss (e.g. occupational noise exposure)

## Workplace Tertiary Prevention

- treatment of the disease or injury to facilitate safe and timely return to the workforce
- may require rehabilitation, retraining, change in job duties, and/or workers' compensation (WSIB)
- often also involves accommodating the workplace for a worker who has a non-occupational injury or illness, with routine reassessments of the fit between the worker and their duties - work that is considered safety-sensitive may be restricted for workers with ailments that could impede their ability to work safely, or a worker may be medically determined to have limitations with what they can reasonably do at work
- advise relevant authorities if necessary (e.g. report notifiable diseases to public health, conditions impeding driving to Ministry of Transportation)

**Occupational Safety And Health Enforcement Tools For Preventing Occupational Diseases And Injuries**
Cochrane DB Syst Rev 2013:CD010183
**Objective**: To assess the effects of occupational safety and health regulation enforcement tools for preventing occupational diseases and injuries.
**Outcome**: Inspections decrease injuries in the long term, but not short term, with an unclear magnitude of effect.

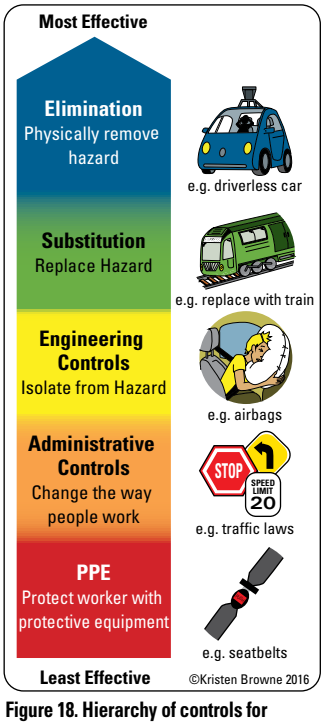

**Figure 18. Hierarchy of controls for reduction of occupational exposures**
Source: Modified from CDC. 2015. Hierarchy of controls. http://www.cdc.gov/niosh/topics/hierarchy/

# Appendix – Mandatory Reporting

## Reportable Diseases

As an essential part of the public health system, physicians in Canada are required by provincial law to report certain diseases to public health. Physician reporting is also outlined by provincial physician licensing Colleges (e.g. College of Physicians and Surgeons of Ontario (CPSO)). Failure to report can result in suspension of a license to practice.

The reasons that reporting is mandatory include:

1. to identify and control an outbreak
2. to prevent spread if the disease presents a significant threat to individuals or a subset of the population (e.g. Lassa Fever)
3. if the disease is preventable with immunization (e.g. polio, diphtheria, congenital rubella)
4. if infected individuals require education, treatment, and/or partner notification (e.g. gonorrhea, TB)
5. surveillance (to monitor disease trends over time)

***Ontario's Workplace Safety and Insurance Act*** (Each province will have their own similar legislation)

- Establishes Workplace Safety and Insurance Board (WSIB), an autonomous government agency that oversees workplace safety training and administers insurance for workers and employers
- WSIB decides benefits for workers, which may include reimbursement for
  - Loss of earned income
  - Non-economic loss (e.g. physical, functional, or psychological loss extending beyond the workplace)
  - Loss of retirement income
  - Health care expenses (e.g. first-aid, medical treatment)
  - Survivor benefits (e.g. dependents and spouses can receive benefits)
- Employers pay for costs (e.g. no government funding)
- No-fault insurance (e.g. worker has no right to sue the employer) in return for guaranteed compensation for accepted claims
- Negligence is not considered a factor
- Physicians are required to provide the WSIB with information about a worker's health without a medical waiver once a claim is made

For more information: http://www.wsib.on.ca/en/community/WSIB

The list of Reportable Diseases is now called "Diseases of Public Health Significance 2018. Each province will have a similar legislation
Note: Diseases marked * (and Influenza in institutions) should be reported immediately to the Medical Officer of Health by either telephone (24 hours a day, 7 days a week) or fax (Mon-Fri, 8:30 am – 4:30 pm only). Other diseases can be reported the next working day by fax, phone or mail.
Source: Health Protection and Promotion Act, O. Reg. 559/91, amended to O. Reg.49/07 (update)

Acquired Immunodeficiency Syndrome (AIDS)
Acute flaccid paralysis <15 yr
Amoebiasis
Anthrax*

Botulism*
Brucellosis*

Campylobacter enteritis
Chancroid
Chickenpox (Varicella)
Chlamydia trachomatis infections
Cholera*
Clostridium difficile* associated disease (CDAD) outbreaks in public hospitals
Creutzfeldt-Jakob Disease, all types
Cryptosporidiosis*
Cyclosporiasis*

Diphtheria*

Encephalitis*, including:
1. Primary, viral*
2. Post-infectious
3. Vaccine-related
4. Subacute sclerosing panencephalitis
5. Unspecified

Food poisoning, all causes*

Gastroenteritis, institutional outbreaks*
Giardiasis, except asymptomatic cases*
Gonorrhea

Haemophilus influenzae b disease, invasive*
Hantavirus pulmonary syndrome*

Hemorrhagic fevers*, including:
1. Ebola virus disease*
2. Marburg virus disease*
3. Other viral causes*

Hepatitis, viral*:
1. Hepatitis A*
2. Hepatitis B
3. Hepatitis C

Influenza
(Note: Influenza in institutions*)

Lassa Fever*
Legionellosis*
Leprosy
Listeriosis*
Lyme Disease

Malaria
Measles*
Meningitis, acute*:
1. Bacterial*
2. Viral*
3. Other*

Meningococcal disease, invasive*
Mumps

Ophthalmia neonatorum

Paralytic shellfish poisoning
Paratyphoid fever*
Pertussis (whooping cough)
Plague*

Pneumococcal disease, invasive
Poliomyelitis, acute*

Psittacosis/Ornithosis

Q Fever*

Rabies*
Respiratory infection outbreaks in institutions*
Rubella*
Rubella, congenital syndrome

Salmonellosis
Severe Acute Respiratory Syndrome (SARS)*
Shigellosis*
Smallpox*
Streptococcal infections, Group A invasive*
Streptococcal infections, Group B neonatal
Syphilis

Tetanus
Trichinosis
Tuberculosis, active and latent
Tularemia*
Typhoid Fever*

Verotoxin-producing E. coli infection* indicator conditions, including Hemolytic Uremic Syndrome (HUS)*

West Nile Virus illness*, including:
1. West Nile fever*
2. West Nile neurological manifestations *

Yellow Fever*
Yersiniosis

# Other Reportable Conditions

- in addition to reporting diseases, physicians have a legal responsibility to report certain conditions. The list below highlights some reportable conditions for Ontario, but is not exhaustive. See your jurisdiction's regulatory body for the full list

### Live Births, Stillbirths, and Deaths – to the Registrar General or Coroner*
- all live and stillbirths must be reported within 2 business days
- a physician with sufficient familiarity of a patient's illness or was in attendance of a deceased patient's last illness must complete and sign the medical certificate of death
- physicians must contact a coroner or the police if patient is suspected to have deceased from violence, misadventure, negligence, misconduct or malpractice or any cause other than disease; by unfair means; during pregnancy or postpartum from circumstances reasonably attributed to the pregnancy; suddenly and unexpectedly; from an illness not treated by a legally qualified medical practitioner; or under circumstances that may require investigation*
- physicians must report all medically assisted deaths to the coroner*

### Child Abuse – to Local Children's Aid Society (CAS)
- all child abuse and neglect where reasonable grounds to suspect exist (including physical harm, emotional harm, sexual harm, and neglect)
- duty to report is ongoing: if additional reasonable grounds are suspect, a further report to CAS is necessary

### Gunshots Wounds – to Local Police Service
- all patients with a gunshot or stab wounds
- self-inflicted knife wounds are not reportable

### Abuse of Long-Term Care or Retirement Home Residents – to the Registrar of the Retirement Homes Regulatory Authority or Long-Term Care Home Director
- any resident suspected of being subject to or at risk of improper or incompetent treatment or care, abuse or neglect, or unlawful conduct including financial abuse

### Unfit to Drive – to Provincial Ministry of Transportation
- all patients with a medical condition (e.g. dementia, untreated epilepsy) that may impede their driving ability
- if a physician does not report and the driver gets into an accident, the physician may be held liable

### Unfit to Fly – to Federal Ministry of Transportation
- all patients believed to be flight crew members or air traffic controller with a medical or optometric condition that is likely to constitute a hazard to aviation safety

| CSA | central sleep apnea |
| CTEPH | chronic thromboembolic pulmonary hypertension |
| CVD | cardiovascular disease |
| CVP | central venous pressure |
| CWP | coal worker's pneumoconiosis |
| DIC | disseminated intravascular coagulation |
| DIP | desquamative interstitial pneumonia |
| $DL_{CO}$ | carbon monoxide diffusing capacity of lung |
| DM | diabetes mellitus |
| DOAC | direct oral anticoagulant |
| EBUS | endobronchial ultrasound |
| ECMO | extracorporeal membrane oxygenation |
| EGPA | eosinophilic granulomatosis with polyangiitis |
| EGDT | early goal-directed therapy |
| ERV | expiratory reserve volume |
| ETT | endotracheal tube |
| FEF | forced expiratory flow rate |
| $FEV_1$ | forced expiratory volume in 1 second |
| $FiO_2$ | fraction of oxygen in inspired air |
| FRC | functional residual capacity |
| GBM | glomerular basement membrane |
| GERD | gastroesophageal reflux disease |
| GPA | granulomatosis with polyangiitis |
| H/A | headache |
| HPA | hypothalamic-pituitary axis |
| HRT | hormone replacement therapy |
| IBD | inflammatory bowel disease |
| IC | inspiratory capacity |
| ICP | intracranial pressure |
| ICS | inhaled corticosteroid |
| ILD | interstitial lung disease |
| IPF | idiopathic pulmonary fibrosis |
| IPPFE | idiopathic pleuroparenchymal fibroelastosis |
| LAAC | long-acting anti-cholinergic |
| LABA | long-acting beta-agonist |
| LIP | lymphocytic interstitial pneumonia |
| LLN | lower limit of normal |
| LMWH | low molecular weight heparin |
| LTRA | leukotriene receptor antagonist |
| LV | left ventricle |
| LVEDP | left ventricular end diastolic pressure |
| LVF | left ventricular failure |
| MAC | *Mycobacterium avium* complex |
| MDI | metered dose inhaler |
| MEP | maximum expiratory pressure |
| MIP | maximum inspiratory pressure |
| MSA | mixed sleep apnea |
| MSK | musculoskeletal |
| NPPV | non-invasive positive pressure ventilation |
| NSCLC | non-small cell lung cancer |
| NSIP | non-specific interstitial pneumonia |
| NTT | nasotracheal tube |
| N/V | nausea/vomiting |
| OCP | oral contraceptive pill |
| OSA | obstructive sleep apnea |
| PA | posteroanterior |
| $P_aCO_2$ | arterial partial pressure of carbon dioxide |
| $P_aO_2$ | arterial partial pressure of oxygen |
| $P_AO_2$ | alveolar partial pressure of oxygen |
| $P_{atm}$ | atmospheric pressure |
| PCP | *Pneumocystis carinii* pneumonia |
| PCV | pressure control ventilation |
| PCWP | pulmonary capillary wedge pressure |
| PDA | patent ductus arteriosus |
| PE | pulmonary embolism |
| PEEP | positive end expiratory pressure |
| PEF | peak expiratory flow |
| PFT | pulmonary function tests |
| PMNs | polymorphonuclear cells |
| PP | pulse pressure |
| PSV | pressure support ventilation |
| PTH | parathyroid hormone |
| PTT | partial thromboplastin time |
| PUD | peptic ulcer disease |
| PVC | premature ventricular contraction |
| RA | rheumatoid arthritis |
| RAD | right axis deviation |
| RAP | right atrial pressure |
| RBBB | right bundle branch block |
| RF | rheumatoid factor |
| RV | residual volume |
| RVEDV | right ventricular end diastolic volume |
| RVH | right ventricular hypertrophy |
| RVSP | right ventricular systolic pressure |
| SCC | squamous cell carcinoma |
| SCLC | small cell lung cancer |
| $S_{cv}O_2$ | central venous oxygen saturation |
| SIMV | synchronous intermittent mandatory ventilation |
| SIRS | systemic inflammatory response syndrome |
| SOFA | sepsis-related organ failure assessment score |
| qSOFA | quick sepsis-related organ failure assessment score |
| SV | stroke volume |
| SVC | superior vena cava |
| SVRI | systemic vascular resistance index |
| TB | tuberculosis |
| TCA | tricyclic antidepressant |
| TLC | total lung capacity |
| TNM | tumour, node, metastasis |
| TPN | total parenteral nutrition |
| UC | ulcerative colitis |
| UIP | usual interstitial pneumonia |
| URTI | upper respiratory tract infection |
| V/Q | ventilation-to-perfusion |
| VATS | video-assisted thoracoscopic surgery |
| VC | vital capacity |
| VSD | ventricular septal defect |
| VTE | venous thromboembolism |

# Approach to the Respiratory Patient

## Basic Anatomy Review

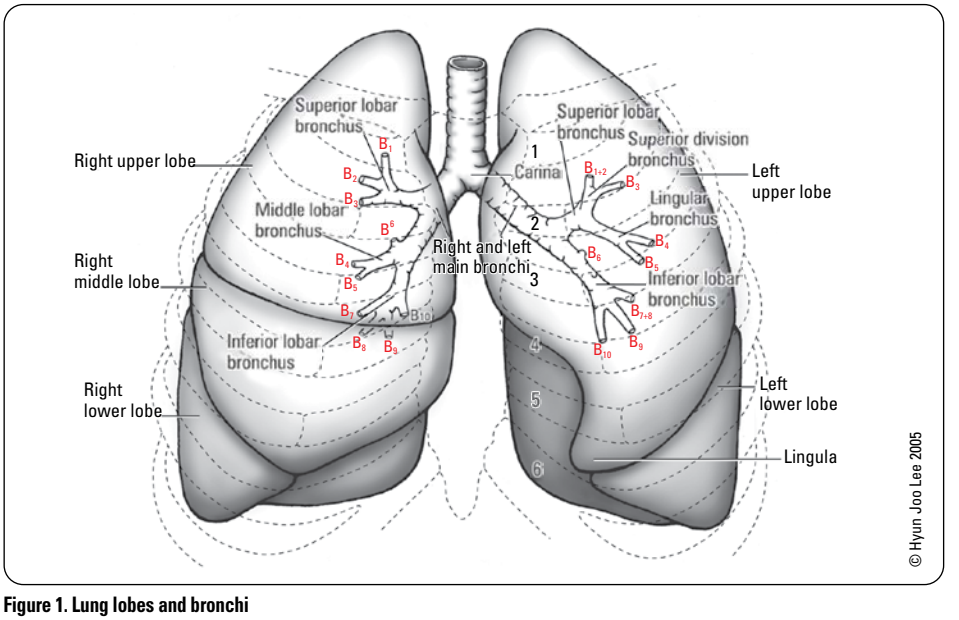

**Figure 1. Lung lobes and bronchi**

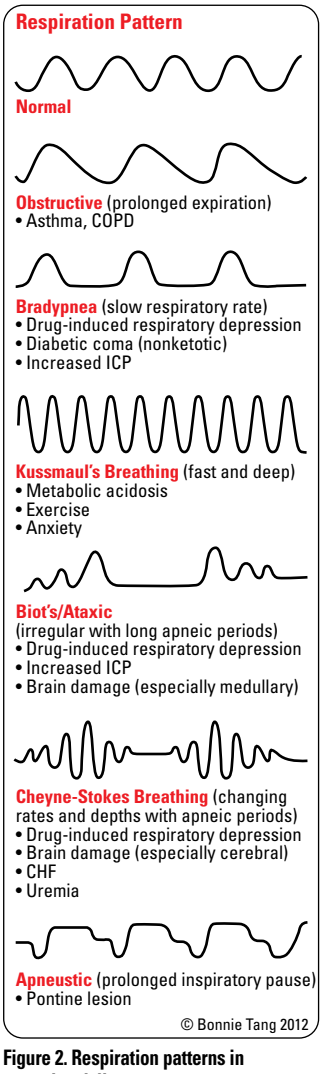

**Figure 2. Respiration patterns in normal and disease states**

# Differential Diagnoses of Common Presentations

## Table 1. Differential Diagnosis of Dyspnea

| ACUTE DYSPNEA (MINUTES-DAYS) |
|---|
| **Cardiac** |
| Acute myocardial infarction |
| CHF exacerbation |
| Cardiac tamponade |
| Coronary artery disease |
| Arrhythmia |
| **Pulmonary** |
| Upper airway obstruction (anaphylaxis, aspiration, croup, EBV) |
| Airway disease (asthma, COPD exacerbation, bronchitis) |
| Parenchymal lung disease (ARDS, pneumonia) |
| Pulmonary vascular disease (PE, vasculitis) |
| Pleural disease (pneumothorax, tension pneumothorax) |
| **Neurologic/Psychogenic** |
| Respiratory control (metabolic acidosis, trauma) |
| Anxiety |
| Panic attack |
| **CHRONIC DYSPNEA (+4 WEEKS)** |
| **Cardiac** |
| Valvular heart disease |
| Myocardial dysfunction (decreased CO) |
| **Pulmonary** |
| Airway disease (asthma, COPD) |
| Parenchymal lung disease (interstitial disease) |
| Pulmonary vascular disease (pulmonary HTN, vasculitis) |
| Pleural disease (effusion) |
| **Metabolic** |
| Medication |
| Severe anemia |
| Hyperthyroidism |
| **Neuromuscular and chest wall disorders** |
| Deconditioning, obesity, pregnancy, neuromuscular disease |
| **Psychogenic** |
| Anxiety |

## Table 2. Differential Diagnosis of Chest Pain

| NONPLEURITIC | PLEURITIC |
|---|---|
| **Pulmonary** | **Pulmonary** |
| Pneumonia | Pneumonia |
| PE | PE |
| Neoplasm | Neoplasm |
| **Cardiac** | Pneumothorax |
| MI | Pleurisy |
| Myocarditis/pericarditis | Hemothorax |
| Deconditioning | TB |
| **Esophageal** | Empyema |
| GERD | **Cardiac** |
| Spasm | Pericarditis |
| Esophagitis | Dressler's syndrome |
| Ulceration | **GI** |
| Achalasia | Subphrenic abscess |
| Neoplasm | **MSK** |
| Esophageal rupture | Costochondritis |
| **Mediastinal** | Fractured rib/flail chest |
| Lymphoma | Myositis |
| Thymoma | Herpes zoster |
| **Subdiaphragmatic** | **Psych** |
| PUD | Anxiety |
| Gastritis | Panic attack/disorder |
| Biliary colic | |
| Pancreatitis | |
| **Vascular** | |
| Aortic aneurysm | |
| Aortic dissection | |
| Aortic injury/rupture | |
| **MSK** | |
| Costochondritis | |
| Skin | |
| Breast | |
| Ribs | |
| Rheumatic disease | |
| **Metabolic** | |
| Anemia | |
| Hyperthyroidism | |
| **Psych** | |
| Anxiety | |
| Panic attack/disorder | |
| **Miscellaneous** | |
| Pregnancy | |
| Weight gain | |

(see Cardiology and Cardiac Surgery C4 and Emergency Medicine ER21)

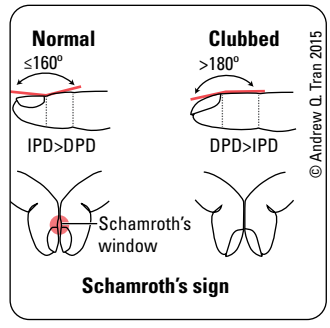

**Figure 3. Signs of nail clubbing**

**Signs of Respiratory Distress**
- Tachypnea
- Central/peripheral cyanosis
- Tachycardia
- Inability to speak
- Nasal flaring
- Tracheal tug
- Intercostal indrawing
- Tripoding
- Abdominal breathing (paradoxical breathing)

**Common Causes of Clubbing**
- Pulmonary: Lung CA, bronchiectasis, pulmonary fibrosis, abscess, CF, TB, empyema, A-V fistula/malformation (NOT COPD)
- Cardiac: Cyanotic congenital heart disease, endocarditis
- GI: IBD, celiac, cirrhosis, neoplasm
- Endocrine: Graves' disease
- Other: Other malignancy, primary hypertrophic osteoarthropathy

Clubbing is not seen in COPD – if present, think malignancy

**Hemoptysis**
- Most common cause is bronchitis
- 90% of massive hemoptysis is from the bronchial arteries
- Considered "massive" if >600 mL/24 h or bleeding rate of >100 mL/h

**Most Common Causes of Chronic Cough in the Non-smoking Patient (cough >3 mo with normal CXR)**
- GERD
- Asthma
- Postnasal drip
- ACEI

## Table 3. Differential Diagnosis of Hemoptysis

| AIRWAY DISEASE |
|---|
| **Acute or chronic bronchitis*** |
| Bronchiectasis |
| Bronchogenic CA |
| Bronchial carcinoid tumour |
| Cystic Fibrosis |
| **Parenchymal Disease** |
| Pneumonia |
| TB |
| Lung abscess |
| Fungal infection |
| Primary lung cancer |
| Pulmonary metastasis |
| **Vascular Disease** |
| PE |
| Elevated pulmonary venous pressure: |
| Left ventricular dysfunction/failure |
| Mitral stenosis |
| Vascular malformation |
| Vasculitis |
| Goodpasture's syndrome |
| Idiopathic pulmonary hemosiderosis |
| **Miscellaneous** |
| Impaired coagulation |
| Pulmonary endometriosis |
| Trauma |
| Foreign Body |

*Most common cause of hemoptysis

## Table 4. Differential Diagnosis of Cough

| AIRWAY IRRITANTS |
|---|
| Inhaled smoke, dusts, fumes |
| Postnasal drip (upper airway cough syndrome) |
| Aspiration |
| **Gastric contents (GERD)*** |
| Oral secretions |
| Foreign body |
| **Airway Disease** |
| **URTI including postnasal drip and sinusitis*** |
| Acute or chronic bronchitis |
| Bronchiectasis |
| Neoplasm |
| External compression by node or mass lesion |
| **Asthma*** |
| COPD |
| **Parenchymal Disease** |
| Pneumonia |
| Lung abscess |
| Interstitial lung disease |
| **PE** |
| **CHF** |
| **Drug-induced (e.g. ACEI)** |
| **Smoking** |

*"Big Three" causes of chronic cough

Adapted from: Weinberger SE. Principles of pulmonary medicine, 5th ed. 2008. With permission from Elsevier

# Pulmonary Function Tests

- useful in differentiating the pattern of lung disease (obstructive vs. restrictive)
- assess lung volumes, flow rates, and diffusion capacity
- **note:** normal values for $FEV_1$ are approximately ±20% of the predicted values (for age, sex, and height); ethnicity may affect predicted values

**Table 5. Comparison of Lung Flow and Volume Parameters in Lung Disease**

| | Obstructive | Restrictive |
|---|---|---|
| | Decreased flow rates (most marked during expiration) | Decreased lung compliance |
| | Air trapping (increased RV/TLC) | Decreased lung volumes |
| | Hyperinflation (increased FRC, TLC) | |
| **DDx** | Asthma, COPD, CF, bronchiolitis, bronchiectasis* | ILD, pleural disease, neuromuscular disease, chest wall disease |
| **$FEV_1$/FVC** | ↓ | ↑ or N |
| **TLC** | ↑ or N | ↓ |
| **RV** | ↑ or N | ↓ |
| **RV/TLC** | ↑ or N | N |
| **$DL_{CO}$** | ↓/↑ or N | ↓ or N |

*Bronchiectasis can be obstructive or mixed

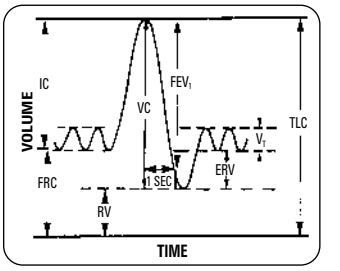

**Figure 4A. Lung volumes and capacities**

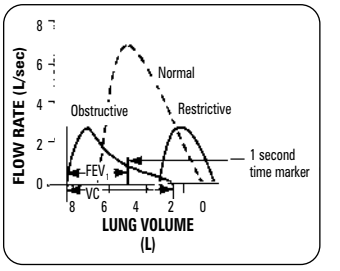

**Figure 4B. Expiratory flow volume curves**
Adapted with permission from Elsevier. Weinberger SE. Principles of pulmonary medicine, 5th ed. 2008

**Table 6. Common Respirology Procedures**

| Technique | Purpose | Description |
|---|---|---|
| **Plethysmography ("body box")** | Measure FRC | After a normal expiration the patient inhales against a closed mouthpiece<br>Resultant changes in the volume and pressure of the plethysmograph are used to calculate the volume of gas in the thorax<br>Useful for patients with air trapping |
| **He Dilution** | Measure FRC | A patient breathes from a closed circuit containing a known concentration and volume of helium<br>Since the amount of helium remains constant, FRC is determined based on the final concentration of the helium in the closed system<br>Only includes airspaces that communicate with the bronchial tree |
| **Bronchoscopy** | Diagnosis and therapy | A flexible or rigid bronchoscope is used for visualization of a patient's airways allows for:<br>Bronchial and broncho-alveolar lavage (washings) for culture and cytology<br>Endobronchial or transbronchial tissue biopsies<br>Removal of secretions/foreign bodies/blood<br>Laser resections<br>Airway stenting<br>Mediastinal lymph nodes can also be sampled using a special bronchoscope equipped with an U/S probe (EBUS) |

**Lung Volumes**
ERV – Expiratory Reserve Volume
FEF – Forced Expiratory Flow Rate
$FEV_1$ – Forced Expiratory Volume (in one second)
FRC – Functional Residual Capacity
IC – Inspiratory Capacity
RV – Residual Volume
TLC – Total Lung Capacity
VC – Vital Capacity
$V_T$ – Tidal Volume

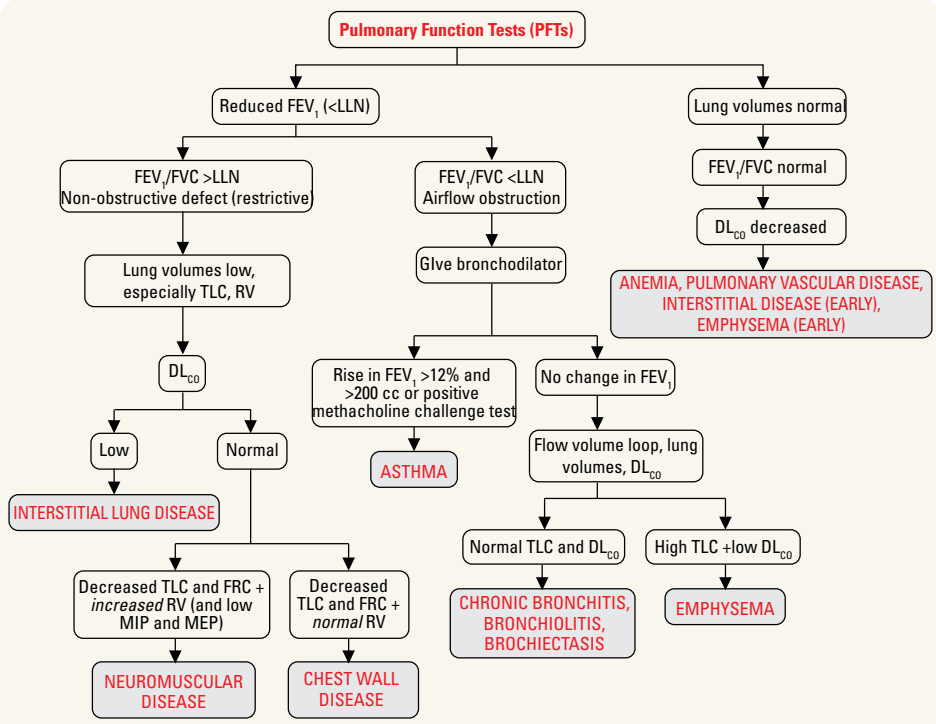

**Figure 5. Interpreting PFTs**

# Chest X-Rays

- see Medical Imaging, MI2

**Table 7. CXR Patterns and Differential Diagnosis**

| Pattern | Signs | Common DDx |
|---|---|---|
| **Consolidation ("Airspace disease")** | Air bronchogram<br>Silhouette sign<br>Less visible blood vessels | Acute: water (PE), pus (pneumonia), blood (hemorrhage)<br>Chronic: neoplasm (lymphoma), inflammatory (eosinophilic pneumonia), infection (TB, fungal) |
| **Reticular ("Interstitial disease")** | Increased linear markings<br>Fine or ground glass<br>Honeycombing (end stage IPF) | ILD (IPF, collagen vascular disease, asbestos, drugs), hypersensitivity pneumonitis, asbestosis, collagen vascular disease, drug reactions |
| **Nodular** | Cavitary vs. non-cavitary | Cavitary: neoplasm (primary vs. metastatic lung cancer), infectious (anaerobic or Gram negative, TB, fungal), inflammatory (RA, sarcoidosis, granulomatosis with polyangiitis [GPA]), IPF<br>Non-cavitary: above + sarcoidosis, Kaposi's sarcoma (in HIV), silicosis and other pneumoconioses |

# Arterial Blood Gases

- provides information on acid-base and oxygenation status
- see Nephrology, NP16

## Approach to Acid-Base Status

1. Is the pH acidemic (pH <7.35), alkalemic (pH >7.45), or normal (pH 7.35-7.45)?
2. What is the primary disturbance?
   - metabolic: change in $HCO_3^-$ and pH in same direction
   - respiratory: change in $HCO_3^-$ and pH in opposite directions
3. Is there appropriate compensation? (see Table 8)
   - metabolic compensation occurs over 2-3 d reflecting altered renal $HCO_3^-$ production and excretion
   - respiratory compensation through ventilatory control of $P_aCO_2$ occurs immediately
   - inadequate compensation may indicate a second acid-base disorder

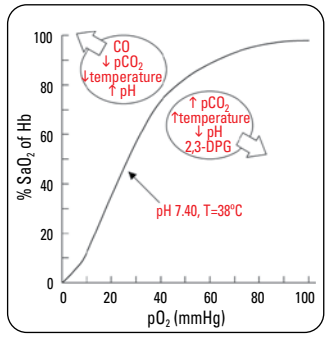

**Figure 6. Oxygen-Hb dissociation curve**

**Table 8. Expected Compensation for Specific Acid-Base Disorders**

| Disturbance | $P_aCO_2$ (mmHg) (normal ~40) | $HCO_3^-$ (mmHg) (normal ~24) |
|---|---|---|
| **Respiratory Acidosis** | | |
| Acute | ↑ 10 | ↑ 1 |
| Chronic | ↑ 10 | ↑ 3 |
| **Respiratory Alkalosis** | | |
| Acute | ↓ 10 | ↓ 2 |
| Chronic | ↓ 10 | ↓ 5 |
| **Metabolic Acidosis** | ↓ 1 | ↓ 1 |
| **Metabolic Alkalosis** | ↑ 5-7 | ↑ 10 |

4. if there is metabolic acidosis, what is the anion gap and osmolar gap?
   - anion gap = $[Na^+]-([Cl^-]+[HCO_3^-])$; normal 5-14 mmol/L
   - osmolar gap = measured osmolarity – calculated osmolarity = measured – $(2[Na^+]$ + glucose + urea); normal ≤10 mmol/L
     - abnormal osmolar gap indicates the presence of alcohols
5. if anion gap is increased, is the change in bicarbonate the same as the change in anion gap?
   - if not, consider a mixed metabolic picture

**Table 9. Differential Diagnosis of Respiratory Acidosis**

*Increased $P_aCO_2$ secondary to hypoventilation*

| Respiratory Centre Depression (Decreased RR) | Neuromuscular Disorders (Decreased Vital Capacity) | Lung Disease | Mechanical Hypoventilation (Inadequate Mechanical Ventilation) |
|---|---|---|---|
| Drugs (anesthesia, sedatives, narcotics) | Myasthenia gravis | COPD | |
| Trauma | Guillain-Barré syndrome | Asthma | |
| Encephalitis | Botulism | Pulmonary edema | |
| Stroke | Poliomyelitis | Pneumothorax | |
| Central apnea | Muscular dystrophies | Pneumonia | |
| Supplemental $O_2$ in chronic $CO_2$ retainers (e.g. COPD) | ALS | ILD (late stage) | |
| | Myopathies | ARDS | |
| | Chest wall disease (obesity, kyphoscoliosis) | | |

**Table 10. Differential Diagnosis of Respiratory Alkalosis**

*Decreased $P_aCO_2$ secondary to hyperventilation*

| | Respiratory Centre Stimulation | Mechanical Hyperventilation (Excessive Mechanical Ventilation) |
|---|---|---|
| Pulmonary disease (pneumonia, edema, PE, interstitial fibrosis) | Drugs (ASA, progesterone, theophylline, catecholamines, psychotropics, nicotine, salicylates) | |
| Severe anemia | Chest wall disease (obesity, kyphoscoliosis) | |
| Heart failure | Hepatic failure | |
| High altitude | Gram-negative sepsis | |
| | Pregnancy | |
| | Anxiety | |
| | Pain | |

- see Nephrology, NP16 for differential diagnosis of metabolic acidosis and alkalosis

**Factors that Shift the Oxygen-Hb Dissociation Curve to the Right**

**"CADET, face right!"**
**C**$O_2$
**A**cid
2,3-**D**PG
**E**xercise
**T**emperature (increased)

Note: 2,3-DPG (2,3-diphosphoglycerate) is now called 2,3-BPG (2,3-biphosphoglycerate)

Acidosis ⟷ Hyperkalemia
Alkalosis ⟷ Hypokalemia

Note: Mixed acid-base disturbances can still have a "normal" pH

Osmolar Gap = measured osmolarity – calculated osmolarity; for calculated osmolarity think "2 salts and a sticky BUN" (2Na + glucose + urea)

**Anion Gap Metabolic Acidosis**

**MUDPILESCAT**
**M**ethanol
**U**remia
**D**iabetic ketoacidosis/starvation ketoacidosis
**P**henformin/**P**araldehyde
**I**soniazid, **I**ron, **I**buprofen
**L**actic acidosis
**E**thylene glycol
**S**alicylates
**C**yanide, **C**arbon dioxide
**A**lcoholic ketoacidosis
**T**oluene, **T**heophylline

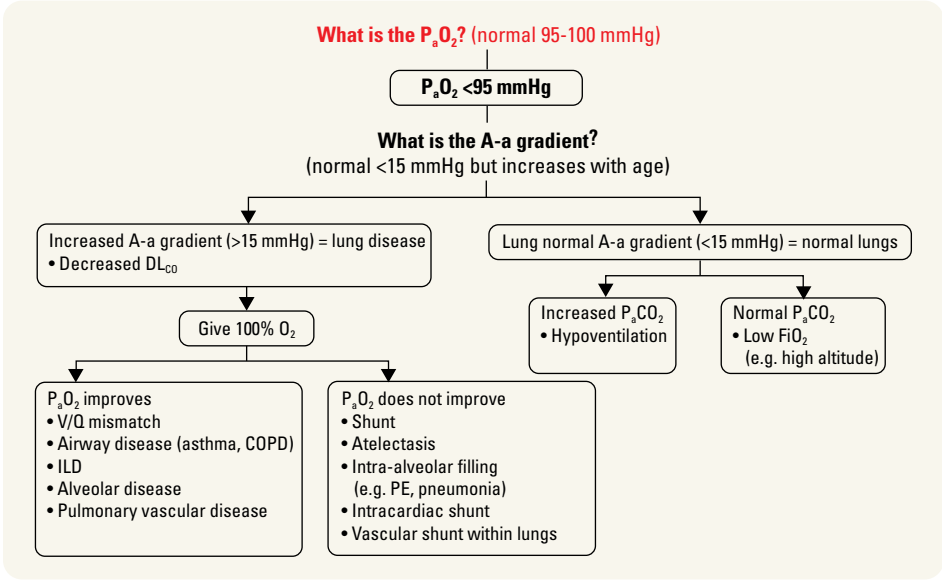

**Figure 7. Approach to hypoxemia**

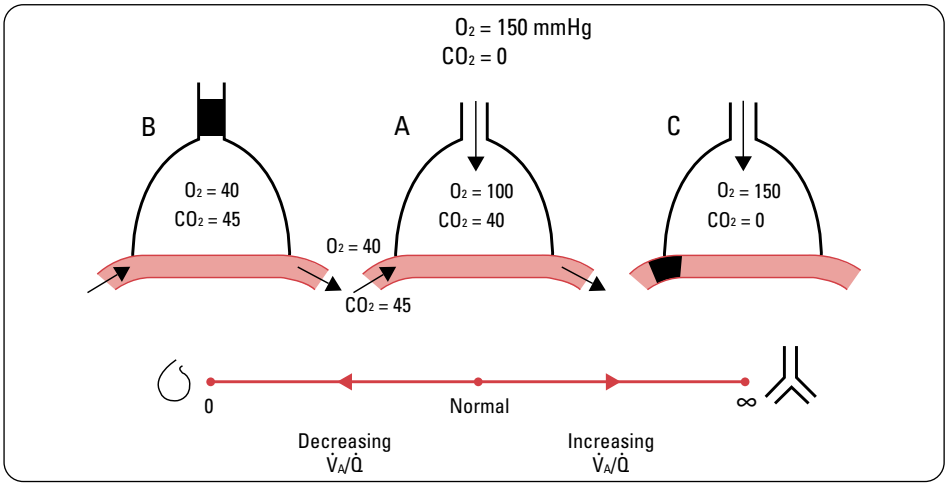

**Figure 8. Pathophysiology of V/Q mismatch**

Figure adapted from West – Respiratory Physiology: The Essentials. 9th Ed. 2012. Lippincott Williams & Wilkins, Philadelphia, PA.

**At Sea Level on Room Air**
$FiO_2$ = 0.21
$P_{atm}$ = 760 mmHg
$PH_2O$ = 47 mmHg
RQ = 0.8
Thus, A-a$DO_2$ Gradient on Room Air
A-a$DO_2$ = (150 – 1.25 [$P_aCO_2$]) – $P_aO_2$

**Diffusion Capacity for CO**

**$DL_{CO}$ decreases in:**
- Interstitial lung disease
- Pulmonary vascular disease
- Anemia
- Emphysema (decreased surface area)

**$DL_{CO}$ increases in/with:**
- Asthma
- Obesity
- Pulmonary hemorrhage
- Left-to-right intracardiac shunt
- Polycythemia
- Postexercise physiology (increased pulmonary blood volume)

**Pulmonary Shunt**
Occurs when the capillary networks of the alveoli are perfused, yet there is a lack of adequate ventilation (and thus oxygenation) in that alveolus or group of alveoli. Thus this blood enters the pulmonary venous system without being oxygenated

# Airway Disease

## Pneumonia

- see Infectious Diseases, ID7

## Asthma

- see Family Medicine, FM16 and Pediatrics, P81

### Definition
- chronic inflammatory disorder of the airways resulting in episodes of reversible bronchospasm causing airflow obstruction
- associated with reversible airflow limitation and airway hyper-responsiveness to endogenous or exogenous stimuli
- inflamed airways undergo a variety of changes including hypertrophied smooth airway muscles and mucous producing goblet cells

### Epidemiology
- common, 7-10% of adults, 10-15% of children
- most children with asthma significantly improve in adolescence
- often family history of atopy (asthma, allergic rhinitis, eczema)
- occupational asthma (organic allergies, isocyanates, animals, etc.)

**Airway Obstruction (decreased $FEV_1$)**
- Asthma
- COPD (chronic bronchitis, emphysema)
- Bronchiectasis (obstructive or mixed)
- Cystic fibrosis (obstructive or mixed)

**Red Flags**
Severe tachypnea/tachycardia, respiratory muscle fatigue, diminished expiratory effort, cyanosis, silent chest, decreased LOC

Central cyanosis is not detectable until $SaO_2$ is <85%. It is more easily detected in polycythemia and less readily detectable in anemia

## Pathophysiology
- airway obstruction → V/Q mismatch → hypoxemia → ↑ ventilation → ↓ $P_aCO_2$ → ↑ pH and muscle fatigue → ↓ ventilation, ↑ $P_aCO_2$/↓ pH

## Signs and Symptoms
- dyspnea, wheezing, chest tightness, cough, sputum
- symptoms usually occur or worsen at night
- symptoms can be paroxysmal or persistent
- signs of respiratory distress
- pulsus paradoxus

**Table 11. Criteria for Determining if Asthma is Well Controlled**

| | |
|---|---|
| Daytime symptoms <4 d/wk | No asthma-related absence from work/school |
| Night-time symptoms <1 night/wk | β2-agonist use <4 times/wk |
| Physical activity unimpaired by symptoms | $FEV_1$ or PEF >90% of personal best |
| Exacerbations mild, infrequent | PEF diurnal variation <10-15% |

Adapted from: Can Respir J 2012; 19:127-164

**Table 12. Pulmonary Function Criteria for Diagnosis of Asthma**

| Preferred Measurement | Alternative Measurements |
|---|---|
| **Spirometry Showing Reversible Airway Obstruction** | **Peak Expiratory Flow Variability** |
| (1) ↓ $FEV_1$/FVC below lower limit of normal | (1) ↓ in PEF after a bronchodilator or course of controller therapy |
| Adults: <0.75 to 0.8 in adults | Adults: PEF ↑ 60 L/min (min. 20%) OR |
| Children age 6+: <0.8-0.9 | Diurnal variation >8% for twice daily readings (20% for multiple daily readings) |
| AND | Children age 6+: PEF ↑ 20% |
| | **Positive Challenge Test** |
| (2) ↑ $FEV_1$ ≥12% and, 200 mL in adults after bronchodilator or controller therapy | (1) Methacholine challenge: positive if $FEV_1$ ↓ >20% when 4 mg/mL of inhaled methacholine is given; borderline if 4-16 mg/mL is required OR |
| | (2) Post-exercise: ↓ $FEV_1$ ≥10-15% |

Adapted from: Can Respir J 2012; 19:127-164

## Treatment
- environment: avoid triggers
- patient education: features of the disease, goals of treatment, self-monitoring
- pharmacological
  - symptomatic relief in acute episodes: short-acting β2-agonist, anticholinergic bronchodilators, inhaled corticosteroids, addition of a long acting β2-agonist
  - long-term maintenance: inhaled/oral corticosteroids, anti-allergic agents, long-acting β2-agonists (do not use LABA alone), long-acting anticholinergics, methylxanthine, LTRA, anti-IgE antibodies (e.g. omalizumab), anti-IL5 drugs (e.g. mepolizumab) (see Figure 9)

## Emergency Management of Asthma
- see Emergency Medicine, ER29

1. inhaled β2-agonist first line (MDI route and spacer device recommended)
2. systemic steroids (PO or IV if severe)
3. if severe add anticholinergic therapy ± magnesium sulfate
4. rapid sequence intubation in life-threatening cases (plus 100% $O_2$, monitors, IV access)
5. SC/IV adrenaline if caused by anaphylaxis, IV salbutamol if unresponsive
6. corticosteroid therapy at discharge

**Asthma Triggers**
- URTIs
- Allergens (pet dander, house dust, moulds, cockroach)
- Irritants (cigarette smoke, air pollution)
- Drugs (NSAIDs, β-blockers)
- Preservatives (sulphites, MSG)
- Other (emotion/anxiety, cold air, exercise, GERD)

**Signs of Poor Asthma Control**

**"DANGERS"**
**D**aytime Sx ≥4 times/wk
**A**ctivities reduced
**N**ightime Sx ≥1 time/wk
**G**P visits
**E**R visits
**R**escue puffer (SABA) use ≥4 times/wk
**S**chool and work absences

**Asthma Action Plan**
Is a written plan developed by patients and their physicians which includes signs and symptoms for patients to recognize their current level of respiratory distress (denoted as 'green', 'yellow', or 'red/emergency' zones) and the personalized treatment options for each zone

**LTRA in Addition to Usual Care for Acute Asthma in Adults and Children**
Cochrane DB Syst Rev 2012;CD006100
**Purpose**: To determine if the addition of LTRA is beneficial to patients with acute asthma receiving inhaled bronchodilators and systemic corticosteroids.
**Methods**: RCTs in Cochrane Airway Group's Specialised Register of trials that compared LTRA and standard vs. placebo and standard in people with acute asthma of any age.
**Results**: 8 trials, 1470 adults and 470 children. For oral treatment, no significant difference between LTRAs and control in hospital admission (RR 0.86; 95% CI 0.21-3.52) or requirement for additional care (RR 0.87; 95% CI 0.60-1.68). LTRAs improved $FEV_1$ in adults (mean difference 0.08; 95% CI 0.01-0.14) but not in children. No significant difference in adverse events between LTRAs and control (RR 0.81; 95% CI 0.22-2.99). Similar results were found for intravenous treatment.
**Conclusions**: Currently, there is no evidence to support routine use of LTRAs in acute asthma.

## Guidelines for Asthma Management

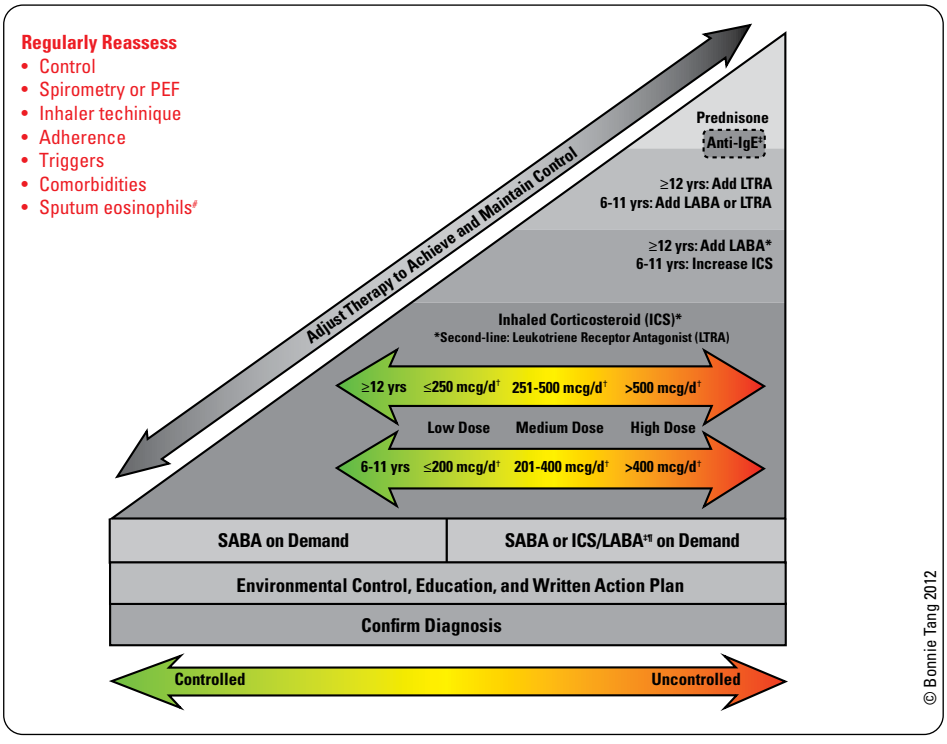

**Figure 9. Guidelines for asthma management**
Adapted from: Can Respir J 2012;19:127-164

# Chronic Obstructive Pulmonary Disease

• see Family Medicine, FM16

## Definition

- progressive and irreversible condition of the lung characterized by chronic obstruction to airflow with many patients having periodic exacerbations, gas trapping, lung hyperinflation, and weight loss
- spirometry required for diagnosis (post-bronchodilator $FEV_1/FVC < 0.70$)
- 2 subtypes: chronic bronchitis and emphysema (usually coexist to variable degrees)
- gradual decrease in $FEV_1$ over time with episodes of acute exacerbations

### Table 13. Clinical and Pathologic Features of COPD*

| Chronic Bronchitis | Emphysema |
|---|---|
| **Defined Clinically**<br>Productive cough on most days for at least 3 consecutive months in 2 successive years<br>Obstruction is due to narrowing of the airway lumen by mucosal thickening and excess mucus<br>Airway changes include increased goblet cells, fibrosis of bronchioles, loss of tethering due to destruction of alveolar walls | **Defined Pathologically**<br>Dilation and destruction of air spaces distal to the terminal bronchiole without obvious fibrosis<br>Decreased elastic recoil of lung parenchyma causes decreased expiratory driving pressure, airway collapse, and air trapping |
| | **2 Types**<br>1) Centriacinar (respiratory bronchioles predominantly affected)<br>Typical form seen in smokers, primarily affects upper lung zones<br>2) **Panacinar** (all parts of acinus)<br>Accounts for about 1% of emphysema cases<br>α1-antitrypsin deficiency, primarily affects lower lobes |

*Note that both chronic bronchitis and emphysema can exist without obstruction. Only if obstruction is also present is it termed COPD.

## Risk Factors

- smoking is the #1 risk factor
- environmental: air pollution, occupational exposure, exposure to wood smoke or other biomass fuel for cooking
- treatable factors: α1-antitrypsin deficiency, bronchial hyperactivity (asthma, chronic bronchitis)
- demographic factors: age, FHx of atopy, history of childhood respiratory infections, low socioeconomic status

Consider LABA for night-time symptoms

**Long-Acting Muscarinic Antagonist Added to LABA/ICS vs. LABA/ICS for Adults with Asthma**
Cochrane DB Syst Rev 2016;CD011721
**Objective**: To assess the effects of adding long-acting muscarinic antagonist to LABA/ICS therapy in adults whose asthma is not well controlled by LABA/ICS.
**Methods**: RCTs in Cochrane Airways Review Group Specialized Register that compared long-acting muscarinic antagonist as an add-on to LABA/ICS vs. LABA/ICS alone for adults with asthma.
**Results**: 4 trials, 1197 adults taking LABA/ICS combination therapy. Individuals taking tiotropium add-on plus LABA/ICS had fewer exacerbations requiring oral steroids than LABA/ICS alone (OR 0.76, 95% CI 0.57-1.02). No difference in quality of life between groups (MD 0.09, 95% CI 0.03-0.2). Inconsistent evidence whether tiotropium increased or decreased serious adverse events in this population (OR 0.60, 95% CI 0.24-1.47). Tiotropium add-on therapy improved lung function, as measured by trough $FEV_1$ (MD 0.07, 95% CI 0.030-0.11) and FVC (MD 0.07, 95% CI 0.020-0.13).
**Conclusions**: Tiotropium may reduce need for rescue oral steroids over LABA/ICS alone in people with severe asthma.

**Natural Progression of COPD**

| | |
|---|---|
| **40s** | Chronic productive cough, wheezing occasionally |
| **50s** | 1st acute chest illness |
| **60s** | Dyspnea on exertion, increasing sputum, more frequent exacerbations |
| **Late Stage** | Hypoxemia with cyanosis, polycythemia, hypercapnia (morning headache), cor pulmonale, weight loss |

**Complications of COPD**
- Polycythemia 2° to hypoxemia
- Chronic hypoxemia
- Pulmonary HTN from vasoconstriction
- Cor pulmonale
- Pneumothorax due to rupture of emphysematous bullae
- Depression
- Bacterial infections

**$CO_2$ Retainers**
On ABG, retainers have chronically elevated $CO_2$ levels with a normal pH. Maintain $O_2$ Sat between 88-92% to prevent Haldane effect, worsening V/Q mismatch, and decreased respiratory drive

Remember, first line therapy for COPD is smoking cessation

**α-1-Antitrypsin Deficiency**
Inherited disorder of defective production of α1-antitrypsin, a protein produced by hepatocytes. Acts in the alveolar tissue by inhibiting the action of proteases from destroying alveolar tissue. When deficient, proteases can destroy lung alveoli resulting in emphysema

## Signs and Symptoms

### Table 14. Clinical Feature and Investigations for Chronic Emphysema

| | Symptoms | Signs | Investigations |
|---|---|---|---|
| **Bronchitis (Blue Bloater*)** | Chronic productive cough<br>Purulent sputum<br>Hemoptysis | Cyanosis (2º to hypoxemia and hypercapnia)<br>Peripheral edema from RVF (cor pulmonale)<br>Crackles, wheezes<br>Prolonged expiration if obstructive<br>Frequently obese | **PFT:**<br>↓ $FEV_1$, ↓ $FEV_1$/FVC<br>N TLC, ↓ or N $DL_{CO}$<br>**CXR:**<br>AP diameter normal<br>↑ bronchovascular markings<br>Enlarged heart with cor pulmonale |
| **Emphysema (Pink Puffer*)** | Dyspnea (± exertion)<br>Minimal cough<br>Tachypnea<br>Decreased exercise tolerance | Pink skin<br>Pursed-lip breathing<br>Accessory muscle use<br>Cachectic appearance due to anorexia and increased work of breathing<br>Hyperinflation/barrel chest<br>Hyperresonant percussion<br>Decreased breath sounds<br>Decreased diaphragmatic excursion | **PFT:**<br>↓ $FEV_1$, ↓ $FEV_1$/FVC<br>↑ TLC (hyperinflation)<br>↑ RV (gas trapping)<br>↓ $DL_{CO}$<br>**CXR:**<br>↑ AP diameter<br>Flat hemidiaphragm (on lateral CXR)<br>↓ cardiac silhouette<br>↑ retrosternal space<br>Bullae<br>↓ peripheral vascular markings |

*Note that the distinction between "blue bloaters" and "pink puffers" is more of historical than practical interest as most COPD patients have elements of both

### Table 15. Treatment of Stable COPD

| Treatment | Details |
|---|---|
| **PROLONG SURVIVAL** | |
| **Smoking Cessation** | Nicotine replacement, bupropion, varenicline |
| **Vaccination** | Annual influenza vaccination, pneumococcal vaccination |
| **Home Oxygen** | Prevents cor pulmonale and decreases mortality if used >15h/d; indicated if:<br>(1) $PaO_2$ <55 mmHg or<br>(2) $PaO_2$ <60 mmHg with cor pulmonale or polycythemia |
| **SYMPTOMATIC RELIEF (no mortality benefit)** | |
| **Bronchodilators** (mainstay of current drug therapy, used in combination) | Short-acting anticholinergics (e.g. ipratropium bromide) and short-acting β2-agonists (e.g. salbutamol, terbutaline) |
| | SABAs: rapid onset but significant side effects at high doses (e.g. hypokalemia) |
| | Short-acting anticholinergics slightly more effective than SABAs with fewer side effects but slower onset |
| | Using a combination of both is superior to monotherapy |
| | LABAs (e.g. salmeterol, formoterol, indacaterol) and long-acting anticholinergics (e.g. tiotropium bromide, glycopyrronium bromide) |
| | More sustained effects for moderate to severe COPD |
| | LAMAs more effective at decreasing exacerbation rates than LABAs |
| | Using a combination of both is superior than monotherapy |
| | Inhaled corticosteroid (ICS) + LABA combination (e.g. Advair®: fluticasone + salmeterol, Symbicort®: budesonide + formoterol) |
| | Theophylline: weak bronchodilator; limited evidence to suggest combination with bronchodilator |
| | Side effects: nervous tremor, nausea/vomiting/diarrhea, tachycardia, arrhythmias, sleep changes |
| | PDE4 inhibitor: roflumilast (Daxas®) anti-inflammatory medication useful in COPD with chronic bronchitis, severe airflow obstruction, frequent exacerbations |
| **Corticosteroids** | ICS monotherapy has been shown to increase the incidence of pneumonia in COPD; ICS should only be used with a LABA in combination in patients with a history of exacerbations |
| | Oral steroids are important when treating exacerbations; chronic systemic glucocorticoids are generally not recommended due to unfavourable benefit to risk ratio |
| **Surgical** | Lung volume reduction surgery (resection of emphysematous parts of lung, associated with higher mortality if $FEV_1$ <20%), lung transplant |
| **Other** | Patient education, eliminate respiratory irritants/allergens (occupational/environmental), exercise rehabilitation to improve physical endurance |

**GOLD Classification of the Severity of COPD**
GOLD 1 Mild $FEV_1$ ≥80% of predicted
GOLD 2 Moderate 50% ≤$FEV_1$ <80% of predicted
GOLD 3 Severe 30% ≤ $FEV_1$ <50% of predicted
GOLD 4 Very Severe $FEV_1$ <30% of predicted
Note: Use COPD Assessment Tool for comprehensive assessment of symptoms, weak correlation between FEV1 and symptoms

Remember to step down therapy to lowest doses which control symptoms/signs of bronchoconstriction

**Influenza Vaccine for Patients with Chronic Obstructive Pulmonary Disease**
Cochrane DB Syst Rev 2006;1:CD002733
**Study**: Cochrane Systematic Review. 11 RCTs included, 6 specifically in COPD patients.
**Population**: Six of the studies were done on COPD patients in particular, while the others were on elderly and high-risk individuals. Asthma patients were excluded.
**Intervention**: Live or inactivated virus vaccines vs. placebo.
**Outcome**: Exacerbation rates, hospitalizations, mortality, lung function and adverse effects.
**Results**: In patients with COPD, inactive vaccine correlated with fewer exacerbations per vaccinated subject than placebo (weighted mean difference (WMD) -0.37, 95% CI -0.64 to -0.11). Inactivated vaccine resulted in fewer influenza-related infections than placebo (WMD 0.19, 95% CI 0.07-0.48). There was also an increased risk of local mild, transient adverse reactions with the vaccine.
**Conclusions**: There appears to be a reduction in influenza-related infections, as well as exacerbations in patients with COPD receiving the vaccine.

**Systemic Corticosteroids for Acute Exacerbations of Chronic Obstructive Pulmonary Disease**
Cochrane DB Syst Rev 2014;9:CD001228
**Study**: Cochrane systematic review 16 studies.
**Population**: 1787 patients with acute COPD exacerbations.
**Intervention**: Oral or parenteral corticosteroids vs. placebo.
**Outcome**: Treatment failure, risk of relapse, time to next COPD exacerbation, likelihood of adverse event, length of hospital stay, and lung function at end of treatment.
**Results**: Systemic corticosteroids reduced the risk of treatment failure by over half compared with placebo in nine studies (n = 917) with median treatment duration 14 d, odds ratio (OR) 0.48 (95% CI 0.35-0.67). The evidence was graded as high quality and it would have been necessary to treat nine people (95% CI 7-14) with systemic corticosteroids to avoid one treatment failure. There was moderate-quality evidence for a lower rate of relapse by 1 mo for treatment with systemic corticosteroid in two studies (n = 415) (hazard ratio (HR) 0.78; 95% CI 0.63-0.97). Mortality up to 30 d was not reduced by treatment with systemic corticosteroid compared with control in 12 studies (n = 1319; OR 1.00; 95% CI 0.60-1.66). FEV1, measured up to 72 hours, showed significant treatment benefits (7 studies; n = 649; mean difference (MD) 140 mL; 95% CI 90-200); however, this benefit was not observed at later time points. The likelihood of adverse events increased with corticosteroid treatment (OR 2.33; 95% CI 1.59-3.43). The risk of hyperglycemia was significantly increased (OR 2.79; 95% CI 1.86-4.19). For general inpatient treatment, duration of hospitalization was significantly shorter with corticosteroid treatment (MD -1.22 d; 95% CI -2.26 to -0.18), with no difference in length of stay in the intensive care unit (ICU) setting. Comparison of parenteral versus oral treatment showed no significant difference in the primary outcomes of treatment failure, relapse or mortality or for any secondary outcomes.
**Conclusion**: There is high-quality evidence to support treatment of exacerbations of COPD with systemic corticosteroid by the oral or parenteral route in reducing the likelihood of treatment failure and relapse by 1 mo, shortening length of stay in hospital inpatients not requiring assisted ventilation in ICU and giving earlier improvement in lung function and symptoms. There is no evidence of benefit for parenteral treatment compared with oral treatment with corticosteroid on treatment failure, relapse or mortality. There is an increase in adverse drug effects with corticosteroid treatment, which is greater with parenteral administration compared with oral treatment.

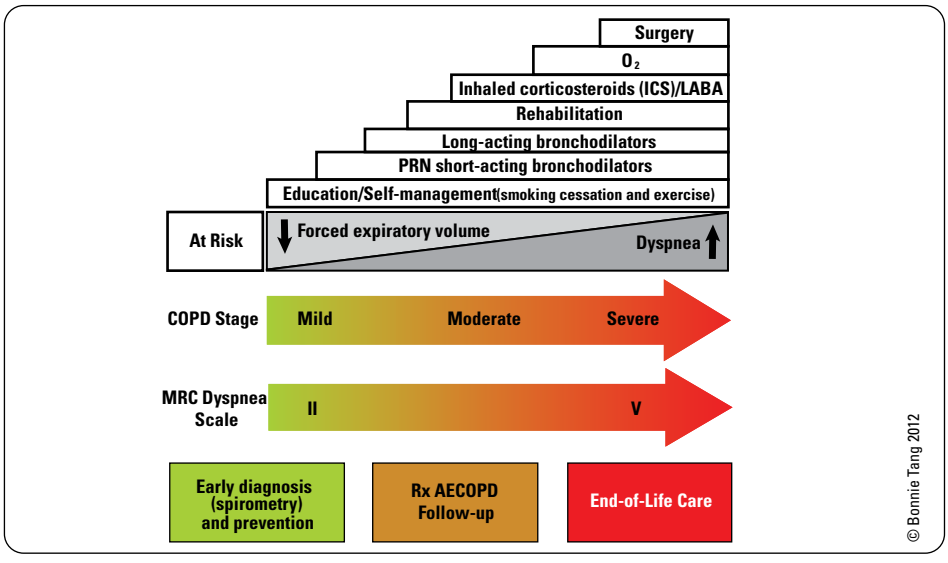

**Figure 10. Guidelines for COPD management**
Adapted from: Canadian Thoracic Society recommendations for management of chronic obstructive pulmonary disease. Can Respir J 2008;(Suppl A):15

## Acute Exacerbations of COPD

- **definition**
  - sustained (>48 h) worsening of dyspnea, cough, or sputum production leading to an increased use of medications
  - in addition, defined as either purulent or non-purulent (to predict need for antibiotic therapy)
- **etiology**: viral URTI, bacteria, air pollution, CHF, PE, MI must be considered
- **management**
  - ABCs, consider assisted ventilation if decreasing LOC or poor ABGs
  - $O_2$: target 88-92% $SaO_2$ for $CO_2$ retainers
  - bronchodilators by MDI with spacer or nebulizer
    - SABA + anticholinergic, e.g. salbutamol and ipratropium bromide via nebulizers × 3 back-to-back q15min
  - systemic corticosteroids: IV solumedrol or oral prednisone
  - antibiotics for exacerbations with sputum purulence, ICU admission, or non-invasive ventilation (NIV use)
    - 1st line: Amoxicillin-Clavulanic Acid
    - if allergic to penicillin, fluoroquinolone or doxycycline
  - post exacerbation: rehabilitation with general conditioning to improve exercise tolerance
- ICU admission
  - for life-threatening exacerbations
  - ventilatory support
    - non-invasive: NIPPV, BiPAP
    - conventional mechanical ventilation

## Prognosis in COPD

- prognostic factors
  - level of dyspnea is the single best predictor
  - development of complications, e.g. hypoxemia or cor pulmonale
- 5 yr survival
  - $FEV_1$ <1 L = 50%
  - $FEV_1$ <0.75 L = 33%
- **BODE** index for risk of death in COPD
  - greater score = higher probability the patient will die from COPD; score can also be used to predict hospitalization
  - 10 point index consisting of four factors:
    - **B**ody mass index (BMI): ≤21 (+1 point)
    - **O**bstruction ($FEV_1$): 50-64% (+1), 36-49% (+2), <35% (+3)
    - **D**yspnea (MRC scale): walks slower than people of same age on level surface, stops occasionally (+1), stops at 100 yards or a few minutes on the level (+2), too breathless to leave house or breathless when dressing/undressing (+3)
    - **E**xercise capacity (6 minute walk distance): 250-349 m (+1), 150-249 m (+2), <149 m (+3)

**Pulmonary Embolism in Patients with Unexplained Exacerbation of COPD: Prevalence and Risk Factors**
Ann Intern Med 2006;144:390-96
**Study**: Prospective cohort study of 211 patients with COPD (all current and former smokers) admitted to hospital for severe COPD exacerbation of unknown origin.
**Measurements**: All patients received spiral CT angiogram (CTA) and venous compression ultrasonography of both legs.
**Results**: 25% of patients met diagnostic criteria for PE (+ CTA or + U/S).
**Conclusions**: Prevalence of PE in patients hospitalized for COPD exacerbation of unknown origin is 25%. Therefore, all patients presenting to hospital with COPD exacerbation without obvious cause require PE workup (leg dopplers or CTA – decision of which to use depends on pre-test probability of the patient).

**Non-Invasive Ventilation for the Management of Acute Hypercapnic Respiratory Failure due to Exacerbation of COPD**
Cochrane DB Syst Rev 2017; 7:CD004104
**Objective**: To compare efficacy of non-invasive ventilation (NIV) in conjunction with usual care vs. usual care alone in adults with acute hypercapnic respiratory failure secondary to acute exacerbation of COPD.
**Methods**: RCTs in Cochrane Airways Group Specialized Register that compared usual care plus non-invasive ventilation vs. usual care alone in acute hospital setting for adult patients with mean admission pH <7.35 and $PaCO_2$ >45 mmHg.
**Results**: 17 trials, 1264 adult patients. Addition of NIV decreased risk of mortality (RR 0.54, 95% CI 0.38-0.76) and risk of needing endotracheal intubation (RR 0.36, 95% CI 0.28-0.46). NIV plus usual care was also associated with reduced length of hospital stay (MD -3.39d, 95% CI -5.93 - -0.85), reduced incidence of complications (RR 0.26, 95% CI 0.13-0.53), improvement of pH (MD 0.05, 95% CI 0.02-0.07), and improvement of $PaO_2$ (MD 7.47 mmHg, 95% CI -11.05-1.80 mmHg).
**Conclusions**: NIV in conjunction with usual care is beneficial as first-line intervention in patients admitted with acute hypercapnic respiratory failure secondary to acute exacerbation of COPD.

**Different Durations of Corticosteroid Therapy for Exacerbations of Chronic Obstructive Pulmonary Disease**
Cochrane DB Syst Rev 2014;12:CD006897
**Study**: Cochrane systematic review. 8 studies.
**Population**: 582 patients, with severe or very severe COPD.
**Intervention**: Corticosteroids given at equivalent daily doses for 3-7 d (short duration) vs. 10-15 d (longer-duration).
**Outcome**: Treatment failure, risk of relapse, time to next COPD exacerbation, likelihood of adverse event, length of hospital stay, and lung function at end of treatment.
**Results**: In four studies there was no difference in risk of treatment failure between short-duration and longer-duration systemic corticosteroid treatment (n = 457; odds ratio (OR) 0.72, 95% confidence interval (CI) 0.36-1.46)), which was equivalent to 22 fewer per 1000 for short-duration treatment (95% CI 51 fewer to 34 more). No difference in risk of relapse (a new event) was observed between short-duration and longer-duration systemic corticosteroid treatment (n = 457; OR 1.04, 95% CI 0.70-1.56), which was equivalent to nine fewer per 1000 for short-duration treatment (95% CI 68 fewer to 100 more). Time to the next COPD exacerbation did not differ in one large study that was powered to detect non-inferiority and compared 5 d versus 14 d of systemic corticosteroid treatment (n = 311; hazard ratio 0.95, 95% CI 0.66 to 1.37). In five studies no difference in the likelihood of an adverse event was found between short-duration and longer-duration systemic corticosteroid treatment (n = 503; OR 0.89, 95% CI 0.46-1.69, or nine fewer per 1000 [95% CI 44 fewer to 51 more]). Length of hospital stay (n = 421; mean difference (MD) -0.61 d, 95% CI -1.51-0.28) and lung function at the end of treatment (n = 185; MD $FEV_1$ -0.04 L; 95% CI -0.19-0.10) did not differ between short-duration and longer-duration treatment.
**Conclusion**: 5 d of oral corticosteroids is likely to be sufficient for treatment of adults with acute exacerbations of COPD, and this review suggests that the likelihood is low that shorter courses of systemic corticosteroids (of around five days) lead to worse outcomes than are seen with longer (10 to 14 d) courses.

# Bronchiectasis

## Definition
- irreversible dilatation of airways due to inflammatory destruction of airway walls resulting from persistently impaired mucous clearance and infected mucus
- usually affects medium sized airways
- the most common sputum pathogens in non-cystic fibrosis patients are *H. influenzae, P. aeruginosa*, and *M. catarrhalis*

**Table 16. Etiology and Pathophysiology of Bronchiectasis**

| Obstruction | Post-Infectious (results in dilatation of bronchial walls) | Impaired Defenses (leads to interference of drainage, chronic infections, and inflammation) |
|---|---|---|
| Tumour | Pneumonia | Hypogammaglobulinemia |
| Foreign body | TB | CF |
| | Measles | Defective leukocyte function |
| | Pertussis | Ciliary dysfunction |
| | Allergic bronchopulmonary aspergillosis | (Kartagener's syndrome: bronchiectasis, sinusitis, situs inversus) |
| | Nontuberculous mycobacterium (NTM) | |

## Signs and Symptoms
- chronic cough, copious purulent sputum (but 10-20% have dry cough), dyspnea, fatigue, chronic rhinosinusitis, hemoptysis (can be massive), recurrent pneumonia, local crackles (inspiratory and expiratory), rhonchi, wheezes
- may be difficult to differentiate from chronic bronchitis

## Investigations
- PFTs: often demonstrate obstructive pattern but may be normal
- CXR
  - nonspecific: increased markings, linear atelectasis, loss of volume in affected areas
  - specific: "tram tracking" – parallel narrow lines radiating from hilum, cystic spaces, honeycomb like structures
- high-resolution thoracic CT (diagnostic, gold standard)
  - 87-97% sensitivity, 93-100% specificity
  - "signet ring": dilated bronchi with thickened walls where diameter bronchus >1.5x diameter of accompanying artery
- sputum cultures (routine + AFB)
- CBC
- LFTs
- immunoglobin panel (serum Ig levels)
- sweat chloride if cystic fibrosis suspected (upper zone predominant)

## Treatment
- vaccination: influenza and pneumococcal vaccination
- chest physiotherapy, breathing exercises, physical exercise
- antibiotics (oral, IV, inhaled):
  - inhaled: used chronically to decrease bacterial load, driven by sputum bacteriology
  - oral/IV: routinely used for exacerbations, driven by sputum sensitivity; macrolides may be used chronically for an anti-inflammatory effect chronically
- mucolytics (e.g. hypertonic saline)
- inhaled corticosteroids: decrease inflammation, however, may increase risk of exacerbations
- oral corticosteroids for acute, major exacerbations
- pulmonary resection: in selected cases with focal bronchiectasis
- transplant: for end stage diffuse causes (e.g. PCD etc.)

# Cystic Fibrosis

- see Pediatrics, P82

## Pathophysiology
- chloride transport dysfunction: thick secretions from exocrine glands (lung, pancreas, skin, reproductive organs) and blockage of secretory ducts

## Clinical Features
- multisystem: results in severe lung disease, pancreatic insufficiency, salt loss syndrome, and azoospermia
- other manifestations: meconium ileus in infancy, distal ileal obstruction in adults, CF related diabetes, sinusitis, liver disease, bone disease, malnutrition
- chronic lung infections
  - *S. aureus* and *H. influenzae*: early
  - *P. aeruginosa*: most common in adulthood
  - *B. cepacia* complex: worse prognosis (some subtypes) so infection control is key
  - In adults, colonization with more resistant bacteria increases (eg. PsA, Burkholderia cepacia complex, Stenotrophomonas, Achromobacter, MRSA, NTM etc.)

Usually presents in childhood as recurrent lung infections that become persistent and chronic

### Investigations
- Genetic testing
  - autosomal recessive- more than 2100 mutations in CFTR described, not all disease causing
- Sweat chloride test
  - increased concentrations of NaCl and $K^+$ ($[Cl^-]$ >60 mmol/L on two occasions supports the diagnosis)
  - carriers have normal sweat tests (and no symptoms)
- PFTs
  - early: airflow limitation in small airways
  - late: severe airflow obstruction, hyperinflation, gas trapping, decreased $DL_{CO}$ (very late)
- ABGs
  - hypoxemia, hypercapnia later in disease with eventual respiratory failure and cor pulmonale
- CXR
  - hyperinflation, increased pulmonary markings (especially upper lobes)

### Treatment
- chest physiotherapy
- pancreatic enzyme replacements, high fat, high calorie diet
- bronchodilators (salbutamol ± ipratropium bromide)
- inhaled mucolytic (reduces mucus viscosity), hypertonic saline, DNase
- inhaled antibiotics (tobramycin, colistin, aztreonam, levofloxacin, vancomycin)
- anti-inflammatory medications (e.g. azithromycin, ICS in some)
- antibiotics oral and IV (targeted to sputum growth e.g. ciprofloxacin for *Pseudomonas*)
- CFTR potentiators and modulators (e.g. Ivacaftor, Orkambi, Symdeko)
- lung transplant

### Prognosis
- depends on: infections (*B. cepacia* colonization), $FEV_1$, acute pulmonary exacerbations, lung transplant vs. non-lung transplant
- female gender and low socioeconomic class have greater risk of early death

# Interstitial Lung Disease

### Definition
- a group of disorders which cause progressive scarring of lung tissue and impair lung function and gas exchange

### Pathophysiology
- inflammatory and/or fibrosing process in the alveolar walls → distortion and destruction of normal alveoli and microvasculature
- typically associated with:
  - lung restriction (decrease in TLC and VC)
  - decreased lung compliance (increased or normal $FEV_1/FVC$)
  - impaired diffusion (decreased $DL_{CO}$)
  - hypoxemia due to V/Q mismatch (usually without hypercapnia until end stage)
  - pulmonary HTN and cor pulmonale occur with advanced disease secondary to hypoxemia and blood vessel destruction

### Etiology
- >100 known disorders can cause ILD
- majority due to unknown agents or cause

**In ILD think**
**FASSTEN** and **BAD RASH**

**Upper Lung Disease (FASSTEN)**
**F**armer's lung (hypersensitivity pneumonitis)
**A**nkylosing spondylitis
**S**arcoidosis
**S**ilicosis
**TB**
**E**osinophilic granuloma (Langerhans-cell histiocytosis)
**N**eurofibromatosis

**Lower Lung Disease (BADRASH)**
**B**ronchiolitis obliterans with organizing pneumonia (BOOP)/Cryptogenic Organizing Pneumonia (COP)
**A**sbestosis
**D**rugs (nitrofurantoin, hydralazine, INH, amiodarone, many chemo drugs)
**R**heumatologic disease
**A**spiration
**S**cleroderma
**H**amman Rich (acute interstitial pneumonia) and IPF

**Table 17. Interstitial Lung Diseases**

| UNKNOWN ETIOLOGY | KNOWN ETIOLOGY | | |
|---|---|---|---|
| Idiopathic interstitial pneumonias | **ILD Associated with Systemic Rheumatic Disorders** | **ILD Associated with Drugs or Treatments** | **Inherited Disorders** |
| UIP (usual interstitial pneumonia e.g. IPF) | Scleroderma | Antibiotics (nitrofurantoin) | Familial IPF |
| NSIP (non-specific interstitial pneumonia) | Rheumatoid arthritis | Anti-inflammatory agents (methotrexate) | Telomerase mutations |
| LIP (lymphocytic interstitial pneumonia) | SLE | Cardiovascular drugs (amiodarone) | Neurofibromatosis |
| COP (cryptogenic organizing pneumonia e.g. BOOP) | Polymyositis/dermatomyositis | Antineoplastic agents (chemotherapy agents) | Tuberous sclerosis |
| DIP (desquamative interstitial pneumonia) | Anti-synthetase syndromes | Illicit drugs (e.g. crack lung, talc granulomatosis) | Gaucher's disease |
| IPPFE (idiopathic pleuroparenchymal fibroelastosis) | Mixed connective tissue disease | Radiation | **Alveolar Filling Disorders** |
| AFOP (acute fibrinous and organizing pneumonia) | **Environment/Occupation Associated ILD** | **ILD Associated with Pulmonary Vasculitis** | Chronic eosinophilic pneumonia |
| Sarcoidosis | Hypersensitivity pneumonitis (usually organic antigen) | Granulomatosis with Polyangiitis (GPA) | Pulmonary alveolar proteinosis |
| Langerhans-cell histiocytosis (eosinophilic granuloma) | Farmer's lung | Goodpasture's syndrome | |
| Lymphangioleiomyomatosis | Air conditioner/humidifier lung | Idiopathic pulmonary hemosiderosis | |
| | Bird breeder's lung | | |
| | Pneumoconioses (inorganic dust) | | |
| | Silicosis | | |
| | Asbestosis | | |
| | Coal worker's pneumoconiosis | | |
| | Chronic beryllium disease | | |
| | Pneumonitis from gases/fumes/vapour | | |

## Signs and Symptoms

- dyspnea, especially on exertion
- nonproductive cough
- crackles (dry, fine, end-inspiratory)
- clubbing (especially in IPF and asbestosis)
- features of cor pulmonale
- note that signs and symptoms vary with underlying disease process
  - e.g. sarcoidosis is seldom associated with crackles and clubbing

## Investigations

- CXR/high resolution CT (see Medical Imaging, MI6)
  - usually decreased lung volumes
  - reticular, nodular, or reticulonodular pattern (nodular <3 mm)
  - hilar/mediastinal adenopathy (bilateral especially in sarcoidosis)
  - honeycombing (pathognomonic for UIP)
- PFTs
  - restrictive pattern: decreased lung volumes and compliance
  - normal or increased $FEV_1/FVC$ (>70-80%), e.g. flow rates are often normal or high when corrected for absolute lung volume
  - $DL_{CO}$ decreased due to V/Q mismatch (less surface area for gas exchange ± pulmonary vascular disease) and diffusion impairment
- ABGs
  - hypoxemia and respiratory alkalosis may be present with progression of disease
- other
  - bronchoscopy, bronchoalveolar lavage, lung biopsy
  - RF (RA), anti-CCP, connective tissue disease (CTD) screen, serum-precipitating antibodies to inhaled organic antigens (hypersensitivity pneumonitis), c-ANCA (GPA), anti-GBM (Goodpasture's)

The CXR can be normal in up to 15% of patients with interstitial lung disease

# Unknown Etiologic Agents

## IDIOPATHIC PULMONARY FIBROSIS

### Definition
- pulmonary fibrosis of unknown cause with usual interstitial pneumonia (UIP) histology (found on biopsy or inferred from CT)
- a progressive, irreversible condition
- DDx: NSIP, COP, desquamative interstitial pneumonitis (DIP), lymphocytic interstitial pneumonitis (LIP), Sjögren's disease

### Signs and Symptoms
- commonly presents over age 50, incidence rises with age; males > females
- dyspnea on exertion, nonproductive cough, constitutional symptoms, late inspiratory fine crackles at lung bases, clubbing

### Investigations
- labs (nonspecific, autoimmune serology usually negative)
- CXR: reticular or reticulonodular pattern with lower lung predominance; often see honeycombing in advanced disease
- high resolution CT: lower zone peripheral reticular markings, traction bronchiectasis, honeycombing; ground glass, consolidation, or nodules should not be prominent in IPF
- biopsy: rarely for UIP as honeycombing usually makes diagnosis possible based on radiologic findings alone

### Treatment
- $O_2$
- pirfenidone and nintedanib can slow disease progression
- lung transplantation for advanced disease
- mean survival of 3-5 yr after diagnosis

**IPF Prevalence**
- Age 35-44: 2-7 per 100,000
- Age >75: 175 per 100,000

**Effect of Pirfenidone on Mortality: Pooled Analyses and Meta-analyses of Clinical Trials in Idiopathic Pulmonary Fibrosis**
Lancet Respir Med 2017;5:33-41
**Objectives**: To compare mortality outcomes over 120 weeks in patients with idiopathic pulmonary fibrosis on pirfenidone vs. placebo.
**Methods**: Pooled analysis of 3 global randomized phase III trials (CAPACITY 004 and 006, ASCEND 016, and SP2 and SP3).
**Results**: All-cause mortality (HR 0.52, 95% CI 0.31-0.87), treatment-emergent all-cause mortality (HR 0.45, 95% CI 0.24-0.83), idiopathic pulmonary fibrosis related mortality (HR 0.35, 95% CI 0.17-0.72), and treatment-emergent idiopathic pulmonary fibrosis (HR 0.32, 95% CI 0.14-0.76) related mortality was reduced in the pirfenidone group vs. placebo.
**Conclusions**: Pirfenidone therapy is associated with reduction in the relative risk of mortality compared to placebo over 120 wk.

## SARCOIDOSIS

### Definition
- idiopathic non-infectious granulomatous multi-system disease with lung involvement in 90%
- characterized pathologically by non-necrotizing granulomas (although occasionally necrosis is present)
- numerous HLA antigens and other genetic markers have been shown to play a role and familial sarcoidosis is now recognized

### Epidemiology
- typically affects young and middle-aged patients
- higher incidence among people of African descent (in USA) and from northern latitudes e.g. Scandinavia, Canada

### Signs and Symptoms
- asymptomatic, cough, dyspnea, fever, arthralgia, malaise, erythema nodosum, chest pain
- chest exam often normal
- common extrapulmonary manifestations
  - eye involvement (anterior or posterior uveitis)
  - skin involvement (skin papules, erythema nodosum, lupus pernio)
  - peripheral lymphadenopathy
  - arthralgia
  - hepatomegaly ± splenomegaly
  - less common extra-pulmonary manifestations involve bone, CNS, kidney, cardiac (arrhythmias, sudden death, CHF)
- two acute sarcoid syndromes
  - Lofgren's syndrome: fever, erythema nodosum, bilateral hilar lymphadenopathy, arthralgias
  - Heerfordt-Waldenstrom syndrome: fever, parotid enlargement, anterior uveitis, facial nerve palsy

### Investigations
- CBC (cytopenias from spleen or marrow involvement, lymphopenia common)
- serum electrolytes, creatinine, liver enzymes, calcium (hypercalcemia/hypercalciuria due to vitamin D activation by granulomas)
- hypergammaglobulinemia, occasionally RF positive
- elevated serum ACE (non-specific and non-sensitive) – reflects total body granuloma load
- CXR: predominantly nodular opacities especially in upper lung zones ± hilar adenopathy
- PFTs: normal, obstructive pattern, restrictive pattern with normal flow rates and decreased $DL_{CO}$, or mixed obstructive/restrictive pattern
- ECG: to rule out conduction abnormalities
- slit-lamp eye exam: to rule out uveitis

Most common presentation of sarcoidosis: asymptomatic CXR finding

### Diagnosis
- biopsy
  - transbronchial lung biopsy, transbronchial lymph node aspiration, endobronchial ultrasound guided surgical (EBUS) biopsy, or mediastinoscopic lymph node biopsy for granulomas
  - in ~75% of cases, transbronchial biopsy shows granulomas in the parenchyma even if the CXR is normal

### Staging
- radiographic, based on CXR
  - Stage 0: normal radiograph
  - Stage I: bilateral hilar lymphadenopathy ± paratracheal lymphadenopathy
  - Stage II: bilateral hilar lymphadenopathy with pulmonary infiltration
  - Stage III: pulmonary infiltration alone (reticulonodular pattern or nodular pattern)
  - Stage IV: pulmonary fibrosis (loss of volume in upper lobes common, honeycombing uncommon)

### Treatment
- 85% of stage I resolve spontaneously within 2 yr, 50% of stage II resolve spontaneously within 5 yr
- treat with prednisone if severe and/or progressive
- steroids for symptoms, declining lung function, hypercalcemia, or involvement of eye, CNS, kidney, or heart (not for abnormal CXR alone)
- methotrexate or other immunosuppressives can be used as steroid sparing agents in place of long term prednisone

### Prognosis
- approximately 10% mortality secondary to progressive fibrosis of lung parenchyma

Hilar adenopathy refers to enlargement of mediastinal lymph nodes which is most often seen by standard CXR as spherical/ellipsoidal and/or calcified nodes. If unilateral - think neoplasia, TB, or sarcoid. If bilateral - think sarcoid or lymphoma

**Corticosteroids for Pulmonary Sarcoidosis**
Cochrane DB Syst Rev 2005;2:CD001114
**Study**: Meta-analysis of 13 RCTs involving 1066 participants examining the use of steroids (oral or inhaled) in sarcoidosis.
**Results**: Oral steroids demonstrated an improvement in CXR (RR 1.46, 95% CI 1.01-2.09). For inhaled corticosteroids, two studies showed no improvement in lung function and one study showed an improvement in diffusing capacity. No data on side-effects.
**Conclusions**: Oral steroids improve CXR findings and global scores of CXR, symptoms, and spirometry over 3-24 mo, but do not improve lung function or modify disease course. Oral steroids may be of benefit for patients with Stage 2 and 3 disease.

# Known Etiologic Agents

## HYPERSENSITIVITY PNEUMONITIS
- also known as extrinsic allergic alveolitis
- non-IgE mediated inflammation of lung parenchyma (acute, subacute, and chronic forms) - Type 4 hypersensitivity reaction
- caused by sensitization to inhaled agents, usually organic dust
- pathology: airway-centred, poorly formed granulomas, and lymphocytic inflammation
- exposure usually related to occupation or hobby
  - Farmer's Lung (*Thermophilic actinomycetes*)
  - Bird Breeder's/Bird Fancier's Lung (immune response to bird IgA)
  - Humidifier Lung (*Aureobasidium pullulans*)
  - Sauna Taker's Lung (*Aureobasidium* spp.)
  - Popcorn lung (diacetyl)

### Signs and Symptoms
- acute presentation: (4-6 h after exposure)
  - dyspnea, cough, fever, chills, malaise (lasting 18-24 h)
  - CXR: diffuse infiltrates
  - type III (immune complex) reaction
- subacute presentation: more insidious onset than acute presentation
- chronic presentation
  - insidious onset
  - dyspnea, cough, malaise, anorexia, weight loss
  - PFTs: progressively restrictive
  - CXR: predominantly upper lobe reticulonodular pattern
- in both acute and chronic reactions, serum precipitins may be detectable (neither sensitive nor specific)

### Treatment
- early diagnosis: avoidance of further exposure is critical as chronic changes are irreversible
- systemic corticosteroids can relieve symptoms and speed resolution

## PNEUMOCONIOSES
- reaction to inhaled inorganic dusts 0.5-5 μm in size
- no effective treatment, therefore key is exposure prevention through the use of protective equipment
- smoking cessation, annual influenza and pneumococcal vaccination, rehabilitation, lung transplant for endstage disease

Calcified diaphragmatic plaques are highly suggestive of asbestosis, especially if bilateral

**CXR Fibrotic Patterns**
- Asbestosis: lower > upper lobes
- Silicosis: upper > lower lobes
- Coal: upper > lower lobes

**Table 18. Pneumoconioses**

| Diagnosis | Etiology | Signs/Symptoms | Investigations | Complications |
|---|---|---|---|---|
| **Asbestosis** | Exposure risks: insulation, shipyard, construction, brake linings, pipe fitters, plumbers<br>Slowly progressive diffuse interstitial fibrosis induced by inhaled asbestos fibres<br>Usually requires >10-20 yr of exposure<br>Latency period: 20-30 yr | Insidious onset<br>Dyspnea<br>Cough: paroxysmal, non-productive<br>Clubbing (much more likely in asbestosis than silicosis or CWP) | CXR<br>Lower > upper lobe<br>Reticulonodular pattern, may develop IPF-like honeycombing<br>Asbestos exposure can also cause pleural and diaphragmatic plaques (± calcification), pleural effusion, round atelectasis<br>Microscopic examination reveals ferruginous bodies: yellow-brown rod-shaped structures which represent asbestos fibres coated in macrophages | Asbestos exposure increases risk of bronchogenic CA and malignant mesothelioma<br>Risk of lung cancer dramatically increased for smokers |
| **Silicosis** | At risk population: sandblasters, rock miners, stone cutters, quarry and highway workers<br>Generally requires >20 yr exposure; may develop with much shorter but heavier exposure | Dyspnea, cough, and wheezing | CXR<br>Upper > lower lobe<br>Early: nodular disease (simple pneumoconiosis), lung function usually normal<br>Late: nodules coalesce into masses (progressive massive fibrosis)<br>Possible hilar lymph node enlargement (frequently calcified), especially "egg shell" calcification | Mycobacterial infection (e.g. TB) |
| **Coal Worker's Pneumoconiosis (CWP)** | At risk population: coal workers, graphite workers<br>Coal and silica, coal is less fibrogenic than silica | Simple CWP<br>No signs or symptoms, usually normal lung function<br>Complicated CWP (also known as progressive massive fibrosis)<br>Dyspnea<br>Course: few patients progress to complicated CWP | Simple CWP<br>CXR: multiple nodular opacities, mostly upper lobe<br>Pathologic hallmark is coal macule<br>Complicated CWP<br>CXR: opacities larger and coalesce | |

Remember to involve occupational health and place of work for data collection and treatment plan.
Also counsel re: worker's insurance as per jurisdiction (e.g. Workers Safety Insurance Board [WSIB] in Ontario)

## INTERSTITIAL LUNG DISEASE ASSOCIATED WITH DRUGS OR TREATMENTS

### Drug-Induced

- antineoplastic agents: bleomycin, mitomycin, busulfan, cyclophosphamide, methotrexate, chlorambucil, BCNU (carmustine)
- antibiotics: nitrofurantoin, penicillin, sulfonamide
- cardiovascular drugs: amiodarone, tocainide
- anti-inflammatory agents: methotrexate, penicillamine
- gold salts
- illicit drugs (heroin, methadone)
- rituximab, anti-TNF-α agents (infliximab, etanercept, adalimumab)

### Radiation-Induced

- early pneumonitis: approximately 6 wk post-exposure
- late fibrosis: 6-12 mo post-exposure
- infiltrates conform to the shape of the radiation field

# Pulmonary Vascular Disease

## Pulmonary Hypertension

### Definition

- mean pulmonary arterial pressure >25 mmHg at rest and >30 mmHg with exercise, or a systolic pulmonary artery pressure of >40 mmHg at rest
- pulmonary HTN is grouped into 5 categories and classified based on etiology

**Table 19. World Health Organization Classification of Pulmonary Hypertension**

| Classification | Some Causes | Treatment Options | Consider in All Patients with PH |
|---|---|---|---|
| **I. Pulmonary Arterial HTN** | Idiopathic<br>Collagen vascular disease (scleroderma, SLE, RA)<br>Congenital systemic-to-pulmonary shunts (Eisenmenger syndrome)<br>Persistent pulmonary hypertension of the newborn (PPHN)<br>Portopulmonary HTN<br>HIV infection<br>Drugs and toxins (e.g. anorexigens)<br>Pulmonary veno-occlusive disease<br>Schistosomiasis<br>Pulmonary capillary hemangiomatosis | Calcium channel blockers (CCBs) for patients with vasoreactivity. Advanced therapy with prostanoids, endothelin receptor antagonists (ERA), PDE5 inhibitors. Lung transplantation for refractory advanced patients | Oxygen therapy<br>Exercise<br>Consider anticoagulation |
| **II. Pulmonary HTN due to Left Heart Disease** | Left-sided atrial or ventricular heart disease (e.g. LV dysfunction)<br>Left-sided valvular heart disease (e.g. aortic stenosis, mitral stenosis)<br>Congenital/acquired left heart inflow/outflow tract obstruction and congenital cardiomyopathies | Treat underlying heart disease | |
| **III. Pulmonary HTN due to Lung Disease and/or Hypoxia** | Parenchymal lung disease (COPD, interstitial fibrosis, cystic fibrosis)<br>Chronic alveolar hypoxia (chronic high altitude, alveolar hypoventilation disorders, sleep-disordered breathing) | Treat underlying cause of hypoxia and correct with supplemental oxygen (proven mortality benefit) | |
| **IV. Chronic Thromboembolic Pulmonary HTN (CTEPH)** | Thromboembolic obstruction of proximal pulmonary arteries<br>Obstruction of distal pulmonary arteries – PE (thrombus, foreign material, tumour, in situ thrombosis) | Anticoagulation, thromboendarterectomy, riociguat | |
| **V. Pulmonary HTN with Unclear Multifactorial Mechanisms** | Hematologic disorders (e.g. sickle cell)<br>Systemic disorders (e.g. sarcoidosis)<br>Metabolic disorders<br>Extrinsic compression of central pulmonary veins (tumour, adenopathy, fibrosing mediastinitis)<br>Chronic hemolytic anemia<br>Segmental pulmonary hypertension | Treat underlying cause | |

Adapted from: Simonneau G, et al. J Am Coll Cardio 2013:62(25 Suppl):D34-D41

## IDIOPATHIC PULMONARY ARTERIAL HYPERTENSION (PRIMARY PULMONARY HYPERTENSION)

### Definition

- pulmonary HTN in the absence of a demonstrable cause
- histology includes medial hypertrophy, intimal fibrosis, and plexiform arteriopathy
- exclude:
  - left-sided cardiac valvular disease
  - myocardial disease
  - congenital heart disease
  - any clinically significant parenchymal lung disease
  - systemic connective-tissue disease
  - chronic thromboembolic disease

### Epidemiology

- usually presents in young females (20-40 yr); mean age of diagnosis is 36 yr
- most cases are sporadic; familial predisposition in 10% of cases, some linked to mutations in BMPR2
- may be associated with the use of anorexic drugs (e.g. Aminorex®, Fenfluramine®), amphetamines, and cocaine

**Guidelines for Vasodilator Response in Pulmonary Arterial HTN**

- Patients with idiopathic pulmonary arterial hypertension (IPAH) that respond to vasodilators acutely, have an improved survival with long-term use of CCBs
- Vasoreactivity testing: short-acting agent such as IV epoprostenol, IV adenosine, or inhaled NO
- Positive vasodilator response: mean pulmonary artery pressure (PAP) fall of at least 10 mmHg to ≤40 mmHg with an increased or unchanged cardiac output (European Society of Cardiology)
- Positive vasodilator response: should be considered as candidate for trial of oral CCB therapy

Medical Therapy for Pulmonary Arterial Hypertension. ACCP Evidence-Based Clinical Practice Guidelines. Chest 2004;(Suppl)06:126

### Signs and Symptoms

**Table 20. Signs and Symptoms of Pulmonary Hypertension**

| Symptoms | Signs |
|---|---|
| Dyspnea | Loud, palpable P2 |
| Fatigue | RV heave |
| Retrosternal chest pain | Right-sided S4 (due to RVH) |
| Syncope | Systolic murmur (tricuspid regurgitation [TR]) |
| Symptoms of underlying disease | If RV failure: right sided S3, increased JVP, positive HJR, peripheral edema, TR |
| | Reynaud's phenomenon |

Pulmonary arterial pressures are measured by pulmonary artery catheters (i.e. Swan-Ganz catheter) which are inserted into a large vein (often internal jugular). A balloon at the end of the catheter tip is inflated causing the catheter to advance through the right side of the heart and into the pulmonary artery. This allows for the measurement of RA, RV, PA, and pulmonary capillary wedge pressures as well as sampling of mixed venous blood. A thermistor near the end of the catheter also allows for assessment of cardiac output by thermodilution

### Investigations
- CXR: enlarged central pulmonary arteries, cardiac changes due to RV enlargement (filling of retrosternal air space)
- ECG: RVH/right-sided strain (see Cardiology and Cardiac Surgery, C34)
- 2-D echo doppler assessment of right ventricular systolic pressure
- cardiac catheterization: direct measurement of pulmonary artery pressures (necessary to confirm diagnosis)
- PFTs to assess for underlying lung disease: $DL_{CO}$ usually reduced; volumes and flows normal
- CT angiogram to assess lung parenchyma and possible PE
- V/Q scan ± pulmonary angiogram to rule out thromboembolic disease
- serology: ANA positive in 30% of patients with primary pulmonary HTN; other serologic markers can be used in the appropriate clinical setting

**Virchow's Triad**
- Venous stasis
- Endothelial cell damage
- Hypercoagulable states

### Treatment
- see Table 19

### Prognosis
- 2-3 yr mean survival from time of diagnosis
- survival decreases to approximately 1 yr if severe pulmonary HTN or right-heart failure

## Pulmonary Embolism

### Definition
- lodging of a blood clot in the pulmonary arterial tree with subsequent increase in pulmonary vascular resistance, impaired V/Q matching, and possibly reduced pulmonary blood flow

### Etiology and Pathophysiology
- one of the most common causes of preventable death in the hospital
- proximal leg thrombi (popliteal, femoral, or iliac veins) are the source of most clinically recognized pulmonary emboli
- thrombi often start in calf, but must propagate into proximal veins to create a sufficiently large thrombus for a clinically significant PE
- fewer than 30% of patients have clinical evidence of DVT (e.g. leg swelling, pain, or tenderness)
- always suspect PE if patient develops fever, sudden dyspnea, chest pain, or collapse 1-2 wk after surgery

### Risk Factors
- stasis
  - immobilization: paralysis, stroke, bed rest, prolonged sitting during travel, immobilization of an extremity after fracture
  - obesity, CHF
  - chronic venous insufficiency
- endothelial cell damage
  - post-operative injury, trauma
- hypercoagulable states
  - underlying malignancy (particularly adenocarcinoma)
  - cancer treatment (chemotherapy, hormonal)
  - exogenous estrogen administration (OCP, HRT)
  - pregnancy, post-partum
  - prior history of DVT/PE, family history
  - nephrotic syndrome
  - coagulopathies: Factor V Leiden, Prothrombin 20210A variant, inherited deficiencies of antithrombin/protein C/protein S, antiphospholipid antibody, hyperhomocysteinemia, increased Factor VIII levels, and myeloproliferative disease
- increasing age

**Multidetector Computed Tomography for Acute Pulmonary Embolism (PIOPED II Trial)**
NEJM 2006;354:2317-27
**Study**: Multicentre, prospective study investigating accuracy of computed tomography angiography (CTA) alone and combined with venous phase imaging (CTA-CTV) for the diagnosis of PE.
**Patients**: 824 patients of several thousand eligible for study received reference diagnosis to confirm absence or presence of PE (V/Q scan, venous compression U/S of lower extremities, and pulmonary digital-subtraction angiography (DSA) if necessary). To confirm absence, patients in whom PE was excluded were telephoned 3-6 mo after enrollment. Any deaths were reviewed by an outcome committee. All patients enrolled also underwent clinical assessment of PE (including a Wells' score) prior to imaging.
**Outcomes**: Diagnosis of pulmonary embolism.
**Results**: 773 of 824 patients had adequate CTAs for interpretation. PE was diagnosed in 192 of the 824 patients. Sensitivity was 83% (150 of 181 patients, 95% CI 0.76-0.92) and specificity was 96% (567 of 592 patients, 95% CI 0.93-0.97). However, the predictive value of CTA-CTV varied when clinical pre-test probability was taken into account. PPV of CTA for high, intermediate and low clinical probability were 96% (95% CI 0.78-0.99), 92% (95% CI 0.84-0.96), and 58% (95% CI 0.40-0.73), respectively. NPV of CTA for high, intermediate, and low clinical probability were 60% (95% CI 0.32-0.83), 89% (95% CI 0.82-0.93), and 96% (95% CI 0.92-0.98) respectively.
**Conclusion**: CTA is effective for diagnosing or excluding PE in accordance with assessment of clinical pretest probability. When clinical probability is inconsistent with imaging results, further investigations are required to rule out PE.

## Investigations (if highly suspicious, go straight to CT angiogram)

- see Emergency Medicine, ER33

### Table 21. Common Investigations for Pulmonary Embolism

| Investigation | Purpose/Utility |
|---|---|
| **Pulmonary Angiogram (Gold Standard)** | Filling defect indicative of embolus; negative angiogram excludes clinically relevant PE<br>More invasive, and harder to perform than CT, therefore done infrequently |
| **D-Dimer** | Highly sensitive D-dimer result can exclude DVT/PE if pretest probability is already low<br>Little value if pretest probability is high<br>If D-dimer positive, will need further evaluation with compression U/S (for DVT) and/or CT (for PE) |
| **CT Angiogram** | Both sensitive and specific for PE<br>Diagnosis and management uncertain for small filling defects<br>CT may identify an alternative diagnosis if PE is not present<br>CT scanning of the proximal leg and pelvic veins can be done at the same time and may be helpful |
| **Venous Duplex U/S or Doppler** | With leg symptoms<br>Positive test rules in proximal DVT<br>Negative test rules out proximal DVT<br>Without leg symptoms<br>Positive test rules in proximal DVT<br>Negative test does not rule out a DVT: patient may have non-occlusive or calf DVT |
| **ECG** | Findings not sensitive or specific<br>Sinus tachycardia most common; may see non-specific ST segment and T wave changes<br>RV strain, RAD, RBBB, S1-Q3-T3 with massive embolization |
| **CXR** | Frequently normal; no specific features<br>Atelectasis (subsegmental), elevation of a hemidiaphragm<br>Pleural effusion: usually small<br>Hampton's hump: cone-shaped area of peripheral opacification representing infarction<br>Westermark's sign: dilated proximal pulmonary artery with distal oligemia/decreased vascular markings (difficult to assess without prior films)<br>Dilatation of proximal PA: rare |
| **V/Q Scan** | Very sensitive but low specificity<br>Order scan if:<br>CXR normal, no COPD<br>Contraindication to CT (contrast allergy, renal dysfunction, pregnancy)<br>Avoid V/Q scan if:<br>CXR abnormal or COPD<br>Inpatient<br>Suspect massive PE<br>Results:<br>Normal: excludes the diagnosis of PE<br>High probability: most likely means PE present, unless pre-test probability is low<br>60% of V/Q scans are nondiagnostic |
| **Echocardiogram** | Useful to assess massive or chronic PE<br>Not routinely done |
| **ABG** | No diagnostic use in PE (insensitive and nonspecific)<br>May show respiratory alkalosis (due to hyperventilation) |

## Treatment

- admit for observation (stable patients with DVT only may be sent home on LMWH)
- oxygen: supplemental oxygen should be administered to target an oxygen saturation ≥90 percent
- pain relief: analgesics if chest pain – narcotics or acetaminophen
  - acute anticoagulation: therapeutic-dose SC LMWH or fondaparinux or unfractionated heparin or oral factor Xa inhibitors (rivaroxaban, apixaban, edoxaban) or direct thrombin inhibitors (dabigatran) – start ASAP
  - anticoagulation stops clot propagation, prevents new clots, and allows endogenous fibrinolytic system to dissolve existing thromboemboli over months; get baseline CBC, INR, aPTT ± renal function ± liver function
  - for SC LMWH: dalteparin 200 U/kg once daily, enoxaparin 1 mg/kg bid, or fondaparinux 5-10 mg once daily – no lab monitoring – avoid or reduce dose in renal dysfunction
  - for IV heparin: bolus of 75 U/kg (usually 5000 U) followed by infusion starting at 20 U/kg/h – aim for aPTT 2-3x control
- long-term anticoagulation
  - for most non-pregnant patients who do not have renal insufficiency or active cancer, first-line is direct oral anticoagulants (rivaroxaban, apixaban, edoxaban, or dabigatran) rather than warfarin
  - warfarin: start the same day as LMWH/heparin – overlap warfarin with LMWH/heparin for at least 5 d and until INR in target range of 2-3 for at least 2 d (use for patients with severe renal insufficiency)
  - LMWH instead of warfarin for pregnancy, active cancer, or high bleeding risk patients
- IV thrombolytic therapy
  - if patient has massive PE (hypotension or clinical right heart failure) and no contraindications
  - hastens resolution of PE but may not improve survival or long-term outcome and doubles risk of major bleeding

D-dimer is elevated in patients with increased age, recent surgery, cancer, inflammation, infection, pregnancy, and severe renal dysfunction. It has good sensitivity and negative predictive value, but poor specificity and positive predictive value

Classic ECG finding of PE is S1-Q3-T3 (inverted T3), but most commonly see only sinus tachycardia

**Clinical Prediction Rule for Pulmonary Embolism**
J Thromb Hemost 2000;83:416-20
**Wells' Criteria**

| Risk Factors | Points |
|---|---|
| Clinical signs of DVT | 3.0 |
| No more likely alternative diagnosis (using H&P, CXR, ECG) | 3.0 |
| Immobilization or surgery in previous 4 wk | 1.5 |
| Previous PE/DVT | 1.5 |
| HR >100 beats/min | 1.5 |
| Hemoptysis | 1.0 |
| Malignancy | 1.0 |
| **Clinical Probability** | |
| Low (0-2) | 3% |
| Intermediate (3-6) | 28% |
| High (>6) | 78% |
| Modified Wells': >4 PE likely; ≤4 PE unlikely | |

JAMA 2006

**PE Rule Out Criteria (PERC)**
**Prospective Multicentre Evaluation of the Pulmonary Embolism Rule Out Criteria**
J Thromb Hemost 2008;6:772

- Age less than 50 yr
- Heart rate less than 100 bpm
- Oxyhemoglobin saturation ≥95 percent
- No hemoptysis
- No estrogen use
- No prior DVT or PE
- No unilateral leg swelling
- No surgery or trauma requiring hospitalization within the past 4 wk

Acute PE can probably be excluded without further diagnostic testing if the patient meets all PERC criteria AND there is a low clinical suspicion for PE, according to either the Wells' criteria or a low gestalt probability determined by the clinician prior to diagnostic testing for PE.

**Evaluation of a Suspected Pulmonary Embolism**
*Low clinical probability of embolism*
D-dimer (+ve) → CT scan (+ve) → ruled in
(–ve) → ruled out
Intermediate or high probability
CT scan (–ve) → ruled out
(+ve) → ruled in

Notes

- Use D-dimers only if low clinical probability, otherwise, go straight to CT
- If using V/Q scans (CT contrast allergy or renal failure):
- Negative V/Q scan rules out the diagnosis
- High probability V/Q scan only rules in the diagnosis if have high clinical suspicion
- Inconclusive V/Q scan requires leg U/S to look for DVT or CT

- interventional thrombolytic therapy
  - massive PE may be treated with catheter-directed thrombolysis by an interventional radiologist
  - catheter-directed thrombolysis is not recommended over systemic thrombolysis
- IVC filter: only if recent proximal DVT + absolute contraindication to anticoagulation
- duration of long-term anticoagulation: individualized, however generally
  - if reversible cause for PE (surgery, injury, pregnancy, etc.): 3-6 mo
  - if PE unprovoked: 6 mo to indefinite
  - if ongoing major risk factor (active cancer, antiphospholipid antibody, etc.): indefinite

### Thromboprophylaxis
- mandatory for most hospital patients: reduces DVT, PE, all-cause mortality, cost-effective
- start ASAP
- continue at least until discharge or recommend extending for 35 d post-operatively, if major orthopedic surgery

**Table 22. VTE Risk Categories and Prophylaxis (see Hematology, H37)**

| Risk Group | Prophylaxis Options |
|---|---|
| **Low Thrombosis Risk** | |
| Medical patients: fully mobile | No specific prophylaxis |
| Surgery: <30 min, fully mobile | Frequent ambulation |
| **Moderate Thrombosis Risk** | |
| Most general, gynecologic, urologic surgery | LMWH |
| Sick medical patients | Low dose unfractionated heparin |
| | Fondaparinux |
| **High Thrombosis Risk** | |
| Arthoplasty, hip fracture surgery | LMWH |
| Major trauma, spinal cord injury | Fondaparinux |
| | Warfarin (INR 2-3) |
| | Dabigatran |
| | Apixaban |
| | Rivaroxaban |
| | Low dose unfractionated heparin |
| **High Bleeding Risk** | |
| Neurosurgery, intracranial bleed | TED stockings™, pneumatic compression devices |
| Active bleeding | LMWH or low dose heparin when bleeding risk decreases |

**Workup for Idiopathic VTE**
Thrombophilia Workup: recurrent or idiopathic DVT/PE, age <50, FHx, unusual location, massive
Malignancy Workup: 12% of patients with idiopathic VTE will have a malignancy

**The Use of Unfractionated Heparin Should Be Limited to:**
- Patients with severe renal dysfunction (CrCl <30 ml/min) in whom LMWH and novel oral anticoagulation should be avoided
- Patients at elevated risk of bleeding that may need rapid reversal of anticoagulation
- Patients who receive thrombolytic therapy

**Extended Use of Dabigatran, Warfarin or Placebo in Venous Thromboembolism**
NEJM 2013;368:709-18
**Study**: Two double blind, RCTs; one comparing against placebo, the other against active treatment.
**Population**: 4199 patients (2856 in active-control study, 1343 in placebo-control study) with VTE who had completed at least 3 mo of therapy.
Intervention: In the active-control study, patients randomized to either 150 mg dabigatran or warfarin (INR 2.0-3.0). Patients in the placebo-control study received either 150 mg dabigatran or placebo.
**Outcome**: Recurrence of VTE, risk of major or clinically relevant bleed.
**Results**: In the active-control study, there was a hazard ratio (HR) of 1.44 (95% CI 0.78-2.64 for non-inferiority) of recurrent VTE with dabigatran vs. warfarin. HR of major or clinically relevant bleed was 0.54 (95% CI 0.41-0.71). In the placebo-control study, the HR of VTE with dabigatran vs. placebo was 0.08 (95% CI 0.02-0.25). HR of major or clinically relevant bleed was 2.92 (95% CI 1.52-5.60).
**Conclusions**: Dabigatran appears to be non-inferior to warfarin in the prevention of VTE recurrence. Dabigatran is associated with a lower risk of major or clinically relevant bleed than warfarin, but greater than placebo.

# Pulmonary Vasculitis

**Table 23. Pulmonary Vasculitis**

| Disease | Definition | Pulmonary Features | Extra-Pulmonary Features | Investigations | Treatment |
|---|---|---|---|---|---|
| **Granulomatosis with Polyangiitis (GPA, previously Wegener's Granulomatosis)** (see Nephrology, NP22) | Systemic vasculitis of medium and small arteries | Necrotizing granulomatous lesions of the upper and lower respiratory tract | Focal necrotizing lesions of arteries and veins; crescentic glomerulonephritis | CXR: nodules, cavities, and alveolar opacities<br>c-ANCA<br>Tissue confirmation | Corticosteroids and cyclophosphamide or rituximab |
| **Eosinophilic Granulomatosis with Polyangiitis (EGPA, Churg-Strauss)** | Multisystem disorder characterized by allergic rhinitis, asthma, and prominent peripheral eosinophilia | Asthma<br>Infiltrates | Life-threatening systemic vasculitis involving the lungs, pericardium and heart, kidneys, skin, and PNS (mononeuritis multiplex) | Peripheral eosinophilia is the most common finding<br>p-ANCA may be positive<br>Biopsy involved tissue | Corticosteroids |
| **Anti-GBM Disease (Goodpasture's)** (see Nephrology, NP22) | A disorder characterized by diffuse alveolar hemorrhage and glomerulonephritis caused by anti-GBM antibodies, which cross-react with basement membranes of the kidney and lung | Hemoptysis<br>May follow influenza infection | Anemia | CXR: may see alveolar infiltrates if hemorrhage is profuse<br>ELISA test with anti-GBM antibodies<br>Renal biopsy/indirect immunofluorescence shows linear staining | Acutely: corticosteroids, plasmapheresis, immunosuppressive therapy<br>Severe cases: bilateral nephrectomy |
| **Systemic Lupus Erythematosus, Rheumatoid Arthritis, Scleroderma** | See Rheumatology, RH18 | | | | |

# Pulmonary Edema

- see Cardiology and Cardiac Surgery, C35

Scleroderma is the most common collagen vascular disease affecting the lung

# Diseases of the Mediastinum and Pleura

## Mediastinal Masses

### Definition
- mediastinum: bound by the thoracic inlet, diaphragm, sternum, vertebral bodies, and the pleura
- can be broken down into 3 compartments: anterior, middle, and posterior

### Etiology and Pathophysiology
- diagnosis is aided by location and patient's age
- anterior compartment: more likely to be malignant
  - "Four Ts" (see sidebar), lymphoma, lipoma, pericardial cyst
- middle compartment
  - pericardial cyst, bronchogenic cyst/tumour, lymphoma, lymph node enlargement, aortic aneurysm
- posterior compartment
  - neurogenic tumours, meningocele, enteric cysts, lymphoma, diaphragmatic hernias, esophageal tumour, aortic aneurysm

**Horner's Syndrome**
Ptosis, Miosis, Anhydrosis

**Differential of an Anterior Compartment Mass**

**4 Ts**
**T**hymoma
**T**hyroid enlargement (goitre)
**T**eratoma
**T**umours (lymphoma, parathyroid, esophageal, angiomatous)

### Signs and Symptoms
- 50% asymptomatic (mainly benign); when symptomatic, 50% are malignant
- chest pain, cough, dyspnea, recurrent respiratory infections
- hoarseness, dysphagia, Horner's syndrome (see sidebar), facial/upper extremity edema (SVC compression)
- paraneoplastic syndromes (e.g. myasthenia gravis [thymomas])

### Investigations
- CXR (compare to previous)
- CT with contrast (anatomic location, density, relation to mediastinal vascular structures)
- MRI: specifically indicated in the evaluation of neurogenic tumours
- U/S (best for assessment of structures in close proximity to the heart and pericardium)
- radionuclide scanning: $^{131}$I (for thyroid), gallium (for lymphoma)
- biochemical studies: thyroid function, serum calcium, phosphate, PTH, AFP, β-hCG
- biopsy (mediastinoscopy, percutaneous needle aspiration)

**Mediastinal Components**
**Anterior**: sternum to pericardium and great vessels. Includes: thymus, extrapericardial aorta and branches, great veins, lymphatic tissues
**Middle**: pericardium (anteriorly), posterior pericardial reflection, diaphragm, thoracic inlet. Includes: heart, intrapericaridal great vessels, pericardium, trachea
**Posterior**: posterior pericardial reflection, posterior border of vertebral bodies, first rib to the diaphragm. Includes: esophagus, vagus nerve, thoracic duct, sympathetic chain, azygous venous system

### Management
- excision - symptomatic benign mass that is enlarging or a mass with concerns for malignancy
- resect bronchogenic cysts and localized neurogenic tumours via minimally invasive video assisted procedures
- exploration via sternotomy or thoracotomy
- diagnostic biopsy rather than major operation if mass is likely to be a lymphoma, germ cell tumour, or unresectable invasive malignancy
- ± post-operative radiotherapy/chemotherapy if malignant

## Mediastinitis

- most common causes: post-operative complications of cardiovascular or thoracic surgical procedures

### Acute
- etiology
  - complication of endoscopy (e.g. esophageal perforation providing entry point for infection)
  - esophageal or cardiac surgery
  - tumour necrosis
- signs and symptoms
  - fever, substernal pain
  - pneumomediastinum, mediastinal compression
  - Hamman's sign (auscultatory "crunch" during cardiac systole)
- treatment
  - antibiotics (IV vancomycin + 3rd gen cephalosporin), drainage, ± surgical closure of perforation

### Chronic
- usually granulomatous process or fibrosis related to previous infection (e.g. histoplasmosis, TB, sarcoidosis, syphilis)

# Pleural Effusions

## Definition
- excess amount of fluid in the pleural space (up to 25 mL normal amount)

## Etiology
- disruption of normal equilibrium between pleural fluid formation/entry and/or pleural fluid absorption/exit
- pleural effusions are classified as transudative or exudative
  - distinguish clinically using Light's Criteria (98% sensitivity and 83% specificity for identifying exudative pleural effusions)

**Starling's hypothesis**: The rate of passive fluid movement across a capillary wall is governed by the gradients of hydrostatic pressure and oncotic pressure across the same capillary wall

### Table 24. Laboratory Values in Exudative Pleural Effusion

| | Light's Criteria | Modified Light's Criteria |
|---|---|---|
| **Protein – Pleural/Serum** | >0.5 | >0.5 |
| **LDH – Pleural/Serum** | >0.6 | >0.6 |
| **Pleural LDH** | >2/3 upper limit of N serum LDH | >0.45 upper limit of N serum LDH |
| **Exudate = any one criterion** | | |

Ann Intern Med 1979;77:507-513 Chest 1997;111:970-980

All criteria for transudate must be fulfilled to be considered a transudative effusion. If any one of the criteria for exudates is met – it is an exudate

## Transudative Pleural Effusions
- pathophysiology: alterations to Starling forces affects the rates of formation and absorption of pleural fluid
- etiology
  - CHF: usually right-sided or bilateral
  - cirrhosis leading to hepatic hydrothorax
  - nephrotic syndrome, protein losing enteropathy, cirrhosis
  - pulmonary embolism (may cause transudative but more often causes exudative effusion)
  - peritoneal dialysis, hypothyroidism, CF, urinothorax

**Transudative** effusions are usually bilateral, not unilateral

**Exudative** effusions can be bilateral or unilateral

## Exudative Pleural Effusions
- pathophysiology: increased permeability of pleural capillaries or lymphatic dysfunction

### Table 25. Exudative Pleural Effusion Etiologies

| Etiology | Examples |
|---|---|
| **Infectious** | Parapneumonic effusion (associated with bacterial pneumonia, lung abscess) |
| | Empyema (bacterial, fungal, TB) |
| | TB pleuritis |
| | Viral infection |
| | Fungal |
| | Parasitic |
| **Malignancy** | Lung carcinoma (35%) |
| | Lymphoma (10%) |
| | Metastases: breast (25%), ovary, kidney |
| | Mesothelioma |
| | Myeloma |
| **Inflammatory** | Collagen vascular diseases: RA, SLE |
| | Pancreatitis |
| | Benign asbestos related effusion |
| | Pulmonary embolism |
| | ARMS |
| | Post-CABG or cardiac injury |
| | Drug reaction |
| **Intra-Abdominal** | Subphrenic abscess |
| | Pancreatic disease (elevated pleural fluid amylase) |
| | Meigs' syndrome (ascites and hydrothorax associated with an ovarian fibroma or other pelvic tumour) |
| **Intra-Thoracic** | Esophageal perforation (elevated fluid amylase) |
| **Trauma** | Hemothorax: rupture of a blood vessel, commonly by trauma or tumours |
| | Pneumothorax (spontaneous, traumatic, tension) |
| | Chylothorax |
| | Iatrogenic |
| **Other** | Drug-induced |
| | Hypothyroidism |

**Appearance of Pleural Fluid**
- Bloody: trauma, malignancy
- White: empyema, chylous, or chyliform effusion
- Black: aspergillosis, amoebic liver abscess
- Yellow-green: rheumatoid pleurisy
- Viscous: malignant mesothelioma
- Ammonia odour: urinothorax
- Food particles: esophageal rupture

### Signs and Symptoms
- often asymptomatic
- dyspnea: varies with size of effusion and underlying lung function
- orthopnea
- pleuritic chest pain
- inspection: trachea deviates away from effusion, ipsilateral decreased expansion
- percussion: decreased tactile fremitus, dullness
- auscultation: decreased breath sounds, bronchial breathing and egophony at above fluid level, pleural friction rub

### Investigations
- CXR
  - must have >200 mL of pleural fluid for visualization on PA film
  - lateral: >50 mL leads to blunting of posterior costophrenic angle
  - PA: blunting of lateral costophrenic angle
  - dense opacification of lung fields with concave meniscus
  - decubitus: fluid will layer out unless it is loculated
  - supine: fluid will appear as general haziness
- CT: helpful in differentiating parenchymal from pleural abnormalities, may identify underlying lung pathology
- U/S: detects small effusions and can guide thoracentesis
- thoracentesis: indicated if pleural effusion is a new finding; order blood work (LDH, glucose, protein) at the same time for comparison
  - risk of re-expansion pulmonary edema if >1.5 L of fluid is removed
  - inspect for colour, character, and odour of fluid
  - analyze fluid
- pleural biopsy: indicated if suspect TB, mesothelioma, or other malignancy (and if cytology negative)

**Role of CT in Pleural Effusion**
- To assess for fluid loculation, pleural thickening and nodules, parenchymal abnormalities, and adenopathy
- Helps to distinguish benign from malignant effusion and transudative from exudative effusion
- May not distinguish empyema from parapneumonic effusion

**Features of Malignant Effusion**
- Multiple pleural nodules

**Features of Exudative Effusion**
- Loculation
- Pleural thickening
- Pleural nodules
- Extrapleural fat of increased density

**Table 26. Analysis of Pleural Effusion**

| Measure | Purpose |
|---|---|
| **Protein, LDH** | Transudate vs. exudate |
| | LDH especially high (>1000 IU/L) in empyema, rheumatoid, malignancy |
| | Protein especially high in TB, myeloma |
| **Gram Stain, Ziehl-Nielsen Stain (TB), Culture** | Looking for specific organisms |
| **Cell Count Differential** | Neutrophils vs. lymphocytes (lymphocytic effusion in TB, cancer, lymphoma, serositis) |
| **Cytology** | Malignancy, infection |
| **Glucose** | Low (fluid:serum <0.5) in rheumatoid, TB, empyema, malignancy, esophageal rupture |
| **Rheumatoid Factor, ANA, Complement** | Collagen vascular disease |
| **Amylase** | Pancreatitis, esophageal perforation, malignancy |
| **pH** | Normally about 7.6 |
| | Very low (<7.0) in empyema, TB, rheumatoid, malignancy, esophageal rupture |
| **Blood** | Mostly traumatic, malignancy, PE with infarction, TB |
| **Triglycerides** | Chylothorax from thoracic duct leakage, mostly due to trauma, lung CA, or lymphoma |
| **Cholesterol** | Distinguish between chylous and chyliform effusion (seen in inflammation, e.g. TB, RA) |

**Pleural Effusions**

**Simple Effusion**
pH >7.2, LDH <1/2 serum, glucose >2.2

**Complicated Effusion**
pH <7.2, LDH >1/2 serum, glucose <2.2, positive Gram stain
Needs drainage

### Treatment
- thoracentesis
- treat underlying cause
- consider indwelling pleural catheter or pleurodesis in refractory effusions

When possible, organism-directed therapy, guided by culture sensitivities or local patterns of drug resistance, should be utilized

## Complicated Effusion
- see General Surgery and Thoracic Surgery, GS16

## Empyema
- see General Surgery and Thoracic Surgery, GS16

## Atelectasis
- see General Surgery and Thoracic Surgery, GS10

# Pneumothorax

- see General Surgery and Thoracic Surgery, GS17

**Need to Rule Out Life-Threatening Tension Pneumothorax**
**If pneumothorax with:**
- Severe respiratory distress
- Tracheal deviation to contralateral side
- Distended neck veins (↑ JVP)
- Hypotension

**Do not perform CXR**
**Needs immediate treatment**
See Emergency Medicine, ER11

# Asbestos-Related Pleural Disease and Mesothelioma

### Etiology and Pathophysiology
- benign manifestations of asbestos exposure:
  - benign asbestos pleural effusion
    - exudative effusion, typically ~10 yr after exposure, resolves
  - pleural plaques, usually calcified
    - marker of exposure; usually an asymptomatic radiologic finding
- mesothelioma
  - primary malignancy of the pleura
  - decades after asbestos exposure (even with limited exposure)
  - smoking not a risk factor, but asbestos and smoking synergistically increase risk of lung cancer

### Signs and Symptoms
- persistent chest pain, dyspnea, cough, bloody pleural effusion, weight loss

### Investigations
- biopsy (pleuroscopic or open)
- needle biopsy may seed needle tract with tumour

### Treatment
- resection (extrapleural pneumonectomy) requires careful patient selection; rarely successful (average survival <1 yr)

# Respiratory Failure

### Definition
- failure of respiratory system to maintain normal blood gases
- hypoxemic ($PaO_2$ <60 mmHg), hypercapnic ($PaCO_2$ >50 mmHg)
- acute vs. chronic (compensatory mechanisms activated)

### Signs and Symptoms
- signs of underlying disease
- hypoxemia: restlessness, confusion, cyanosis, coma, cor pulmonale
- hypercapnia: headache, dyspnea, drowsiness, asterixis, warm periphery, plethora, increased ICP (secondary to vasodilatation)

### Investigations
- serial ABGs
- CXR and/or CT, bronchoscopy to characterize underlying cause if unclear

# Hypoxemic Respiratory Failure

### Definition
- $PaO_2$ decreased, $PaCO_2$ normal or decreased

### Treatment
- reverse the underlying pathology
- oxygen therapy: maintain oxygenation (if shunt present, supplemental $O_2$ is less effective; see Anesthesia and Perioperative Medicine, A10, for oxygen delivery systems)
- ventilation, BiPAP, and PEEP/CPAP (see Anesthesia and Perioperative Medicine, A10): positive pressure can recruit alveoli and redistribute lung fluid
- improve cardiac output: ± hemodynamic support (fluids, vasopressors, inotropes), reduction of $O_2$ requirements

**Table 27. Approach to Hypoxemia**

| Type of Hypoxemia | Settings | $P_aCO_2$ | A-a$DO_2$ | Oxygen Therapy | Ventilation, BiPAP, and PEEP | Change in Cardiac Output |
|---|---|---|---|---|---|---|
| **1. Low $F_iO_2$** | Postop, high altitude | N or ↓ | N | Improves | No change | No change |
| **2. Hypoventilation** | Drug overdose | ↑ | N | Improves | Improves with ventilation | No change |
| **3a. Shunt (Intrapulmonary)** | ARDS, pneumonia | N or ↓ | ↑ | No change | Improves (except if one-sided) | Improves |
| **3b. Shunt (Right to Left)** | Pulmonary HTN | N or ↓ | ↑ | No change | Worsens | Worsens |
| **4. Low Mixed Venous $O_2$ Content** | Shock | ↓ | ↑ | Improves or no change | Worsens | Improves |
| **5. V/Q Mismatch** | COPD | N or ↑ | ↑ | Improves (small amounts) | Often improves | Improves |
| **6. Diffusion Impairment** | ILD, emphysema | N | ↑ | Improves | Improves with positive pressure | No change or worsens |

Reprinted with permission from Dr. Ian Fraser *Where "N" = within normal limits

# Hypercapnic Respiratory Failure

## Definition
- $PaCO_2$ increased, $PaO_2$ decreased

## Pathophysiology
- increased $CO_2$ production: fever, sepsis, seizure, acidosis, carbohydrate load
- alveolar hypoventilation: COPD, asthma, CF, chest wall disorder, dead space ventilation (rapid shallow breathing)
  - inefficient gas exchange results in inadequate $CO_2$ removal in spite of normal or increased minute volume
- hypoventilation
  - central: brainstem stroke, hypothyroidism, severe metabolic alkalosis, drugs (opiates, benzodiazepines)
  - neuromuscular: myasthenia gravis, Guillain-Barré, phrenic nerve injury, muscular dystrophy, polymyositis, kyphoscoliosis
  - muscle fatigue

## Treatment
- reverse the underlying pathology
- if $PaCO_2$ >50 mmHg and pH <7.35 consider noninvasive or mechanical ventilation
- correct exacerbating factors
  - NTT/ETT suction: clearance of secretions
  - bronchodilators: reduction of airway resistance
  - antibiotics: treatment of infections
  - reverse medications that may be contributing (e.g. narcotics)
- maintain oxygenation (see above)
- diet: increased carbohydrates can increase $PaCO_2$ in those with mechanical or limited alveolar ventilation; high lipids decrease $PaCO_2$

**Dead Space**
- Ventilation without perfusion
- The opposite of shunt

**Causes of Hypercapnia**
- High inspired $CO_2$
- Low total ventilation
- High deadspace ventilation
- High $CO_2$ production

In chronic hypercapnia, supplemental $O_2$ may decrease the hypoxic drive to breathe, but do not deny oxygen if the patient is hypoxic

In COPD patients with chronic hypercapnia ("$CO_2$ retainers"), provide supplemental oxygen to achieve target $SaO_2$ from 88-92%

# Acute Respiratory Distress Syndrome

## Definition
- clinical syndrome characterized by severe respiratory distress, hypoxemia, and noncardiogenic pulmonary edema
- The Berlin Criteria (JAMA 2012;307:2526-2533) for ARDS
  - acute onset
    - within 7 d of a defined event, such as sepsis, pneumonia, or patient noticing worsening of respiratory symptoms
      - usually occurs within 72 h of presumed trigger
    - bilateral opacities consistent with pulmonary edema on either CT or CXR
    - not fully explained by cardiac failure/fluid overload, but patient may have concurrent heart failure
    - objective assessment of cardiac function (e.g. echocardiogram) should be performed even if no clear risk factors

## Etiology
- direct lung injury
  - airway: aspiration (**gastric contents**, drowning), **pneumonia**, inhalation injury (oxygen toxicity, nitrogen dioxide, smoke)
  - circulation: embolism (fat, amniotic fluid), reperfusion injury

**ALI vs. ARDS:** Definition is the same, except ALI is a $P_aO_2/F_iO_2 \leq 300$, while ARDS is a $P_aO_2/F_iO_2 \leq 200$

**Categorization of ARDS as Mild, Moderate or Severe – The Berlin Criteria**

| ARDS Severity | $P_aO_2/FiO_2$ (mmHg)* | Mortality (95% CI) |
|---|---|---|
| Mild | 200-300 | 27 (24-30)% |
| Moderate | 100-200 | 32 (29-34)% |
| Severe | <100 | 45 (42-48)% |

*on ≥5 cm $H_2O$ PEEP, #P<0.001
JAMA 2012;307:2526-33

- indirect lung injury
  - circulation: **sepsis, shock, trauma**, blood transfusion, pancreatitis
  - neurogenic: head trauma, intracranial hemorrhage, drug overdose (narcotics, sedatives, TCAs)

### Pathophysiology
- disruption of alveolar capillary membranes → leaky capillaries → interstitial and alveolar pulmonary edema → reduced compliance, V/Q mismatch, shunt, hypoxemia, pulmonary HTN

### Clinical Course
**A. Exudative Phase**
- first 7 d of illness after exposure to ARDS precipitant
- alveolar capillary endothelial cells and type I pneumocytes are injured, resulting in loss of normally tight alveolar barrier
- patients develop dyspnea, tachypnea, increased work of breathing
  - these result in respiratory fatigue and eventually respiratory failure (see *Hypoxemic Respiratory Failure*, R25)

**B. Fibroproliferative Phase**
- after day 7
- may still experience dyspnea, tachypnea, fatigue, and hypoxemia
- most patients clinically improve and are able to wean off mechanical ventilation
- some patients develop fibrotic lung changes that may require long-term support on supplemental oxygen or even mechanical ventilation
- if fibrosis present, associated with increased mortality

### Treatment
- based on ARDS Network (see *Landmark Respirology Trials*, R34)
- treat underlying disorder (e.g. antibiotics if infection present)
- mechanical ventilation using low tidal volumes (<6 mL/kg) to prevent barotrauma
  - use optimal amount of PEEP to keep airways open and allow the use of lower $F_iO_2$
  - may consider using prone ventilation, ± inhaled nitric oxide, short term paralytics (<48 h) or ECMO (extracorpeal membrane oxygenation) if conventional treatment is failing
- fluids and inotropic therapy (e.g. dopamine, vasopressin) if cardiac output inadequate
- pulmonary-arterial catheter now seldom used for monitoring hemodynamics
- mortality: 30-40%, usually due to non-pulmonary complications
- sequelae of ARDS include residual pulmonary impairment, severe debilitation, polyneuropathy and psychologic difficulties, which gradually improve over time
- most survivors eventually regain near-normal lung function, often with mildly reduced diffusion capacity

**Risk Factors for Aspiration Pneumonia**

| Categories | Examples |
|---|---|
| Decreased level of consciousness | Alcoholism |
| Upper GI tract disorders | Dysphagia, esophageal disorders |
| Mechanical instrumentation | Intubation, nasogastric tube, feeding tube |
| Neurologic conditions | Dementia, Parkinson disease |
| Others | Protracted vomiting |

# Neoplasms

## Lung Cancer

- see General Surgery and Thoracic Surgery, GS18

## Approach to the Solitary Pulmonary Nodule

- see Medical Imaging, MI7
- see General Surgery and Thoracic Surgery, GS18

# Sleep-Related Breathing Disorders

## Hypoventilation Syndromes

- primary alveolar hypoventilation: idiopathic
- obesity-hypoventilation syndrome (Pickwickian syndrome)
- respiratory neuromuscular disorders

**Normal Respiratory Changes during Sleep**
- Tidal volume decreases
- Arterial $CO_2$ increases (due to decreased minute ventilation)
- Pharyngeal dilator muscles relax causing increased upper airway resistance

## Sleep Apnea

**Apnea**: absence of breathing for ≥10 s
**Hypopnea**: excessive decrease in rate or depth of breathing (>50% reduction in ventilation for >10 sec)
**Hyperpnea**: excessive increase in rate or depth of breathing

### Definition
- episodic decreases in airflow during sleep
- quantitatively measured by the Apnea/Hypopnea Index (AHI) = # of apneic and hypopneic events per hour of sleep
- sleep apnea generally accepted to be present if AHI ≥5
  - AHI: Mild OSA 5-15 events/h, Moderate 15-30 events/h, Severe >30 events/h

### Classification
- obstructive (OSA)
  - caused by transient, episodic obstruction of the upper airway
  - absent or reduced airflow despite persistent respiratory effort
- central (CSA) (see Neurology, N47)
  - can be hypercapneic CSA caused by transient, episodic decreases in CNS drive to breathe or nonhypercapnic where the drive to breathe is increased
  - no airflow because no respiratory effort
- Cheyne-Stokes Respiration: a form of CSA in which central apneas alternate with hyperpneas to produce a crescendo-decrescendo pattern of tidal volume; seen in severe LV dysfunction, brain injury, and other settings (see Figure 2)
- mixed (MSA)
  - features of both CSA and OSA
  - loss of hypoxic and hypercapnic drives to breathe secondary to "resuscitative breathing": overcompensatory hyperventilation upon awakening from OSA induced hypoxia

### Risk Factors
- for OSA: obesity, upper airway abnormality, neuromuscular disease, hypothyroidism, alcohol/sedative use, nasal congestion, sleep deprivation, enlarged tonsils, crowded oropharynx, short/wide neck
- for CSA: LV failure, brainstem lesions, stroke, brain tumours, encephalitis, encephalopathy, obesity (hypoventilation), neuromuscular disease, myxedema, high altitude, narcotics

### Signs and Symptoms
- obtain history from spouse/partner
- secondary to repeated arousals and fragmentation of sleep: nocturnal gasping/choking, daytime somnolence, personality and cognitive changes, snoring
- secondary to hypoxemia and hypercapnia: morning headache, polycythemia, pulmonary/systemic HTN, cor pulmonale/CHF, nocturnal angina, arrhythmias
- a typical presentation for OSA is a middle-aged obese male who snores

### Investigations
- sleep study (polysomnography)
- evaluates sleep stages, (EEG, EOG, EMG), airflow, ribcage movement, arousals, ECG, $SaO_2$, limb movements, snoring, body position, video recording
- indications
  - excessive daytime sleepiness
  - unexplained pulmonary HTN or polycythemia
  - daytime hypercapnia
  - titration of optimal nasal CPAP or BiPAP
  - assessment of objective response to other interventions (e.g. oral appliances for sleep apnea, positional therapy)

**Continuous Positive Airways Pressure for Obstructive Sleep Apnea**
Cochrane DB Syst Rev 2006;CD001106
**Study**: Pooled analysis of 36 RCTs (n=1718) comparing nocturnal CPAP with an inactive control or oral appliances in adults with OSA.
**Conclusions**: The use of CPAP showed significant improvements in objective and subjective measures including cognitive function, sleepiness, measures of quality of life, and a lower average systolic and diastolic blood pressure. People who responded equally well to CPAP and oral appliances expressed a strong preference for oral appliances; however, participants on oral appliances were more likely to withdraw from therapy.

### Treatment
- modifiable factors: weight loss, decreased alcohol/sedatives, nasal decongestion, treatment of underlying medical conditions
- OSA or MSA: nasal CPAP, postural therapy (e.g. no supine sleeping), dental appliance
- CSA or hypoventilation syndromes: nasal BiPAP/CPAP, respiratory stimulants (e.g. acetazolamide, theophylline, progesterone), adaptive servoventilation (e.g. progesterone) in select cases
- tracheostomy rarely required and should be used as last resort for OSA

CPAP has been shown to reduce cardiovascular risk and cardiovascular related deaths in patients with obstructive sleep apnea

### Complications
- depression, weight gain, decreased quality of life, workplace and vehicular accidents, cardiac complications (e.g. HTN), reduced work/social function
- associated with higher potential risk of CVS complications (e.g. heart attacks, strokes, arrhythmias, heart failure)

# Introduction to Intensive Care

## Intensive Care Unit Basics

- goal is to stabilize critically ill patients: hemodynamic, respiratory, or cardiac instability, or need for close monitoring

## Lines and Catheters

- arterial lines
  - monitor beat-to-beat blood pressure variations, obtain blood for routine ABGs
  - common sites are the radial and femoral arteries
- central venous catheter (central line)
  - administer IV fluids, monitor CVP, insert pulmonary artery catheters
  - administer TPN and agents too irritating for peripheral line (e.g. vasopressors, chemotherapy)
  - common sites: internal jugular vein, subclavian vein, femoral vein
- pulmonary arterial catheter
  - balloon guides the catheter from a major vein to the right heart
  - measures pulmonary capillary wedge pressure (PCWP) via a catheter wedged in distal pulmonary artery
  - PCWP reflects the LA and LV diastolic pressure (barring pulmonary venous or mitral valve disease)
  - indications (now used infrequently due to associated complications)
    - diagnosis of shock, primary pulmonary HTN, valvular disease, intracardiac shunts, cardiac tamponade, PE
    - assessment of hemodynamic response to therapies
    - differentiation of high- versus low-pressure pulmonary edema
    - management of complicated MI, multiorgan system failure and/or severe burns, or hemodynamic instability after cardiac surgery
  - absolute contraindications
    - tricuspid or pulmonary valve mechanical prosthesis
    - right heart mass (thrombus or tumour)
    - tricuspid or pulmonary valve endocarditis

**Intensive vs. Conventional Glucose Control in Critically Ill Patients**
NEJM 2009;360:1283-97
**Purpose**: To assess whether intensive glucose control improves mortality in critically ill patients.
**Study**: Prospective, randomized controlled trial.
**Population**: 6104 patients expected to require ICU treatment for 3 or more consecutive days.
**Intervention**: Patients were randomized to insulin therapy regimens with intensive (blood glucose 4.5-6 mM) or conventional (blood glucose 10 mM or less) glucose control targets. Intravenous insulin therapy was used to maintain blood glucose in target range.
**Primary Outcome**: Death from any cause within 90 d after randomization.
**Results**: The odds ratio for death in the intensive control group was 1.14 (95% CI 1.02-1.28; P=0.02) and this effect did not differ between surgical and medical patients. Severe hypoglycemia (blood glucose <2.2 mM) was significantly more common in the intensive management group (6.8% versus 0.5%; P<0.001).
**Conclusion**: Intensive insulin therapy in ICU patients increased mortality compared to blood glucose targeting of less than 10 mM with a number needed to harm of 38.

**Table 28. Useful Equations and Cardiopulmonary Parameters**

| | |
|---|---|
| BSA = [Ht (cm) + Wt (kg) – 60]/100 | PCWP = LVEDP |
| SV = CO / HR | SVI = CI / HR |
| CI = CO / BSA | RV Ejection Fraction = SV / RVEDV |
| SVRI = [(MAP – RAP) 80]/CI | PP = sBP – dBP |
| P:F ratio = $P_aO_2$ / $F_iO_2$ | MAP = 1/3 sBP + 2/3 dBP = dBP + 1/3 PP |

BSA = body surface area; CI = cardiac index; CO = cardiac output; dBP = diastolic blood pressure; HR = heart rate; LVEDP = left ventricular end diastolic pressure; MAP = mean arterial pressure; PCWP = pulmonary capillary wedge pressure; PP = pulse pressure; RAP = right atrial pressure; RVEDV = right ventricular end diastolic volume; sBP = systolic blood pressure; SV = stroke volume; SVI = stroke volume index; SVRI = systemic vascular resistance index

## Organ Failure

**Table 29. Types of Organ Failure**

| Type of Failure | Clinical Feature | Treatment |
|---|---|---|
| **Respiratory Failure** (see *Respiratory Failure*, R25) | Hypoxemia<br>Hypercapnia | Treat underlying cause (e.g. lung disease, shunt, V/Q mismatch, drug-related, cardiac)<br>Manage mechanical ventilation settings<br>Supplemental oxygen |
| **Cardiac Failure** (see Cardiology and Cardiac Surgery, C34) | Hypotension<br>Decreased urine output<br>Altered mental status<br>Arrhythmia<br>Hypoxia | Treat underlying cause (e.g. bradycardia, tachycardia, blood loss, adrenal insufficiency)<br>Volume resuscitation<br>Vasopressors<br>Inotropes<br>Intra-aortic balloon pump |
| **Coagulopathy** (see Hematology, H27, H31, H33) | Increased INR or PTT<br>Low platelet count<br>Bleeding, bruising | Treat underlying cause (e.g. thrombocytopenia, drug-related, immune-related, DIC)<br>Transfusion of blood products, clotting factors |
| **Liver Failure** (see Gastroenterology, G38) | Elevated transaminases, bilirubin<br>Coagulopathy<br>Jaundice<br>Altered mental status (encephalopathy)<br>Hypoglycemia | Treat underlying cause (e.g. viral hepatitis, drug related, metabolic)<br>Lactulose<br>Liver transplant |
| **Renal Failure** (see Nephrology, NP37) | Elevated creatinine<br>Reduced urine output<br>Signs of volume overload (e.g. CHF, effusions) | Treat underlying cause (e.g. shock, drug-related, obstruction)<br>Correct volume and electrolyte status, eliminate toxins<br>Diuretics<br>Dialysis |

# Shock

- see Emergency Medicine, ER3
- inadequate tissue perfusion potentially resulting in end organ injury
  - categories of shock
    - hypovolemic: hemorrhage, dehydration, vomiting, diarrhea, interstitial fluid redistribution
    - cardiogenic: myopathic (myocardial ischemia ± infarction), mechanical, arrhythmic, pharmacologic
    - obstructive: massive PE (saddle embolus), pericardial tamponade, constrictive pericarditis, increased intrathoracic pressure (e.g. tension pneumothorax)
    - distributive: sepsis, anaphylaxis, neurogenic, endocrine, toxins

**Causes of SHOCK**
**S**pinal (neurogenic), **S**eptic
**H**emorrhagic
**O**bstructive (e.g. tension pneumothorax, cardiac tamponade, PE)
**C**ardiogenic (e.g. arrhythmia, MI)
Anaphyla**K**tic

**Table 30. Changes Seen in Different Classes of Shock**

| | Hypovolemic | Cardiogenic | Obstructive | Distributive |
|---|---|---|---|---|
| **HR** | ↑ | ↑, N, or ↓ | ↑ | ↑ or ↓ |
| **BP** | ↓ | ↓ | ↓ | ↓ |
| **JVP** | ↓ | ↑ | ↑ | ↓ |
| **Extremities** | Cold | Cold | N or Cold | Warm |
| **Other** | Look for visible hemorrhage or signs of dehydration | Bilateral crackles on chest exam | Depending on cause, may see pulsus paradoxus, Kussmaul's sign, or tracheal deviation | Look for obvious signs of infection or anaphylaxis |

**Shock: Clinical Correlation**
**Hypovolemic**: patients have cool extremities due to peripheral vasoconstriction
**Cardiogenic**: patients usually have signs of left-sided heart failure
**Obstructive**: varied presentation
**Distributive**: patients have warm extremities due to peripheral vasodilation

- treat underlying cause (hypovolemia is the most common cause)
- treatment goal is to return critical organ perfusion to normal (e.g. normalize BP)
- common treatment modalities include:
  - fluid resuscitation (NOT in cardiogenic shock)
  - inotropes (e.g. dobutamine), vasopressors (e.g. norepinephrine), vasopressin
  - revascularization or thrombolytics for ischemic events
  - needle decompression or tube thoracostomy for suspected tension pneumothorax

# Sepsis

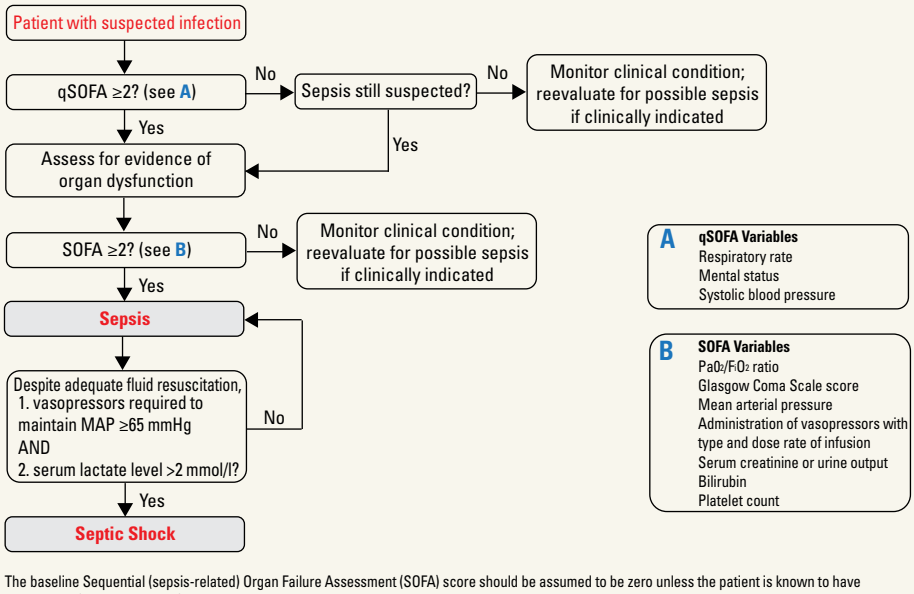
- the leading cause of death in noncoronary ICU settings is multi-organ failure due to sepsis
- the predominant theory is that sepsis is attributable to uncontrollable immune system activation

## Definitions

- sepsis: life threatening organ dysfunction caused by dysregulated host response to infection (Table 31)
- septic shock: a subset of sepsis, where sufficient circulatory and/or cellular/metabolic abnormalities substantially increase mortality. Clinically defined as sepsis with persisting hypotension requiring vasopressors to maintain MAP ≥65 mmHg and having a serum lactate ≥2 mmol/L (18 mg/dL) despite adequate fluid resuscitation

**Systemic Inflammatory Response Syndrome (SIRS):** generalized inflammatory reaction caused by infectious and noninfectious entities, manifested by two or more of:
- Body temperature >38°C or <36°C
- Heart rate >90/min
- Respiratory rate >20/min or $P_aCO_2$ <32 mmHg
- WBC >12,000 cells/mL or <4000 cells/mL or >10% bands

## Signs and Symptoms



- new guidelines recommend the use of quick SOFA (qSOFA) criteria and SOFA score to replace SIRS criteria
- in patients with suspected infection, bedside application of qSOFA criteria identifies individuals with high likelihood of poor outcomes, including prolonged ICU stay and/or death
- a positive qSOFA (≥2 criteria) should prompt application of the SOFA score, and further evaluation of possible infection and organ dysfunction
- in the context of suspected infection, a SOFA score ≥2 reflects an overall mortality risk of 10%
- the absence of ≥2 criteria on either qSOFA or SOFA score should not delay or defer investigation or treatment of infection or any other aspect of care deemed necessary by the practitioners

**Quick SOFA (qSOFA) Criteria**
- Respiratory rate ≥22/min
- Altered mentation
- Systolic blood pressure ≤100 mmHg

**Table 31. Sequential (Sepsis-Related) Organ Failure Assessment (SOFA) Score**

| | Score | | | | |
|---|---|---|---|---|---|
| **System** | **0** | **1** | **2** | **3** | **4** |
| **Respiratory** | | | | | |
| $PaO_2/FiO_2$, mmHg (kPa) | ≥400 (53.3) | <400 (53.3) | <300 (40) | <200 (26.7) with respiratory support | <100 (13.3) with respiratory support |
| **Coagulation** | | | | | |
| Platelets, x103/μL | ≥150 | <150 | <100 | <50 | <20 |
| **Liver** | | | | | |
| Bilirubin, μmol/L (mg/dL) | <20 (1.2) | 20-32 (1.2-1.9) | 33-101 (2.0-5.9) | 102-204 (6.0-11.9) | >204 (12.0) |
| **Cardiovascular** | MAP ≥70 mmHg | MAP <70 mmHg | Dopamine <5a or dobutamine (any dose)[a] | Dopamine 5.1-15a or epinephrine <0.1a or norepinephrine <0.1a | Dopamine >15a or epinephrine >0.1a or norepinephrine >0.1a |
| **Central Nervous System** | | | | | |
| Glasgow coma scale score | 15 | 13-14 | 10-12 | 6-9 | <6 |
| **Renal** | | | | | |
| Creatinine, μmol/L (mg/dL) | <110 (1.2) | 110-170 (1.2-1.9) | 171-299 (2.0-3.4) | 300-440 (3.5-4.9) | >440 (5.0) |
| Urine output, mL/d | | | | <500 | <200 |

[a]Catecholamine doses are given as μg/kg/min for at least 1hr
Table adapted from Singer et al. The Third International Consensus Definitions for Sepsis and Septic Shock (Sepsis-3). JAMA 2016; 315(8): 801-810

The baseline Sequential (sepsis-related) Organ Failure Assessment (SOFA) score should be assumed to be zero unless the patient is known to have pre-existing (acute or chronic) organ dysfunction before the onset of infection. qSOFA indicated quick SOFA; MAP, mean arterial pressure.

**Figure 11. Approach to sepsis**
Figure adapted from Singer et al. The Third International Consensus Definitions for Sepsis and Septic Shock (Sepsis-3). JAMA 2016; 315(8): 801-810.

**Goal-Directed Resuscitation for Patients with Early Septic Shock**
NEJM 2014: 371;1496-06
**Study**: Prospective, randomized controlled trial.
**Population**: 1600 patients in Australia and New Zealand presenting to the emergency department with early septic shock.
**Intervention**: patients were randomized to receive early goal-directed therapy (EGDT) or usual care.
**Outcome**: The primary outcome was all-cause mortality within 90 d of randomization.
**Results**: The rate of death did not significantly differ between patients treated with EGDT or usual care (absolute risk difference EGDT versus usual care = -0.3%, 95% CI -4.1 to 3.6%; P=0.90). EGDT treated patients received more intravenous fluids, vasopressor infusions, red blood cell transfusions, and dobutamine (P<0.0001 for all). Survival time, in-hospital mortality, duration of organ support, and length of hospital stay did not significantly differ between patients randomized to EGDT or usual care.
**Conclusions**: EGDT did not improve all-cause mortality at 90 d in patients presenting to the emergency department with early septic shock.

**Corticosteroids for Treating Sepsis**
Cochrane DB Syst Rev 2015; CD002243
**Objectives**: Determine effects of corticosteroids on death at 1 mo in patients with sepsis.
**Methods**: RCTs in the Central Register of Controlled Trials, MEDLINE, and Latin American Caribbean Health Sciences Literature comparing corticosteroids vs. placebo or supportive treatment in patients with sepsis.
**Results**: 33 trials, 4268 participants. Corticosteroids reduced 28 d mortality (RR 0.87, 95% CI 0.76-1.00). Corticosteroids increased proportion of shock reversal by 7 d (RR 1.31, 95% CI 1.14-1.51) and 28 (RR 1.11, 95% CI 1.02-1.21) and reduced survivors' length of stay in ICU (MD -2.19, 95% CI -3.93- -0.46). Corticosteroids did not induce gastroduodenal bleeding, superinfection or neuromuscular weakness by did increase risk of hyperglycemia and hypernatremia.
**Conclusions**: Corticosteroids reduce mortality among patients with sepsis.

## Treatment

- identify the cause and source of infection: blood, sputum, urine Gram stain, and C&S
- initiate empiric antibiotic therapy
- monitor, restore, and maintain hemodynamic function

## Surviving Sepsis (adapted from International Guidelines for Management of Severe Sepsis and Septic Shock 2012)

- adjustments of cardiac preload, afterload, and contractility to balance oxygen delivery with demand
- initial resuscitation (goals during first 6 h of resuscitation for sepsis induced hypotension persisting after initial fluid challenge or blood lactate ≥4 mmol/L)
- maintain CVP 8-12 mmHg with IV crystalloids/colloids
  - maintain MAP ≥65 mmHg with use of vasopressor agents, first line: norepinephrine
  - urine output ≥0.5 mL/kg/hr
  - central venous (SVC) or mixed oxygen saturation 70% or 65% respectively
  - in patients with elevated lactate levels target resuscitation to normalize lactate
  - corticosteroid replacement therapy not indicated if adequate hemodynamic stability achieved with fluid resuscitation and vasopressor therapy

- infection control
  - prompt diagnosis of infection
    - cultures as clinically indicated prior to antibiotic therapy if no significant delay
    - imaging studies performed promptly to confirm possible infectious source
  - antibiotic therapy
- administer effective IV antimicrobials within first hour of recognition of sepsis
  - choice of anti-infective therapy should consider activity against all likely pathogens and penetrance of adequate concentration into tissue presumed to be source of infection
  - antimicrobial regimen should be reassessed daily for potential deescalation
- surgical source control when appropriate
- supportive oxygenation and ventilation using lung-protective regimen
- early nutritional support: enteral route is used to preserve function of intestinal mucosal barrier
- DVT/PE prophylaxis
- advanced care planning, including the communication of likely outcome and realistic goals of treatment with patients and families

# Common Medications

**Table 32. Common Medications for Respiratory Diseases**

| | Drug | Typical Adult Dose | Indications | Side Effects |
|---|---|---|---|---|
| **β2-AGONISTS** | | | | |
| **Short-Acting** | salbutamol/albuterol (Ventolin®, Airomir®) (light blue/navy MDI or diskus)<br>terbutaline (Bricanyl®) (blue turbuhaler) | 1-2 puffs q4-6h prn | Bronchodilator in acute reversible airway obstruction | CV (angina, flushing, palpitations, tachycardia, can precipitate atrial fibrillation), CNS (dizziness, H/A, insomnia, anxiety), GI (diarrhea, N/V), rash, hypokalemia, paroxysmal bronchospasm |
| **Long-Acting** | salmeterol (Serevent®) (green diskus), formoterol (Oxeze®, Foradil®) (blue/green turbuhalor or aerolizer) indacaterol (Onbrez®) (blue/white breezhaler) | 1-2 puffs bid<br>1 puff daily | Maintenance treatment (prevention of bronchospasm) in COPD, asthma | |
| **Combination Long-Acting β2- Agonist and Inhaled Corticosteroid** | fluticasone and salmeterol (Advair®) (purple MDI or diskus)<br>budesonide and formoterol (Symbicort®) (red turbuhaler)<br>Mometasone and formoterol (Zenhale®) (blue MDI) | 1 puff bid<br>2 puffs bid | COPD and asthma | Common: CNS, H/A, dizziness<br>Resp: URTI, GI (N/V, diarrhea, pain/discomfort, oral candidiasis) |
| **Combination Short-Acting β2- Agonist and Short-Acting Anti-Cholinergic** | ipratropium/salbutamol (Combivent®, Respimat®) (orange respimat) | 1 puff qid | Bronchodilator used in COPD | Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drugs |
| **Combination Long-Acting β2- Agonist and Long-Acting Anti-Cholinergic** | umeclidinium/vilanterol (Anoro®) (red ellipta)<br>aclidinium/formoterol (Duaklir®) (yellow genuair)<br>tiotropium/olodaterol (Inspiolto®) (green respimat)<br>indacaterol/glycopyrronium (Ultibro®) (yellow breezhaler) | 1 puff daily<br>1 puff bid<br>1 puff daily<br>1 puff daily | Bronchodilator used in COPD | Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drugs |
| **ANTICHOLINERGICS** | | | | |
| **Short-Acting Anti-Cholinergic** | ipratropium bromide (Atrovent®) (clear/green MDI) | 2-3 puffs qid | Bronchodilator used in asthma and COPD | Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drugs |
| **Long-Acting Anti-Cholinergic** | tiotropium bromide (Spiriva®) (green handihaler or respimat)<br>glycopyrronium bromide (Seebri®) (orange breezhaler), umeclidinium (Incruse™) (green ellipta), aclidinium (Genuair®, Tudorza®) (green inhaler) | 1 puff qam<br>1 puff daily | Bronchodilator used in asthma and COPD | Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drug |

**Table 32. Common Medications for Respiratory Diseases** (continued)

| | Drug | Typical Adult Dose | Indications | Side Effects |
|---|---|---|---|---|
| **CORTICOSTEROIDS** | | | | |
| **Inhaled** | fluticasone (Flovent®) (orange/peach MDI or diskus)<br>budesonide (Pulmicort®) (brown turbuhaler)<br>ciclesonide (Alvesco®) (red MDI)<br>beclomethasone (QVAR®, Vanceril®) (brown MDI)<br>mometasone (Asmanex®) (pink/grey/brown twisthaler)<br>fluticasone furoate (Arnuity®) (orange ellipta) | 2-4 puffs bid<br>2 puffs bid<br>1 puff daily or bid<br>1-4 puffs bid<br>1 puff daily or bid<br>1 puff daily | Maintenance treatment of asthma | H/A, fever, N/V, MSK pain, URTI, throat irritation, growth velocity reduction in children/adolescents, HPA axis suppression, increased pneumonia risk in COPD |
| **Systemic** | prednisone (Apo-prednisone®, Deltasone®)<br>methylprednisolone (Depo-Medrol®, Solu-Medrol®) | Typically 40-60 mg/d PO<br>125 mg q8h IV (sodium succinate) loading dose 2 mg/kg then 0.5-1 mg/kg q6h for 5 d | Acute exacerbation of COPD; severe, persistent asthma, PCP<br>Status asthmaticus | Endocrine (hirsutism, DM/glucose intolerance, Cushing's syndrome, HPA axis suppression), GI (increased appetite, indigestion), ocular (cataracts, glaucoma), edema, AVN, osteoporosis, H/A, psychiatric (anxiety, insomnia), easy bruising |
| **ADJUNCT AGENTS** | | | | |
| | theophylline (Uniphyll®) | 400-600 mg OD | Treatment of symptoms of reversible airway obstruction due to COPD | GI upset, diarrhea, N/V, anxiety, H/A, insomnia, muscle cramp, tremor, tachycardia, PVCs, arrhythmias<br>Toxicity: persistent, repetitive vomiting, seizures |
| **LEUKOTRIENE ANTAGONISTS** | | | | |
| | montelukast (Singular®)<br>zafirlukast (Accolate®) | 10 mg PO qhs, now only available as once daily slow release 20 mg bid | Prophylaxis and chronic treatment of asthma | H/A, dizziness, fatigue, fever, rash, dyspepsia, cough, flu-like symptoms |
| **ANTI-IgE MONOCLONAL ANTIBODIES** | | | | |
| | omalizumab (Xolair®) | 150-375 mg SC q2-4wk | Moderate-severe persistant asthma | H/A, sinusitis, pharyngitis, URTI, viral infection, thrombocytopenia, anaphylaxis |
| **PDE-4 INHIBITORS** | | | | |
| | roflumilast (Daxas®) | 500 µg PO OD | Severe emphysema, with frequent exacerbations | Weight loss, suicidal ideation |
| **ANTIBIOTICS – COMMUNITY ACQUIRED PNEUMONIA** | | | | |
| **Macrolide** | erythromycin<br>azithromycin<br>clarithromycin | 250-500 mg PO tid x 7-10 d<br>500 mg PO x 1 dose, then 250 mg OD x 4<br>1000 mg od or 500 mg PO bid x 7-10 d | Alternate to doxycycline or fluoroquinolone | GI (abdominal pain, diarrhea, N/V), H/A, prolonged QT, ventricular arrhythmias, hepatic impairment<br>GI (diarrhea, N/V, abdominal pain), renal failure, deafness<br>H/A, rash, GI (diarrhea, N/V, abnormal taste, heartburn, abdominal pain), increased urea |
| **Doxycycline** | | 100 mg PO bid x 7-10 d | Alternate to macrolide or fluoroquinolone | Photosensitivity, rash, urticaria, anaphylaxis, diarrhea, entercolitis, tooth discolouration in children |
| **Fluoroquinolone** | levofloxacin (Levaquin®)<br>moxifloxacin (Avelox®) | 500 mg PO OD x 7-10 d<br>400 mg PO OD x 7 d | Alternate to macrolide or doxycycline | CNS (dizziness, fever, H/A), GI (N/V, diarrhea, constipation), prolonged QT |
| **ANTIBIOTICS – HOSPITAL ACQUIRED PNEUMONIA** | | | | |
| **3rd gen Cephalosporin** | ceftriaxone (Rocephin®) | 1-2 g IV OD x 7-10 d | Combine with fluoroquinolone or macrolide | Rash, diarrhea, eosinophilia, thrombocytosis, leukopenia, elevated transaminases |
| **Fluoroquinolone** | levofloxacin<br>moxifloxacin | 750 mg PO OD x 5 d<br>400 mg PO OD x 7 d (5 d for AECOPD) | Combine with 3rd gen cephalosporin | Rash, diarrhea, eosinophilia, thrombocytosis, leukopenia, elevated transaminases |
| **Piperacillin/Tazobactam (Tazocin®)** | | 4.5 g IV q6-8h x 7-10 d | Suspect Pseudomonas | CNS (confusion, convulsions, drowsiness), rash<br>Hematologic (abnormal platelet aggregation, prolonged PT, positive Coombs) |
| **Vancomycin (Vancocin®)** | | 1 g IV bid x 7-10 d | Suspect MRSA | CNS (chills, drug fever), hematologic (eosinophilia), rash, red man syndrome, interstitial nephritis, renal failure, ototoxicity |
| **Macrolide** | azithromycin<br>clarithromycin | 500 mg IV OD x 2 d, then 500 mg PO OD x 5 d<br>1000 mg od or 500 mg PO bid x 7-10 d | Suspect Legionella | CNS (chills, drug fever), hematologic (eosinophilia), rash, red man syndrome, interstitial nephritis, renal failure, ototoxicity |

**Table 32. Common Medications for Respiratory Diseases** (continued)

| | Drug | Typical Adult Dose | Indications | Side Effects |
|---|---|---|---|---|
| **ICU MEDICATIONS** | | | | |
| **Pressors/Inotropes** | norepinephrine (Levophed®)<br>phenylephrine<br>dobutamine | 0.5-30 µg/min IV<br>0.5 µg/kg/min IV<br>2-20 µg/kg/min IV | Acute hypotension<br>Severe hypotension<br>Inotropic support | Angina, bradycardia, dyspnea, hyper/hypotension, arrhythmias<br>See above |
| **Sedatives/Analgesia** | fentanyl (opioid class)<br><br>propofol (anesthetic) | 50-100 µg then 50-unlimited µg/h IV<br>1-3 mg/kg then 0.3-5 mg/kg/h IV | Sedation and/or analgesia<br>Sedation and/or analgesia | Bradycardia, respiratory depression, drowsiness, hypotension<br>Apnea, bradycardia, hypotension (good for ventilator sedation) |

See Infectious Diseases, ID24 – for the management of pulmonary tuberculosis

# Landmark Respirology Trials

| Trial | Reference | Results |
|---|---|---|
| ARDS Network | NEJM 2000;342:1301-8 | Mortality decreased in ARDS patients ventilated with a low tidal volume strategy |
| Berlin Criteria | JAMA 2012;307:2526-33 | The new definition of ARDS, better predicts mortality |
| CPAP and Apnea | NEJM 2005;353:2025-33 | CPAP ameliorates symptoms of sleep apnea but does not affect mortality in CHF |
| EINSTEIN-PE | NEJM 2012;366:1287-97 | Fixed dose of rivoxabarin was non-inferior to standard therapy (Vit K antagonist) initial and long-term treatment of PE |
| Emphysema Treatment Trial | NEJM 2003;348:2059-73 | Lung volume reduction surgery benefits patients with upper lobe disease and low exercise capacity |
| IELCAP | NEJM 2006;355:1763-71 | High survival rate in patients with early stage lung cancer detected by low dose CT screening |
| Lung Health | JAMA 1994;272:1497-505 | Aggressive smoking intervention significantly decreases the age-related decline in $FEV_1$ in middle-aged smokers with mild airways obstruction |
| OSCILLATE | NEJM 2013;368: 795-805 | Early high-frequency oscillatory ventilation in patients with moderate to severe ARDS might increase in-hospital mortality |
| ILD | NEJM 1978;298:801-9 | Interstitial lung disease subsets have different prognoses and response to treatment (e.g. desquamative but not usual interstitial pneumonia respond well to corticosteroids) |
| POET-COPD | NEJM 2011;364:1093-103 | Tiotropium decreases the number of moderate-to-severe exacerbations in comparison to salmeterol |
| REDUCE | JAMA 2013;309: 2223-2231 | 5 d course of glucocorticoids is non-inferior to a 14 d course for treatment of acute COPD exacerbations |
| ROFLUMILAST | Lancet 2009;374:695-703 | Phosphodiesterase-4 inhibitor improves $FEV_1$ when used as add-on therapy in COPD patients on tiotropium or salmeterol |
| TORCH | NEJM 2007;356:775-89 | Combination of inhaled steroids and long-acting β2-agonists improves COPD symptoms, reduces exacerbations, and shows a trend to lowers mortality |
| UPLIFT | NEJM 2008;359:1543-54 | Tiotropium improves symptoms of COPD with fewer exacerbations, but does not affect $FEV_1$ decline |

| WBC | white blood cell |

# Anatomy of Joint Pathology

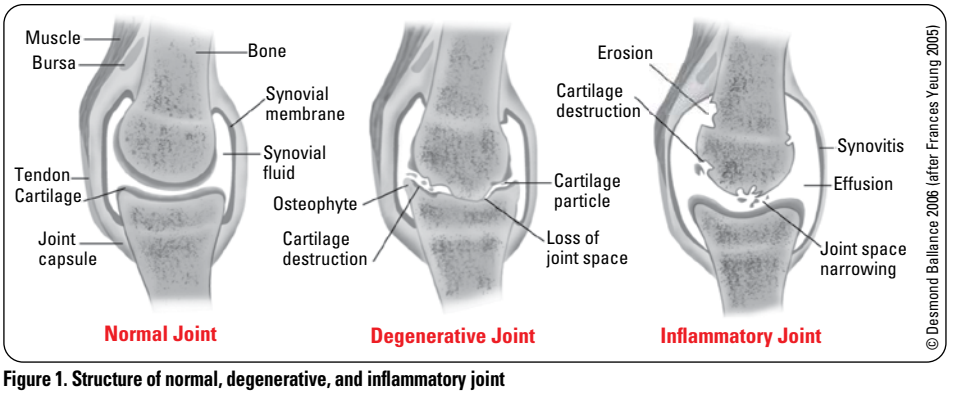

**Figure 1. Structure of normal, degenerative, and inflammatory joint**

**Terminology in Rheumatology**

**Arthritis**
- Joint swelling: effusion/synovial thickening
- Decreased ROM
- Stress pain (pain at the end of ROM)
- Increased warmth

**Arthralgia**: perception of joint pain without obvious clinical findings
**Active Joint**: swollen joint, joint line tenderness, or stress pain

**Innate Immune Cells**
- **Neutrophil (PMN):** circulate in blood and respond to inflammatory stimuli, kill invading organisms by phagocytosis, degranulation, and neutrophil extracellular traps
- **Natural Killer Cell:** innate immunity against intracellular infections (especially viruses), killing function, and produce cytokines
- **Macrophage:** arrive after PMNs, suppress PMN efflux and phagocytose PMN debris, secrete pro-inflammatory cytokines in response to microbial debris
- **Dendritic Cell:** actively phagocytic when immature, activated by signals from toll-like receptor (TLR), release pro-inflammatory cytokines, present antigens to T cells in lymph nodes
- **Eosinophil:** respond to inflammatory cytokines and degranulate, releasing reactive oxygen species, and cytokines, associated with allergy, asthma, and parasitic infection
- **Mast Cell:** present in connective tissue and mucosa, allergen cross-linking of IgE bound to mast cell triggers degranulation and release of inflammatory mediators

# Basics of Immunology

## Immune Mechanisms of Disease

**Table 1. Mechanisms of Immune-Mediated Disorders**

| Type | Pathophysiology | Examples |
|---|---|---|
| **Immediate Hypersensitivity (Type I)** | Formation of IgE → release of immunologic mediators from basophils/mast cells → diffuse inflammation | Asthma, allergic rhinitis, anaphylaxis |
| **Cytotoxic (Type II)** | Formation of Ab → deposit and bind to Ag on cell surface → phagocytosis or lysis of target cell | Autoimmune hemolytic anemia, anti-glomerular basement membrane disease (Goodpasture syndrome), Graves' disease, pemphigus vulgaris, rheumatic fever, ITP |
| **Immune Complex (Type III)** | Formation and deposition of Ag-Ab complexes → activate complement → leukocyte recruitment and activation → tissue injury | SLE, PAN, post-streptococcal glomerulonephritis, serum sickness, viral hepatitis |
| **Cell-Mediated/Delayed Hypersensitivity (Type IV)** | Release of cytokines by sensitized T cells and T cell mediated cytotoxicity | Contact dermatitis, insect venom, mycobacterial proteins |

## Immunogenetics and Disease

- cell surface molecules called HLAs play a role in mediating immune reactions
- MHC are genes on the short arm of chromosome 6 that encode HLA molecules
- certain HLA haplotypes are associated with increased susceptibility to autoimmune diseases

**Table 2. Classes of MHCs**

| MHC Class | Types | Location | Function |
|---|---|---|---|
| **I** | HLA-A, B, C | All cells | Recognized by CD8+ (cytotoxic) T-lymphocytes |
| **II** | HLA-DP, DQ, DR | Ag presenting cells (mononuclear phagocytes, B cells, etc.) | Recognized by CD4+ (helper) T-lymphocytes |
| **III** | Some components of the complement cascade | In plasma | Chemotaxis, opsonization, lysis of bacteria and cells |

**Table 3. HLA-Associated Rheumatic Disease**

| HLA Type | Associated Conditions | Comments |
|---|---|---|
| **B27** | Ankylosing Spondylitis (AS)<br>Reactive Arthritis (ReA)<br>Enteropathic Arthritis (EA) (axial)<br>Psoriatic Arthritis (PsA) (axial) | Relative risk 20x for developing AS and ReA |
| **DR4, DR1** | Rheumatoid Arthritis (RA) | In RA, relative risk = 2-10x; found in 93% of patients |
| **DR3** | Sjögren's syndrome (SS)<br>Systemic Lupus Erythematosus (SLE) | DR3 is associated with the production of anti-Ro/SSA and anti-La/SSB antibodies |

# Differential Diagnoses of Common Presentations

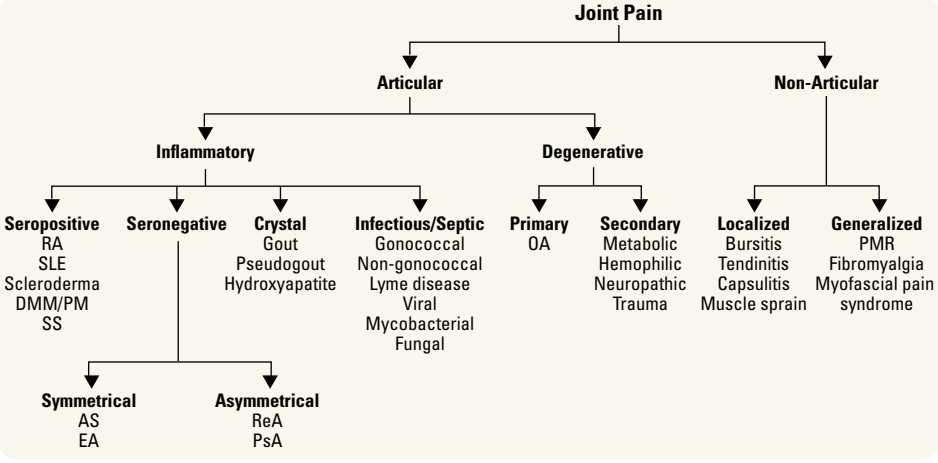

**Figure 2. Clinical approach to joint pain**

**Table 4. Differential Diagnosis of Monoarthritis**

| ACUTE MONOARTHRITIS | | | | |
|---|---|---|---|---|
| **Non-Inflammatory** | **Inflammatory** | | **Infectious** | **Hemorrhagic** |
| **Trauma** | **Crystal induced**<br>Monosodium urate (MSU-gout)<br>Calcium pyrophosphate dehydrate (CPPD) or pseudogout<br>Hydroxyapatite (HA) | **Non-crystal induced**<br>Seropositive<br>Seronegative | Most bacterial infections, e.g.: *S. aureus, GC*<br>viral arthopathies are rarely monoarticular | Trauma, fracture, blood dyscrasias, and anticoagulants<br>Congenital clotting disorders e.g. hemophilia |

| CHRONIC MONOARTHRITIS | | | |
|---|---|---|---|
| **Non-Inflammatory** | **Inflammatory** | **Infectious** | **Hemorrhagic** |
| OA and osteonecrosis | Serpositive<br>Seronegative | TB and fungi | Tumour |

**Table 5. Differential Diagnosis of Oligoarthritis/Polyarthritis**

| ACUTE (<6 wk) | CHRONIC (>6 wk) | | |
|---|---|---|---|
| Post-viral infection (parvovirus B19, HIV)<br>Post-bacterial infection (GC and non-GC, rheumatic fever)<br>Crystal induced<br>Other (sarcoidosis, Lyme disease)<br>Very early rheumatoid arthritis (VERA) | **Seropositive inflammatory arthritis**<br>RA<br>SLE<br>Scleroderma<br>DMM/PM | **Seronegative inflammatory arthritis**<br>AS<br>EA<br>PsA<br>ReA<br>Crystal (polyarticular gout) | **Degenerative**<br>OA |

**Key Cytokine Targets of Biologic Drugs**

**TNF**
- **Source of cytokine**: T cells, macrophages
- **Major Functions**: cachexia, induces other cytokines, T cell stimulation, induces metalloproteinases and prostaglandins, increases expression of adhesion molecules; increases vascular permeability leading to increased entry of IgG, complement and cells into tissues

**IL-6**
- **Source of cytokine**: Many cells including monocytes and macrophages
- **Major Functions**: anemia of inflammation (hepcidin production), proliferation of B and T cells, acute phase reactant, induces natural protease inhibitor, promotes erosions, induces elevated CRP

**Adaptive Immune Cells**
- **B-cell**: produce antibodies after activation by specific antigen and B-cell co-receptor, additional signals provided by CD4 T helper cells
- **Cytotoxic T cell**: CD8, direct cytotoxicity of target cells at sites of infection, kill via lytic granules and FasL-Fas interaction, recognize specific antigen and MHC1
- **Helper T cell**: subset of CD4 cells, activate and help other types of cells carry out immune defense (activate macrophages, help B cells, release cytokines)
- **Regulatory T cell**: subset of CD4 cells, suppress activation of naïve autoreactive T cells

**Causes of Joint Pain**

**SOFTER TISSUE**
**S**epsis
**O**A
**F**racture
**T**endon/muscle
**E**piphyseal
**R**eferred
**T**umour
**I**schemia
**S**eropositive arthritides
**S**eronegative arthritides
**U**rate (gout)/other crystal
**E**xtra-articular rheumatism (PMR/fibromyalgia)

**Patterns of Joint Involvement**
- Symmetrical vs. asymmetrical
- Small vs. large
- Mono vs. oligo (2-4 joints) vs. polyarticular (≥5 joints)
- Axial vs. peripheral

**Table 6. Symptoms of Inflammatory Arthritis vs. Degenerative Arthritis**

| Inflammatory | Degenerative |
|---|---|
| Pain at rest, relieved by gentle motion | Pain with motion, relieved by rest |
| Morning stiffness >1 h | Morning stiffness <1/2 h |
| Warmth, swelling, erythema | Joint instability, buckling, locking |
| Malalignment/deformity (late finding) | Bony enlargement, malalignment/deformity (late finding) |
| Extra-articular manifestations | Evening/end of day pain |
| Nighttime awakening due to pain | |

The presence of synovitis often indicates articular as opposed to non-articular joint pain; synovitis presents with: soft tissue swelling, effusion, warmth, and pain with movement

**Table 7. Seropositive vs. Seronegative Rheumatic Diseases**

| | Seropositive | Seronegative |
|---|---|---|
| **Demographics** | F>M | M>F |
| **Peripheral Arthritis** | Symmetrical<br>Small (PIP, MCP) and medium joints (wrist, knee, ankle, elbow) common<br>DIP less often involved | Usually asymmetrical<br>Usually larger joints, lower extremities (exception: PsA)<br>DIP in PsA<br>Dactylitis ("sausage digit") |
| **Pelvic/Axial Disease** | No (except for C-spine) | Yes |
| **Enthesitis** | No | Yes |
| **Extra-Articular** | Nodules<br>Vasculitis<br>Sicca<br>Raynaud's phenomenon<br>Rashes, internal organ involvement (lung, cardiac)<br>Entrapment neuropathies (i.e. carpal tunnel syndrome) | Iritis (anterior uveitis)<br>Oral ulcers<br>Gastrointestinal<br>Dermatological (psoriasis or keratodermia)<br>Genitourinary inflammation |

**Monitoring CRP**
**Advantages**
- Unaffected by age/gender
- Rapid response to inflammatory stimulus
- Wide range of clinically relevant values
- Can be measured on stored sera
- Quantification precise/reproducible

**Disadvantages**
- More expensive

# Synovial Fluid Analysis

- synovial fluid is an ultrafiltrate of plasma plus hyaluronic acid; it lubricates joint surfaces and nourishes articular cartilage

## Indications
- diagnostic: to clarify cause of an acute monoarthritis; to analyze fluid for cell count to differentiate inflammatory or degenerative; can be diagnostic for septic vs. crystal-induced vs. hemarthrosis in unexplained joint, bursa or tendon sheath swelling
- therapeutic: drainage of blood, purulent or tense effusions; corticosteroid injection in absence of sepsis

## Contraindications to Joint Aspiration or Injection
- absolute: open lesion or suspected infection of overlying skin or soft tissue
- relative: bleeding diathesis, thrombocytopenia, prosthetic joint

## Synovial Fluid Analysis
- most important to assess the 3C's: cell count (WBC), differential culture and Gram stain, and crystal analysis
- other parameters to consider are listed in Table 8

**Most Important Tests of Synovial Fluid (3 Cs)**
1. **C**ulture and Gram stain
2. **C**ell count and differential
3. **C**rystal examination (protein, LDH, glucose less helpful)

**Table 8. Synovial Fluid Analysis**

| Parameter | Normal | Non-Inflammatory | Inflammatory | Infectious | Hemorrhagic |
|---|---|---|---|---|---|
| **Colour** | Pale yellow | Pale yellow | Pale yellow | Yellow to white | Red/brown |
| **Clarity** | Clear | Clear | Opaque | Opaque | Sanguinous |
| **Viscosity** | High | High | Low | Low or paradoxically high if purulent | Variable |
| **WBC/mm$^3$** | <200 | <2000 | ≥2000 (crystal induced arthritis – often much higher than 2000) | >2000 (>50,000) | Variable |
| **% PMN** | <25% | <25% | ≥25% | >75% | Variable |
| **Culture/Gram Stain** | – | – | – | Usually positive | – |
| **Examples** | | Trauma<br>OA<br>Neuropathy<br>Hypertrophic – arthropathy | Seropositive<br>Seronegative<br>Crystal arthropathies | *S. aureus*<br>Gram negative<br>GC → difficult to culture, (may have a low WBC) | Trauma<br>Hemophilia |

**Choosing Wisely Canada Recommendations**
1. Do not order ANA as a screening test in patients without specific signs or symptoms of SLE or another CTD
2. Do not order an HLA-B27 unless spondyloarthritis is suspected based on specific signs or symptoms
3. Do not repeat DEXA scans more often than every 2 yr
4. Do not prescribe bisphosphonates for patients at low risk of fracture
5. Do not perform whole body bone scans (e.g. scintigraphy) for diagnostic screening for peripheral and axial arthritis in the adult population

# Septic Arthritis

- septic arthritis is a medical emergency, it can lead to rapid joint destruction and has a 10-15% risk of mortality
- knee and hip are most commonly affected joints, with knee accounting for approximately 50% of cases
- most commonly caused by hematogenous spread of bacterial infection (gram positive cocci > Gram negative bacilli)
- risk factors: very young or very old age (>80), portal of entry (IV drug use), recent infection, RA (related to prior joint damage and immunosuppressed state of host), type 2 DM
- poor prognostic factors: older age, immunocompromised, delay in treatment, previously damaged joint, joint prosthesis
- consider empiric antibiotic therapy until septic arthritis is excluded from history, physical examination, and synovial fluid analysis and culture
- see Infectious Diseases, ID11 and Orthopedic Surgery, *Septic Joint* OR11

Septic arthritis is a medical emergency; it leads to rapid joint destruction, and there is a 10-15% risk of mortality

# Degenerative Arthritis: Osteoarthritis

- see Family Medicine, FM40

## Definition

- progressive deterioration of articular cartilage and surrounding joint structures caused by genetic, metabolic, biochemical, and biomechanical factors with secondary components of inflammation

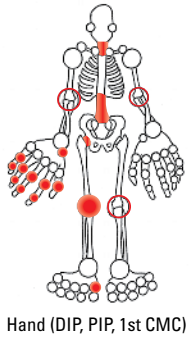
## Classification (Based on Etiology)

- primary (idiopathic)
  - most common, unknown etiology
- secondary
  - post-traumatic or mechanical
  - post-inflammatory (e.g. RA) or post-infectious
  - heritable skeletal disorders (e.g. scoliosis)
  - endocrine disorders (e.g. acromegaly, hyperparathyroidism, hypothyroidism)
  - metabolic disorders (e.g. gout, pseudogout, hemochromatosis, Wilson's disease, ochronosis)
  - neuropathic (e.g. Charcot joints)
    - atypical joint trauma due to peripheral neuropathy (e.g. DM, syphilis)
  - avascular necrosis (AVN)
  - other (e.g. congenital malformation)

## Pathophysiology

- the process appears to be initiated by abnormalities in biomechanical forces and/or, less often, in cartilage
- elevated production of pro-inflammatory cytokines is important in OA progression
- tissue catabolism > repair
- contributing factors (mechanisms unknown): genetics, alignment (bow-legged, knock-kneed), joint deformity (hip dysplasia), joint injury (meniscal or ligament tears), obesity, environmental, mechanical loading, age, and gender
- now considered to be a systemic musculoskeletal disorder rather than a focal disorder of synovial joints

## Epidemiology



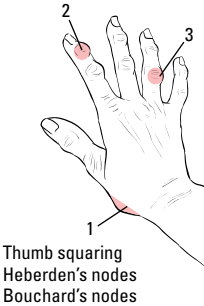
- most common arthropathy (accounts for ~75% of all arthritis)
- increased prevalence with increasing age (35% of 30 yr olds, 85% of 80 yr olds)

## Risk Factors

- genetic predisposition, advanced age, obesity (for knee and hand OA), female, trauma

OA of MCP joints can be seen in hemochromatosis or CPPD-related disease (chondrocalcinosis)

**ESR** can also be elevated in anemia, end-stage renal disease, females, increased age, and obesity



- Hand (DIP, PIP, 1st CMC)
- Hip
- Knee
- 1st MTP
- L-spine (L4-L5, L5-S1)
- C-spine
- Uncommon: ankle, shoulder, elbow, MCP, rest of wrist

© Linda Colati

**Figure 3. Common sites of joint involvement in OA**

**Table 9. Signs and Symptoms of OA**

| Signs | Symptoms |
|---|---|
| Joint line tenderness; stress pain ± joint effusion | Joint pain with motion; relieved with rest |
| Bony enlargement at affected joints | Short duration of stiffness (<1/2 h) after immobility, called gelling |
| Malalignment/deformity (angulation) | Joint instability/buckling (often due to ligamentous instability) |
| Limited ROM | Joint locking due to "joint mouse" (bone or cartilage fragment) |
| Crepitus on passive ROM | Loss of function (e.g. meniscal tear or other internal derangements) |
| Inflammation (mild if present) | Insidious onset of pain, localized to affected joints |
| Periarticular muscle atrophy | Fatigue, poor sleep, impact on mood |

1. Thumb squaring
2. Heberden's nodes
3. Bouchard's nodes

© Tabby Lulham

**Figure 4. Hand findings in OA**

### Joint Involvement

- generalized osteoarthritis: 3+ joint groups
- asymmetric (knees usually affected bilaterally)
- hand
  - DIP (Heberden's nodes = osteophytes → enlargement of joints)
  - PIP (Bouchard's nodes)
  - CMC (usually thumb squaring)
  - 1st MCP (other MCPs are usually spared)
- hip
  - usually presents as groin pain ± dull or sharp pain in the trochanteric area, internal rotation and abduction are lost first
  - pain can radiate to the anterior thigh, but generally does not go below the knee
- knee
  - initial narrowing of one compartment, medial > lateral; seen on standing x-rays, often patellar-femoral joint involved
- foot
  - common in first MTP and midfoot
- lumbar spine
  - very common, especially L4-L5, L5-S1
  - degeneration of intervertebral discs and facet joints
  - reactive bone growth can contribute to neurological impingement (e.g. sciatica, neurogenic claudication) or spondylolisthesis (forward or backward movement of one vertebra over another)
- cervical spine
  - commonly presents with neck pain that radiates to scapula, especially in mid-lower cervical area (C5 and C6)

**Differential Diagnosis of Elevated ESR**
- Systemic inflammatory diseases
- Localized inflammatory diseases
- Malignancy
- Trauma
- Infection
- Tissue injury/ischemia

### Investigations

- blood work
  - normal CBC and ESR, CRP
  - negative RF and ANA
- radiology: 4 hallmark findings, see sidebar
- synovial fluid: non-inflammatory (see Table 8)

**The Radiographic Hallmarks of OA**
- Joint space narrowing
- Subchondral sclerosis
- Subchondral cysts
- Osteophytes

### Treatment

- presently no treatment alters the natural history of OA
- prevention: prevent injury, weight management, maintenance of muscle strength
- **non-pharmacological therapy**
  - weight loss (minimum 5-10 lb loss) if overweight
  - physiotherapy: heat/cold, low impact exercise programs
  - occupational therapy: aids, splints, cane, walker, bracing
- **pharmacological therapy** (see Table 34, RH29)
  - 1st line with few joints affected, knee, hand – topical: transdermal NSAIDs preparations, capsaicin
  - 1st line with multiple joints, hip – oral: acetaminophen/NSAIDs
  - treat neuropathic pain if present (anti-depressants, anti-epileptics, etc.)
  - joint injections: corticosteroid (sparse use, effective for short-term treatment), hyaluronic acid (little evidence of benefits)
  - glucosamine ± chondroitin (efficacy not supported)
- **surgical treatment**
  - total and/or partial joint replacement, joint debridement (not shown to be effective), osteotomy, fusion

# Seropositive Rheumatic Disease

- diagnosis vs. classification in rheumatology
  - diagnostic criteria are selected for sensitivity, as opposed to specificity, thus may misdiagnose some cases
  - classification criteria are developed for specificity so well-defined cases can be studied in clinical trials
  - modern classification criteria are more sensitive and specific for diagnostic use in studies of earlier disease
- seropositive arthropathies are characterized by the presence of a serologic marker such as positive RF or ANA
- a small subset of the vasculitides, the small vessel ANCA-associated vasculitides, have a measurable serological component, but they are often considered a separate entity from seropositive disease by experts

**Table 10. Autoantibodies and their Prevalence in Rheumatic Diseases**

| Autoantibody | Disease | Healthy Controls | Comments |
|---|---|---|---|
| **RF** | RA 80%<br>SS 50%<br>SLE 20% | <5%<br>10-20%<br>>65 | Serologic hallmark of RA<br>Autoantibodies directed against Fc domain of IgG<br>Sensitive in RA (can be negative early in disease course), levels correlate with disease activity<br>May be present in ANA positive diseases, often in lower titre<br>Non-specific; may be present in IE, TB, hepatitis C, silicosis, sarcoidosis |
| **Anti-CCP** | RA 80% | | Specific for RA (94-98%)<br>May be useful in early disease and to predict aggressive disease, can occur before clinical disease apparent |
| **ANA** | SLE 98%<br>MCTD 100%<br>SS 40-70%<br>CREST 60-80%<br>(Often seen in other CTDs) | High titers <5%<br>Low titers<br>Up to 30%,<br>Prevalence of non-disease related ANA rises with age | Ab against nuclear components (DNA, RNA, histones, centromere)<br>Sensitive but not specific for SLE<br>Given high false positive rate - only measure when high pre-test probability of CTD |
| **Anti-dsDNA** | SLE 50-70% | 0% | Specific for SLE (95%)<br>Levels correlate with disease activity (i.e. SLE flare) |
| **Anti-Sm** | SLE <30% | 0% | Specific but not sensitive for SLE<br>Does not correlate with SLE disease activity<br>If positive, will remain positive through disease course |
| **Anti-Ro (SSA)** | SS 40-95%<br>SSc 21%<br>SLE 32%<br>RA 15% | 0.5% | Subacute cutaneous SLE (74%)<br>May be only Ab present in ANA negative SLE<br>Increases risk of having child with neonatal lupus syndrome |
| **Anti-La (SSB)** | SS 40%<br>SLE 10% | 0% | Usually occurs with anti-Ro<br>Specific for SS and SLE when anti-Ro is also positive<br>Increases risk of having child with neonatal lupus syndrome |
| **Antiphospholipid Ab (LAC, aCLA, a$B_2$GP)** | APLS 100%<br>SLE 31-40% | <5% | By definition, present in APLS<br>Only small subset of SLE patients develop clinical syndrome of APLS<br>If positive, will often get a false positive VDRL test |
| **Anti-Histone** | Drug-induced SLE 95%<br>SLE 30-80% | 0%<br>0% | Highly specific for drug-induced SLE |
| **Anti-RNP** | MCTD<br>SLE | | High titres present in MCTD; present in many other CTDs (especially SLE) |
| **Anti-Centromere** | Limited SSc (CREST) >80% | 0% | Specific for CREST, limited cutaneous variant of systemic sclerosis |
| **Anti-Topoisomerase I (formerly Scl-70)** | Diffuse SSc 26-76% | 0% | Specific for SSc<br>Increased risk pulmonary fibrosis in SSc |
| **Anti-Jo1** | PM DMM | 0% | Less frequent for DMM |
| **c-ANCA** | Active GPA >90% | 0% | Specific and sensitive |
| **p-ANCA** | GPA 10%<br>Other vasculitis | 0% | Nonspecific and poor sensitivity (found in ulcerative colitis, PAN, microscopic polyangiitis, Churg-Strauss, rapidly progressive glomerulonephritis) |
| **Anti-Mi-2** | DMM 15-20% | | Specific but not sensitive (not available in all centres) |
| **Ab Against RBCs, WBCs, or Platelets** | SLE | | Perform direct antiglobulin test (DAT), test Hb, reticulocyte, leukocyte, and platelet count, antiplatelet Abs |
| **Anti-mitochondria** | Primary biliary cholangitis | 0% | Sensitive and specific |

Note: some individuals in the normal population test positive for RF and/or ANA, but do not have the conditions listed above

# Connective Tissue Disorders

**Table 11. Features of Seropositive Arthropathies**

| | RA | SLE | Scleroderma | Dermatomyositis |
|---|---|---|---|---|
| **CLINICAL FEATURES** | | | | |
| **History** | Symmetrical polyarthritis (small joint involvement)<br>Morning stiffness (>1 h) | Multisystemic disease: rash, photosensitivity, Raynaud's, alopecia, cardiac and pulmonary serositis, CNS symptoms, glomerulonephritis | Skin tightness, stiffness of fingers, Raynaud's, heartburn, dysphagia, shortness of breath on exertion due to pulmonary HTN or ILD, renal crisis with new onset HTN or hypertensive urgency/emergency, dyspnea on exertion | Heliotrope rash (periorbital), Gottron's papules (violaceous papules over knuckles and IP joints) ± poikiloderma<br>Shawl sign: macular erythema over chest and shoulder<br>Proximal muscle weakness > pain, dyspnea on exertion |
| **Physical Examination** | Early: Effused joints<br>Tenosynovitis<br>Subcutaneous nodules<br>Other extra-articular manifestations<br>Late: Joint deformities<br>Bone-on-bone crepitus in advanced disease | Confirm historical findings (rash, serositis, renal, CVS, etc.)<br>± effused (typically small) joints (can be minimal, look for soft tissue swelling) | Skin tightness on dorsum of hand, facial skin tightening, telangiectasia, calcinosis, non-effused joint, inspiratory crackles, features of right side heart failure | Rash, proximal muscle weakness, inspiratory crackles |
| **LABORATORY** | | | | |
| **Non-Specific** | ↑ ESR in 50-60%<br>↑ CRP<br>↑ Platelets<br>↓ Hb (chronic disease)<br>↓ WBC (neutropenia rare) | ↑ ESR<br>↓ Platelets (autoimmune)<br>↓ Hb (autoimmune)<br>↓ WBC (leukopenia, lymphopenia) | ↑ ESR<br>↓ Hb<br>Normal WBC | Possible increased ESR<br>↑ CRP<br>↓ Hb<br>Normal WBC |
| **Specific** | RF +ve in ~80%<br>Anti-CCP +ve in ~80% | ANA +ve in 98%<br>Anti-dsDNA +ve in 50-70%<br>Anti-SM +ve in 30%<br>↓ C3, C4, total hemolytic complement<br>False positive VDRL (in SLE subtypes)<br>↑ PTT (in SLE subtypes, e.g. APLA) | ANA +ve in >90%<br>Anti-topoisomerase 1 (diffuse)<br>Anti-centromere (usually in *CREST*, see sidebar RH13) | CK elevated in 80%<br>ANA +ve in 33%<br>Anti-Jo-1, anti-Mi-2<br>Muscle biopsy<br>EMG<br>MRI |
| **Radiographs** | Very Early: normal<br>Early: Periarticular osteopenia<br>Later: Joint space narrowing<br>Erosions<br>Symmetric/concentric | Non-erosive<br>± Osteopenia<br>± Soft tissue swelling | ± Pulmonary fibrosis<br>± Esophageal dysmotility<br>± Calcinosis<br>± ILD | ± Esophageal dysmotility<br>± ILD<br>± Calcifications |

# Rheumatoid Arthritis

## Definition

- chronic, symmetric, erosive synovitis of peripheral joints (e.g. wrists, MCPs, MTPs)
- characterized by inflammatory joint disease ± a number of extra-articular features
- 1 joint with definite clinical synovitis (swelling) not explained by another disease

**Table 12. 2010 ACR/EULAR Classification Criteria for RA (score-based algorithm: add score of categories A-D; a score of 6/10 for definite RA)**

| Criteria | Score | Comments |
|---|---|---|
| A. Joint involvement (swollen or tender) | | |
| 1 large joint (shoulders, elbows, hips, knees, and ankles) | 0 | |
| 2-10 large joints | 1 | |
| 1-3 small joints (MCPs, PIPs, wrists, 2nd-5th MTPs) | 2 | |
| 4-10 small joints | 3 | |
| >10 joints (at least 1 small joint) | 5 | |
| B. Serology | | Total score of ≥6: definite RA<br>Must have ≥1 joint with definite clinical swelling, not better explained by other disease |
| Negative RF and negative Anti-CCP | 0 | |
| Low-positive RF or low-positive Anti-CCP (<3x ULN) | 2 | |
| High-positive RF or high-positive Anti-CCP (>3x ULN) | 3 | |
| C. Acute phase reactants | | |
| Normal CRP and normal ESR | 0 | |
| Abnormal CRP and abnormal ESR | 1 | |
| D. Duration of symptoms | | |
| <6 wk | 0 | |
| ≥6 wk | 1 | |

*Arthritis Rheum* 2010;62:2569-2581

RA is an independent risk factor for atherosclerosis and CV disease. RA is associated with increased overall mortality/morbidity from all causes: CV disease, neoplasm (especially lymphoma), infection

**Common Presentation**

- Morning stiffness >1 h, improves with use
- Symmetric joint involvement
- Initially involves small joints of hands and feet
- Constitutional symptoms

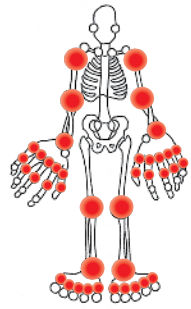
## Pathophysiology

- autoimmune disorder, unknown etiology
- complex interaction of genes and environment leading to breakdown of immune tolerance; many pathways result in autoreactivity leading to a final common pathway to synovial inflammation
  - genetic predisposition: HLA-DR4/DR1 association (93% of patients have either HLA type), cytokine promotors, T cell signaling
    - induction of enzymes that convert arginine to citrulline caused by environmental stress (cigarette smoking)
    - RA: propensity for immune reactivity to neoepitopes created by protein citrullination and production of anti-citrullinated protein antibodies
- once inflammatory process is established, synovium organizes itself into an invasive tissue that degrades cartilage and bone
- progressive bone destruction with absence of bone repair in response to inflammation
  - elevated TNF level increases osteoclasts and decreases osteoblasts at the site of inflammation (results in periarticular osteopenia)
  - upregulation of RANK ligand increases osteoclast-mediated destruction

## Epidemiology

- most common inflammatory arthritis: prevalent in 1% of population
- F:M = 3:1
- age of onset 20-40 yr

## Signs and Symptoms

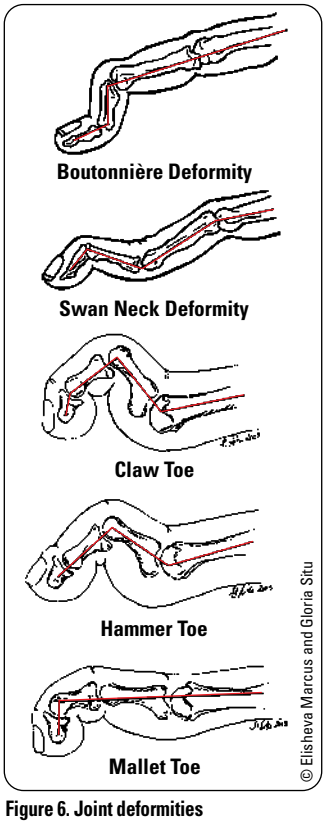


- variable course of exacerbations and remissions
- morning stiffness >1 h, improves with use, worsens with rest
- polyarthritis: symmetric joint involvement (tender, swollen), small joints affected, most commonly in hands and feet (MCP, PIP, MTP)
- constitutional symptoms: profound fatigue, depression, myalgia, weight loss
- extra-articular features
- limitation of function and decrease in global functional status
- complications of chronic synovitis
  - signs of mechanical joint damage: loss of motion, instability, deformity, crepitus, joint deformities
    - swan neck deformity, boutonnière deformity
    - ulnar deviation of MCP, radial deviation of wrist joint
    - hammer toe, mallet toe, claw toe
    - flexion contractures
  - atlanto-axial and subaxial subluxation
    - C-spine instability
      - neurological impingement (long tract signs)
      - difficult/dangerous intubation: risk of worsening subluxation and damage to spinal cord
- limited shoulder mobility, spontaneous tears of the rotator cuff leading to chronic spasm
- tenosynovitis → may cause rupture of tendons
- carpal tunnel syndrome
- ruptured Baker's cyst (outpouching of synovium behind the knee); presentation similar to acute DVT
- poor prognostic factors include: young age of onset, high RF titer, elevated ESR, activity of >20 joints, and presence of extra-articular features

**Table 13. Extra-Articular Features of RA Classified by Underlying Pathophysiology**

| System | Vasculitic | Lymphocytic Infiltrate |
|---|---|---|
| **Skin** | Periungual infarction, cutaneous ulcers, palpable purpura | Rheumatoid nodules (may have vasculitic component) |
| **Ocular** | Episcleritis, scleritis | Keratoconjunctivitis sicca |
| **Head and Neck** | | Xerostomia, Hashimoto's thyroiditis (see Endocrinology, E28) |
| **Cardiac** | | Peri-/myocarditis, valvular disease, conduction defects |
| **Pulmonary** | | Pulmonary fibrosis, pleural effusion, pleuritis, pulmonary nodules |
| **Neurologic** | Peripheral neuropathy: sensory stocking-glove, mononeuritis multiplex | |
| **Hematologic** | | Splenomegaly, neutropenia (Felty's syndrome) |
| **Renal** | | Amyloidosis – caused by accumulation of abnormal proteins |

## Classification of Global Functional Status in RA



- **Class I**: able to perform usual ADLs (self-care, vocational, avocational)
- **Class II**: able to perform self-care and vocational activities, restriction of avocational activities
- **Class III**: able to perform self-care, restriction of vocational and avocational activities
- **Class IV**: limited ability to perform self-care, vocational, and avocational activities

- PIP
- MCP
- Wrist, not 1st CMC
- Elbow
- Shoulder
- Knee
- Ankle
- MTP
- C-spine

© Linda Colati

**Figure 5. Common sites of joint involvement in RA**

© Elisheva Marcus and Gloria Situ

**Figure 6. Joint deformities**

**Syndromes in RA**

- SS (common): keratoconjunctivitis sicca and xerostomia (dry eyes and mouth)
- Caplan's syndrome (very rare): combination of RA + Pneumoconiosis that manifests as multiple intrapulmonary nodules
- Felty's syndrome (rare): arthritis, splenomegaly, neutropenia

## Investigations

- blood work
  - RF: 80% sensitivity but non-specific; may not be present at onset of symptoms; levels do not correlate with disease activity
    - can be associated with more erosions, more extra-articular manifestations, and worse function
  - anti-CCP: 80% sensitivity but more specific (94-98%); may precede onset of symptoms
  - increased disease activity is associated with decreased Hb (anemia of chronic disease), increased platelets, ESR, CRP, and RF
- imaging
  - bilateral hands/wrists, ankles/feet x-ray
    - first change is periarticular osteopenia, followed by erosions
  - C-spine x-ray (may be normal at onset, required for pre-operative assessment in long standing disease)
  - U/S (with power doppler) – often changes of synovitis/erosion noted in advance of those seen on plain x-ray
  - MRI may be used to image hands to detect early synovitis and erosions
  - MRI T1 inflamed synovium is hypointense and hyperintense on T1; bone marrow edema can be seen as well as areas of increased uptake gadolinium contrast

Poor prognostic features of RA include: young age of onset, high RF titer, elevated ESR, activity of >20 joints, and presence of extra-articular features

**Side Effects of Steroids**

- Weight gain
- Osteoporosis
- AVN
- Cataracts, glaucoma
- PUD
- Susceptibility to infection
- Easy bruising
- Acne
- HTN
- Hyperlipidemia
- Hypokalemia, hyperglycemia
- Mood swings

## Treatment

- goals of therapy: remission or lowest possible disease activity
  - key is early diagnosis and early intervention with DMARDs
  - "window of opportunity" = early treatment within first 3 mo of disease may allow better control/remission
  - assess poor prognostic factors at baseline (RF positive, functional limitations, and extra-articular features)
- behavioural
  - exercise program: active, gentle ROM and isometric exercise during flares; aquatic/aerobic/strengthening exercise between flares
  - job modification, assistive devices as necessary
  - interventions to reduce cardiovascular disease, smoking cessation, lipid control
- pharmacologic: alter disease progression
  - DMARDs and biologics (not analgesics or NSAIDs) can alter the course of RA
  - DMARDs
    - treatment with DMARDs should be started as soon as RA diagnosis is made, and should be aimed at reaching sustained remission
    - methotrexate (MTX) is the gold standard and is first-line unless contraindicated
      - chest X-ray should be assessed prior to MTX therapy
      - monitor every 3 mo, if inadequate response (3-6 mo) → combine or switch
      - consider including add-on medications to MTX if patients have poor prognostic features or high disease activity
      - add-ons include: hydroxychloroquine, sulfasalazine, leflunomide, biologics
      - if contraindication to MTX, hydroxychloroquine, sulfasalazine and/or leflunomide, should be considered with the former being considered as a weaker agent and the latter as more potent
  - biologics (bDMARD)
    - should be used if inadequate response to DMARDs
    - should be combined with DMARD therapy (initiating with combination therapy is associated with faster response rates and longer duration of effect)
    - first-line (anti-TNF) options: infliximab, etanercept, adalimumab, golimumab, and certolizumab
    - non anti-TNF agents include anakinra (almost never ued for RA), abatacept, rituximab, and tocilizumab
    - reassess every 3-6 mo and monitor disease activity (predominantly via assessing swollen joint count)
- pharmacologic: supportive to reduce inflammation and pain
  - NSAIDs
    - individualize according to efficacy and tolerability
    - contraindicated/cautioned in some patients (e.g. PUD, ischemic cardiac disease, pregnancy)
    - add acetaminophen for synergistic pain control
  - corticosteroids
    - local: injections to control symptoms in a specific joint
    - systemic (prednisone)
      - low dose (5-10 mg/d) useful for short-term to improve symptoms if NSAIDs are ineffective and to bridge gap until DMARDs take effect
      - can try DepoMedrol® with potential same effect as oral prednisone
      - severe RA: add low dose prednisone to DMARDs
      - do baseline DEXA bone density scan and consider bone supportive pharmacologic therapy if using corticosteroids >3 mo at 7.5 mg/d, particularly in those with other risk factors
      - cautions/contraindications: active infection, TB, osteoporosis, HTN, gastric ulcer, DM
- surgical
  - indicated for structural joint damage
  - surgical options include: synovectomy, joint replacement, joint fusion, reconstruction/tendon repair

DMARDs, prednisone and biologics alter the course of RA but not analgesics or NSAIDs

### Follow-Up Management and Clinical Outcomes

- clinical reassessment every 3-6 mo, then 6-12 mo after inflammation has been suppressed
- examine joints for active inflammation – if active, consider adjusting medications, PT/OT
- RA patients should be screened and managed for cardiovascular disease given increased risk
- if assessment reveals joint damage – consider analgesia, referral to PT/OT, surgical options
- outcome depends on disease activity, joint damage, physical functional status, psychological health, and comorbidities
- functional capacity is a useful tool for determining therapeutic effectiveness; many tools for evaluation have been validated
- patients with RA have an increased prevalence of other serious illnesses: infection (e.g. pulmonary, skin, joint), renal impairment, lymphoproliferative disorders, cardiovascular disease (correlates with disease activity and duration)
- risk of premature mortality, decreased life expectancy (most mortality not directly caused by RA)

## Systemic Lupus Erythematosus

- see Nephrology, NP23

### Definition

- chronic inflammatory multi-system disease of unknown etiology
- characterized by production of autoantibodies and diverse clinical manifestations

**Table 14. Diagnostic Criteria of SLE***

| Criteria | Description |
|---|---|
| **CLINICAL** | |
| Malar rash | Classic "butterfly rash", sparing of nasolabial folds, no scarring |
| Discoid rash | May cause scarring due to invasion of basement membrane |
| Photosensitivity | Skin rash in reaction to sunlight |
| Oral/nasal ulcers | Usually painless |
| Arthritis | Symmetric, involving ≥2 small or large peripheral joints, non-erosive |
| Serositis | Pleuritis or pericarditis |
| Neurologic disorder | Headache, seizures or psychosis, peripheral neuropathies |
| **LABORATORY** | |
| Renal disorder | Proteinuria (>0.5 g/d or 3+) |
| | Cellular casts (RBC, Hb, granular, tubular, mixed) |
| Hematologic disorder | Hemolytic anemia, leukopenia, lymphopenia, thrombocytopenia |
| Immunologic disorder | Anti-dsDNA or anti-Sm or antiphospholipid Ab (anticardiolipin Ab, SLE anticoagulant) or false positive VDRL with 6 mo confirmatory negative |
| ANA | Most sensitive test (98%), not specific, ruling out SLE when negative |

*Note: "4, 7, 11" rule → 4 (or more) out of 11 criteria (4 lab, 7 clinical) must be present, serially or simultaneously, for diagnosis
American College of Rheumatology, 1997 update

**Diagnostic Criteria of SLE**

**MD SOAP BRAIN**
**M**alar rash
**D**iscoid rash
**S**erositis
**O**ral ulcers
**A**NA
**P**hotosensitivity
**B**lood
**R**enal
**A**rthritis
**I**mmune
**N**eurologic

### Etiology and Pathophysiology

- production of cytotoxic autoantibodies and immune complex formation
- multi-factorial etiology
- **genetics**
  - common association with HLA-B8/DR3; ~10% have positive family history
  - strong association with defects in apoptotic clearance → fragments of nuclear particles captured by antigen-presenting cells → develop anti-nuclear antibodies
  - cytokines involved in inflammatory process and tissue injury: B-lymphocyte stimulator (BlyS), IL-6, IL-17, IL-18, TNF-α
- **environment**
  - UV radiation, cigarette smoking, infection, vitamin D deficiency
- **estrogen**
  - increased incidence after puberty, decreased incidence after menopause
  - men with SLE have higher concentration of estrogenic metabolites
- **infection**
  - viral (non-specific stimulant of immune response)
- **drug-induced**
  - anti-hypertensives (hydralazine), anti-convulsants (phenytoin), anti-arrhythmics (procainamide), isoniazid, biologics, oral contraceptive pills
  - anti-histone Abs are commonly seen in drug-induced SLE
  - symptoms resolve with discontinuation of offending drug

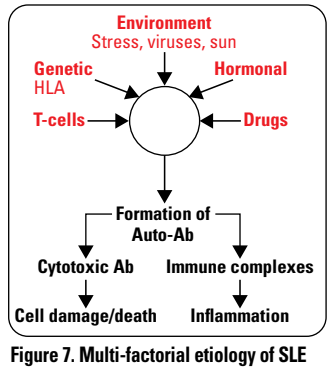


**Figure 7. Multi-factorial etiology of SLE**

**Drug-Induced SLE**
Often presents atypically with systemic features and serositis; usually associated with anti-histone Ab

## Epidemiology
- prevalence: 0.05% overall
- F:M = 10:1
- age of onset in reproductive yr (13-40)
- more common and severe in African-Americans and Asians
- bimodal mortality pattern
  - early (within 2 yr)
    - active SLE, active nephritis, infection secondary to steroid use
  - late (>10 yr)
    - inactive SLE, inactive nephritis, atherosclerosis likely due to chronic inflammation

## Signs and Symptoms
- characterized by periods of exacerbation and remission

**Table 15. Signs and Symptoms of SLE**

| System | Symptoms |
|---|---|
| **Systemic** | Fatigue, malaise, weight loss, fever, lymphadenopathy |
| **Renal** | Hematuria, proteinuria (glomerulonephritis), HTN, peripheral edema, renal failure |
| **Dermatologic** | Photosensitivity, malar rash, discoid rash, oral ulcers, alopecia (hair loss), purpura, panniculitis (inflammation of subcutaneous fat and muscle tissue), urticaria |
| **Musculoskeletal** | Polyarthralgias, polyarthritis, myalgias, AVN; reducible deformities of hand = Jaccoud's arthritis |
| **Ophthalmic** | Keratoconjunctivitis sicca, episcleritis, scleritis, cytoid bodies (cotton wool exudates on fundoscopy = infarction of nerve cell layer of retina) |
| **Cardiac** | Pericarditis, CAD, non-bacterial endocarditis (Libman-Sachs), myocarditis<br>Note: SLE is an independent risk factor for atherosclerosis and CAD |
| **Vascular** | Raynaud's phenomenon, livedo reticularis (mottled discolouration of skin due to narrowing of blood vessels, characteristic lacy or net-like appearance), thrombosis, vasculitis |
| **Respiratory** | Pleuritis, ILD, pulmonary HTN, PE, alveolar hemorrhage |
| **Gastrointestinal** | Pancreatitis, SLE enteropathy, hepatitis, hepatomegaly, splenomegaly |
| **Neurologic/Psychiatric** | H/A, depression, psychosis, seizures, cerebritis, transverse myelitis, peripheral neuropathy, stroke |
| **Life/Organ-Threatening** | Cardiac: coronary vasculitis, malignant HTN, tamponade<br>Hematologic: hemolytic anemia, neutropenia, thrombocytopenia, TTP, thrombosis<br>Neurologic: seizures, CVA, stroke<br>Respiratory: pulmonary hypertension, pulmonary hemorrhage, emboli |

**Raynaud's Phenomenon**
Vasospastic disorder characteristically causing discolouration of fingers and toes (white → blue → red)
Classic triggers: cold and emotional stress

## Investigations
- ANA (98% sensitivity, but poor specificity → used as a screening test; ANA titres are not useful to follow disease course)
- anti-dsDNA and anti-Sm are specific (95-99%)
- anti-dsDNA titre and serum complement (C3, C4) are useful to monitor treatment response in patients who are clinically and serologically concordant (anti-dsDNA, C3, and C4 also fluctuate with disease acitivity)
- antiphospholipid Ab (anti-cardiolipin Ab, SLE anticoagulant, anti-β2 glycoprotein-I Ab), may cause increased risk of clotting and increased aPTT

Consider SLE in a patient who has involvement of 2 or more organ systems

## Treatment
- **goals of therapy**
  - usually immunosuppressive ± corticosteroid
  - treat early and avoid long-term steroid use, if unavoidable see Endocrinology, E44 for osteoporosis management
  - if high doses of steroids necessary for long-term control, add steroid-sparing agents and taper when possible
  - treatment is tailored to organ system involved and severity of disease
  - all medications used to treat SLE require periodic monitoring for potential toxicity
- **dermatologic**
  - sunscreen, avoid UV light and estrogens
  - topical steroids, hydroxychloroquine
- **musculoskeletal**
  - NSAIDs ± gastroprotective agent for arthritis (also beneficial for pleuritis and pericarditis)
  - hydroxychloroquine improves long-term control and prevents flares
  - bisphosphonates, calcium, vitamin D to combat osteoporosis
- **organ-threatening disease**
  - high-dose oral prednisone or IV methylprednisolone in severe disease
  - steroid-sparing agents: azathioprine, MTX, mycophenolate (can use mofetil or sodium)
  - IV cyclophosphamide for serious organ involvement (e.g. cerebritis or lupus nephritis) for clinical features of lupus nephritis

The arthritis of SLE can be deforming but it is non-erosive (in contrast to RA)

# Antiphospholipid Antibody Syndrome

## Definition

- multi-system vasculopathy manifested by recurrent thromboembolic events, spontaneous abortions, and thrombocytopenia
- circulating antiphospholipid autoantibodies interfere with coagulation
- **primary APLS**: occurs in the absence of other disease
- **secondary APLS**: occurs in the setting of a connective tissue disease (including SLE), malignancy, drugs (hydralazine, procainamide, phenytoin, interferon, quinidine), and infections (HIV, TB, hepatitis C, infectious mononucleosis)
- **catastrophic APLS**: development within 1 wk of small vessel thrombotic occlusion in ≥3 organ systems with positive antiphospholipid Ab (high mortality)

**Table 16. Classification Criteria of APLS***

| Criteria | Description |
|---|---|
| **CLINICAL** | |
| Vascular thrombosis | Arterial: stroke/TIA, multi-infarct dementia, MI, valvular incompetence, limb ischemia |
| | Venous: DVT, PE, renal and retinal vein thrombosis |
| | Must be confirmed by imaging or histopathology |
| Pregnancy morbidity | Recurrent spontaneous abortions (<10 wk GA) , fetal death (>10 wk GA), or premature birth (<34 wk GA) |
| **LABORATORY** | Labs must be positive on 2 occasions, at least 12 wk apart |
| Lupus anticoagulant | Prolonged aPTT not corrected by the addition of normal plasma |
| Anti-cardiolipin Ab | IgG and/or IgM |
| Anti-β2 glycoprotein-I Ab | IgG and/or IgM |
| ANA | Most sensitive test (98%), not specific |

* 1 clinical and 1 laboratory criteria must be present J Thromb Haemost 2006;4:295-306

**Manifestations of APLA**
- Thromboembolic events
- Spontaneous abortions
- Thrombocytopenia
- Associated with livedo reticularis, migraine headaches

## Signs and Symptoms

- see Clinical Criteria in Table 16
- hematologic
  - thrombocytopenia, hemolytic anemia, neutropenia
- dermatologic
  - livedo reticularis, Raynaud's phenomenon, purpura, leg ulcers, and gangrene

Arterial and venous thrombosis are usually mutually exclusive

## Treatment

- thrombosis
  - lifelong anti-coagulation with warfarin
  - target INR 2.0-3.0 for first venous event, >3.0 for recurrent and/or arterial event
- recurrent fetal loss
  - heparin/low molecular weight heparin ± ASA during pregnancy
- catastrophic APLS
  - high-dose steroids, anti-coagulation, cyclophosphamide, plasmapheresis

# Scleroderma (i.e. Systemic Sclerosis)

## Definition

- a non-inflammatory autoimmune disorder characterized by widespread small vessel vasculopathy, production of autoantibodies, and fibroblast dysfunction causing fibrosis

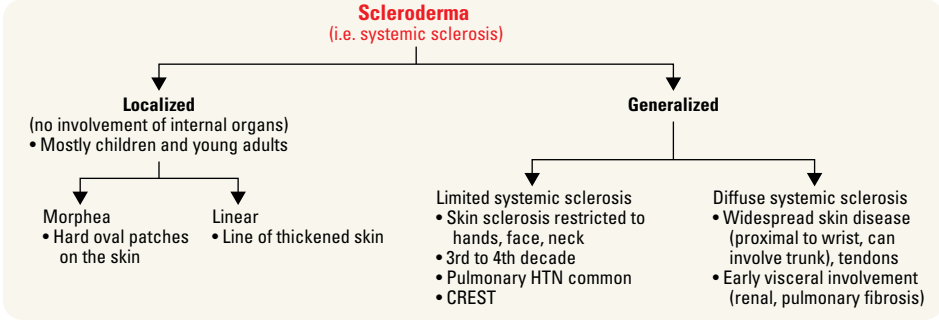

**Figure 8. Forms of scleroderma**

**CREST Syndrome**
**C**alcinosis
**R**aynaud's phenomenon
**E**sophageal dysmotility
**S**clerodactyly
**T**elangiectasia

Scleroderma is the most common cause of secondary Raynaud's phenomenon

**Table 17. The American College of Rheumatology (ACR)/European League Against Rheumatism (EULAR) Criteria for Scleroderma***

| Item | Sub-item | Score |
|---|---|---|
| 1. Skin thickening of fingers of both hands extending proximal to the MCP (sufficient criterion) | | 9 |
| 2. Skin thickening of the fingers | Puffy fingers<br>Sclerodactyly | 2<br>4 |
| 3. Fingertip lesions | Digital tip ulcers<br>Fingertip pitting scars | 2<br>3 |
| 4. Telangiectasia | | 2 |
| 5. Abnormal nailfold capillaries | | 2 |
| 6. Pulmonary arterial HTN ± ILD (max score 2) | Pulmonary arterial HTN<br>ILD | 2<br>2 |
| 7. Raynaud's phenomenon | | 3 |
| 8. Scleroderma related Ab | Anti-centromere<br>Anti-topoisomerase I<br>Anti-RNA polymerase III | 3 |

* Score of ≥9 is sufficient to classify a patient as having definite scleroderma (sensitivity 0.95, specificity 0.93)
Arthritis & Rheum 2013;65(11):2737-2747

**Cyclophosphamine versus Placebo in Scleroderma Lung Disease**
NEJM 2006; 354:2655-66
**Study**: Double-blind, randomized, placebo-controlled trial.
**Study**: Lung function and health-related symptoms.
**Results**: The mean absolute difference in adjusted 12 mo FVC percent predicted between cyclophosphamide and placebo groups was 2.53 percent, favouring cyclophosphamide. There were also treatment-related differences in physiological and symptom outcomes, and the difference in FVC was maintained at 24 mo.
**Conclusion**: Cyclophosphamide has a significant but modest beneficial effect on lung function, dyspnea, thickening of skin, and health-related quality of life in patients with symptomatic, scleroderma-related interstitial lung disease.

## Etiology and Pathophysiology

- idiopathic vasculopathy (not vasculitis) leading to atrophy and fibrosis of tissues
  - intimal proliferation and media mucinous degeneration → progressive obliteration of vessel lumen → fibrotic tissue
  - resembles malignant HTN
  - lung disease is the most common cause of morbidity and mortality

## Epidemiology

- F:M = 3-4:1, peaking in 5th decades
- associated with HLA-DR1 and environmental exposures (silica, epoxy resins, toxic oil, aromatic hydrocarbons, polyvinyl chloride)
- limited systemic sclerosis has a higher survival prognosis (>70% at 10 yr) than diffuse systemic sclerosis (40-60% at 10 yr)

**Raynaud's Phenomenon DDx**

**COLD HAND**
**C**ryoglobulins/**C**ryofibrinogens
**O**bstruction/**O**ccupational
**L**upus erythematosus, other connective tissue disease
**D**iabetes mellitus/**D**rugs
**H**ematologic problems (polycythemia, leukemia, etc.)
**A**rterial problems (atherosclerosis)/**A**norexia nervosa
**N**eurologic problems (vascular tone)
**D**isease of unknown origin (idiopathic)

## Signs and Symptoms

**Table 18. Clinical Manifestations of Scleroderma**

| System | Features |
|---|---|
| **Dermatologic** | Painless non-pitting edema → skin tightening<br>Ulcerations, calcinosis, periungual erythema, hypo/hyperpigmentation, pruritus, telangiectasias<br>Characteristic face: mask-like facies with tight lips, beak nose, radial perioral furrows |
| **Vascular** | Raynaud's phenomenon → digital pits, gangrene |
| **Gastrointestinal (~90%)** | Distal esophageal hypomotility → dysphagia<br>Loss of lower esophageal sphincter function → GERD, ulcerations, strictures<br>Small bowel hypomotility → bacterial overgrowth, diarrhea, bloating, cramps, malabsorption, weight loss<br>Large bowel hypomotility → wide mouth diverticuli are pathognomonic radiographic finding on barium study |
| **Renal** | Mild proteinuria, Cr elevation, HTN<br>"Scleroderma renal crisis" (10-15%) may lead to malignant arterial HTN, oliguria, and microangiopathic hemolytic anemia |
| **Pulmonary** | Interstitial fibrosis, pulmonary HTN, pleurisy, pleural effusions |
| **Cardiac** | Left ventricular dysfunction, pericarditis, pericardial effusion, arrhythmias |
| **Musculoskeletal** | Polyarthralgias<br>"Resorption of distal tufts" (radiological finding)<br>Proximal weakness 2° to disuse, atrophy, low grade myopathy |
| **Endocrine** | Hypothyroidism |

**Features of Pathologic Raynaud's Syndrome**
- New onset
- Asymmetric
- Precipitated by stimuli other than cold or emotion
- Associated with distal pulp pitting or tissue reabsorption
- Digit ischemia
- Capillary dilatation by capillaroscopy

## Investigations

- blood work
  - CBC, Cr, ANA
  - anti-topoisomerase 1/anti-Scl-70: specific but not sensitive for diffuse systemic sclerosis
  - anti-centromere: favours diagnosis of CREST (limited systemic sclerosis)
- PFT
  - assess for interstitial lung disease
- imaging
  - CXR for fibrosis, echo for pulmonary HTN

### Treatment
- dermatologic
  - good skin hygiene
  - low-dose prednisone (>20 mg may provoke renal crisis if susceptible), MTX (limited evidence)
- vascular
  - patient education on cold avoidance
  - vasodilators (CCBs, local nitroglycerine cream, systemic PGE2 inhibitors, PDE5 inhibitors)
- gastrointestinal
  - GERD: PPIs are first-line, then H2-receptor agonists
  - small bowel bacterial overgrowth: broad spectrum antibiotics (tetracycline, metronidazole)
- renal disease
  - ACE inhibitor for hypertensive crisis
  - see Nephrology, NP32 for scleroderma renal crisis
- pulmonary
  - early interstitial disease: mycophenolate mofetil (less toxicity) or cyclophosphamide
  - pulmonary HTN: vasodilators (e.g. bosentan , epoprostenol, and PDE5 inhibitors)
  - rapidly progressive disease at risk of organ failure: consider hematopoietic stem cell transplantation
- cardiac
  - pericarditis: systemic steroids
- musculoskeletal
  - arthritis: NSAIDs
  - myositis: systemic steroids

## Idiopathic Inflammatory Myopathy

### Definition
- autoimmune diseases characterized by proximal muscle weakness ± pain
- muscle becomes damaged by a non-suppurative lymphocytic inflammatory process
- associated with malignancy
  - increased risk of malignancy: age >50, DMM>PM, normal CK, refractory disease
- associated with other connective tissue disease, Raynaud's phenomenon, autoimmune disorders

### Classification
- PM/DMM
- adult and juvenile form

### Inclusion Body Myositis
- age >50, M>F, slowly progressive, vacuoles in cells on biopsy
- suspect when patient unresponsive to treatment
- distal as well as proximal muscle weakness
- muscle biopsy positive for inclusion bodies

### POLYMYOSITIS/DERMATOMYOSITIS

**Table 19. Classification Criteria for PM/DMM***

| Criteria | Description |
|---|---|
| 1. Symmetric proximal muscle weakness (usually progressive) | Typical involvement of shoulder girdle and hip girdle<br>Dysphagia or esophageal dysmotility |
| 2. Elevated muscle enzymes | ↑ CK, aldolase, LDH, AST, ALT |
| 3. EMG changes | Short polyphasic motor units, high frequency repetitive discharge, insertional irritability |
| 4. Muscle biopsy | DMM: peripheral round cell infiltrate into fascicle with necrosis, complement and pos. immunofluorescence; PM: round cell infiltrate in fascicle with necrotic or regenerating fibres throughout muscle bundle |
| 5. Typical rash of dermatomyositis | Required for diagnosis of DMM (see below) |

*Definite if 4 present, probable if 3 present NEJM 1975;292:403-407

**Signs of DMM**
Gottron's papules and Gottron's sign are pathognomonic of DMM (occur in 70% of patients)

### Etiology and Pathophysiology
- PM is CD8 cell-mediated muscle necrosis, found in adults
- DMM is B-cell and CD4 immune complex-mediated, and causes peri-fascicular vascular abnormalities

### Signs and Symptoms

- progressive symmetrical proximal muscle weakness (shoulder and hip) developing over weeks to months
  - difficulty lifting head off pillow, arising from chair, climbing stairs
- dermatological
  - DMM has characteristic dermatological features (F>M, children and adults)
    - Gottron's papules
      - pink-violaceous, flat-topped papules overlying the dorsal surface of the interphalangeal joints
    - Gottron's sign
      - erythematous, smooth or scaly patches over the dorsal IPs, MCPs, elbows, knees, or medial malleoli
    - heliotrope rash: violaceous rash over the eyelids; usually with edema
    - shawl sign: poikilodermatous erythematous rash over neck, upper chest, and shoulders
    - mechanic's hands: dry, crackled lesions on palmar and lateral surface of digits, especially over the pulp space
    - periungual erythema
- cardiac
  - arrhythmias, CHF, conduction defect, ventricular hypertrophy, pericarditis
- gastrointestinal
  - oropharyngeal and lower esophageal dysphagia, reflux
- pulmonary
  - weakness of respiratory muscles, ILD, aspiration pneumonia

**Malignancies Associated with DMM**
- Breast
- Lung
- Colon
- Ovarian

### Investigations

- blood work: CK, ANA, anti-Jo-1 (DMM), anti-Mi-2, anti-SRP
- imaging: MRI may be used to localize biopsy site
- EMG: characteristic findings of muscle inflammation and damage
  - muscle biopsy can aid in diagnosis, however not needed in those with classic skin findings and muscle weakness

**Classic Triad (identifies 93% of Sjögren's patients)**
- Dry eyes
- Dry mouth (xerostomia) → dysphagia
- Arthritis (small joint, asymmetrical, non-erosive) but may be associated with rheumatoid arthritis, in which case, the arthritis is erosive and symmetric

### Treatment

- non-pharmacological treatment
  - physical therapy and occupational therapy, speech language therapy for esophageal dysfunction
- pharmacological treatment
  - high-dose corticosteroid (1-2 mg/kg/d) usually not exceeding 80 mg daily and slow taper
  - add immunosuppressive agents (azathioprine, MTX)
  - IVIg if severe or refractory
  - hydroxychloroquine for DMM rash
- malignancy surveillance
  - detailed history and physical (breast, pelvic, and rectal exam)
  - CXR, abdominal and pelvic U/S, fecal occult blood, Pap test, mammogram ± CT scan (thoracic, abdominal, pelvic)

## Sjögren's Syndrome

### Definition

- autoimmune condition characterized by dry eyes (keratoconjunctivitis sicca/xerophthalmia) and dry mouth (xerostomia), caused by lymphocytic infiltration of salivary and lacrimal glands
- may evolve into systemic disorder (20%) with diminished exocrine gland activity in respiratory tract and skin
- primary and secondary form (associated with RA, SLE, DMM, and HIV)
- prevalence 0.5%, F>>M 10:1, 40-60 yr
- increased risk of non-Hodgkin's lymphoma (lifetime incidence 6-7%)

**Table 20. The American College of Rheumatology (ACR)/European League Against Rheumatism (EULAR) Criteria for Primary Sjögren's Syndrome (no condition in exclusion criteria, score ≥6)**

| Criteria | Score | Comments |
|---|---|---|
| Labial salivary gland biopsy with focal lymphocytic sialadenitis with focus score ≥1 focus /4mm$^2$ | 3 | Focus scores are histopathologic grading systems<br>Strongly associated with phenotypic ocular and serological components of Sjögren's |
| Anti-SSA or Ro positive | 3 | |
| Ocular staining score ≥5 (or van Bijsterfeld score ≥4 on at least one eye | 1 | Ocular staining score based on fluorescein dye examination of conjunctiva and cornea to determine clinical changes |
| Schirmer's test ≤5 mm / 5 min on at least one eye | 1 | |
| Unstimulated whole saliva flow rate ≤0.1 mL/min | 1 | |
| Exclusion criteria include prior diagnosis of any of the following conditions: 1) history of head and neck radiation treatment, 2) active hepatitis C infection (with confirmation by polymerase chain reaction, 3) AIDS, 4) sarcoidosis, 5) amyloidosis, 6) graft-versus-host disease, 7) IgG4-related disease | | |

Arthritis Rheumatol. 2017;69:35-45

### Signs and Symptoms

- "sicca complex": dry eyes (keratoconjunctivitis sicca/xerophthalmia), dry mouth (xerostomia), complicated by staphylococcal blepharitis
- dental caries, oral candidiasis, angular cheilitis (inflammation and fissuring at the labial commissures of the mouth)
- systemic complications
  - sinusitis
  - autoimmune thyroid dysfunction
  - arthralgias, arthritis
  - subclinical diffuse ILD, xerotrachea leading to chronic dry cough
  - renal disease, glomerulonephritis
  - palpable purpura, vasculitis
  - peripheral neuropathy
  - lymphoma risk greatly increased

### Treatment

- ocular
  - artificial tears/ tear gel if severe, or surgical punctal occlusion for dry eyes
- oral
  - good dental hygiene, hydration
  - parasympathomimetic agents that stimulate salivary flow (e.g. pilocarpine)
  - topical nystatin or clotrimazole x 4-6 wk for oral candidiasis
- systemic (e.g. hydroxychloroquine, corticosteroids), Rituximab can be used in severe disease

## Mixed Connective Tissue Disease

- syndrome with features of 3 different connective tissue diseases (e.g. SLE, scleroderma, PM)
- common symptoms: Raynaud's phenomenon, swollen fingers
- blood work: anti-RNP (see Table 10)
- treatment is generally guided by the severity of symptoms and organ system involvement
- prognosis
  - 50-60% will evolve into SLE
  - 40% will evolve into scleroderma
  - only 10% will remain as MCTD for the rest of their lives
  - cardiac involvement (arrhythmia) common, renal or lung involvement rare

## Overlap Syndrome

- syndrome with sufficient diagnostic features of 2+ different connective tissue diseases

# Vasculitides

- inflammation and subsequent necrosis of blood vessels leading to tissue ischemia or infarction of any organ system
- diagnosis
  - clinical suspicion: suspect in cases of unexplained multiple organ ischemia or systemic illness with no evidence of malignancy or infection; constitutional symptoms such as fever, weight loss, anorexia, fatigue
  - labs non-specific: anemia, increased WBC and ESR, abnormal U/A
  - investigations: biopsy if tissue accessible; angiography if tissue inaccessible
- treatment generally involves corticosteroids and/or immunosuppressive agents

**Features of Small Vessel Vasculitis**
- Palpable purpura
- Vesicles
- Chronic urticaria
- Superficial ulcers (erosions)

**Table 21. Classification of Vasculitis and Characteristic Features**

| Classification | Characteristic Features |
|---|---|
| **SMALL VESSEL** | |
| Non-ANCA-associated | Immune complex-mediated (most common mechanism) |
| Anti-GBM (Goodpasture's disease) | Autoantibodies targeting type IV collagen in both glomerular basement membrane and alveoli causing glomerulonephritis and/or pulmonary findings |
| Anti-C1q vasculitis (Hypocomplementemic urticarial vasculitis syndrome) | Specific autoimmune disorder with at least 6 mo of urticaria with C1q complement deficiency with various systemic findings |
| Predominantly cutaneous vasculitis | Also known as hypersensitivity/leukocytoclastic vasculitis |
| IgA vasculitis (formely Henoch-Schönlein purpura [HSP]) (see Pediatrics, P88) | Vascular deposition of IgA causing systemic vasculitis (skin, GI, renal), usually self-limiting; most common in childhood |
| Cryoglobulinemic vasculitis (CV) | Systemic vasculitis caused by circulating cryoproteins forming immune complexes; 60-80% of cases are due to Hepatitis C, 5-10% are due to a CTD (SLE, RA, SS), 5-10% are due to a lymphoproliferative disorder and the remaining 5-10% are idiopathic or "essential". CV may be associated with underlying infection (e.g. hepatitis C) or connective tissue disease |
| ANCA-associated (i.e. PR3-ANCA) Granulomatosis with polyangiitis (GPA, formerly Wegener's) PR3 (c-ANCA) > MPO (p-ANCA) | Granulomatous inflammation of vessels of respiratory tract and kidneys; initially have URTI symptoms; most common in middle age |
| Eosinophilic granulomatosis with polyangiitis (EGPA), formerly Churg-Strauss syndrome) (50% ANCA positive) | Granulomatous inflammation of vessels with hypereosinophilia and eosinophilic tissue infiltration, frequent lung involvement (asthma, allergic rhinitis), associated with MPO-ANCA in 40-50% of cases. Other manifestations include peripheral neuropathy (70%), GI involvement, myocarditis, and rarely coronary arteritis; average age 40s |
| Microangiopathic polyangiitis (MPA) (70% ANCA positive, usually MPO) | Pauci-immune necrotizing vasculitis, affects kidneys (necrotizing glomerulonephritis), lungs (capillaritis and alveolar hemorrhage), skin; most common in middle age |
| **MEDIUM VESSEL** | |
| Polyarteritis nodosa | Segmental, non-granulomatous necrotizing inflammation<br>Unknown etiology in most cases, any age (average 40-50s), M>F |
| Kawasaki disease (see Pediatrics, P88) | Arteritis and mucocutaneous lymph node syndrome |
| **LARGE VESSEL** | |
| GCA/Temporal arteritis | Inflammation predominantly of the aorta and its branches<br>>50 yr of age, F>M |
| Takayasu's arteritis | "Pulseless disease", unequal peripheral pulses, chronic inflammation, most often the aorta and its branches<br>Most common in young adults of Asian descent, 10-40 yr of age, F>M, risk of aortic aneurysm |
| **OTHER VASCULITIDES** | |
| Buerger's disease ("Thromboangiits Obliterans") | Inflammation and clotting of small and medium-sized arteries and veins of distal extremities, may lead to distal claudication and gangrene, most important etiologic factor is cigarette smoking. Most common in young Asian males, M>F |
| Behçet's disease | Multi-system disorder presenting with ocular involvement (uveitis), recurrent oral and genital ulceration, venous thrombosis, skin and joint involvement; most common in Mediterranean and Asian populations, average age 30 yr old, M>F |
| Vasculitis mimicry (i.e. pseudovasculitis) | Cholesterol emboli, atrial myxoma, bacterial endocarditis (SBE), APLS |

**c-ANCA** (i.e. pR3-ANCA): cytoplasmic anti-neutrophil cytoplasmic Ab associated with anti-PR3
**p-ANCA** (i.e. MPO-ANCA): perinuclear anti-neutrophil cytoplasmic Ab associated with multiple antigens, e.g. myeloperoxidase, lactoferrin (IBD), cathepsin, elastase etc. Of these only antibodies to myeloperoxidase have been associated with the development of vasculitis

**Churg-Strauss Triad**
- Allergic rhinitis and asthma (often quiescent at time of vasculitis)
- Eosinophilic infiltrative disease resembling pneumonia
- Systemic vasculitis often mononeuritis multiplex/peripheral neuropathy and peripheral eosinophilia

**Features of Medium Vessel Vasculitis**
- Livedo reticularis
- Erythema nodosum
- Raynaud's phenomenon
- Nodules
- Digital infarcts
- Ulcers

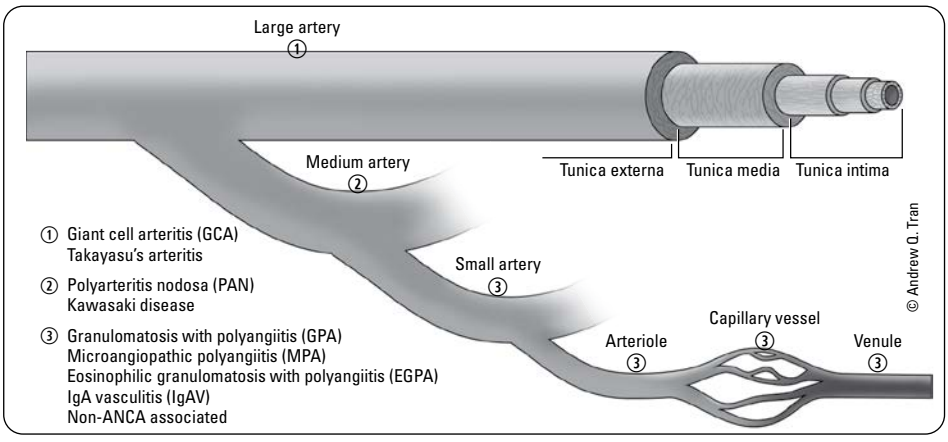

**Figure 9. Classification of vasculitides by vessel size**

# Small Vessel Non-ANCA Associated Vasculitis

## CUTANEOUS VASCULITIS

- subdivided into:
  - drug-induced vasculitis
  - serum sickness reaction
  - vasculitis associated with other underlying primary diseases (CTD, infections, malignancies – hematologic > solid tumours)

### Etiology and Pathophysiology

- cutaneous vasculitis following:
  - drug exposure (allopurinol, gold, sulfonamides, penicillin, phenytoin)
  - viral or bacterial infection
  - idiopathic causes
- small vessels involved (post-capillary venules most frequently)
- usually causes a leukocytoclastic vasculitis: debris from neutrophils around vessels
- sometimes due to cryoglobulins which precipitate in cold temperatures

### Signs and Symptoms

- palpable purpura ± vesicles and ulceration, urticaria, macules, papules, bullae, subcutaneous nodules
  - renal or joint involvement may occur, especially in children

### Investigations

- vascular involvement (both arteriole and venule) established by skin biopsy

### Treatment

- stop possible offending drug
- NSAID, low dose corticosteroids
  - immunosuppressive agents in resistant cases
- usually self-limiting

# Small Vessel ANCA-Associated Vasculitis

## GRANULOMATOSIS WITH POLYANGIITIS (GPA, formerly known as Wegener's Granulomatosis)

### Definition

- granulomatous inflammation of vessels that may affect the upper airways (rhinitis, sinusitis), lungs (pulmonary nodules, infiltrates), and kidneys (glomerulonephritis, renal failure)
- highly associated with c-ANCA by indirect immunofluorescence (IIF) and PR3-ANCA by ELISA; however, changes in ANCA levels do not predict remission or relapse
- incidence 2-3 per 100,000; more common in Northern latitudes

**Table 22. Classification Criteria for GPA***

| Criteria | Description |
|---|---|
| 1. Nasal or oral involvement | Inflammation, ulcers, epistaxis |
| 2. Abnormal findings on CXR | Nodules, cavitations, etc. |
| 3. Urinary sediment | Microscopic hematuria ± RBC casts |
| 4. Biopsy of involved tissue | Lungs show granulomas, kidneys show necrotizing segmental glomerulonephritis |

*Diagnosed if 2 or more of the above 4 criteria present American College of Rheumatology, 1990

**Classic Features of GPA**
- Necrotizing granulomatous vasculitis of lower and upper respiratory tract
- Focal segmental glomerulonephritis

### Etiology
- pathogenesis depends on genetic susceptibility and environmental triggers (e.g. infection)
  - dysregulated immune response due to loss of B and T cell tolerance
  - acute vascular injury mediated by neutrophils and monocytes

### Signs and Symptoms
- systemic
  - malaise, fever, weakness, weight loss
- HEENT
  - sinusitis or rhinitis, nasal crusting and bloody nasal discharge, nasoseptal perforation, saddle nose deformity
  - proptosis due to: inflammation/vasculitis involving extra-ocular muscles, granulomatous retrobulbar space occupying lesions or direct extension of masses from the upper respiratory tract
  - hearing loss due to involvement of CN VIII
- pulmonary
  - cough, hemoptysis, granulomatous upper respiratory tract masses, tracheal and bronchial stenosis
- renal
  - hematuria, proteinuria, elevated creatinine, glomerulonephritis
- other
  - joint, skin, eye complaints, vasculitic neuropathy

### Investigations
- blood work: anemia (normal MCV), increased WBC, increased Cr, increased ESR, elevated platelet count, ANCA (PR3 > MPO)
- urinalysis: proteinuria, hematuria, RBC casts
- CXR: pneumonitis, lung nodules, infiltrations, cavitary lesions
- biopsy for confirmation of disease: skin, renal (segmental necrotizing glomerulonephritis), lung (vasculitis, necrosis)
- ESR and/or CRP may be used to monitor response to treatment in some patients

### Treatment
- for severe, life or organ threatening disease
  - pulse methylprednisolone 0.5-1.0 g/d x 1-3 d followed by prednisone 1 mg/kg/d PO + cyclophosphamide 2 mg/kg/d PO for 3-6 mo OR rituximab 375 mg/m$^2$ x 4 weekly infusions followed by high dose MTX (20-25 mg PO/SC weekly) or azathioprine (2 mg/kg/d PO OD)
- plasma exchange is usually not recommended as it does not reduce mortality nor end stage renal disease

**Efficacy of Remission Induction Regimens for ANCA-Associated Vasculitides (RAVE) Trial**
NEJM 2013; 369:417-427
**Study**: Multicentre, randomized, double-blind, double-dummy, non-inferiority trial.
**Intervention**: Rituximab
**Outcome**: Complete remission of disease by 6 mo, with remission maintained through 18 mo.
**Results**: 64% of the patients in the rituximab group, as compared with 53% of the patients in the cyclophosphamide–azathioprine group, had a complete remission by 6 mo. At 12 and 18 mo, 48% and 39%, respectively, of the patients in the rituximab group maintained complete remission, as compared with 39% and 33%, respectively, in the comparison group. Rituximab met the prespecified criteria for noninferiority. There was no significant difference between the groups in any efficacy measure, including the duration of complete remission and the frequency or severity of relapses. Among the 101 patients who had relapsing disease at baseline, rituximab was superior to conventional immunosuppression at 6 mo (P=0.01) and at 12 mo (P=0.009) but not at 18 mo.
**Conclusion**: In patients with severe ANCA-associated vasculitis, a single course of rituximab was as effective as continuous conventional immunosuppressive therapy for the induction and maintenance of remission over the course of 18 mo.

# Medium Vessel Vasculitis

## POLYARTERITIS NODOSA (PAN)

### Definition
- systemic, necrotizing vasculitis of medium sized vessels
- ANCA negative, classically lung-sparing
- 5-10% associated with hepatitis B positivity
- incidence 0.7 per 100,000; affects individuals between 40-60 yr; M:F = 2:1

**Table 23. Classification Criteria for PAN***

| Criteria | Description |
|---|---|
| 1. Weight loss | ≥4 kg, not due to dieting or other factors |
| 2. Myalgias, weakness, or leg tenderness | Diffuse myalgias or muscle weakness |
| 3. Livedo reticularis | Mottled, reticular pattern over skin |
| 4. Neuropathy | Mononeuropathy, mononeuropathy multiplex, or polyneuropathy |
| 5. Testicular pain or tenderness | Not due to infection, trauma, or other causes |
| 6. dBP >90 mmHg | Development of HTN with dBP >90 mmHg |
| 7. Elevated Cr or BUN | Cr >130 µmol/L (1.5 mg/dL), BUN >14.3 mmol/L (40 mg/dL) |
| 8. Hepatitis B positive | Presence of hepatitis B surface antigen or Ab |
| 9. Arteriographic abnormality | Commonly aneurysms |
| 10. Biopsy of artery | Presence of granulocytes and/or mononuclear leukocytes in the artery wall |

*Diagnosed if 3 or more of the above 10 criteria present  American College of Rheumatology, 1990

### Signs and Symptoms
- systemic: fatigue, weight loss, weakness, fever, arthralgias
- dermatologic: livedo reticularis, nodules, purpura, eruptions
- renal: renal insufficiency leading to HTN
- neuro: Mononeuropathy multiplex in both motor and sensory nerves
- abdo: abdominal pain, mesenteric arteritis

### Etiology and Pathophysiology
- focal panmural necrotizing inflammatory lesions in small and medium-sized arteries
- thrombosis, aneurysm, or dilatation at lesion site may occur
- healed lesions show proliferation of fibrous tissue and endothelial cells that may lead to luminal occlusion

### Investigations
- blood work: CBC, ESR, Cr, BUN, p-ANCA, hepatitis B serology
- imaging: angiography
- arterial biopsy

### Treatment
- prednisone 1 mg/kg/d PO (max 60 mg/d) ± and cyclophosphamide 2 mg/kg/d PO (max 200 mg/d) followed by azathioprine (2 mg/kg/d) or MTX (20-25 mg/kg/w) for remission maintenance; total treatment duration (18 mo)
- ± anti-viral therapy to enhance clearance of hepatitis B virus

## Large Vessel Vasculitis

### GCA/TEMPORAL ARTERITIS

**Table 24. Classification Criteria for GCA***

| Criteria | Description |
|---|---|
| 1. Age at onset ≥50 | |
| 2. New H/A | Often temporal |
| 3. Temporal artery abnormality | Temporal artery tenderness or decreased pulsations, not due to arteriosclerosis |
| 4. Elevated ESR | ESR ≥50 mm/h |
| 5. Abnormal artery biopsy | Mononuclear cell infiltration or granulomatous inflammation, usually with multinucleated giant cells |

*Diagnosed if 3 or more of the above 5 criteria present American College of Rheumatology, 1990

**GCA Criteria**
Presence of 3 or more criteria yields sensitivity of 94%, specificity of 91%

### Epidemiology
- most frequent vasculitis in North America
- patients >50 yr; peak incidence 70-80 yr
- F:M = 2:1
- North-South gradient (predominance in Northern Europe/US)
- affects extracranial arteries

### Signs and Symptoms
- new onset temporal H/A ± scalp tenderness overlying temporal artery
- sudden, painless loss of vision and/or diplopia due to narrowing of the ophthalmic or posterior ciliary arteries (PCA more common); can affect both eyes
- tongue and jaw claudication (pain in muscles of mastication on prolonged chewing)
- PMR (proximal myalgia, constitutional symptoms, elevated ESR) occurs in 30% of patients
- aortic arch syndrome (involvement of subclavian and brachial branches of aorta resulting in pulseless disease), aortic aneurysm ± rupture are late complications
- constitutional symptoms (e.g. fever of unknown origin in patients ≥65 years) and shoulder/pelvic girdle pain and stiffness

**Medical Emergency**
If untreated, GCA can lead to permanent blindness in 20-25% of patients
Treat on clinical suspicion

### Investigations
- diagnosis made by clinical suspicion, increased ESR, increased CRP, colour doppler U/S of temporal ± axillary arteries (+ halo sign), MRI, consider temporal artery biopsy

### Treatment
- if suspect GCA, immediately start high dose prednisone 1 mg/kg PO in divided doses for 2-4 wk, and then tapering prednisone by 10 mg per 1-2 wk as symptoms resolve; highly effective in treatment and in prevention of blindness and other vascular complications
- consider low dose ASA to help decrease visual loss
- if presenting with vision loss at diagnosis, start methylprednisolone 1000 mg/d IV for 3 d followed by high dose prednisone 1 mg/kg/d PO in divided doses for 4 wk

### Prognosis
- increased risk of thoracic aortic aneurysm and aortic dissection
- yearly CXR ± abdominal U/S as screening

# Seronegative Rheumatic Disease

**Table 25. A Comparison of the Spondyloarthropathies***

| Feature | Ankylosing Spondylitis (AS) | Psoriatic Arthritis (PsA) | Reactive Arthritis (ReA) | Enteropathic Arthritis (EA) |
|---|---|---|---|---|
| M:F | 3:1 | 1:1 | 8:1 | 1:1 |
| Age of Onset | 20s | 35-45 | 20s | Any |
| Peripheral Arthritis | 25% | 96% | 90% | Common |
| Distribution | Axial, LE | Any | LE | LE |
| Sacroiliitis | 100% | 40% | 80% | 20% |
| Dactylitis | Uncommon | Common | Occasional | Uncommon |
| Enthesitis | Common | Common | Common | Less Common |
| Skin Lesions | Rare | 100%<br>Psoriasis eventually<br>70% at onset of arthritis | Occasional<br>Keratoderma<br>blennorrhagica | Occasional<br>Pyoderma, erythema<br>nodosum |
| Uveitis | Common | Occasional | 20% | Rare |
| Urethritis | Rare | Uncommon | Common | Rare |
| HLA-B27 | 90-95% | 40% | 80% | 30% |

LE = lower extremities *Spondylarthropathy: inflammatory joint disease of the vertebral column

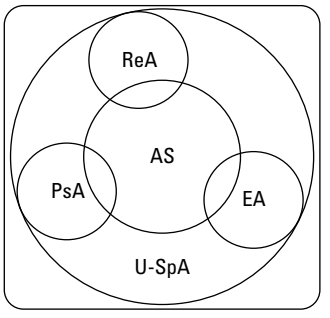

**Figure 10. Spondyloarthropathy subsets**

AS shares some features with the other three types of seronegative spondyloarthopathies such as ReA, EA, PsA and undifferentiated spondyloarthropathy (U-PSA)

Enthesitis: inflammation of tendon or ligament at site of attachment to bone

# Ankylosing Spondylitis

## Definition

- chronic inflammatory arthritis involving the sacroiliac joints and vertebrae
- enthesitis is a major feature (e.g. Achilles tendonitis, plantar fasciitis)
- prototypical spondyloarthropathy

**Table 26. ASAS Classification Criteria for Axial Spondyloarthritis***

| Sacroiliitis on Imaging plus ≥1 AS Feature or HLA-B27 Positive plus ≥2 AS Features | |
|---|---|
| **AS Features** | **Sacroiliitis on Imaging** |
| HLA-B27 positive | Active (acute) inflammation on MRI highly suggestive of sacroiliitis associated with AS |
| Inflammatory back pain | OR |
| Arthritis | Definite radiographic sacroiliitis ≥ grade 2 bilaterally or grade 3-4 unilaterally |
| Enthesitis (heel) | |
| Uveitis | |
| Dactylitis | |
| Psoriasis | |
| Crohn's disease/colitis | |
| Good response to NSAIDs | |
| Family history of AS | |
| Elevated CRP | |

*For patients with ≥3 mo back pain and age at onset <45 yr

Consider AS in the differential for causes of aortic regurgitation

**Rule of 2s**
**AS occurs in**
0.2% of the general population
2% of HLA-B27 positive individuals
20% of HLA-B27 positive individuals with affected family member

## Etiology and Pathophysiology

- inflammation → osteopenia → erosion → ossification → osteoproliferation (syndesmophytes)

## Epidemiology

- M:F = 3:1; females have milder disease which may be under-recognized and more peripheral arthritis and upper spine spondylitis
- 90-95% of patients have HLA-B27 (9% HLA-B27 positive in general population)

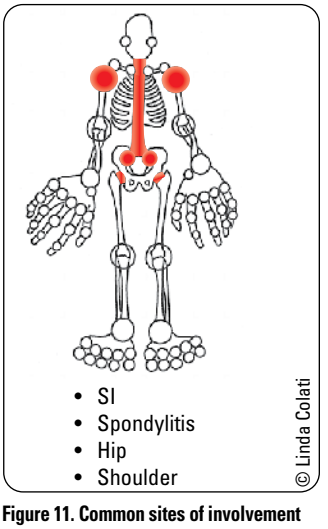

**Figure 11. Common sites of involvement of AS**

**Table 27. Types of Back Pain**

| Parameter | Mechanical | Inflammatory |
|---|---|---|
| **Past History** | ± | ++ |
| **Family History** | – | + |
| **Onset** | Acute | Insidious |
| **Age** | 15-90 yr | <45 yr |
| **Sleep Disturbance** | ± | ++ (worse during 2nd half of night) |
| **Morning Stiffness** | <30 min | >1 h |
| **Involvement of Other Systems** | – | + |
| **Exercise** | Worse | Better |
| **Rest** | Better | Worse |
| **Radiation of Pain** | Anatomic (L5-S1) | Diffuse (thoracic, buttock) |
| **Sensory Symptoms** | + | – |
| **Motor Symptoms** | + | – |

**The Bath Ankylosing Spondylitis Disease Activity Index (BASDAI)**
Self-reported scoring system that focuses on fatigue, axial pain, peripheral pain, enthesitis, and morning stiffness

### Signs and Symptoms

- **axial**
  - mid and lower back stiffness, morning stiffness >1 h, night pain, persistent buttock pain, painful sacroiliac joint (+ FABER test)
  - spinal restriction (decreased ROM): lumbar (decreased Schöber), thoracic (decreased chest wall expansion, normal >5 cm at T4), cervical (global decrease, often extension first)
  - postural changes: decreased lumbar lordosis + increased thoracic kyphosis + increased cervical flexion = increased occiput to wall distance (>5 cm)
- **peripheral**
  - asymmetrical large joint arthritis, most often involving lower limb
  - enthesitis: tenderness over tibial tuberosity, or Achilles tendon and plantar fascia insertions into the calcaneus
  - dactylitis: toes or fingers
- **extra-articular manifestations**
  - ophthalmic: acute anterior uveitis is common (25-30% patients)
  - renal: amyloidosis (late and rare), IgA nephropathy
  - gastrointestinal: IBD
  - cardiac: aortitis, aortic regurgitation, pericarditis, conduction disturbances, heart failure (rare)
  - respiratory: apical fibrosis (rare)
  - neurologic: cauda equina syndrome (rare)
  - skin: psoriasis

### Investigations

- x-ray of SI joint: "pseudowidening" of joint due to erosion with joint sclerosis → bony fusion (late), symmetric sacroiliitis
- x-ray of spine: "squaring of edges" from erosion and sclerosis on corners of vertebral bodies (shiny corner sign) leading to ossification of outer fibres of annulus fibrosis (bridging syndesmophytes) → "bamboo spine" radiographically
- MRI of spine: assess activity in early disease; detection of cartilage changes, bone marrow edema, bone erosions, and subchondral bone changes. Best seen on T2 STIR (short tau inversion recovery) images (suppress fat and see bone edema)
- Labs: CBC, elevated ESR/CRP, ALP, $Ca^{2+}$, SPEP, BMD, HLA-B27

### Treatment

- **non-pharmacological therapy**
  - prevent fusion from poor posture and disability through: exercise (e.g. swimming), postural and deep breathing exercises, outpatient PT, smoking cessation
- **pharmacological therapy**
  - NSAIDs (first line of treatment for peripheral and axial disease)
  - glucocorticoids (topical eye drops, local injections, occasionally require systemic steroids prior to other effective Rx)
  - DMARDs only for peripheral arthritis (sulfasalazine, MTX)
  - if inadequate response to two NSAIDs (or DMARD for peripheral arthritis only), consider anti-TNF agents for axial and peripheral involvement
  - manage extra-articular manifestations
- **surgical therapy**
  - hip replacement and vertebral osteotomy for marked deformity (latter done rarely)

### Prognosis

- spontaneous remissions and relapses are common and can occur at any age
- function may be excellent despite spinal deformity
- favourable prognosis if female and age of onset >40 yr
- early onset with hip disease may lead to severe disability; may require arthroplasty

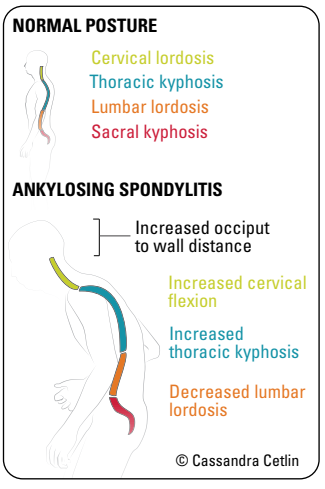

**Figure 12. AS postural change**

**FABER (Flexion, ABduction, and External Rotation) Test**
Passively flex, abduct, then gently externally rotate the leg. If pain is elicited during this movement, the location of the pain may help determine the location of the patient's pathology (e.g. hip joint, sacroiliac joint). However, it is poorly reproducible and inaccurate in discerning inflammatory vs. mechanical back pain

**Modified Schöber Test**
Patient must be standing erect with normal posture
Mark an imaginary line connecting both posterior superior iliac spines (close to the dimples of Venus)
The next mark is placed 10 cm above
The patient bends forward maximally: measure the difference
Report the increase (in cm to the nearest 0.1 cm)
The better of two tries is recorded

**Extra-Articular Manifestations of AS**

**6 As**
**A**tlanto-axial subluxation
**A**nterior uveitis
**A**pical lung fibrosis
**A**ortic incompetence
**A**myloidosis (kidneys)
**A**utoimmune bowel disease (ulcerative colitis)

Both AS and EA feature symmetric sacroiliitis

# Enteropathic Arthritis

- see Gastroenterology, *Inflammatory Bowel Disease*, G22
- MSK manifestations in the setting of either ulcerative colitis or Crohn's disease include peripheral arthritis (large joint, asymmetrical), spondylitis, and hypertrophic osteoarthropathy
- non-arthritic MSK manifestations can occur 2° to steroid treatment of bowel inflammation (arthralgia, myalgia, osteoporosis, AVN)

**Table 28. Comparing Features of Spondylitis vs. Peripheral Arthritis in EA**

| Parameter | Spondylitis | Peripheral Arthritis |
|---|---|---|
| **HLA-B27 Association** | Yes | No |
| **Gender** | M>F | M=F |
| **Onset Before IBD** | Yes | No |
| **Parallels IBD Course** | No | Yes |
| **Type of IBD** | UC=CD | CD |
| **Treatment** | NSAIDs (use cautiously, may exacerbate bowel disease); TNF inhibitors if resistant | NSAIDs, DMARDs; TNF inhibitors if resistant |

# Psoriatic Arthritis

## Definition
- arthritic inflammation associated with psoriasis

## Etiology and Pathophysiology
- unclear but many genetic, immunologic, and some environmental factors involved (e.g. bacterial, viral, and trauma)

## Epidemiology
- psoriasis affects 1% of population
- arthropathy in 15% of patients with psoriasis
- 15-20% of patients will develop joint disease before skin lesions appear

Check "hidden" areas for psoriatic lesions (ears, hair line, umbilicus, gluteal cleft, nails)
TNF-α inhibitors are effective treatments for PsA with no important added risks associated with their short-term use

## Signs and Symptoms
- **dermatologic**
  - well-demarcated erythematous plaques with silvery scale
  - nail involvement: pitting, transverse or longitudinal ridging, discolouration, subungual hyperkeratosis, onycholysis, and oil drops
- **musculoskeletal**
  - 5 general patterns
    - asymmetric oligoarthritis (<5 small and/or large joints affected in asymmetric distribution; most common – 70%)
    - arthritis of DIP joints with nail changes
    - symmetric polyarthritis (similar to RA)
    - sacroiliitis and spondylitis (usually older, male patients)
    - arthritis mutilans (destructive and deforming small joint polyarthritis
  - other findings: dactylitis, enthesopathy, morning stiffness >30 min (50%)
- **ophthalmic**
  - conjunctivitis, iritis (anterior uveitis)
- **cardiac and respiratory** (late findings)
  - aortic insufficiency
  - apical lung fibrosis
- **neurologic**
  - cauda equina syndrome
- **radiologic**
  - floating syndesmophytes
  - pencil-in-cup appearance at IP joints
  - osteolysis, periostitis

## Treatment
- treat skin lesions (e.g. steroid cream, salicylic and/or retinoic acid, tar, UV light)
- NSAIDs or IA steroids (benefit should be seen within a few weeks, should not be the sole therapy >3 mo)
- DMARDs to minimize erosive disease (use early in peripheral joint involvement)
- non-biologic DMARDs (methotrexate, sulfasalazine or leflunomide)
- biologic therapies include anti-TNF agents, anti-IL-17 (secukinumab), and anti-IL-12/23 (ustekinumab)

**Table 29. CASPAR Criteria for PsA***

| Criterion | Description |
|---|---|
| 1. Evidence of psoriasis | Current, past, or family history |
| 2. Psoriatic nail dystrophy | Onycholysis, pitting, hyperkeratosis |
| 3. Negative results for RF | Preferably by ELISA, nephelometry |
| 4. Dactylitis | Current or past history |
| 5. Radiological evidence | Juxta-articular bone formation on hand or foot x-rays |

* To meet the CASPAR (CIASsification criteria for Psoriatic ARthritis) criteria, a patient must have inflammatory articular disease (joint, spine, or entheseal) with ≥3 points from the above 5 categories
Arthritis Rheum 2006 Aug;54(8):2665-73. Classification criteria for PsA: development

# Reactive Arthritis

## Definition
- one of the seronegative spondyloarthropathies in which patients have a peripheral arthritis (≥1 mo duration) accompanied by one or more extra-articular manifestations that appears shortly after certain infections of the GI or GU tracts
- this term should not be confused with rheumatic fever or viral arthritides

**Clinical Triad of Reactive Arthritis**
- Arthritis
- Conjunctivitis/uveitis
- Urethritis/cervicitis

## Etiology
- onset following an infectious episode either involving the GI or GU tract
  - GI: *Shigella, Salmonella, Campylobacter, Yersinia, C. Difficile* species
  - GU: *Chlamydia* (isolated in 16-44% of ReA cases), *Mycoplasma* species

**"Can't See, Can't Pee, Can't Climb a Tree"**
Triad of conjunctivitis, urethritis, and arthritis is 99% specific (but 51% sensitive) for ReA

- acute clinical course
  - onset 1-4 wk post-infection
  - lasts weeks to months
  - often recurring
  - spinal involvement persists

### Epidemiology
- in HLA-B27 patients, axial > peripheral involvement
- M>F

### Signs and Symptoms
- **musculoskeletal**
  - asymmetric peripheral arthritis, spondylitis/sacroiliitis, enthesitis (Achilles tendinitis, plantar fasciitis), dactylitis
- **ophthalmic**
  - iritis (anterior uveitis), conjunctivitis
- **dermatologic**
  - keratoderma blennorrhagicum (hyperkeratotic skin lesions on palms and soles) and balanitis circinata (small, shallow, painless ulcers of glans penis and urethral meatus) are diagnostic
- **gastrointestinal**
  - oral ulcers, diarrhea
- **genitourinary**
  - urethritis, prostatitis, cervicitis, cystitis, sterile pyuria; presence not related to site of initiating infection

### Investigations
- diagnosis is clinical plus laboratory
- evidence of antecedent or concomitant infection (stool culture, urine, and genital swab testing)
- blood work: normocytic, normochromic anemia, and leukocytosis
- sterile cultures
- serology: HLA-B27 positive, elevated ESR/CRP

### Treatment
- antibiotics for non-articular infections
- NSAIDs (naproxen 500 mg bid/tid, diclofenac 50 mg tid, indomethacin 50 mg tid/qid), physical therapy, exercise
- local therapy
  - IA steroid injection (triamcinolone acetonide)
  - topical steroid for ocular involvement
- systemic therapy
  - corticosteroids (starting dose 20 mg/d)
  - DMARD (for refractory reactive arthritis with peripheral joint involvement only) (sulfasalazine, MTX)
  - TNF-α inhibitors for spinal inflammation (for disease refractory to NSAIDs, DMARD)

### Prognosis
- self-limited, typically 3-5 mo, varies based on pathogen and patient's genetic background
- chronic in 15-20% of cases

# Crystal-Induced Arthropathies

**Table 30. Gout vs. Pseudogout**

| Parameter | Gout | Pseudogout |
|---|---|---|
| **Gender** | M>F | M=F |
| **Age** | Middle-aged males | Usually elderly |
| **Post-menopausal females** | Age >60 yr | |
| **Onset of Disease** | Acute | Acute<br>Chondrocalcinosis is asymptomatic but the clinical feature is generally acute |
| **Crystal Type** | Monosodium urate<br>Negative birefringence (yellow when parallel to compensator filter), needle-shaped | CPPD<br>Positive birefringence (blue when parallel), rhomboid-shaped |
| **Distribution** | First MTP classically; also midfoot, ankle, knee, or polyarticular | Knee, wrist; monoarticular, or polyarticular if chronic |
| **Radiology (note findings are non-specific)** | Erosions | Chondrocalcinosis<br>OA (knee, wrist, 2nd and 3rd MCP) |
| **Treatment** | Acute: NSAIDs, corticosteroids, colchicine<br>Chronic: ± allopurinol, fuboxostat | NSAIDs, corticosteroids |

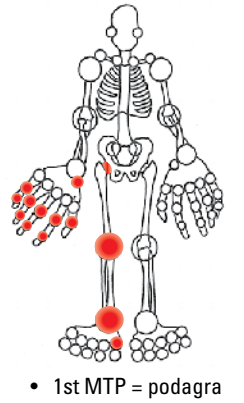

**Figure 13. Common sites of involvement of gout** (asymmetric joint involvement)

# Gout

## Definition
- derangement in purine metabolism resulting in hyperuricemia; monosodium urate crystal deposits in tissues (tophi) and synovium (microtophi)

## Etiology and Pathophysiology
- uric acid can be obtained from the diet or made endogenously by xanthine oxidase, which converts xanthine to uric acid
- an excess of uric acid results in hyperuricemia
- uric acid can deposit in the skin/subcutaneous tissues (tophi), synovium (micro-tophi) and kidney, where they can crystalize to form monosodium urate crystals that lead to gout
- non-modifiable risk factors include: genetic mutations, male gender, and advanced age
- modifiable risk factors include: diet (alcohol, purine rich foods such as meats and seafoods, fructose/sugar sweetened foods; see list of precipitants below)
- other risk factors: renal failure, metabolic syndrome, dehydration (e.g. diuretics)

## Signs and Symptoms
- single episode progressing to recurrent episodes of acute inflammatory arthritis
- **acute gouty arthritis**
  - severe pain, redness, joint swelling, usually involving lower extremities
  - joint mobility may be limited
  - attack will subside spontaneously within days to weeks (5-10 d); may recur
- **tophi**
  - urate deposits on cartilage, tendons, bursae, soft tissues, and synovial membranes
  - common sites: first MTP, ear helix, olecranon bursae, tendon insertions (common in Achilles tendon)
- **kidney**
  - gouty nephropathy
  - uric acid nephrolithiasis

## Investigations
- joint aspirate: >90% of joint aspirates show crystals of monosodium urate (negatively birefringent, needle-shaped) if done early in course of presentation
- x-rays may show tophi as soft tissue swelling, bone/joints - punched-out lesions, erosion with "over-hanging" edge
- correlated with hyperuricemia in the blood
- may see elevated WBC and ESR (nonspecific)

## Treatment
- **acute gout**
  - NSAIDs: high dose, then taper as symptoms improve
  - corticosteroids: IA, oral, or intra-muscular (if renal, cardiovascular or GI disease and/or if NSAIDs contraindicated or failed)
  - colchicine 1.2 mg at the first signs of an attack followed by 0.6 mg one hour later and 0.6 mg bid on subsequent days until the attack has resolved
  - allopurinol can worsen an acute attack (do not start during acute flare)
- **chronic gout**
  - conservative
    - avoid foods with high purine content (e.g. visceral meats, sardines, shellfish, beans, peas)
    - avoid drugs with hyperuricemic effects (e.g. pyrazinamide, ethambutol, thiazide, alcohol)
  - medical
    - anti-hyperuricemic drugs (allopurinol and febuxostat): decrease uric acid production by inhibiting xanthine oxidase
    - uricosuric drugs (probenecid, sulfinpyrazone): very rarely used in combination with allopurinol or febuxostat in patients in whom hyperuricemia is not controlled with the latter
  - prophylaxis with low dose NSAID/colchicine may be required prior to starting antihyperuricemic drugs
  - in renal disease secondary to hyperuricemia, use low-dose allopurinol and monitor Cr
- indications for treatment with antihyperuricemic medications include
  - recurrent attacks (more than 2-3 yr), tophi, bone erosions, urate kidney stones
  - perhaps in renal dysfunction with very high urate load (controversial)

An acute gout attack may mimic cellulitis; however, joint mobility is usually preserved in cellulitis unless it overlaps a joint

**Precipitants of Gout**

**Drugs are FACT**
**F**urosemide
**A**spirin® (low dose)/**A**lcohol
**C**yclosporine
**T**hiazide diuretics

**Foods are SALT**
**S**eafood
**A**lcohol (beer and spirits)
**L**iver and kidney
**T**urkey (meat)

The majority of people with hyperuricemia do not have gout
Normal or low uric acid levels do not rule out gout

**10 Recommendations on the Diagnosis and Management of Gout**
Ann of Rheum Dis 2013;73:328-335

1. Identification of monosodium urate crystals in joint aspirate should be performed for a definitive diagnosis of gout.
2. Gout/hyperuricemia should prompt investigations of renal function and CV risk factors.
3. Acute gout should be treated with colchicine, NSAIDs, and/or glucocorticoids.
4. Patients should be counselled about lifestyle.
5. Allopurinol is first line for urate lowering therapy, with uricosurics as second line.
6. Patients should be informed about the risk of acute gout flare with initiation of urate lowering therapy; colchicine prophylaxis should be considered.
7. Allopurinol can be used in patients with mild /moderate renal impairment with slow titration and monitoring.
8. Treatment goal is urate <0.36 mM and absence of attacks and resolution of tophi.
9. Tophi should be treated medically by lowering serum urate to <0.3 mM. Surgery is only for select cases.
10. Prophylactic pharmacological management of asymptomatic hyperuricemia is not recommended.

## Pseudogout (Calcium Pyrophosphate Dihydrate Disease)

### Definition
- joint inflammation caused by calcium pyrophosphate crystals

### Etiology and Pathophysiology
- acute inflammatory arthritis due to phagocytosis of IgG-coated CPPD crystals by neutrophils and subsequent release of inflammatory mediators within joint space
- Usually monoarticular but can be polyarticular
- slower in onset in comparison to gout, lasts up to 2-3 wk but is self-limited

### Risk Factors
- old age, advanced OA, neuropathic joints
- other associated conditions: hyperparathyroidism, hypothyroidism, hypomagnesemia, hypophosphatasia (low ALP), DM, hemochromatosis

### Signs and Symptoms
- affects knees, wrists, MCPs, hips, shoulders, elbows, ankles, big toe, spine
- asymptomatic crystal deposition (seen on radiograph only)
- acute crystal arthritis (self-limited flares of acute inflammatory arthritis resembling gout)
- pseudo-OA (progressive joint degeneration, sometimes with episodes of acute inflammatory arthritis)
- pseudo-RA (symmetrical polyarticular pattern with morning stiffness and constitutional symptoms)
- frequently triggered by dehydration, acute illness, surgery, trauma

### Investigations
- must aspirate joint to rule out septic arthritis, gout
- CPPD crystals: present in 60% of patients, often only a few crystals, positive birefringence (blue) and rhomboid shaped
- x-rays show chondrocalcinosis in 75%: radiodensities in fibrocartilaginous structures (e.g. knee menisci) or linear radiodensities in hyaline articular cartilage

### Treatment
- joint aspiration, rest, and protection
- NSAIDs: also used for maintenance therapy
- prophylactic colchicine 0.6-1.2 mg/d PO (controversial)
- IA or oral steroids to relieve inflammation

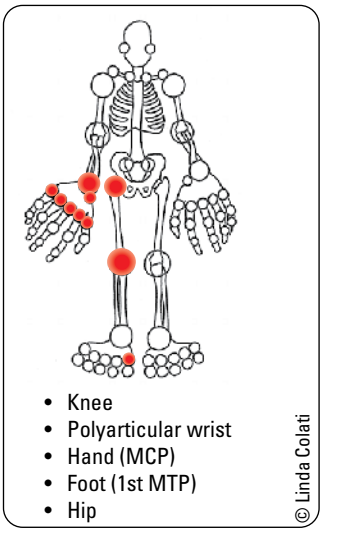

**Figure 14. Common sites of involvement of CPPD**

# Non-Articular Rheumatism

### Definition
- disorders that primarily affect soft tissues or periarticular structures
- includes bursitis, tendinitis, tenosynovitis, fibromyalgia, and PMR

## Polymyalgia Rheumatica

### Definition
- characterized by pain and stiffness of the proximal extremities (girdle area)
- closely related to GCA (15% of patients with PMR develop GCA)
- no muscle weakness

**Table 31. PMR Classification Criteria Scoring Algorithm***

| | Points without U/S (0-6) | Points with Abnormal U/S** (0-8) |
|---|---|---|
| Morning stiffness duration >45 min | 2 | 2 |
| Hip pain or limited ROM | 1 | 1 |
| Absence of RF or ACPA | 2 | 2 |
| Absence of other joint involvement | 1 | 1 |
| At least one shoulder with subdeltoid and/or biceps tenosynovitis and/or glenohumeral synovitis (either posterior or axillary) and at least one hip with synovitis and/or trochanteric bursitis on U/S | N/A | 1 |
| Both shoulders with subdeltoid bursitis, biceps tenosynovitis, or gleno-humeral synovitis on U/S | N/A | 1 |

*Required criteria: age ≥50 yr, bilateral shoulder aching, and abnormal ESR/CRP
**A score of 4 or more is categorized as PMR in the algorithm without U/S and a score of 5 or more is categorized as PMR in the algorithm with U/S
**Optional U/S criteria
Ann Rheum Dis 2012;71:484-492

### Epidemiology
- incidence 50 per 100,000 per year in those >50 yr
- age of onset typically >50 yr, F:M = 2:1

### Signs and Symptoms
- constitutional symptoms prominent (fever, weight loss, malaise)
- pain and stiffness of symmetrical proximal muscles (neck, shoulder and hip girdles, thighs)
- gel phenomenon (stiffness after prolonged inactivity)
- physical exam reveals tender muscles, but no true weakness or atrophy

### Investigations
- blood work: often shows anemia of chronic disease, elevated platelets, elevated ESR and CRP, and normal CK; up to 5% of PMR reported with normal inflammatory markers

### Treatment
- goal of therapy: symptom relief
- start with prednisone dose of 15-20 mg PO OD, reconsider diagnosis if no response within several days
- taper slowly over 1 yr period with closely monitoring
- relapses should be diagnosed and treated on clinical basis; do not treat a rise in ESR as a relapse
- treat relapses aggressively (50% relapse rate)
- monitor for steroid side effects, glucocorticoid-induced osteoporosis prevention, and follow for symptoms of GCA

## Fibromyalgia

### Definition
- chronic (>3 mo), widespread (axial, left- and right-sided, upper and lower segment), non-articular pain with characteristic tender points

### Diagnosis

**Table 32. 2010 ACR Preliminary Diagnostic Criteria for Fibromyalgia**

| Criteria | Comments |
|---|---|
| Widespread Pain Index = number of areas in which the patient had pain over the last week (max score = 19):<br>L and R: shoulder girdle, upper arm, lower arm, hip, upper leg, lower leg, jaw<br>One Area: chest, abdomen, upper back, lower back, neck<br><br>Symptom Severity Score = sum of:<br>a) severity of fatigue<br>b) waking unrefreshed<br>c) cognitive symptoms over the past week<br>d) extent of somatic symptoms (IBS, H/A, abdominal pain/ cramps, dry mouth, fever, hives, ringing in ears, vomiting, heartburn, dry eyes, SOB, loss of appetite, rash, hair loss, easy bruising, etc.)<br>all (a-d) rated on 0-3 scale: 0 = no problem, 1 = mild, 2 = moderate, 3 = severe | A patient satisfies diagnostic criteria for fibromyalgia if the following 3 conditions are met:<br>1. Widespread Pain Index (WPI) ≥7 and Symptom Severity (SS) scale score ≥5 or WPI 3–6 and SS scale score ≥9<br>2. Symptoms have been present at a similar level for at least 3 mo<br>3. The patient does not have a disorder that would otherwise explain the pain |

Arthritis Care and Research 2010;62(5):600-610

### Epidemiology
- F:M = 3:1
- primarily ages 25-45 yr, some adolescents
- prevalence of 2-5% in general population
- overlaps with chronic fatigue syndrome and myofascial pain syndrome
- strong association with psychiatric illness

### Signs and Symptoms
- widespread aching, stiffness
- easy fatigability
- sleep disturbance: non-restorative sleep, difficulty falling asleep, and frequent wakening
- symptoms aggravated by physical activity, poor sleep, emotional stress
- patient feels that joints are diffusely swollen although joint examination is normal
- neurologic symptoms of hyperalgesia, paresthesias, allodynia
- associated with irritable bowel or bladder syndrome, migraines, tension H/As, restless leg syndrome, obesity, depression, and anxiety
- physical exam should reveal only tenderness with palpation of soft tissues, with no specificity for trigger/tender points

### Investigations
- blood work: includes TSH and ESR; all typically normal unless unrelated, underlying illness present
- serology: do not order ANA or RF unless there is clinical suspicion for a connective tissue disease
- laboratory sleep assessment

### Treatment

- **non-pharmacological therapy**
  - education
  - exercise program (walking, aquatic exercises), physical therapy (good posture, stretching, muscle strengthening, massage)
  - stress reduction, CBT
  - no evidence for alternative medicine such as biofeedback, meditation, acupuncture
- **pharmacological therapy**
  - low dose tricyclic antidepressant (e.g. amitriptyline)
    - for sleep restoration
    - select those with lower anticholinergic side effects
  - SNRI: duloxetine, milnacipran
  - anticonvulsant: pregabalin, gabapentin
  - analgesics may be beneficial for pain that interferes with sleep (NSAIDs, not narcotics)

### Prognosis

- variable; usually chronic, unless diagnosed and treated early

**Table 33. Clinical Features of Inflammatory Myopathy vs. Polymyalgia Rheumatica vs. Fibromyalgia**

| | Polymyositis | PMR | Fibromyalgia |
|---|---|---|---|
| **Epidemiology** | F > M, 40-50 yr | F > M, >50 yr | F > M, 25-45 yr |
| **Muscle Involvement** | Proximal muscle | Proximal muscle | Diffuse |
| **Weakness** | Yes | No | No |
| **Pain** | Painless | Painful | Painful |
| **Stiffness** | Mild | Significant morning and gelling stiffness (shoulders, neck, hips) | May have morning stiffness |
| **Investigations** | Muscle biopsy, CK, EMG, R/O malignancy | ESR/CRP, R/O giant cell arteritis | Sleep assessment, TSH |
| **ESR/CRP** | Usually normal | Markedly elevated | Normal |
| **Treatment** | High dose steroids, immunosuppressants | Low dose steroids | Exercise, TCAs, SNRIs, anticonvulsants |

# Common Medications

**Table 34. Common Medications for Osteoarthritis**

| Class | Generic Drug Name | Trade Name | Dosing (PO) | Indications | Contraindications | Adverse Effects |
|---|---|---|---|---|---|---|
| Analgesic | acetaminophen | Tylenol® | 500 mg tid q4h<br>(3 g daily max) | 1st line | | Hepatotoxicity<br>Overdose<br>Potentiates warfarin |
| NSAIDs | ibuprofen<br>diclofenac<br>diclofenac/misoprostol<br>naproxen<br>meloxicam | Voltaren®<br>Arthrotec®<br>Naprosyn®<br>Aleve®<br>Mobicox® | 200-600 mg tid<br>25-50 mg tid<br>50-75/200 mg tid<br>125-500 mg bid<br>7.5-15 mg OD | 2nd line | GI bleed<br>Renal impairment<br>Allergy to ASA, NSAIDs<br>Pregnancy (T3) | Nausea, tinnitus, vertigo, rash, dyspepsia, GI bleed, PUD, hepatitis, renal failure, HTN, nephrotic syndrome |
| **COX-2 INHIBITORS** | | | | | | |
| | celecoxib | Celebrex® | 200 mg OD | High risk for GI bleed:<br>age >65<br>Hx of GI bleed, PUD | Renal impairment<br>Cardiovascular disease | Delayed ulcer healing<br>Renal/hepatic impairment<br>Rash |

| Other Treatments | Comments |
|---|---|
| Combination analgesics (acetaminophen + codeine, acetaminophen + NSAIDs) | Enhanced short-term effect compared to acetaminophen alone<br>More adverse effects: sedation, constipation, nausea, GI upset |
| IA corticosteroid injection | Short-term (weeks-months), joint specific treatment<br>Decrease in pain and improvement in function<br>Used for management of an IA inflammatory process when infection has been ruled out |
| IA hyaluronic acid q6mo | Used for mild-moderate OA of the knees, however little supporting evidence, and not considered to be effective<br>Precaution with chicken/egg allergy |
| Topical NSAIDs | % wt/wt topical diclofenac (Pennsaid®, Voltaren Emulgel®)<br>May use for patients who fail acetaminophen treatment and who wish to avoid systemic therapy, better on small joints |
| Capsaicin cream | Mild decrease in pain |
| Glucosamine sulfate ± chondroitin | Limited clinical studies. No regulation by Health Canada |

**Table 35. Disease Modifying Anti-Rheumatic Drugs (DMARDs)**

| Generic Drug Name | Trade Name | Dosing | Contraindications | Adverse Effects |
|---|---|---|---|---|
| **COMMONLY USED** | | | | |
| hydroxychloroquine $ | Plaquenil® | 400 mg PO OD initially 200-400 mg PO OD maintenance (6.5 mg/kg ideal body weight per day to a maximum of 400 mg/d) | Retinal disease, G6PD deficiency | GI symptoms, skin rash, macular damage, neuromyopathy Requires regular ophthalmological screening to monitor for retinopathy |
| sulfasalazine $ | Salazopyrim® Azulfidine® (US) | 1000 mg PO bid-tid | Sulfa/ASA allergy, kidney disease, G6PD deficiency | GI symptoms, rash, H/A, leukopenia |
| methotrexate $ | Rheumatrex® Folex/Mexate® | 7.5-25 mg PO/IM/SC qweekly | Bone marrow suppression, liver disease, significant lung disease, immunodeficiency, pregnancy, EtOH abuse | Oral ulcers, GI symptoms, cirrhosis, myelosuppression, pneumonitis, tubular necrosis |
| leflunomide $$ | Arava® | 10-20 mg PO OD | Liver disease, lung disease | Alopecia, GI symptoms, liver dysfunction, pulmonary infiltrates |
| **NOT COMMONLY USED** | | | | |
| cyclosporine $$ | Neoral® | 2.5-3 mg/kg/d divided and given in 2 doses PO | Kidney/liver disease, infection, HTN | HTN, decreased renal function, hair growth, tremors, bleeding |
| gold (injectable) $ | Solganal® Myocrysine® | 50 mg IM q1wk after gradual introduction | IBD, kidney/liver disease | Rash, mouth soreness/ulcers, proteinuria, marrow suppression |
| azathioprine $ | Imuran® | 2/5 mg/kg/d PO once daily | Kidney/liver disease TPMT deficiency | Rash, pancytopenia (especially ↓ WBC, ↑ AST, ALT), biliary stasis, vomiting, diarrhea |
| cyclophosphamide $ | Cytoxan® | 1 g/m²/mo IV as per protocol | Kidney/liver disease | Cardiotoxicity, GI symptoms, hemorrhagic cystitis, nephrotoxicity, bone marrow suppression, sterility |

| Generic Drug Name | Trade Name | Dosing | Mechanism of Action |
|---|---|---|---|
| **NEWER DMARDs (Biologics)** | | | |
| etanercept $$$ | Enbrel® | 25 mg biweekly or 50 mg weekly SC | Fusion protein of TNF receptor and Fc portion of IgG |
| infliximab $$$ | Remicade® | 3-5 mg/kg IV q8wk | Chimeric mouse/human monoclonal anti-TNF |
| adalimumab $$$ | Humira® | 40 mg SC q2wk | Monoclonal anti-TNF |
| golimumab $$$ | Simponi® | 50 mg SC q1mo | Monoclonal anti-TNF |
| certolizumab $$$ | Cimzia® | 400 mg SC q2wk x3 then 200 mg SC q4wk | PEGylated monoclonal anti-TNF |
| apremilast $$$ | Otezla® | Day 1: 10 mg (AM), titrate up to 30 mg BID by day 6 | Inhibitor of PDE4 which inhibits production of TNFα |
| abatacept $$$ | Orencia® | IV infusion | Costimulation modulator of T cell activation |
| rituximab $$$ | Rituxan® | 2 IV infusions, 2 wk apart | Causes B-cell depletion, binds to CD20 |
| tocilizumab $$$ | Actemra® | 4-8 mg/kg IV q4wk | Interleukin-6 receptor antagonist |
| tofacitinib $$ | Xeljanz® | 5 mg BID | Inhibits the JAK enzyme and thus interferes with JAK-STAT signaling pathway |

**Risks of Biologics**
Patients require negative TB skin test, chest x-ray, and negative hepatitis B virus serology prior to starting any of these medications. Increased risk of: serious infections, worsening heart failure, multiple sclerosis, and positive auto-antibodies

# Landmark Rheumatology Trials

| Trial | Reference | Results |
|---|---|---|
| **RHEUMATOID ARTHRITIS** | | |
| ATTEST | Ann Rheum Dis 2008;67:1096-103 | Abatacept and infliximab have similar efficacy in RA patients who have failed MTX |
| ATTRACT | Lancet 1999;354:1932-9 | Infliximab and MTX combined are more effective than MTX alone for patients with active RA |
| COMET | Lancet 2008;372:375-82 | Etanercept add-on therapy increases rates of remission in early RA |
| ERA | NEJM 2000;343:1586-93 | Etanercept more rapidly decreases symptoms in early RA compared to MTX |
| European Leflunomide Study Group | Lancet 1999;353:259-66 | Leflunomide is equal in efficacy to sulphasalazine and superior to placebo |
| FIN-RACo | Lancet 1999;353:1568-73 | Combination therapy with DMARDs improves remission rates in early RA |
| Infliximab and MTX | NEJM 2000;343:1594-602 | Infliximab combined with MTX reduces joint damage in RA |
| Leflunomide Rheumatoid Arthritis Investigators Group | Arch Intern Med 1999;159:2542-50 | Leflunomide is equivalent to MTX therapy and superior to placebo |
| PREMIER | Arthritis Rheum 2006;54:26-37 | Combination therapy with adalimumab and MTX is superior to either treatment alone, in patients with early RA |
| Swefot | Lancet 2009;374:459-66 | Anti-TNF agents are more effective second-line therapy than DMARDs in patients who fail MTX |
| **OSTEOARTHRITIS** | | |
| GAIT | NEJM 2006;354:795-808 | Glucosamine, chondroitin, and the combination of both are no more effective than placebo in treatment of knee OA |
| Hyaluronan | Ann Rheum Dis 2010;69:1097-102 | Hyaluronan injections do not improve disease activity in patients with moderate-severe knee OA |
| **SLE** | | |
| Belimumab | Lancet 2011;377:721-31 | Treatment with belimumab reduces the incidence of BILAG A and B flares in patients with SLE compared to placebo |
| BILAG open-RCT | Rheumatology 2010;49:723-32 | Low dose cyclosporine and azathioprine are equivalent in efficacy as maintenance therapy for SLE |
| Mycophenylate mofetil or intravenous cyclophosphamide | NEJM 2005;353:2219-28 | Mycophenylate mofetil is more efficacious than cyclophosphamide in inducing remission of SLE nephritis |
| **CONNECTIVE TISSUE DISEASES** | | |
| Azathioprine or MTX maintenance for ANCA-associated vasculitis | NEJM 2008;359:2790-803 | MTX and azathioprine are equally safe and effective as maintenance agents in ANCA vasculitis |
| CYCLOPS | Ann Intern Med 2009;69:670-80 | Pulse cyclophosphamide therapy requires a lower cumulative dose compared to daily oral treatment in ANCA vasculitis |
| Cyclophosphamide in scleroderma lung disease | NEJM 2006;354:2655-66 | Cyclophosphamide therapy leads to transient improvements in lung function, skin scores, and overall health in patients with scleroderma |
| Etanercept plus standard therapy for granulomatosis with polyangiitis | NEJM 2005;352:351-61 | Etanercept is not effective in inducing remission in patients with ANCA vasculitis |
| Mycophenylate mofetil vs. azathioprine for maintenance in ANCA-associated vasculitis | JAMA 2010;304:2381-8 | Mycophenylate mofetil is less effective than azathioprine for maintaining disease remission in ANCA-associated vasculitis |
| Rituximab versus cyclophosphamide for ANCA-associated vasculitis | NEJM 2010;363:221-32 | Rituximab is not inferior to cyclophosphamide for induction of remission in ANCA vasculitis |
| **GOUT** | | |
| Febuxostat vs. allopurinol | NEJM 2005;353:2450-61 | Febuxostat is more effective than allopurinol at lowering serum urate, and has similar effectiveness on flare reduction |
| **ANKYLOSING SPONDYLITIS** | | |
| Adalimumab | Arthritis Rheum 2006;54:2136-46 | Adalimumab induced partial remission in 22% of AS patients |
| ASSERT (rituximab) | Arthritis Rheum 2005;52:582-91 | Sixty percent of patients treated with rituximab had a clinical response to the medication |
| ATLAS (adalimumab) | J Rheumatol 2008;35:1346-53 | Compared to placebo, adalimumab significantly reduces pain and fatigue in AS patients |
| Infliximab in AS | Lancet 2002;359:1187-93 | Infliximab induces regression of symptoms in 50% of patients and is superior to placebo |
| SPINE (etanercept) | Ann Rheum Dis 2011;70:799-804 | Etanercept has short-term efficacy for patients with advanced AS and reduces disease severity |
| Sulfasalazine | Arthritis Rheum 1995;38:618-27 | Sulfasalazine is superior to placebo in treatment of patients with seronegative spondyloarthropathy |

| VUR | vesicoureteral reflux |

# Basic Anatomy Review

- recall that the anatomical position of the penis is erect; therefore, the anatomical ventral side of the penis appears to be the dorsal side of the flaccid penis

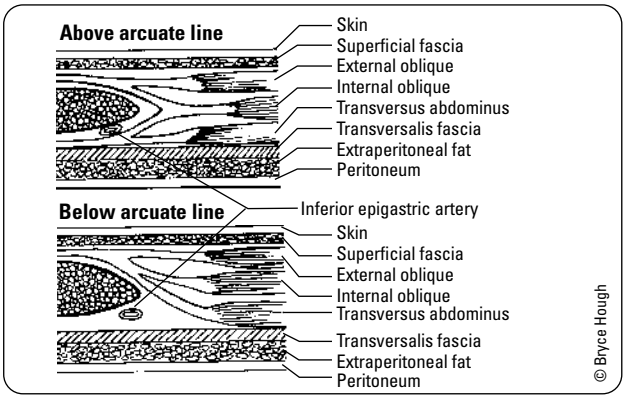

**Figure 1. Midline cross-section of abdominal wall**

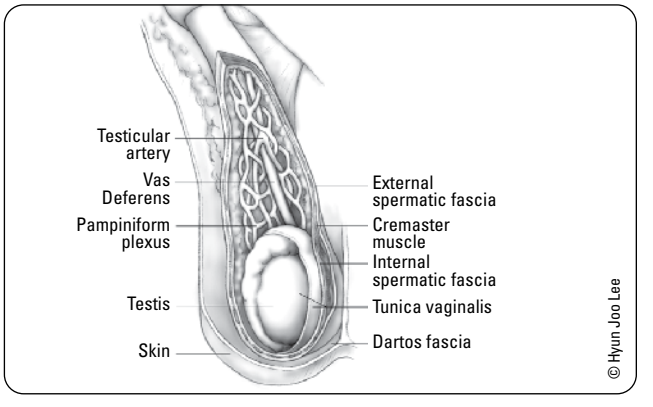

**Figure 2. Anatomy of scrotum**

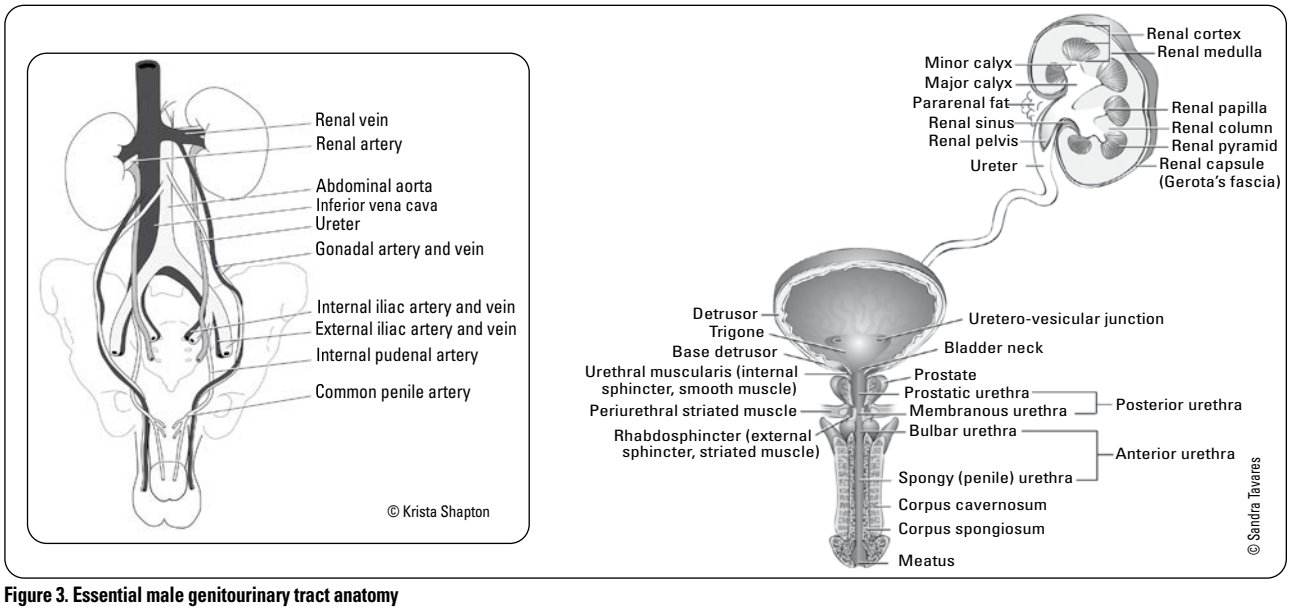

**Figure 3. Essential male genitourinary tract anatomy**

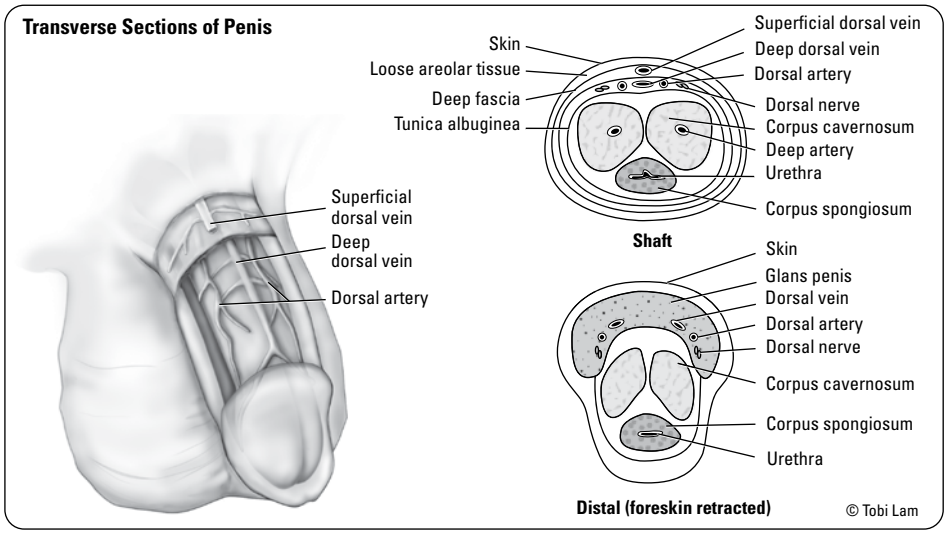

**Figure 4. Cross section of the penis**

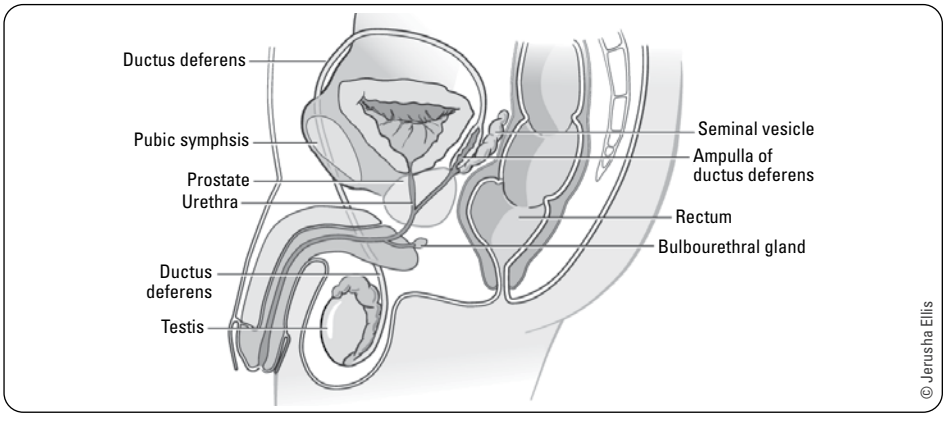

**Figure 5. Median sagittal section of the male pelvis and perineum**

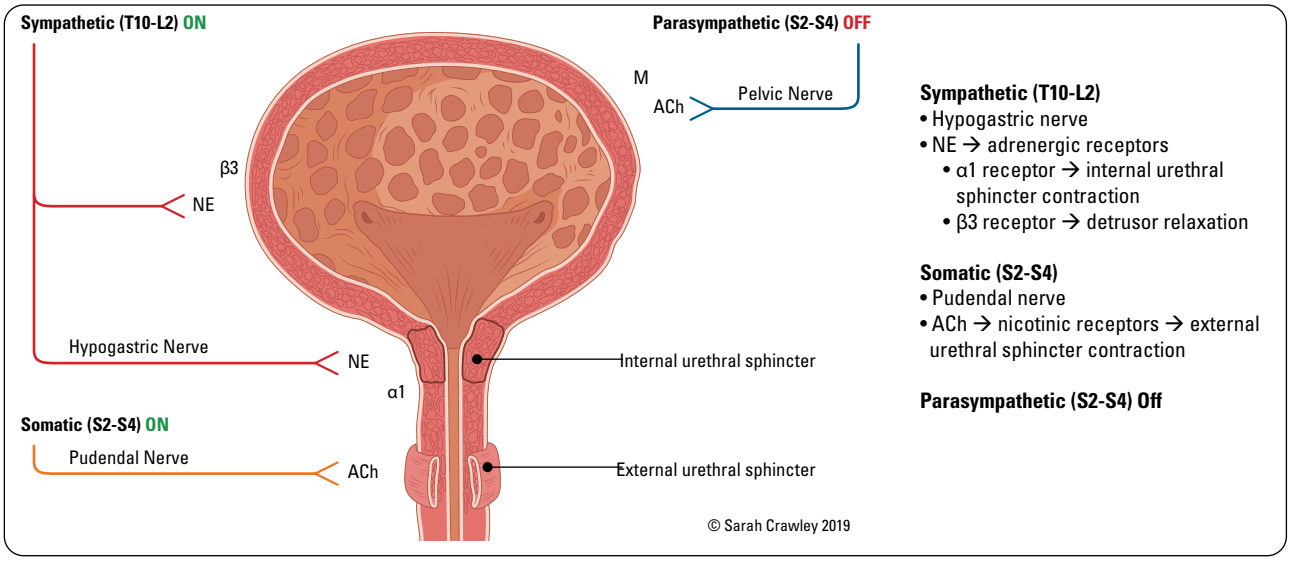

**Figure 6. Bladder innervation during storage phase**

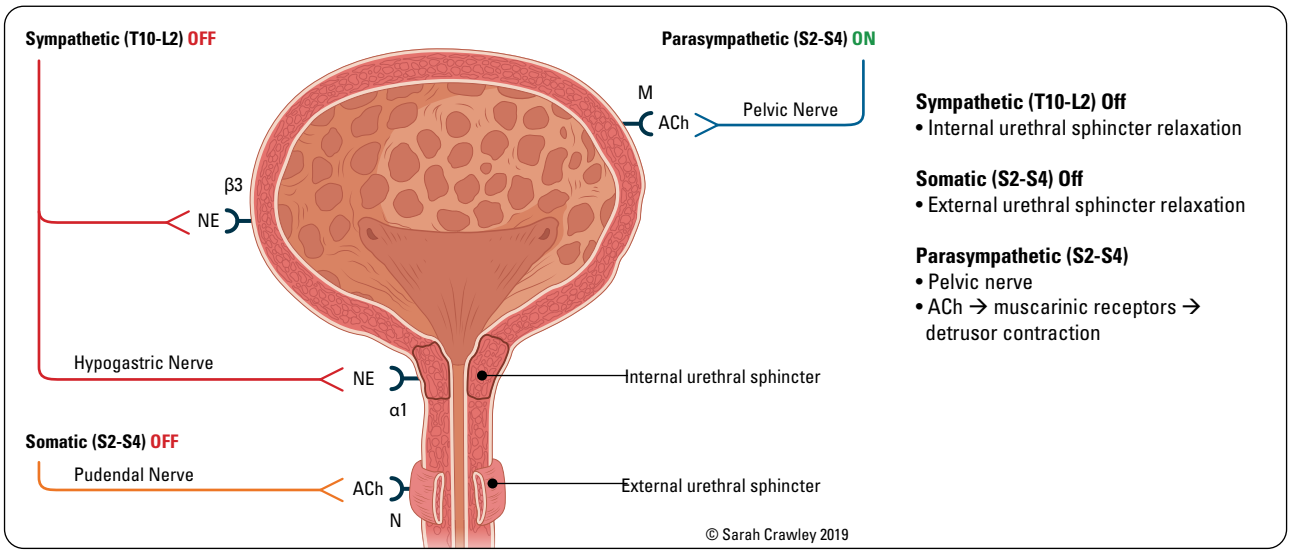

**Figure 7. Bladder innervation during voiding phase**

# Urologic History

- follow OPQRSTU approach
  - note that pain may not be limited to the genital region (e.g. lower abdomen, CVA)
- urinary habits
  - LUTS (see *Lower Urinary Tract Symptoms*, U7)
  - storage symptoms (FUN): frequency, urgency (rush to toilet), nocturia
  - voiding symptoms (SHED): stream changes/straining, hesitancy, incomplete emptying, post-void dribbling
  - dysuria: burning, pain on voiding
  - hematuria: blood clots, red/pink tinged urine (see *Hematuria*)
  - incontinence: stress, urgency, mixed, overflow (see *Incontinence,* U6)
- sexual function
  - scrotal mass (see *Scrotal Mass*, U31)
  - ED (see *Erectile Dysfunction*, U33)
  - infertility (see *Infertility*, U36)
- associated symptoms
  - N/V
  - bowel dysfunction
- constitutional symptoms
  - fever, chills, unintentional weight loss, night sweats, fatigue, malaise, bone pain
- risk factors: past urologic disease (e.g. UTI, stones, STI, cancers, anatomic abnormalities), family Hx, medications, lifestyle factors (smoking, alcohol, inactivity), trauma, previous surgical procedures

Always ask about sexual function on history. Change in erectile function can be one of the first symptoms that there is concomitant vascular disease. If there is new onset ED, consider screening for DM and CAD risk factors

# Hematuria

## Macroscopic (Gross) Hematuria

### Definition
- blood in the urine that can be seen with the naked eye

### Classification
- see Nephrology, NP21

### Etiology

**Table 1. Etiology by Age Group**

| Age (yr) | Etiology | |
|---|---|---|
| 0-20 | UTI, glomerulonephritis, congenital abnormalities | |
| 20-40 | UTI, stones, bladder tumour, exercise | |
| 40-60 | Male: bladder tumour, stones, UTI | Female: UTI, stones, bladder tumour |
| >60 | Male: BPH, bladder tumour, UTI, RCC | Female: bladder tumour, UTI, RCC |

Gross, painless hematuria in adults is bladder cancer until proven otherwise

**Table 2. Etiology by Type**

| Pseudohematuria | Infectious/ Inflammatory | Malignancy | Benign | Structural | Hematologic |
|---|---|---|---|---|---|
| Vaginal bleeding<br>Dyes (beets, rhodamine B in candy and juices)<br>Hemoglobin (hemolytic anemia)<br>Myoglobin (rhabdomyolysis)<br>Drugs (rifampin, phenazopyridine, phenytoin)<br>Porphyria<br>Laxatives (phenolphthalein) | Pyelonephritis<br>Cystitis<br>Urethritis<br>Glomerulonephritis<br>Interstitial nephritis<br>Tuberculosis | RCC (mainly adults)<br>Urothelial cancer<br>Wilms' tumour (mainly pediatric)<br>Prostate cancer<br>Leukemia | BPH<br>Polyps<br>Exercise-induced | Stones<br>Trauma<br>Foreign body<br>Urethral stricture<br>Polycystic kidneys<br>Arteriovenous malformation<br>Infarct<br>Hydronephrosis<br>Fistula | Anticoagulants<br>Coagulation defects<br>Sickle cell disease<br>Thromboembolism |

**Common Urologic Causes of Hematuria can be Classified as:**

**TICS**
**T**rauma/**T**umour/**T**oxins
**I**nfection/**I**nflammatory
**C**alculi/**C**ysts
**S**urgery/**S**ickle cell and other hematological causes

### History
- timing of hematuria in urinary stream
  - initial: anterior urethra
  - terminal: bladder neck, prostatic urethra
  - total: bladder and above
- presence of blood clots
- LUTS and associated symptoms
  - pyuria, dysuria: UTI
  - flank pain, radiation: ureteral obstruction
- last menstrual period, history of kidney stones, UTI, or previous urologic surgery
  - recent URTI, post-infectious glomerulonephritis, IgA nephropathy
- medications (anticoagulants, rifampin, phenazopyridine, phenytoin)
- risk factors for malignancy (smoking, chemical exposures, Hx of cyclophosphamide therapy, pelvic radiation)

### Investigations
- U/A, urine C&S, urine cytology
- imaging
  - lower tract: cystoscopy
  - upper tract: CT (gold standard), U/S
- CBC (rule out anemia, leukocytosis), electrolytes, Cr, BUN, INR, PTT, PSA (in men)

**Upper Tract Imaging Options**
**CT Urography (CTU):** test of choice for renal parenchyma, calculi, and infections. Involves exposure to radiation and IV contrast (assess renal function and allergies)
**U/S:** Superior to IVP for evaluation of renal parenchyma and renal cysts; limited sensitivity for UCC and small renal masses; U/S alone is insufficient for upper tract imaging
**Intravenous Pyelogram (IVP):** Traditional option but rarely used (replaced by CTU); reasonable sensitivity for UCC, but poor sensitivity for RCC

### Acute Management of Severe Bladder Hemorrhage
- manual irrigation via catheter with normal saline to remove clots
- Continuous Bladder Irrigation (CBI) using large (22-26 Fr) 3-way Foley to help prevent clot formation
  - should be done after manual irrigation of all clots
- cystoscopy
  - identify tumours or other source(s)
  - coagulate obvious sites of bleeding or transurethral resection of tumours (under general or regional anesthesia)

# Microscopic Hematuria

### Definition
- blood in the urine that is not visible to the naked eye
- >2 RBCs/HPF on urinalysis of at least two separate samples

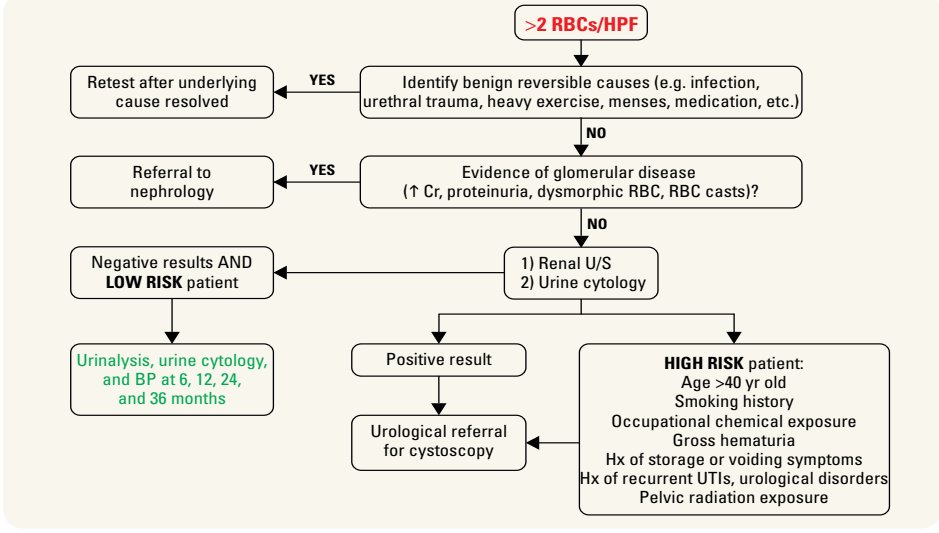

**Figure 8. Workup of asymptomatic microscopic hematuria**
Based on CUA Guidelines. Alternatively, the AUA recommends cystoscopy and CT urogram for all patients with confirmed microscopic hematuria; follow-up for negative workup is urinalysis yearly for two years, with repeat anatomic evaluation if microscopic hematuria persists

# Lower Urinary Tract Dysfunction

- two phases of lower urinary tract function
  1. storage phase (bladder filling and urine storage)
     - accommodation and compliance
     - no involuntary contraction(s)
  2. voiding phase (bladder emptying)
     - coordinated detrusor contraction
     - synchronous relaxation of outlet sphincters
     - no anatomic obstruction
- lower urinary tract dysfunction can therefore be classified as:
  - failure to store: due to bladder or outlet
  - failure to void: due to bladder or outlet
- three types of symptoms
  - storage (formerly known as irritative)
  - voiding (formerly known as obstructive)
  - post-voiding

**Transient Causes of Reversible Urinary Incontinence in the Elderly**

**DIAPERS**
**D**elirium
**I**nflammation/Infection
**A**trophic vaginitis/urethritis
**P**harmaceuticals/**P**sychological
**E**xcess U/O
**R**estricted mobility/**R**etention
**S**tool impaction

# Urinary Incontinence

## Definition
- involuntary leakage of urine

Urgency is the complaint of a sudden compelling desire to void that is difficult to defer; it is not necessarily associated with incontinence

## Epidemiology
- variable prevalence in women: 25-45%
- F:M = 2:1
- more frequent in the elderly, affecting 5-15% of those living in the community and 50% of nursing home residents

**Table 3. Urinary Incontinence: Types and Treatments**

| Type | Stress | Urgency | Mixed | Overflow |
|---|---|---|---|---|
| **Definition** | Leakage with sudden increases in intra-abdominal pressure (cough, sneeze, exertion) | Leakage preceded by strong, sudden urge to void | Leakage with urgency and increased intra-abdominal pressure | Leakage associated with urinary retention |
| **Etiology** | Sphincter incompetence<br>Urethral hypermobility<br>Common in middle aged and older women, and men following prostate cancer treatment or rarely surgical treatment of BPH | Detrusor overactivity<br>Bladder hypersensitivity | Same as stress and urgency incontinence | BPH with overflow incontinence<br>From weak bladder that does not empty (e.g. diabetic cystopathy) |
| **Investigations** | Hx: when leakage occurs, number of pads, LUTS, history of neurologic disease, pelvic surgery/radiotherapy, obstetrical history, bowel and sexual function, medications, impact on quality of life<br>P/E: general (edema, neurologic abnormalities, mobility, cognition, dexterity), abdomen (distended bladder), GU (prolapse in women, DRE in men), cough test<br>U/A, urine C&S, voiding diary (type of incontinence, how often, volume of leakage)<br>Urodynamics | | | See *Urinary Retention*, U7 |
| **Management** | Risk reduction: weight loss, smoking cessation<br>Kegel exercises<br>Urethral bulking agents<br>Surgery: urethral slings, or artificial sphincter in men | Conservative: fluid management, bladder training, Kegel exercises<br>Medication: anticholinergics, β-3 agonist<br>Botulinum toxin A bladder injection<br>Neuromodulation | Combination of management of stress and urgency incontinence | Catheterization<br>Treat underlying cause |

# Lower Urinary Tract Symptoms

## Urinary Retention

- storage symptoms (FUN): frequency, urgency (strong need to void), nocturia
- voiding symptoms (SHED): stream changes/straining, hesitancy, incomplete emptying, post-void dribbling

**Table 4. Etiology of Urinary Retention**

| Outflow Obstruction | Bladder Innervation | Pharmacologic | Infection |
|---|---|---|---|
| Bladder neck or urethra: calculus, clot, foreign body, neoplasm, neurological (DSD)<br>Prostate: BPH, prostate cancer<br>Urethra: stricture, phimosis, traumatic disruption<br>Miscellaneous: constipation, pelvic mass | Intracranial: CVA, tumour, Parkinson's, cerebral palsy<br>Spinal cord: injury, disc herniation, MS<br>DM<br>Post-abdominal or pelvic surgery | Anticholinergics<br>Narcotics<br>Antihypertensives (ganglionic blockers, methyldopa)<br>OTC cold medications containing ephedrine or pseudoephedrine<br>Antihistamines<br>Psychosomatic substances (e.g. ecstasy) | GU: UTI, prostatitis, abscess, genital herpes<br>Infected foreign body<br>Varicella zoster |

If a trauma patient is unable to void, has blood at urethral meatus, a scrotal hematoma, or a high riding prostate, there is urethral injury until proven otherwise so catheterization is CONTRAINDICATED unless performed by urology staff or resident

### Clinical Features

- suprapubic pain (with acute retention), incomplete emptying, weak stream
- palpable and/or percussible bladder (suprapubic)
- possible purulent/bloody meatal discharge (with UTI)
- increased size of prostate or reduced anal sphincter tone on DRE
- neurological: presence of abnormal or absent deep tendon reflexes, reduced "anal wink", saddle anesthesia

**Acute vs. Chronic Retention**
**Acute** retention is a medical emergency characterized by suprapubic pain and inability to void
**Chronic** retention can be painless with greatly increased bladder volume and detrusor hypertrophy followed by atony (late)

### Investigations

- CBC, electrolytes, Cr, BUN, U/A and urine C&S, U/S, cystoscopy, urodynamic studies, PVR

Patients with ascites may have a falsely elevated PVR measured by bladder scan

### Treatment

- treat underlying cause
- catheterization
  - acute retention
    - immediate catheterization to relieve retention; leave Foley in to drain bladder; follow-up to determine cause; closely monitor fluid status and electrolytes (risk of POD)
  - chronic retention
    - intermittent catheterization by patient may be used; definitive treatment depends on etiology
- suprapubic catheter if obstruction precludes urethral catheter
- for post-operative patients with retention:
  - encourage ambulation
  - α-blockers to relax bladder neck/outlet (men only)
  - may need catheterization
  - definitive treatment will depend on etiology

## Benign Prostatic Hyperplasia

### Definition

- periurethral hyperplasia of stroma and epithelium in prostatic transition zone
- prostatic smooth muscle cells play a role in addition to hyperplasia

### Etiology

- unknown
  - DHT required (converted from testosterone by 5-α reductase)
  - possible role of impaired apoptosis, estrogens, other growth factors

### Epidemiology

- age-related, extremely common (50% of 50 yr olds, 80% of 80 yr olds)
- 25% of men will require treatment

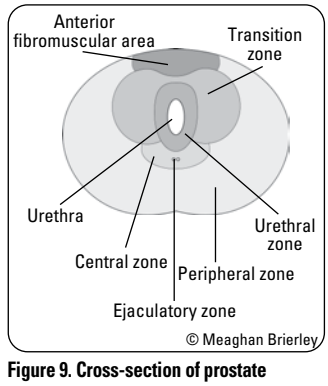

**Figure 9. Cross-section of prostate**

### Clinical Features

- result from outlet obstruction and compensatory changes in detrusor function
- voiding and storage symptoms
- DRE
  - prostate is smooth, rubbery, and may be symmetrically enlarged

Prostate size does not correlate well with symptoms in BPH

- complications
  - retention
  - overflow incontinence
  - hydronephrosis
  - renal insufficiency
  - infection
  - gross hematuria
  - bladder stones

### Investigations
- mandatory: Hx including LUTS, surgery, trauma, medications (OTC and phytotherapeutic agents), impact of QOL, P/E including DRE, U/A to exclude UTI
- recommended: symptom inventory (IPSS or AUA-SI), PSA if >10 yr life expectancy or if it changes management of voiding symptoms
- optional: Cr, urine cytology, uroflowmetry, PVR, voiding diary, sexual function questionnaire
- renal U/S to assess for hydronephrosis
- consider cystoscopy or bladder ultrasound prior to potential surgical management to evaluate outlet and prostate volume
- biopsy if suspicious for malignancy, i.e. elevated PSA or abnormal DRE

### Treatment

**Table 5. Treatment of BPH (see Table 28 and Figure 6 and 7)**

| | Conservative | Medical | Surgical | Minimally Invasive Surgical Therapies |
|---|---|---|---|---|
| **When to use** | Asymptomatic or mildly symptomatic, minimal bother | Moderately to severely symptomatic, bothersome | Absolute or relative indications, significant bother | Patients who wish to avoid or may not tolerate surgery |
| **Options** | Watchful waiting: 50% of patients improve spontaneously<br>Lifestyle modifications (e.g. evening fluid restriction, planned voiding) | α-adrenergic antagonists: reduce stromal smooth muscle tone<br>5-α reductase inhibitor: block conversion of testosterone to DHT; act to reduce prostate size<br>Combination is synergistic<br>Antimuscarinics or β-3 agonist (for storage LUTS, without elevated PVR)<br>PDE5 inhibitors (ED and for storage and voiding LUTS)<br>Desmopressin (LUTS with nocturia); risk of hyponatremia in ≥65 year old | TURP (see U43)<br>BPKVP (<60 cc)<br>Laser prostatectomy<br>TUIP (<30 cc)<br>Aquablation (new, <80 cc)<br>Open simple prostatectomy (>100 cc) | TUMT<br>UroLift (new, <80 cc)<br>Convective water vapour energy ablation (new)<br>Prostatic stent (for those unfit for surgery) |

**Approximate Prostate Sizes**
20 cc – chestnut
25 cc – plum
50 cc – lemon
75 cc – orange
300 cc – grapefruit

**AUA BPH Symptom Score**

**FUNWISE**
**F**requency
**U**rgency
**N**octuria
**W**eak stream
**I**ntermittency
**S**training
**E**mptying, incomplete feeling of

Each symptom graded out of 5
0-7: Mildly symptomatic
8-19: Moderately symptomatic
20-35: Severely symptomatic
Note: dysuria not included in score but is commonly associated with BPH

Initial alpha-adrenergic antagonist monotherapy for score <20, combination therapy for score >20

Men with planned cataract surgery should avoid starting α-adrenergic antagonists until after their surgery due to the risk of intraoperative floppy iris syndrome

**BPH Surgery**

**Absolute Indication**
Renal failure with obstructive uropathy
Refractory urinary retention

**Relative Indications**
Recurrent UTIs
Recurrent hematuria refractory to medical treatment
Renal insufficiency (rule out other causes)
Bladder stones
Severe symptoms unresponsive to medical therapies

# Urethral Stricture

### Definition
- decrease in urethral calibre due to scar formation in urethra (may also involve corpus spongiosum)
- M>F

### Etiology
- congenital
  - failure of normal canalization (i.e. posterior urethral valves)
- trauma
  - instrumentation/catheterization (most common)
  - external trauma (e.g. burns, straddle injury)
  - foreign body
- infection
  - long-term indwelling catheter
  - STI (gonococcal or chlamydial disease)
- inflammation
  - balanitis xerotica obliterans (BXO; lichen sclerosus or chronic progressive sclerosing dermatosis of the male genitalia) causing meatal and urethral stenosis
  - radiation
- malignancy (urothelial carcinoma)
  - most urethral cancers in men are squamous

### Clinical Features
- voiding and storage symptoms
- urinary retention
- hydronephrosis
- related infections: recurrent UTI, secondary prostatitis/epididymitis

### Investigations
- laboratory findings
  - flow rates <10 mL/s (normal >15 mL/s) on uroflowmetry
  - urine culture usually negative, but U/A may show pyuria
- radiologic findings
  - RUG and VCUG will demonstrate location
- cystoscopy

### Treatment
- urethral dilatation
  - temporarily increases lumen size by breaking up scar tissue
  - healing will often reform scar tissue, recurrence of stricture
- visual internal urethrotomy (VIU)
  - endoscopically incise stricture
  - equal success rates to dilation with mid bulbar strictures <2 cm
  - high rate of recurrence (30-80%), avoid in younger patients
- open surgical reconstruction (urethroplasty)
  - complete stricture excision with anastomosis depending on location and size of stricture
  - may require graft to reconstruct (e.g. buccal mucosa)

## Neurogenic Bladder

### Definition
- dysfunction of the urinary bladder due to deficiency in some aspect of its innervation

### Neurophysiology
- see Figure 6 and 7
- stretch receptors in the bladder wall relay information to PMC and activate micturition reflex (normally inhibited by cortical input)
  - micturition (voiding)
    - stimulation of parasympathetic neurons (bladder contraction)
    - inhibition of sympathetic and somatic neurons (internal and external sphincter relaxation, respectively)
    - voluntary relaxation of the pelvic floor and striated urethral sphincter
  - urine storage
    - opposite of micturition
- voluntary action of external sphincter (pudendal nerve roots S2-S4) can inhibit urge to urinate
- cerebellum, basal ganglia, thalamus, and hypothalamus all have input at PMC in the brainstem to inhibit the detrusor reflex

### Examples of Neurogenic Lower Urinary Tract Dysfunction
- neurogenic detrusor overactivity (NDO)(formerly termed detrusor hyperreflexia)
  - lesion above PMC (e.g. stroke, tumour, MS, Parkinson's disease)
  - loss of voluntary inhibition of voiding
  - intact pathway inferior to PMC maintains coordination of bladder and sphincter
- detrusor sphincter dyssynergia (DSD)
  - suprasacral lesion of spinal cord (e.g. trauma, MS, arteriovenous malformation, transverse myelitis)
  - loss of coordination between detrusor and sphincter (detrusor contracts on closed sphincter and vice versa)
  - component of detrusor overactivity as well
- detrusor atony/areflexia
  - lesion of sacral cord or peripheral efferents (e.g. trauma, DM, disc herniation, MS, congenital spinal cord abnormality, post abdominoperineal resection)
  - flaccid bladder which fails to contract
  - may progress to poorly compliant bladder with high pressures
- peripheral autonomic neuropathy
  - deficient bladder sensation → increasing residual urine → decompensation (e.g. DM, neurosyphilis, herpes zoster)
- muscular lesion
  - can involve detrusor, smooth/striated sphincter

**Combination Therapy vs. α-Blocker or 5ARI**
BJU Int 2011;107(6):946-54
**Summary**: Men with baseline prostate volume ≥40 mL and baseline PSA ≥1.5 ng/mL had greater reductions in RR of BPH-related surgery and RR of clinical progression on combined therapy or dutasteride monotherapy than on tamulosin monotherapy.
**Methods**: 4 year combination of dutasteride and tamulosin study was a multicentre double-blind RCT of outcomes in men ≥50 years old with symptomatic BPH, with PSA ≥1.5 ng/mL and ≤10ng/mL, and prostate volume ≤30 mL. Patients received tamulosin, dutasteride or combination therapy. Primary endpoint was time to first acute urinary retention or BPH-related surgery; secondary endpoint was clinical progression of BPH/symptoms.
**Results**: Combination therapy resulted in significantly greater improvements in symptoms compared to dutasteride from 3 mo, and tamsulosin from 9 mo, and in BPH-related health status from 3 and 12 mo, respectively. There was a significant increase in ADE with combination therapy vs. monotherapies. However, withdrawal rates due to drug-related adverse events were similar across the treatment groups.

**Finasteride for Benign Prostatic Hyperplasia**
Cochrane DB Syst Rev 2010;10:CD006015
**Purpose**: To examine the effectiveness and safety of finasteride versus placebo or other active controls for the treatment of urinary tract symptoms.
**Summary of Findings**:
1. Finasteride improved urinary symptoms more than placebo in trails >1 yr duration and significantly lowered the risk of BPH progression.
2. Compared with α-blockers, finasteride was less effective than either doxazosin or terazosin, but equally as effective as tamsulosin.
3. Symptom improvement with finasteride + doxazosin is equal to doxazosin alone.
4. Finasteride treatment resulted in an increased risk of ejaculation disorder, impotence and lowered libido compared with placebo.
5. Compared with doxazosin and terazosin, finasteride had a lower risk of asthenia, dizziness, and postural hypotension.

Nerve roots in micturition:
**"S2-3-4 keeps the urine off the floor"**

### Neuro-Urologic Evaluation

- Hx and P/E (urologic and general neurologic)
- voiding diary
- catheterization volumes in patients with CIC
- U/A, renal profile
- imaging
  - U/S to rule out hydronephrosis and stones; occasionally CT scanning with or without contrast
- cystoscopy
- urodynamic studies
  - uroflowmetry to assess flow rate, pattern
  - filling CMG to assess capacity, compliance, detrusor overactivity
  - voiding CMG (pressure-flow study) to assess bladder contractility and extent of bladder outflow obstruction
  - video study to visualize bladder/bladder neck/urethra during CMG using x-ray contrast
  - EMG and video ascertains presence of coordinated or uncoordinated voiding, allows accurate diagnosis of DSD

"Spinal shock" initially manifests as atonic bladder

### Treatment

- goals of treatment
  - prevent renal deterioration
  - prevent infections
  - achieve social continence
- clean intermittent catheterization (CIC) (if there is associated inability to void)
- treatment options depend on status of bladder and urethra
  - bladder hyperactivity → antimuscarinic medications to relax bladder (see *Urinary Incontinence*, U6)
    - if refractory
      - botulinum toxin injections into bladder wall (detrusor muscle)
      - occasionally augmentation cystoplasty (enlarging bladder volume and improving compliance by grafting section of detubularized bowel onto the bladder)
      - occasionally urinary diversion (ileal conduit or continent diversion) in severe cases if bladder management unsuccessful
  - flaccid bladder → CIC

## Dysuria

### Definition

- painful urination

### Etiology

**Table 6. Differential Diagnosis of Dysuria**

| | |
|---|---|
| **Infectious** | Cystitis, urethritis, prostatitis, epididymitis/orchitis (if associated with lower tract inflammation), cervicitis, vulvovaginitis, perineal inflammation/infection, TB, vestibulitis |
| **Neoplasm** | Kidney, bladder, prostate, penis, vagina/vulva, BPH |
| **Calculi** | Bladder stone, urethral stone, ureteral stone |
| **Inflammatory** | Seronegative arthropathies (reactive arthritis: arthritis, uveitis, urethritis), drug side effects, autoimmune disorders, chronic pelvic pain syndrome (CPPS), interstitial cystitis |
| **Hormonal** | Endometriosis, hypoestrogenism |
| **Trauma** | Catheter insertion, post-coital cystitis (honeymoon cystitis) |
| **Psychogenic** | Somatization disorder, depression, stress/anxiety disorder |
| **Other** | Contact sensitivity, foreign body, radiation/chemical cystitis, diverticulum |

### Investigations

- focused Hx and P/E to determine cause (fever, d/c, conjunctivitis, CVA tenderness, back/joint pain)
  - any d/c (urethral, vaginal, cervical) should be sent for gonococcus/chlamydia testing; wet mount if vaginal d/c
  - U/A and urine C&S
  - if suspect infection, may start empiric ABx treatment (see Table 9)
  - ± imaging of urinary tract (tumour, stones)

# Hydronephrosis

### Definition
- the upper urinary tract consists of the kidneys and ureters
- dilation of the renal pelvis and calyces caused by the impairment in antegrade urine flow (aka pelvicaliectasis)

### Etiology
- mechanical
  - congenital: see *Congenital Abnormalities*, U37
  - acquired
    - intrinsic: trauma, inflammation and bleeding, calculi, urologic neoplasms, BPH, urethral stricture, phimosis, previous urological surgery
    - extrinsic: trauma, neoplasms (uterine fibroid; colorectal, uterine, and cervical malignancies; lymphoma), aortic aneurysm, pregnancy (gravid uterus)
- functional
  - neuropathic: neurogenic bladder, diabetic neuropathy, spinal cord disease
  - hormonal: pregnancy (progesterone decreases ureteral tone)

### Investigations
- focused Hx, inquiring about pain (flank, lower abdomen, testes, labia), U/O, medication use, pregnancy, trauma, fever, Hx of UTIs, calculi, PID, and urological surgery
- CBC, electrolytes, Cr, BUN, U/A, urine C&S
- imaging studies (U/S is >90% sensitive and specific)
  - CT: helps delineate anatomy and potential causes (e.g. obstructing stone), but does not provide much functional information
  - MAG3 diuretic renogram: provides little anatomic structural information but evaluates differential renal function and demonstrates if functional obstruction exists

### Treatment
- hydronephrosis can be physiologic (e.g. pregnancy)
- treatment should be guided at improving symptoms, treating infections, or improving renal function
- urgent treatment may require percutaneous nephrostomy tube or ureteral stenting to relieve pressure

# Post-Obstructive Diuresis

### Definition
- polyuria resulting from relief of obstructive uropathy (i.e. elevated creatinine)
- >3 L/24 h or >200 cc/h over each of two consecutive hours

### Pathophysiology
- physiologic POD secondary to excretion of retained urea, $Na^+$, and $H_2O$ (high osmotic load) after relief of obstruction
  - self-limiting; usually resolves in 48 h with PO fluids but may persist to pathologic POD
- pathologic POD is a $Na^+$-wasting nephropathy secondary to impaired concentrating ability of the renal tubules due to:
  - decreased reabsorption of NaCl in the thick ascending limb and urea in the collecting tubule
  - increased medullary blood flow (solute washout)
  - increased flow and solute concentration in the distal nephrons

### Management
- admit patient and closely monitor hemodynamic status and electrolytes ($Na^+$ and $K^+$ q6-12h and replace prn; follow Cr and BUN to baseline)
- monitor U/O q2h and ensure total fluid intake <U/O by replacing every 1 mL U/O with 0.5 mL 1/2 NS IV (PO fluids if physiologic POD)
- avoid glucose-containing fluid replacement (iatrogenic diuresis)

# Overactive Bladder

## Definition
- a symptom complex that includes urinary urgency with or without urgency incontinence, urinary frequency (voiding ≥8 times in a 24 h period), and nocturia (awakening ONE or more times at night to void)

## Etiology
- multiple etiologies proposed (neurogenic, myogenic, idiopathic)
- symptoms usually associated with involuntary contractions of the detrusor muscle
- may be associated with other conditions such as SUI in women and BPH in men (see Table 5)

## Epidemiology
- F:M= 1:1
- prevalence increases with age. 42% in males ≥75 years; 31% in females ≥75 years
- women experience incontinence more commonly than men

## Diagnosis
- the diagnostic process should document symptoms that define overactive bladder and exclude other disorders that could cause of the patient's symptoms
- minimal requirements for the process consist of:
  - focused history including past genitourinary disorders and conditions outlined in Table 7, questionnaires of LUTS and diaries of urination frequency, volume and pattern
  - P/E including genitourinary, pelvic and rectal examination
  - U/A to rule out hematuria and infection
- in some patients, the following investigations could be considered
  - post-void residual
  - cystoscopy to rule out recurrent infections, carcinoma in situ and other intravesical abnormalities
- urodynamics to rule out obstruction in older men

## Treatment
- non-pharmacological: behaviour therapies such as bladder training, bladder control strategies, pelvic floor muscle training, fluid management, and avoidance of caffeine and alcohol
- pharmacological (see Table 29)
  - anti-muscarinics: oxybutynin hydrochloride, tolterodine, solifenacin, fesoterodine, darifenacin, propiverine or trospium
  - β3-adrenoceptor agonist: mirabegron
- refractory patients may be treated with:
  - neuromuscular-junction inhibition: botulinum toxin bladder injection
- others
  - percutaneous tibial nerve stimulation (not used commonly in Canada)
  - sacral neuromodulation

**Table 7. Conditions that Could Contribute to Symptoms of Overactive Bladder**

| | |
|---|---|
| **Lower Urinary Tract Conditions** | UTI, obstruction, impaired bladder contractility |
| **Neurological Conditions** | Stroke, MS, dementia, diabetic neuropathy |
| **Systemic Diseases** | CHF, sleep disorders (primarily nocturia) |
| **Functional and Behavioural** | Excessive caffeine and alcohol, constipation, impaired mobility |
| **Medication** | Diuretics, anticholinergic agents, narcotics, calcium-channel blocker, cholinesterase inhibitors |

# Infectious and Inflammatory Diseases

**Table 8. Antibiotic Treatment of Urological Infections**

| Condition | Drug | Duration |
|---|---|---|
| **Urethritis** | **Non-Gonococcal** | |
| | azithromycin (1 g PO) | x 1 d |
| | OR | |
| | doxycycline (100 mg PO bid) | 7 d |
| | **Gonococcal** | |
| | ceftriaxone (250 mg IM) AND treat for *Chlamydia trachomatis* | x 1 |
| **Simple, Uncomplicated UTI** | TMP-SMX (160 mg/800 mg PO bid) | 3 d |
| | OR | |
| | nitrofurantoin (100 mg PO bid) | 5 d |
| **Complicated UTI** | ciprofloxacin (1 g PO daily OR 400 mg IV q12h) | up to 2-3 wk |
| | OR | |
| | ampicillin (1 g IV q6h) + gentamicin (1 mg/kg IV q8h) (used for relatively short courses because of toxicity) | up to 2-3 wk |
| | OR | |
| | ceftriaxone (1-2 g IV q24h) | up to 2-3 wk |
| **Recurrent/Chronic Cystitis** | Prophylactic Treatment | |
| | Continuous: TMP-SMX (40 mg/200 mg PO qHS OR 3x/wk) | 6-12 mo |
| | OR | |
| | nitrofurantoin (50-100 mg PO qHS) | 6-12 mo |
| | Post-Coital: TMP-SMX (40 mg/200 mg-80 mg/400 mg) | within 2 h of coitus |
| | OR | |
| | nitrofurantoin (50-100 mg PO qd) | within 2 h of coitus |
| **Acute Prostatitis** | ciprofloxacin (500-750 mg PO bid) | 2-4 wk |
| | OR | |
| | TMP-SMX (160 mg/800 mg PO bid) | 4 wk |
| | OR | |
| | IV therapy with gentamicin and ampicillin, penicillin with β-lactamase inhibitor, 3rd gen cephalosporin, OR a fluoroquinolone | 4 wk (IV and oral step-down) |
| **Chronic Prostatitis** | ciprofloxacin (500 mg PO bid) | 4-6 wk |
| **Epididymitis/Orchitis** | <35 yr | |
| | ceftriaxone (200 mg IM) | x 1 |
| | AND | |
| | doxycycline (100 mg PO bid) | 10 d |
| | ≥35 yr | |
| | ofloxacin (300 mg PO bid) | 10 d |
| **Acute Uncomplicated Pyelonephritis** | ciprofloxacin (500 mg PO bid) | 7 d |
| | ± ceftriaxone (1 g IV) OR ciprofloxacin (400 mg IV) | x 1 |
| | OR | |
| | IV therapy with a fluoroquinolone, gentamicin and ampicillin, extended spectrum cephalosporin, extended spectrum penicillin, OR a carbapenem | 14 d total IV and oral step-down |

Antibiotic therapy should always be based on local resistance patterns and adjusted according to culture and sensitivity results

Acute uncomplicated pyelonephritis: suspected or confirmed *Enterococcus* infection requires treatment with ampicillin

## Urinary Tract Infection

- for UTIs during pregnancy, see Obstetrics, OB29

### Definition

- symptoms suggestive of UTI + evidence of pyuria and bacteriuria on U/A or urine C&S
  - if asymptomatic + 100,000 CFU/mL = asymptomatic bacteriuria; only requires treatment in certain patients (e.g. pregnancy, immunosuppressed, prior to urologic surgery)

### Classification

- uncomplicated: lower UTI in a setting of functionally and structurally normal urinary tract
- complicated: structural and/or functional abnormality, male patients, immunocompromised, diabetic, iatrogenic complication, pregnancy, pyelonephritis, catheter-associated
- recurrent: see *Recurrent/Chronic Cystitis*, U14

### Risk Factors

- stasis and obstruction
  - residual urine due to impaired urine flow e.g. PUVs, reflux, medication, BPH, urethral stricture, cystocele, neurogenic bladder
- foreign body
  - introduce pathogen or act as nidus of infection e.g. catheter, instrumentation

- decreased resistance to organisms
  - DM, malignancy, immunosuppression, spermicide use, estrogen depletion, antimicrobial use
- other factors
  - trauma, anatomic abnormalities, female, sexual activity, menopause, fecal incontinence

### Clinical Features
- storage symptoms: frequency, urgency
- voiding symptoms: hesitancy, post-void dribbling, dysuria
- other: suprapubic pain, hematuria, foul-smelling urine
- pyelonephritis – if present: typically presents with more severe symptoms (e.g. fever/chills, CVA tenderness, flank pain)

### Indications for Investigations
- pyelonephritis
- persistence of pyuria/symptoms following adequate antibiotic therapy
- severe infection with an increase in Cr
- recurrent/persistent infections
- atypical pathogens (urea splitting organisms)
- Hx of structural abnormalities/decreased flow

### Investigations
- U/A, urine C&S
  - U/A: leukocytes ± nitrites ± hematuria
  - C&S: midstream, catheterized, or suprapubic aspirate
- if hematuria present, retest post-treatment, if persistent need hematuria workup (see *Microscopic Hematuria*, U5)
- U/S, CT scan if recurrent or treatment-resistant UTIs, suspected anatomic abnormalities, history indicates complicated cystitis

### Treatment
- see Table 8, U13, *Antibiotic Treatment of Urological Infections*
- if febrile, consider admission with IV therapy and rule out obstruction

### Prevention of UTIs
- maintain good hydration (emerging evidence re: cranberry preparations)
- void regularly (do not hold urine for prolonged periods of time)
- wipe from front to back to avoid contamination of the urethra with feces from the rectum
- avoid feminine hygiene sprays and scented douches
- empty bladder immediately before and after intercourse

**Prevention of UTIs**
- Maintain good hydration (try cranberry preparations)
- Wipe from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse

### Organisms
- typical organisms: SEEK PP (*E. coli* 75-95%)
- atypical organisms
  - tuberculosis (TB)
  - *Chlamydia trachomatis*
  - *Mycoplasma (Ureaplasma urealyticum)*
  - fungi (*Candida*)

## Recurrent/Chronic Cystitis

### Definition
- ≥3 UTIs/yr

### Etiology
- bacterial reinfection (80%) vs. bacterial persistence (relapse)
  - bacterial reinfection
    - recurrence of infection with either 1) a different organism, 2) the same organism if cultured >2 wk following therapy, or 3) with any organism with an intermittent sterile culture
  - bacterial persistence
    - same organism cultured within 2 wk of sensitivity-based therapy

### Investigations
- assess predisposing factors
- investigations may include cystoscopy, U/S, CT

### Treatment
- lifestyle changes (limit caffeine intake, increase fluid/$H_2O$ intake)
- ABx (various strategies): continuous low-dose daily suppression vs. post-coital only vs. self-start therapy
- post-menopausal women: consider topical or systemic estrogen therapy
- no treatment for asymptomatic bacteriuria except in pregnant women or patients undergoing urinary tract instrumentation

# Interstitial Cystitis (Painful Bladder or Bladder Pain Syndrome)

### Definition
- bladder pain, chronic urgency, and frequency without other identifiable causation

### Classification
- non-ulcerative (more common) and ulcerative

### Etiology
- unknown

### Epidemiology
- prevalence: 20/100,000
- 90% of cases are in females, 94% are Caucasian
- median age is 40 yr (non-ulcerative seen in younger to middle-aged, while ulcerative seen in middle-aged to older)

### Clinical Features
- pelvic pain (typically supra-pubic tenderness)
- storage symptoms (frequency > urgency > nocturia)
- negative U/A, urine C&S, urine cytology
- cystoscopy: glomerulations (submucosal petechiae), Hunner's lesions

Cystoscopic evaluation is not necessary to make a diagnosis

### Differential Diagnosis
- Uro: non-infectious cystitis (radiation, chemical, eosinophilic, TB), OAB, bladder calculi, prostate-related pain
- Gyne: endometriosis, vulvar disorders
- Neuro: pudendal nerve entrapment
- MSK: pelvic floor disorders
- Drugs: ketamine, tiaprofenic acid

### Investigations
- Hx, P/E, frequency volume chart
- symptom scores to establish baseline and response to treatment
- U/A, urine C&S, urine cytology
- cystoscopy

### Treatment
- first line: patient education, dietary modifications, bladder retraining, stress management
  - pelvic floor physiotherapy can be added for patients with pelvic floor dysfunction or pelvic pain
- second line: guided by symptom phenotype
  - oral: amitriptyline, cimetidine, hydroxyzine, pentosan polysulfate (PPS), gabapentin, quercetin
  - intravesical: dimethylsulfoxide (DMSO), heparin, lidocaine, PPS, oxybutynin
- third line: hydrodistension, botulinum toxin A, sacral neuromodulation
  - endoscopic treatment if Hunner's lesions (cauterization, resection, triamcinolone injection)
- fourth line: radical surgery (substitution cystoplasty or urinary diversion ± cystectomy)

# Acute Pyelonephritis

### Definition
- infection of the renal parenchyma with local and systemic manifestations
- clinical diagnosis of flank pain, fever and elevated WBC

### Etiology
- ascending (usually GN bacilli) or hematogenous route (usually GP cocci)
- causative microorganisms
  - Gram positives: *Enterococcus faecalis, S. aureus, S. saphrophyticus*
  - Gram negatives: *E. coli, Klebsiella, Proteus, Pseudomonas, Enterobacter*
- common underlying causes of pyelonephritis
  - stones, strictures, prostatic obstruction, vesicoureteric reflux, neurogenic bladder, catheters, DM, sickle-cell disease, PCKD, immunosuppression, post-renal transplant, instrumentation, pregnancy

### Clinical Features
- rapid onset (<24 h)
- LUTS including frequency, urgency, hematuria; NOT dysuria unless concurrent cystitis
- fever, chills, nausea, vomiting, myalgia, malaise
- CVA tenderness and/or exquisite flank pain

### Investigations
- U/A, urine C&S
- CBC and differential: leukocytosis, left shift
- imaging if complicated pyelonephritis or symptoms do not improve with 48-72 h of treatment
  - abdominal/pelvic U/S
  - CT
- nuclear medicine: DMSA scan can be used to help secure the diagnosis
  - a photopenic defect indicates active infection or scar; if normal alternative diagnoses should be considered

### Treatment
- hemodynamically stable
  - outpatient oral ABx treatment ± single initial IV dose (see Table 8, U13)
- severe or non-resolving
  - admit, hydrate, and treat with IV ABx (see Table 8, U13)
- emphysematous pyelonephritis
  - most patients receive nephrectomy after IV ABx started and patient stabilized
  - consider temporization with nephrostomy tubes
- renal obstruction
  - admit for emergent stenting or percutaneous nephrostomy tube

## Prostatitis/Prostatodynia

### Epidemiology
- prevalence: 9% of men/year, 6% with bothersome symptoms
- most common urologic diagnosis in men <50, 3rd most common in men >50

### Classification

**Table 9. Comparison of the Four Types of Prostatitis**

| | Acute Bacterial Prostatitis (Category I) | Chronic Bacterial Prostatitis (Category II) | Chronic Pelvic Pain Syndrome (Category III) | Asymptomatic Prostatitis (Category IV) |
|---|---|---|---|---|
| **Etiology** | Acute infection<br>SEEK PP (80% *E. coli*) | Chronic infection ± prostatitis symptoms | Symptoms without evidence of infection<br>IIIA: inflammatory<br>IIIB: non-inflammatory | Incidental inflammation |
| **Clinical Features** | LUTS, pelvic pain<br>Systemic signs: fever, chills, malaise<br>Leukocytosis in prostatic fluid<br>Positive bacterial cultures | LUTS, pelvic pain<br>No systemic signs<br>Recurrent UTIs<br>Leukocytosis in prostatic fluid<br>Positive bacterial cultures | LUTS, pelvic pain<br>IIIA: leukocytosis in prostatic fluid<br>IIIB: no leukocytosis in prostatic fluid | No symptoms<br>Leukocytosis in prostatic fluid |
| **Investigations** | Hx, P/E (abdo, external genitalia, perineum, prostate)<br>U/A, urine C&S<br>TRUS if suspect abscess | Hx, P/E (same as Category I + pelvic floor)<br>4 glass test for culture:<br>VB1 (urethra)<br>VB2 (bladder)<br>EPS (post-massage)<br>VB3 (post-massage) | Hx, P/E (same as Category II)<br>Symptom score (NIH-CPSI*)<br>4-glass test<br>Consider psychological assessment | No investigations unless considering ABx for elevated PSA or infertility |
| **Treatment** | ABx (see Table 8, U13)<br>Catheterization if severe obstructive<br>Drainage if abcess is present | ABx (see Table 8, U13)<br>α-blocker if obstruction | Supportive measures<br>ABx if ABx naïve<br>Multimodal therapy (UPOINT), including:<br>α-blockers<br>Anti-inflammatories<br>Phytotherapy (quercetin, cernilton) | ABx if elevated PSA, infertility, or planned prostate biopsy |

*NIH-CPSI: National Institute of Health Chronic Prostatitis Symptom Index

# Epididymitis and Orchitis

## Etiology
- common infectious causes
  - <35 yr: *N. gonorrhoeae* or *Chlamydia trachomatis*
  - ≥35 yr or penetrative anal intercourse: GI organisms (especially *E. coli*)
- other causes
  - mumps infection may involve orchitis, post-parotitis
  - TB
  - syphilis
  - granulomatous (autoimmune) in elderly men
  - amiodarone (involves only head of epididymis)
  - chemical: reflux of urine into ejaculatory ducts

## Risk Factors
- UTI
- unprotected sexual contact
- instrumentation/catheterization
- increased pressure in prostatic urethra (straining, voiding, heavy lifting) may cause reflux of urine along vas deferens → sterile epididymitis
- immunocompromise

If unsure between diagnoses of epididymitis and torsion, always go to OR
**Remember**: torsion >6 h has poor prognosis

## Clinical Features
- sudden onset scrotal pain and swelling ± radiation along cord to flank
- scrotal erythema and tenderness
- Prehn's Sign (relief of pain with lifting of testicle)
- fever
- storage symptoms, purulent d/c
- reactive hydrocele

## Investigations
- U/A, urine C&S
- ± urethral d/c: Gram stain/culture
- if diagnosis uncertain, MUST rule out testicular torsion (U/S Doppler)

## Treatment
- rule out torsion (see *Investigations* Table 23, U31)
- see Table 8, U13 for ABx therapy
- scrotal support, bed rest, ice, analgesia

## Complications
- if severe → testicular atrophy
- 30% have persistent infertility problems
- inadequately treated acute epididymitis may lead to chronic epididymitis or epididymo-orchitis

# Urethritis

## Etiology
- infectious or inflammatory (e.g. reactive arthritis)

**Table 10. Infectious Urethritis: Gonococcal vs. Non-Gonococcal**

| | Gonococcal | Non-Gonococcal |
|---|---|---|
| **Causative Organism** | *Neisseria gonorrhoeae* | Usually *Chlamydia trachomatis* |
| **Diagnosis** | Hx of sexual contact, thick, profuse, yellow-grey purulent d/c, LUTS<br>Gram stain (GN diplococci), urine PCR and/or culture from urethral specimen | Hx of sexual contact, mucoid whitish purulent d/c, ± storage LUTS<br>Gram stain demonstrates >4 PMN/oil immersion field, no evidence of *N. gonorrhoeae*, urine PCR and/or culture from urethral specimen |
| **Treatment** | See Table 8, U13 | See Table 8, U13 |

**Reactive Arthritis (formerly known as Reiter's syndrome)**
Urethritis, uveitis (or conjunctivitis), and arthritis
**(can't pee, can't see, can't climb a tree)**

If culture negative or unresponsive to treatment consider: *Ureaplasma urealyticum, Mycoplasma genitalium, Trichimonas vaginalis*, HSV, or adenovirus

# Stone Disease

## Epidemiology
- prevalence: ~8% and increasing
- M:F = 2:1
- peak incidence 30-50 yr of age
- recurrence rate: 10% at 1 yr, 50% at 5 yr, 60-80% lifetime

## Risk Factors
- hereditary: RTA, Glucose-6-phosphate dehydrogenase deficiency, cystinuria, xanthinuria, oxaluria, etc.
- lifestyle: minimal fluid intake; excess vitamin C, oxalate, purines, calcium
- medications: loop diuretics (furosemide, bumetanide), acetazolamide, topiramate, zonisamide, indinavir, acyclovir, sulfadiazine, triamterene
- medical conditions: UTI (with urea-splitting organisms: *Proteus, Pseudomonas, Providencia, Klebsiella, Mycoplasma, Serratia, S. aureus*), myeloproliferative disorders, IBD, gout, DM, hypercalcemia disorders (hyperparathyroidism, tumour lysis syndrome, sarcoidosis, histoplasmosis), obesity (BMI >30)
- bladder stones: bladder outlet obstruction, catheters, neurologic disease, DM (requires different management)

**Key Points in Stone Hx**
- Diet (especially FLUID INTAKE)
- Predisposing medical conditions
- Predisposing medications
- Previous episodes/investigations/treatments
- Family Hx (1st degree relative)

## Clinical Features
- urinary obstruction → upstream distention → pain
  - flank pain from renal capsular distention (non-colicky)
  - severe waxing and waning pain radiating from flank to groin, testis, or tip of penis from distended collecting system or ureter (ureteral colic)
- writhing, persistent discomfort, nausea, vomiting, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency), if the stone is in the lower ureter
- bladder stones result in: storage and voiding LUTS, terminal hematuria, suprapubic pain
- if fever, rule out concurrent pyelonephritis and/or obstruction
- can also present incidentally, without any pain or symptoms

**The Four Narrowest Passage Points for Upper Tract Stones**
- UPJ
- Pelvic brim
- Under vas deferens/broad ligament
- UVJ

**Table 11. Differential Diagnosis of Renal Colic**

| GU | Abdominal | Neurological |
|---|---|---|
| Pyelonephritis<br>Ureteral obstruction from other cause: UPJ obstruction, clot colic secondary to gross hematuria, sloughed papillae<br>Gynecological: ectopic pregnancy, torsion/rupture of ovarian cyst, PID | AAA<br>Bowel ischemia<br>Pancreatitis<br>Other acute abdominal crisis (appendicitis, cholecystitis, diverticulitis) | Radiculitis (L1): herpes zoster, nerve root compression |

## Location of Stones
- calyx: may cause flank discomfort, persistent infection, persistent hematuria, or remain asymptomatic
- pelvis: tend to cause obstruction at UPJ, may cause persistent infection
- ureter: <5 mm diameter will pass spontaneously in 75% of patients

| | Radiopaque | Radiolucent |
|---|---|---|
| **KUB** | Calcium<br>Struvite<br>Cystine | Uric acid<br>Indinavir<br>Atazanavir |
| **CT** | Calcium<br>Struvite<br>Cystine<br>Uric acid | Indinavir<br>Atazanavir |

## Stone Pathogenesis
- supersaturation of stone constituents (at appropriate temperature and pH)
- stasis, low flow, and low volume of urine (dehydration)
- crystal formation and stone nidus
- loss of inhibitory factors
  - citrate (forms soluble complex with calcium)
  - magnesium (forms soluble complex with oxalate)
  - pyrophosphate
  - Tamm-Horsfall glycoprotein

# Approach to Renal Stones

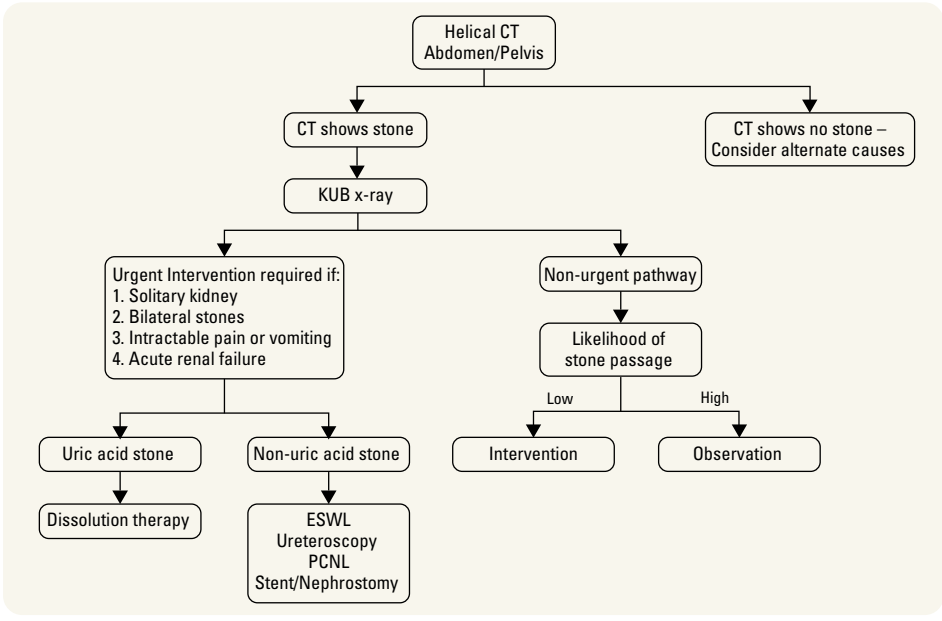

**Figure 10. Approach to renal stone**

Although hypercalciuria is a risk factor for stone formation, decreasing dietary calcium is NOT recommended to prevent stone formation. Low dietary calcium leads to increased GI oxalate absorption and higher urine levels of calcium oxalate

**Stones and Infection**
If septic, urgent decompression via ureteric stent or percutaneous nephrostomy is indicated. Definitive treatment of the stone should be delayed until the sepsis has cleared

**Indications for PCNL**
- Size >2 cm
- Staghorn
- UPJ obstruction with correction of obstruction
- Calyceal diverticulum
- Cystine stones (poorly fragmented with ESWL)
- Anatomical abnormalities
- Failure of less invasive modalities

## Investigations

**Table 12. Investigations for Renal Stones**

| | CBC, U/A, Urine C&S | KUB X-ray | CT Scan | Abdominal Ultrasound | Cystoscopy | Uric Acid | PTH, 24 h urine x 2 for volume, Cr, $Ca^{2+}$, $Na^{+}$, $PO_4^{3-}$, $Mg^{2+}$, oxalate, citrate, ± cystine |
|---|---|---|---|---|---|---|---|
| **Who gets it?** | Everyone | Most | First episode renal colic | Pediatric cases or those concerning for obstruction | ± Those concerning for bladder stone | Stone not seen on KUB | Recurrent $Ca^{2+}$ stone formers ± pediatric cases |
| **Why is it done?** | May show signs of infection, ± sensitivities | 90% of stones are radiopaque<br>Good for follow-up | Distinguish radiolucent stone from soft tissue filling defect<br>X-ray comparison | Identify and follow-up stone without radiation exposure<br>Visualize hydronephrosis | Visualize bladder | Suspected uric acid stone | Need to rule out metabolic cause for stones |
| **Cautions** | — | Do not mistake phleboliths for stones! | Radiation (especially if female of child bearing age)<br>Must be a non-contrast scan | — | — | | — |

## Treatment

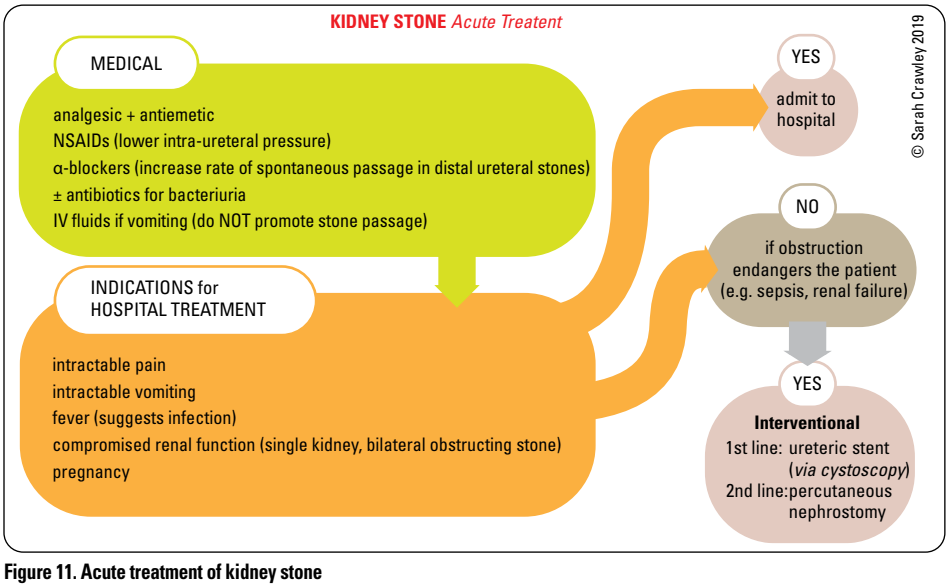

**Figure 11. Acute treatment of kidney stone**

24 h urine collections must be done AFTER discontinuing stone preventing/promoting medications

Detailed metabolic studies are NOT recommended unless complex patient (recurrent stone formers, pregnancy, pediatrics, strong family Hx, underlying kidney or systemic disease, etc.)

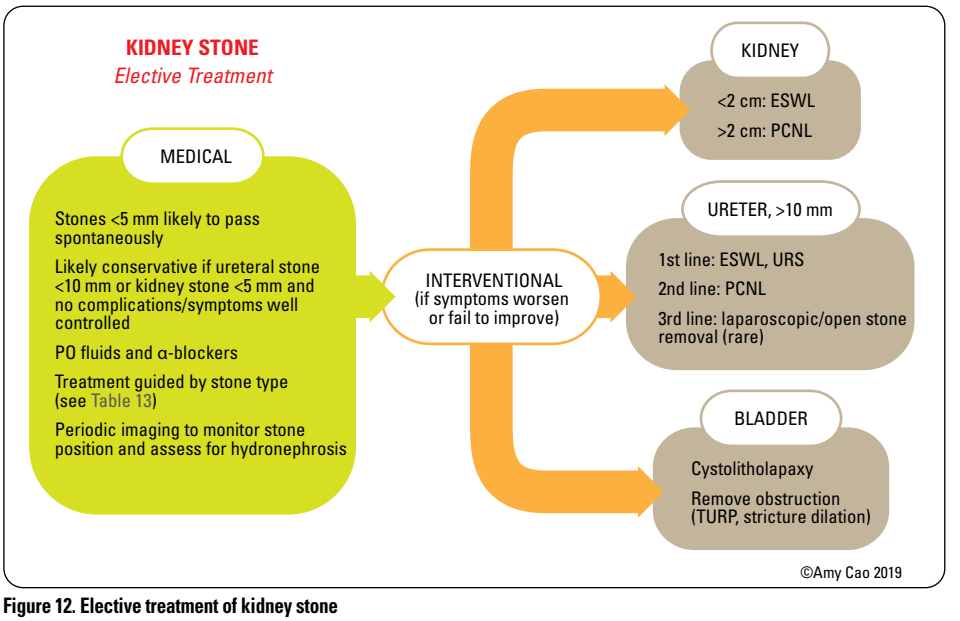

**Figure 12. Elective treatment of kidney stone**

**α-Blockers as Medical Expulsive Therapy for Ureteral Stones**
Cochrane DB Syst Rev 2018;4:CD008509
**Purpose**: To assess effects of α-blockers compared with standard therapy for ureteral stones 1 cm or smaller in adult patients presenting with symptoms of ureteral stone disease.
**Methods**: meta-analysis of 67 RCTs for ureteral stone passage in 10,509 adult patients.
**Results**: Treatment with an α-blocker resulted in increased stone clearance (risk ratio (RR) 1.45, 95% confidence interval (CI) 1.36 to 1.55; low-quality evidence). Subgroup analyses suggest that α-blockers may be less effective for smaller (5 mm or smaller) than for larger stones (greater than 5 mm).
**Conclusions**: α-blockers likely increase stone clearance, but also slightly increase the risk of major adverse events.

## Prevention

- dietary modification
  - increase fluid (>2 L/d), $K^+$ intake
  - reduce animal protein, oxalate, $Na^+$, sucrose, and fructose intake
  - avoid high-dose vitamin C supplements
- medications
  - thiazide diuretics for hypercalciuria
  - allopurinol for hyperuricosuria
  - potassium citrate for hypocitraturia, hyperuricosuria

### Table 13. Stone Classification

| Type of Stone | Calcium (75-85%) | Uric Acid (5-10%) | Struvite (5-10%) | Cystine (1%) |
|---|---|---|---|---|
| **Etiology** | Hypercalciuria<br>Hyperuricosuria (25% of patients with $Ca^{2+}$ stones)<br>Hyperoxaluria (<5% of patients)<br>Hypocitraturia (12% of patients)<br>Other causes:<br>Hypomagnesemia – associated with hyperoxaluria and hypocitraturia<br>High dietary $Na^+$<br>Decreased urinary proteins<br>High urinary pH, low urine volume (e.g. GI water loss)<br>Hyperparathyroidism, obesity, gout, DM | Uric acid precipitates in low volume, acidic urine with a high uric acid concentration:<br>Hyperuricosuria alone<br>Drugs (ASA, thiazides)<br>Diet (purine rich red meats)<br>Hyperuricosuria with hyperuricemia<br>Gout<br>High rate of cell turnover or cell death (leukemia, cytotoxic drugs) | Infection with urea-splitting organisms (*Proteus, Pseudomonas, Providencia, Klebsiella, Mycoplasma, Serratia, S. aureus*) results in alkaline urinary pH and precipitation of struvite (magnesium ammonium phosphate) | Autosomal recessive defect in small bowel mucosal absorption and renal tubular absorption of dibasic amino acids results in "COLA" in urine (cystine, ornithine, lysine, arginine) |
| **Key Features** | Radiopaque on KUB<br>Reducing dietary $Ca^{2+}$ is NOT an effective method of prevention/treatment | Radiolucent on KUB<br>Radiopaque on CT<br>Acidic urine, pH <5.5 (NOT necessarily elevated urinary uric acid) | Perpetuates UTI because stone itself harbours organism<br>Stone and all foreign bodies must be cleared to avoid recurrence<br>Associated with staghorn calculi<br>Positive urine dip and cultures<br>Note: *E. coli* infection does not cause struvite stones<br>M:F = 3:1, UTI more common in female | Aggressive stone disease seen in children and young adults<br>Recurrent stone formation, family Hx<br>Often staghorn calculi<br>Faintly radiopaque on KUB<br>Positive urine sodium nitroprusside test, urine chromatography for cystine |
| **Treatment**<br>Medical if stone <5 mm and no complications<br><br>Procedural/Surgical treatment if stone >5 mm or presence of complications<br><br>Can observe selected, asymptomatic stones | Fluids to increase urine volume to >2 L/d<br>For calcium stones: increase citrate in diet, reduce salt, moderate oxalate-rich foods, weight loss<br>Calcium oxalate: thiazides, ± potassium citrate, ± allopurinol<br>Calcium struvite: ABx (stone must be removed to treat infection) | Increased fluid intake<br>Alkalinization of urine to pH 6.5 to 7 (potassium citrate, sodium bicarbonate)<br>± allopurinol | Complete stone clearance<br>ABx for 6 wk<br>Regular follow-up urine cultures | Increased fluid intake (3-4 L of urine/d)<br>Alkalinize urine (bicarbonate, potassium citrate), Penicillamine/α-MPG or Captopril (form complex with cystine)<br>ESWL not effective |

# Urological Neoplasms

## Approach to Renal Mass

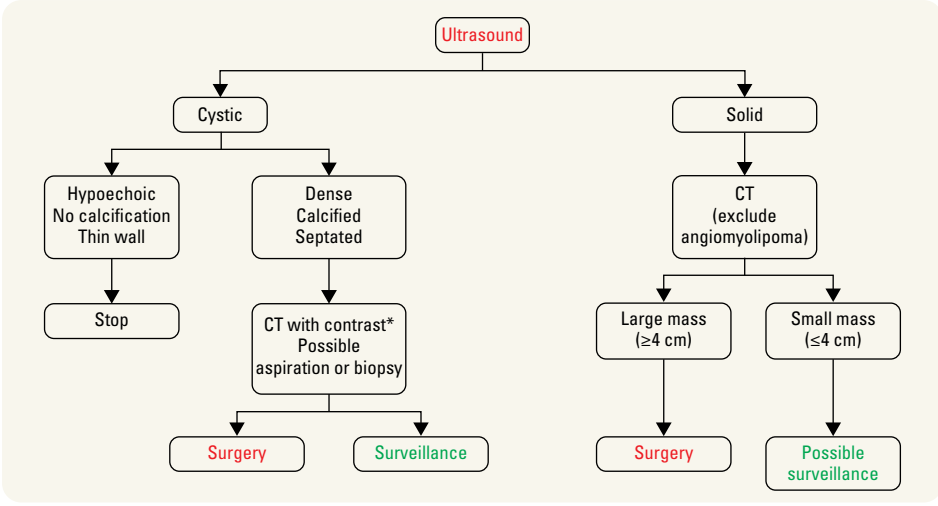

**Figure 13. Workup of a renal mass**
*Imaging modality may be different in cases of contrast allergy or elevated creatinine

There is controversy over optimal management of small renal masses

Percutaneous needle biopsies of cystic renal masses may lead to peritoneal seeding

**Tuberous Sclerosis**
- Syndrome characterized by mental retardation, epilepsy, and adenoma sebaceum
- 45-80% of patients also present with angiomyolipomas which are often multiple and bilateral

## Benign Renal Neoplasms

### CYSTIC KIDNEY DISEASE

- simple cysts: usually solitary or unilateral
  - very common: up to 50% at age 50
  - usually incidental finding on abdominal imaging
  - Bosniak Classification is used to stratify for risk of malignancy based on cyst features from contrast CT
- polycystic kidney disease
  - autosomal recessive: multiple bilateral cysts, often leading to early renal failure in infants
  - autosomal dominant: progressive bilateral disease leading to HTN and renal failure, adult-onset
- medullary sponge kidney: cystic dilatation of the collecting ducts
  - usually benign course, but patients are predisposed to stone disease
- von Hippel-Lindau syndrome: multiple bilateral cysts or renal cell carcinomas (50% incidence of RCC)
  - renal cysts, cerebellar, spinal and retinal hemangioblastomas, pancreatic and epididymal cysts, pheochromocytomas

**Table 14. Bosniak Classification of Renal Cysts**

| Class | Features | Risk of Malignancy | Management Plan |
|---|---|---|---|
| **I (simple cyst)** | Round, no septa/ calcifications/enhancement, homogeneous, <20 HU | Near zero | No follow-up |
| **II (simple cyst)** | Thin septum (<1 mm), fine calcification, no enhancement, <3 cm, >20 HU | Minimal | No follow-up |
| **IIF (minimally complex cyst)** | Multiple thin septa, calcifications, no enhancement, >3 cm, >20 HU | 5-20% | Follow-up, imaging q6-12mo, surgical resection if lesion evolves |
| **III (complex cyst)** | Irregular, thickened, calcified septa with enhancement | >50% | Surgical resection |
| **IV (likely malignant)** | Irregular, thickened, calcified septa with enhancement, enhancing soft-tissue components | >90% | Surgical resection |

**Table 15. Benign Renal Masses**

| | Angiomyolipoma (Renal Hamartoma) | Renal Oncocytoma |
|---|---|---|
| **Epidemiology** | <10% of adult renal tumours<br>F>M<br>20% associated with tuberous sclerosis (especially if multiple, recurrent) | 3-7% of renal tumours<br>M>F<br>Oncocytomas also found in adrenal, thyroid and parathyroid glands |
| **Characteristics** | Clonal neoplasm consisting of blood vessels (angio-), smooth muscle (-myo-), and fat (-lipoma)<br>May extend into regional lymphatics and other organs and become symptomatic | Spherical, capsulated with possible central scar<br>Histologically organized aggregates of eosinophilic cells originating from intercalated cells of collecting duct |
| **Diagnosis** | Incidental finding on CT<br>Negative attenuation (-20 HU) on CT is pathognomonic<br>Rare presentation of hematuria, flank pain, and palpable mass (same as RCC) | Incidental finding on CT<br>Difficult to distinguish from RCC on imaging – treated as RCC until proven otherwise<br>Biopsy may be performed to rule out malignancy |
| **Management** | May consider surgical excision or embolization if symptomatic (pain, bleeding) or higher risk of bleeding (e.g. pregnancy)<br>Potential role for mTOR inhibitors in unresectable/metastatic disease<br>Follow with serial U/S | Partial/radical nephrectomy for large masses<br>HIFU or RFA for smaller masses |

# Malignant Renal Neoplasms

## RENAL CELL CARCINOMA

### Etiology
- cause unknown
- originates from proximal convoluted tubule epithelial cells in clear cell subtype (most common)
- hereditary forms seen with von Hippel-Lindau syndrome and hereditary papillary renal carcinoma

### Epidemiology
- 85% of primary malignant tumours in kidney, ~3% of all malignancies
- M:F = 1.5:1
- peak incidence at 50-60 yr of age

### Pathology
- histological subtypes: clear cell (75-85%), papillary (10-15%), chromophobe (5-10%), collecting duct (<1%), other (<1%)
- sarcomatoid elements in any subtype is a marker of poor prognosis

### Risk Factors
- top 3 risk factors: smoking, HTN, obesity
- end-stage renal disease
- miscellaneous: horseshoe kidney, acquired renal cystic disease
- role of environmental exposures (aromatic hydrocarbons, etc.) remains an unproven risk factor for development of RCC

### Clinical Features
- usually asymptomatic: frequently diagnosed incidentally by U/S or CT (>50%)
- indicators for poor prognosis: weight loss, weakness, anemia, bone pain
- classic "too late triad" found in 10-15%
  - gross hematuria 50%
  - flank pain <50%
  - palpable mass <30%
- metastases: seen in a 1/3 of new cases; additional 20-40% will go on to develop metastases (mostly in late presentations or large tumours)
  - bone, brain, lung and liver most common site
  - may invade renal veins and IVC lumen. This may result in ascites, hepatic dysfunction, right atrial tumour, and pulmonary emboli

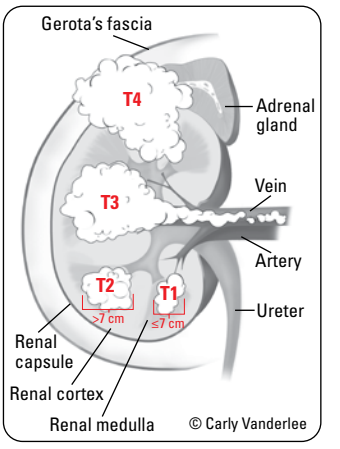

**Figure 14. RCC staging**

Role of environmental exposures (aromatic hydrocarbons, etc.) remains an unproven risk factor for development of RCC

**RCC Systemic Effects: paraneoplastic syndromes (10-40% of patients)**
- Hematopoietic disturbances: anemia, polycythemia, raised ESR
- Endocrinopathies: hypercalcemia (increased vitamin D hydroxylation), erythrocytosis (increased erythropoietin), HTN (increased renin), production of other hormones (prolactin, gonadotropins, TSH, insulin, and cortisol)
- Hepatic cell dysfunction or Stauffer syndrome: abnormal LFTs, decreased WBC count, fever, areas of hepatic necrosis; no evidence of metastases; reversible following removal of primary tumour
- Hemodynamic alterations: systolic HTN (due to AV shunting), peripheral edema (due to caval obstruction)

Tumour may invade renal veins and inferior vena cava lumen. This may result in ascites, hepatic dysfunction, right atrial tumour, and pulmonary emboli

## Investigations
- routine labs for paraneoplastic syndromes (CBC, ESR, LFTs, extended electrolytes)
- U/A
- renal U/S: solid vs. cystic lesion
- contrast-enhanced CT: higher sensitivity than U/S for detection of renal masses and for staging purposes
- MRI: useful for evaluation of vascular extension
- renal biopsy: to confirm diagnosis if considering observation or other non-surgical therapy
- genetic testing: consider if FHx of von Hippel-Lindau syndrome, non-clear cell carcinoma, bilateral/multifocal tumour, onset ≤45 yr, FHx of renal tumour, or any renal tumour with Hx of pneumothorax, dermatologic findings, associated tumours, lymphangiomyomatosis, or childhood seizure disorder

## Staging
- involves CT, CXR, liver enzymes and LFTs, bone/head imaging (if symptoms dictate)

**Table 16. 2018 TNM Classification of Renal Cell Carcinoma (AJCC 8th edition)**

| T | N | M |
|---|---|---|
| **TX**: primary tumour cannot be assessed<br><br>**T1**: tumour <7 cm, confined to renal parenchyma<br>**T1a**: <4 cm<br>**T1b**: 4-7 cm<br><br>**T2**: tumour >7 cm, confined to renal parenchyma<br>**T2a**: >7 cm but ≤10 cm<br>**T2b**: >10 cm<br><br>**T3**: tumour extends into major veins or perinephric tissues, but NOT into ipsilateral adrenal or beyond Gerota's fascia<br>**T3a**: into renal vein or sinus fat<br>**T3b**: into infradiaphragmatic IVC<br>**T3c**: into supradiaphragmatic IVC<br><br>**T4**: tumour extends beyond Gerota's fascia including extension into ipsilateral adrenal<br><br>**T Suffix**<br>**(m):** if synchronous primary tumours are found in single organ | **NX:** regional lymph nodes cannot be assessed<br><br>**N0**: no regional lymph node metastasis<br><br>**N1**: metastasis in regional lymph nodes<br><br>**N Suffix**<br>**(sn):** regional lymph node metastasis identified by SLN biopsy only<br>**(f):** regional lymph node metastasis identified by FNA or core needle biopsy only | **cM0**: no evidence of distance metastasis<br><br>**cM1**: presence of distance metastasis<br><br>**pM1**: presence of distant metastasis, microscopically confirmed |

**Differential Diagnosis of Filling Defect**
- Urothelial carcinoma (differentiate via cytology and CT scan)
- Uric acid stone (differentiate via cytology and CT scan)
- Blood clot
- Pyelitis cystica
- Papillary necrosis
- Fungus ball
- Gas bubble from gas producing organisms

## Treatment
- surgical (open, laparoscopic, robotic)
  - radical nephrectomy: en bloc removal of kidney, tumour, ipsilateral adrenal gland (in upper pole tumours) and intact Gerota's capsule
  - partial nephrectomy (parenchyma-sparing): small tumour (roughly <4 cm) or solitary kidney/bilateral tumours
  - surgical removal of solitary metastasis may be considered
- ablative techniques (RFA)
- palliative radiation to painful bony lesions
- therapy for advanced stage
  - tyrosine kinase inhibitors for metastatic disease (e.g. sunitinib, sorafenib)
  - anti-angiogenesis/anti-VEGF (e.g. bevacizumab)
  - mTOR inhibitors (e.g. temsirolimus, everolimus)
  - high-dose IL-2 (high toxicity but able to induce long-term cure in 5-7% of patients)
  - IFN-α: monotherapy has been largely replaced by molecularly targeted agents listed above

## Prognosis
- stage at diagnosis most important prognostic factor
  - T1: 90-100% 5 yr survival
  - T2-T3: 60% 5 yr survival
  - metastatic disease: <5% 10 yr survival
- predictors of relapse: tumour grade, local extent of the primary tumour, presence of local metastases, histological subtype

# Carcinoma of the Renal Pelvis and Ureter

### Etiology
- risk factors include:
  - smoking
  - chemicals/dietary exposures (industrial dyes and solvents; aristolochic acid, aniline dyes)
  - analgesic abuse (acetaminophen, ASA, and phenacetin)
  - Balkan nephropathy
  - prior exposure to cyclophosphamide

### Epidemiology
- rare: accounts for 5% of all urothelial cancers
- frequently multifocal, 2-5% are bilateral
- M:F = 3:1
- relative incidence: bladder:renal:ureter = 100:10:1

### Pathology
- 85% are papillary urothelial carcinoma; others include SCC and adenocarcinoma
- UC of ureter and renal pelvis are histologically similar to bladder UC

### Clinical Features
- gross/microscopic hematuria
- flank pain
- storage or voiding symptoms (dysuria only if lower urinary tract involved)
- flank mass ± hydronephrosis (10-20%)

### Investigations
- CT urogram
- cystoscopy and retrograde pyelogram

### Treatment
- radical nephroureterectomy with excision of ipsilateral bladder cuff
- distal ureterectomy for distal ureteral tumours with concomitant ureteral reimplant
- segmental resection with uretero-ureterostomy for some mid-ureteral tumours is also done
- emerging role for endoscopic laser ablation in patients with low grade disease, poor baseline renal health

# Bladder Carcinoma

### Etiology
- unknown, but environmental risk factors include:
  - smoking (main factor – implicated in 60% of new cases)
  - aromatic amines: naphthylamines, benzidine, tryptophan, phenacetin metabolites
  - cyclophosphamide
  - prior Hx of radiation treatment to the pelvis
  - *Schistosoma hematobium* infection (associated with SCC)
  - chronic irritation: cystitis, chronic catheterization, bladder stones (associated with SCC)
  - aristolochic acid: associated with Balkan Nephropathy (renal failure, upper tract urothelial cancer) and Chinese Herbal Nephropathy

### Epidemiology
- 2nd most common urological malignancy
- M:F = 3:1, more common among whites than blacks
- mean age at diagnosis is 65 yr

### Pathology
- classification
  - urothelial carcinoma (UC) >90%
  - SCC 5-7%
  - adenocarcinoma 1%
  - others <1%
- stages and prognoses of urothelial carcinoma at diagnosis
  - non-muscle invasive (75%) → >80% overall survival
    - 15% of these will progress to invasive UC
    - majority of these patients will have recurrence
  - invasive (25%) → 50-60% 5 yr survival
    - 85% have no prior history of superficial UC (i.e. de novo)
    - 50% have occult metastases at diagnosis, and most of these will develop overt clinical evidence of metastases within 1 yr – lymph nodes, lung, peritoneum, liver
- carcinoma *in situ* → flat, non-papillary erythematous lesion characterized by dysplasia confined to urothelium
  - more aggressive, worse prognosis
  - usually multifocal
  - may progress to invasive UC

**Radiotherapy With or Without Chemotherapy in Muscle-Invasive Bladder Cancer**
NEJM 2012;366:1477-1488
**Study**: Phase 3 trial with random assignment of 360 patients with muscle-invasive bladder cancer to radiotherapy with or without chemotherapy.
**Results**: At 2 yr, rates of locoregional disease-free survival were 67% in the chemoradiotherapy group and 54% in the radiotherapy group (HR 0.68, 95% CI 0.48-0.96). Five year overall survival rates were 48% in the chemoradiotherapy group and 35% in the radiotherapy group (HR 0.82, 95% CI 0.63-1.09).
**Conclusions**: Chemotherapy with fluorouracil and mitomycin C in combination with radiotherapy improves locoregional control of bladder cancer compared to radiotherapy alone, with no significant increase in adverse events.

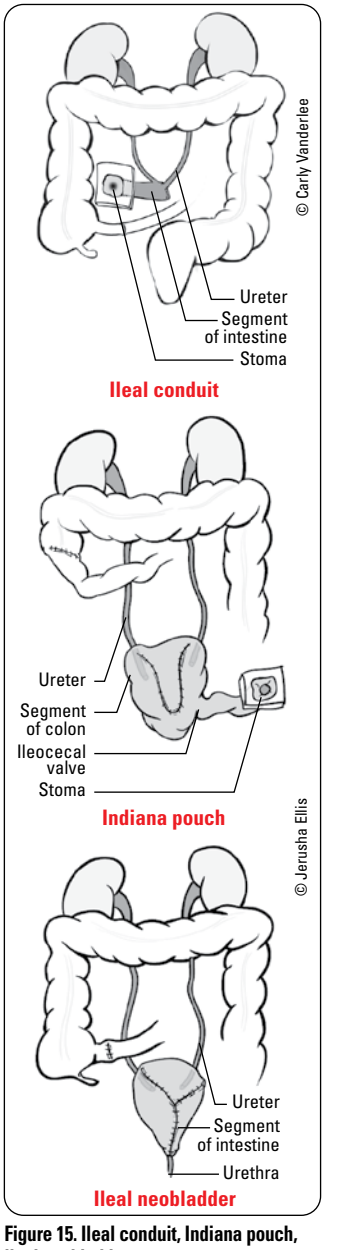

**Figure 15. Ileal conduit, Indiana pouch, ileal neobladder**

## Clinical Features
- asymptomatic (20%)
- hematuria (key symptom: 85-90% at the time of diagnosis)
- pain (50%) → location determined by size/extent of tumour (i.e. flank, suprapubic, perineal, abdominal, etc.)
- clot retention (17%)
- storage urinary symptoms → consider carcinoma in situ
- palpable mass on bimanual exam → likely muscle invasion
- obstruction of ureters → hydronephrosis and uremia (nausea, vomiting, and diarrhea)

## Investigations
- U/A, urine C&S, urine cytology
- U/S
- CT scan with contrast → look for filling defects in upper tracts
- cystoscopy with biopsy (if small lesion)
- TURBT (gold standard, diagnostic and often therapeutic) → establish diagnosis and determine depth of penetration
- specific bladder tumour markers (e.g. NMP-22, BTA, Immunocyt, FDP); utility in clinical practice debatable

## Grading
- low grade: ≤10% invasive, 60% recur locally
- high grade: 50-80% are invasive or are expected to progress to invasive over time

## Staging
- for invasive disease: CT or MRI, CXR, LFTs, extended electrolytes ($Ca^{2+}$, $Mg^{2+}$, $PO_4^{3-}$) (metastatic workup)

**Table 17. 2018 TNM Classification of Bladder Carcinoma (AJCC 8th edition)**

| T | N | M |
|---|---|---|
| **TX**: Primary tumour cannot be assessed<br>**T0**: No evidence of primary tumour<br>**Ta**: Noninvasive papillary carcinoma<br>**Tis**: Carcinoma *in situ*: "flat tumour"<br>**T1**: Tumour invades subepithelial connective tissue<br>**T2**: Tumour invades muscularis propria<br>**pT2a**: Tumour invades superficial muscularis propria (inner half)<br>**pT2b**: Tumour invades deep muscularis propria (outer half)<br>**T3**: Tumour invades perivesical tissue<br>**pT3a**: Microscopically<br>**pT3b**: Macroscopically (extravesical mass)<br>**T4**: Tumour invades any of the following: prostatic stroma, seminal vesicles, uterus, vagina, pelvic wall, abdominal wall<br>**T4a**: Tumour invades prostatic stroma, uterus, vagina<br>**T4b**: Tumour invades pelvic wall, abdominal wall<br>**T Suffix**<br>**(m):** Synchronous primary tumours are found in single organ | **NX**: Lymph nodes cannot be assessed<br>**N0**: No lymph node metastasis<br>**N1**: Single regional lymph node metastasis in the true pelvis (hypogastric, obturator, external iliac, or presacral lymph node)<br>**N2**: Multiple regional lymph node metastasis in the true pelvis (hypogastric, obturator, external iliac, or presacral lymph node metastasis)<br>**N3**: Lymph node metastasis to the common iliac lymph nodes<br>**N Suffix**<br>**(sn):** regional lymph node metastasis identified by SLN biopsy only<br>**(f):** regional lymph node metastasis identified by FNA or core needle biopsy only | **cM0:** No distant metastasis<br>**cM1:** Distant metastasis<br>**cM1a:** Distant metastasis limited to lymph nodes beyond the common iliacs<br>**cM1b:** Non-lymph-node distant metastasis<br>**pM1:** Distant metastasis, microscopically confirmed<br>**pM1a:** Distant metastasis limited to lymph nodes beyond the common iliacs , microscopically confirmed<br>**pM1b:** Non-lymph-node distant metastasis microscopically confirmed |

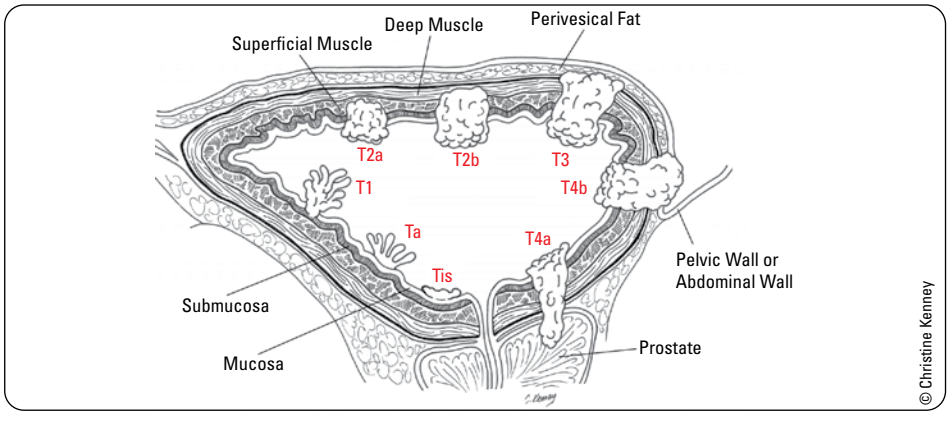

**Figure 16. Urothelial carcinoma of bladder**

The "field defect" theory helps to explain why UC has multiple lesions and has a high recurrence rate. The entire urothelium (pelvis to bladder) is bathed in carcinogens

The ENTIRE urinary tract must be evaluated in patients with hematuria unless there is clear evidence of glomerular bleeding (e.g. red cell casts, dysmorphic RBCs, etc.)

Cystoscopy is the initial procedure of choice for the diagnosis and staging of urothelial malignancy

Unexplained hematuria in any individual >40 yr old must be investigated to rule out a malignancy

Tumour grade is the single most important prognostic factor for progression

**Neoadjuvant Chemotherapy plus Cystectomy Compared with Cystectomy Alone for Locally Advanced Bladder Cancer**
NEJM 2003;349:859-866
**Study**: Randomized clinical trial.
**Patients**: 317 patients with transitional-cell carcinoma of the bladder (T2N0M0 to T4aN0M0).
**Intervention**: Randomized to undergo radical cystectomy or to receive three cycles of combined chemotherapy (methotrexate, vinblastine, doxorubicin, and cisplatin) followed by radical cystectomy.
**Main Outcome**: Survival. Secondary objective was to quantify down-staging of tumour following chemotherapy.
**Results**: At 5 yr after treatment initiation, 57% of the combination-therapy group vs. 43% of the cystectomy group were alive (p=0.06). In the combination-therapy group, 38% of the patients were pathologically free of cancer at the time of cystectomy vs. 15% of the cystectomy-only group at the time of surgery (p<0.001).
**Conclusions**: For locally advanced bladder carcinoma, neoadjuvant chemotherapy significantly reduces tumour volume and also improves survival.

**Non-Muscle-Invasive Bladder Cancer (NMIBC) and BCG**
AHRQ Publication 2015:15-EHC017-EF #153
**Summary**: BCG is the only intravesical therapy associated with decreased risk of bladder cancer progression; however, it is also associated with a high rate of adverse events. More research is needed to define optimal dose/regimen.
**Methods**: Review of Ovid Medline, Cochrane Central Register of Controlled Trials, Cochrane Database of SR, Health Technology Assessment, National Health Sciences Economic Evaluation, Database of Abstract of Review of Effects for studies on NMIBC interventions, including intravesical therapy.
**Results**: BCG is superior in prevention of bladder cancer recurrence compared to no intravesical therapy. BCG is superior to doxorubicin, epirubicin, and mitomycin in prevention of bladder cancer recurrence.

### Treatment

| Non-muscle invasive | Muscle invasive | Advanced/Metastatic |
|---|---|---|
| **Low risk (Ta low-grade)**<br>TURBT + intravesical chemo<br>Follow-up with cystoscopy and cytology<br><br>**Intermediate risk (Multifocal, recurrent Ta)**<br>TURBT + intravesical chemo<br>BCG (1 yr)<br><br>**High risk (T1, Tis, Ta high-grade)**<br>TURBT ± intravesical chemo<br>Repeat TURBT (2-6 wk)<br>BCG (3 yr) | **T2, T3**<br>Radical cystectomy + PLND + urinary diversion (see Figure 15)<br>Neoadjuvant chemo<br>Maximal TURBT + chemoradiation | **T4, N+, M+**<br>Chemo ± radiation ± cystectomy |

©Amy Cao 2019

**Figure 17. Treatment for bladder carcinoma**

### Prognosis
- depends on stage, grade, size, number of lesions, recurrence and presence of CIS
  - T1: 90% 5 yr survival
  - T2: 55% 5 yr survival
  - T3: 30% 5 yr survival
  - T4/N+/M+: <5% 5 yr survival

**10 Year Outcomes After Monitoring, Surgery, or Radiotherapy for Localized Prostate Cancer**
*NEJM.* 2016;375(15):1415-1424
**Summary**: At 10 years, prostate-cancer-specific mortality was low regardless of the treatment, with no significant difference among treatments. Surgery and radiotherapy were associated with lower incidences of disease progression and metastasis vs. active monitoring.
**Methods**: 1643 men randomized into active monitoring (545), surgery (553), and radiotherapy (545).
- Primary outcome: prostate-cancer mortality at median 10 year follow-up.
- Secondary outcomes: rate of disease progression, metastases, and all-cause deaths.

**Results**:
1. Primary outcome: 17 prostate-cancer-specific deaths overall; 8 in active-monitoring group, 5 in the surgery group, and 4 in the radiotherapy group; difference among the groups was not significant (p=0.48). No significant difference was seen among groups in numbers of deaths from any cause (169 deaths overall; p=0.87).
2. Secondary outcomes: metastases developed more in active monitoring group (33 men) vs. surgery group (13 men) or radiotherapy group (16 men) (overall p=0.004). Higher rates of disease progression in active-monitoring group (112 events) vs. surgery group (46 events) or radiotherapy group (46 events) (p<0.001 for the overall comparison).

# Prostate Cancer

### Etiology
- not known
- risk factors
  - age >50 yr, risk increases 1% per year after 65 yr
  - increased incidence in persons of African descent
  - high dietary fat (2x)
  - family Hx
    - 1st degree relative (2x)
    - 1st and 2nd degree relatives (9x)
  - positive BRCA mutation

### Epidemiology
- most prevalent cancer in males
- 3rd leading cause of male cancer deaths (following lung and colon)
- up to 50% risk of CaP at age 50
- lifetime risk of death from CaP is 3%
- 75% diagnosed between ages of 60 and 85; mean age at diagnosis is 65

### Pathology
- adenocarcinoma
  - >95%, often multifocal
- urothelial carcinoma of the prostate (4.5%)
  - associated with UC of bladder; does NOT follow TNM staging below; not hormone-responsive
- endometrial (rare)
  - carcinoma of the utricle

### Anatomy
- 60-70% of nodules arise in the peripheral zone
- 10-20% arise in the transition zone
- 5-10% arise in the central zone

### Clinical Features
- usually asymptomatic
- most commonly detected by DRE, elevated PSA, or as an incidental finding on TURP
  - DRE: hard irregular nodule or diffuse dense induration involving one or both lobes
  - PSA: see *PSA Screening*, U28
- locally advanced disease
  - storage and voiding symptoms, ED (all uncommon without spread)
- metastatic disease
  - bony metastases to axial skeleton common
  - visceral metastases are less common (liver, lung, and adrenal gland most common sites)
  - leg pain and edema with nodal metastases obstructing lymphatic and venous drainage

## Methods of Spread
- local invasion
- lymphatic spread to regional nodes
  - obturator > iliac > presacral/para-aortic
- hematogenous dissemination occurs early

## Investigations
- DRE
- PSA elevated in the majority of patients with CaP
- TRUS-guided needle biopsy
- bone scan (only if bone pain, high risk disease, or PSA >20 ng/mL)
- CT scanning to assess metastases
- MRI: being investigated for possible role in detection, staging, MRI-guided biopsy and active surveillance

**Table 18. 2018 TNM Classification of Prostate Carcinoma (AJCC 8th edition)**

| T | N | M |
|---|---|---|
| **TX:** Primary tumour cannot be assessed<br><br>**T0:** No evidence of primary tumour<br><br>**T1**: clinically undetectable tumour, normal DRE and TRUS<br>**T1a**: tumour incidental histologic finding in <5% of tissue resected<br>**T1b**: tumour incidental histologic finding in >5% of tissue resected<br>**T1c**: tumour identified by needle biopsy (due to elevated PSA level)<br><br>**T2**: palpable, confined to prostate<br>**T2a**: tumour involving ≤ one half of one lobe<br>**T2b**: tumour involving > one half of one lobe, but not both lobes<br>**T2c**: tumour involving both lobes<br><br>**T3**: tumour extends through prostate capsule<br>**T3a**: extracapsular extension (unilateral or bilateral)<br>**T3b**: tumour invading seminal vesicle(s)<br><br>**T4**: tumour invades adjacent structures (besides seminal vesicles)<br><br>**T Prefix**<br>**(c):** Clinical T<br>**(p):** Pathological T. **Table 19. Prostate Cancer Mortality Risk**

| | Low Risk (if any of following) | Intermediate Risk (if any of following) | High Risk (if any of following) |
|---|---|---|---|
| **PSA** | <10 | 10-20 | >20 |
| **Gleason Score** | <7 | 7 | 8-10 |
| **Stage** | pT1-2a | pT2b-T2c | pT3/4 |

## Treatment
- T1/T2 (localized, low-risk)
  - if adequate life expectancy or no other significant comorbidities, consider active surveillance vs. definitive local treatment (RP, brachytherapy, or EBRT)
  - active surveillance for low risk, small volume Gleason 6 prostate cancer shown to be safe for most
  - minimal differences in cure or recurrence rates between definitive treatment modalities
  - in older population: watchful waiting + palliative treatment for symptomatic progression
- T1/T2 (intermediate or high-risk)
  - definitive therapy over active surveillance
  - watchful waiting in elderly or infirm
- T3, T4
  - EBRT + androgen deprivation therapy
  - RP + adjuvant EBRT
- N >0 or M >0
  - requires hormonal therapy/palliative radiotherapy for metastases; may consider combined androgen blockade
  - bilateral orchiectomy – decreases testosterone production by 90%
  - GnRH agonists (e.g. leuprolide, goserelin), see Table 28, GnRH antagonist (e.g. degarelix)
  - antiandrogens (e.g. bicalutamide)
  - local irradiation of painful secondaries or half-body irradiation

**Screening for Prostate Cancer**
Cochrane DB Syst Rev 2013;1:CD004720
**Background**: Screening for prostate cancer has an unclear benefit for reducing prostate cancer-specific mortality and morbidity.
**Study**: Systematic review of randomized clinical trials of screening vs. no screening. A total of 31 trials were retrieved for this review.
**Results**: A meta-analysis of 5 RCTs with 341,342 participants was done. Collectively, there was no significant reduction in prostate cancer-specific mortality within 10 yr of follow-up. Screening procedures and biopsies were commonly associated with bleeding, bruising, and short-term anxiety; subsequent over-diagnosis and overtreatment resulted in additional harms, some severe.
**Conclusions**: Men who have a life expectancy less than 10-15 yr should be informed that screening for prostate cancer is unlikely to be beneficial. Significant harms are associated with screening, over-diagnosis, and overtreatment.

- hormone-refractory prostate cancer
  - chemotherapy: docetaxel, cabazitaxel
  - novel antiandrogens (e.g. abiraterone, enzalutamide)
  - other novel agents: denosumab, sipuleucel-T

**Table 20. Treatment Options for Localized Prostate Cancer**

| Modality | Population Considered | Limitations |
|---|---|---|
| **Watchful Waiting** | Short life expectancy (<5-10 yr); will likely only receive non-curative hormonal therapy if disease progresses | Disease progression |
| **Active Surveillance (serial PSA, DRE, and biopsies)** | Low grade disease, good follow-up; is still considering more curative treatment if disease progresses | Disease progression; decrease in QOL associated with serial testing; risks associated with biopsies; no optimal monitoring schedule has been defined to date |
| **Brachytherapy** | Low volume, low PSA (<10), low grade | ED (50%), long-term effectiveness not well-established |
| **EBRT** | Locally advanced disease, older patients | Radiation proctitis (5%), ED (50%), risk of rectal cancer |
| **RP** | Young patients (<75 yr), high-risk disease | Incontinence (10%), ED (30-50%) |

*Other options include cryosurgery, HIFU, hormonal ablation

### Prognosis
- T1-T2: comparable to normal life expectancy
- T3-T4: 40-70% 10 yr survival
- $N^+$ and/or $M^+$: 4% 5 yr survival
- prognostic factors: tumour stage, tumour grade, PSA value, PSA doubling time

## PSA Screening

### Digital Rectal Exam
- should be included as part of initial screening
- suspicious findings: abnormal feeling, nodularity, focal lesion, discrete change in texture/fullness/symmetry

### Prostate Specific Antigen
- glycoprotein produced by epithelial cells of prostate gland
- leaks into circulation in setting of disrupted glandular architecture
- value of <4 ng/mL traditionally considered as cut-off to differentiate normal from pathologic value, but no single justifiable cut-off point
- measured serum PSA is a combination of free (15%) and bound PSA (85%)
- decreased free:total PSA, elevated PSA velocity and elevated PSA density associated with increased CaP rates

### Screening Recommendations

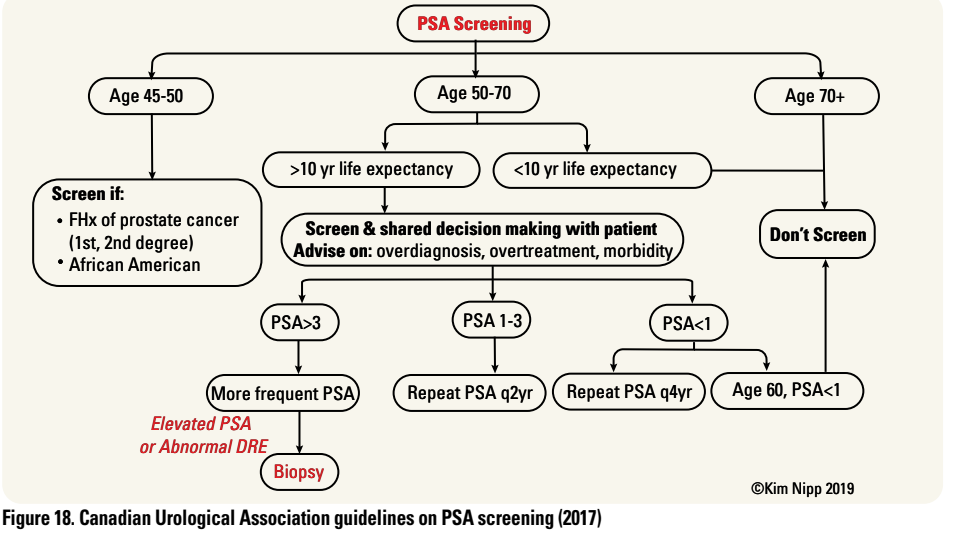

**Figure 18. Canadian Urological Association guidelines on PSA screening (2017)**

**Causes of Increased PSA**
BPH, prostatitis, prostatic ischemia/infarction, prostate biopsy/surgery, prostatic massage, acute urinary retention, urethral catheterization, cystoscopy, TRUS, strenuous exercise, perineal trauma, ejaculation, acute renal failure, coronary bypass graft, radiation therapy

PSA is specific to the PROSTATE, but NOT to prostate cancer

**Long-Term Follow-Up on PSA Screening**
Lancet 2014;384:2027-2035
**Summary**: With 13 yr follow-up, the mortality reduction remains unchanged (21%, and 29% after non-compliance adjustment). However, the number needed to screen and to treat is decreasing, and is now below the number needed to screen observed in breast cancer trials.
**Methods**: multi-centre RCT with predefined central database, analysis, and core age group (55-69 years) evaluating PSA in 8 European countries. Incidence and mortality truncated at 9, 11, and 13 years follow-up in the intervention arm was compared to control arm.
**Results**: RR of PCa incidence between intervention and control arms was 1.91 after 9 yr follow-up, 1.66 at 11 year follow-up, and 1.67 at 13 yr follow-up. RR of PCa mortality was 0.85, 0.78, and 0.79, at 9, 11, 13 yr follow-up, respectively. RRR is 21%, and ARR from death is 1.28 per 1000 men.

# Testicular Tumours

## Etiology/Risk Factors
- cryptorchidism, atrophy, sex hormones, HIV infection, infertility, family Hx, past Hx of testicular cancer

## Epidemiology
- rare, but most common solid malignancy in young males 15-35 yr
- any solid testicular mass or acute hydrocoele in young patient – must rule out malignancy
- slightly more common in right testis (corresponds with slightly higher incidence of right-sided cryptorchidism)
- 2-3% bilateral (simultaneously or successively)

## Pathology
- primary
  - 1% of all malignancies in males
  - cryptorchidism has increased risk (10-40x) of malignancy
  - 95% are germ cell tumours (all are malignant)
    - seminoma (35%) → classic, anaplastic, spermatocytic
    - NSGCT → embryonal cell carcinoma (20%), teratoma (5%), choriocarcinoma (<1%), yolk sac (<<1%), mixed cell type (40%)
  - 5% are non-germ cell tumours (usually benign) → Leydig (testosterone, precocious puberty), Sertoli (gynecomastia, decreased libido)
- secondary
  - male >50 yr
  - usually lymphoma or metastases (e.g. lung, prostate, GI)

## Clinical Features
- painless testicular enlargement (painful if intratesticular hemorrhage or infarction)
- dull, heavy ache in lower abdomen, anal area or scrotum
- associated hydrocele (10%)
- coincidental trauma (10%)
- infertility (rarely presenting complaint)
- gynecomastia due to secretory tumour effects
- supraclavicular and inguinal lymphadenopathy
- abdominal mass (retroperitoneal lymph node mets)

## Methods of Spread
- local spread follows lymphatics
  - right → medial, paracaval, anterior, and lateral nodes
  - left → left lateral and anterior paraaortic nodes
  - "cross-over" metastases from right to left are fairly common, but no reports from left to right
- hematogenous most commonly to lung, liver, bones, and kidney

Testes and scrotum have different lymphatic drainage, therefore trans-scrotal approach for biopsy or orchiectomy should be avoided

## Investigations
- diagnosis is established by pathological evaluation of specimen obtained by radical inguinal orchidectomy
- tumour markers (β-hCG, LDH, AFP)
  - β-hCG and AFP are positive in 85% of non-seminomatous tumours
  - elevated marker levels return to normal post-operatively if no metastasis
  - β-hCG positive in 7% of pure seminomas, AFP never elevated with seminoma
- testicular U/S (hypoechoic area within tunica albuginea = high suspicion of testicular cancer)
- evidence of testicular microlithiasis is not a risk factor for testicular cancer
- needle aspiration contraindicated

## Staging
- clinical: CXR (lung mets), markers for staging (β-hCG, AFP, LDH), CT abdomen/pelvis (retroperitoneal lymphadenopathy)
  - Stage I: disease limited to testis, epididymis, or spermatic cord
  - Stage II: disease limited to the retroperitoneal nodes
  - Stage III: disease metastatic to supradiaphragmatic nodal or visceral sites

**Table 21. 2018 TNM Classification of Testicular Carcinoma (AJCC 8th edition)**

| T | N | M |
|---|---|---|
| **TX**: Primary tumour cannot be assessed<br><br>**T0**: No evidence of primary tumour<br><br>**Tis**: intratubular germ cell neoplasia<br><br>**T1**: limited to testis and epididymis without lymphovascular invasion<br>**T1a**: tumour <3 cm<br>**T1b**: tumour >3 cm<br><br>**T2**: limited to testis and epididymis with lymphovascular invasion or invading hilar soft tissue or epididymis, or penetrating visceral mesothelial layer covering the external surface of tunica albuginea with or without lymphovascular invasion<br><br>**T3**: invasion of the spermatic cord ± lymphovascular invasion<br><br>**T4**: invasion of the scrotum ± invasion<br><br>**T Prefix**<br>**(c):** Clinical T. Except for Tis confirmed by biopsy an T4, the extent of primary tumour is classified by radical orchiectomy<br>**(p):** Pathological T. Subclassification of pT1 applies only to pure seminoma<br><br>**T Suffix**<br>**(m):** Synchronous primary tumours are found in single organ | **NX**: regional lymph nodes were not assessed<br><br>**N0**: no regional lymph node metastasis<br><br>**N1**: Metastasis with a lymph node mass 2 cm or less in greatest dimension; or multiple lymph nodes, none more than 2 cm in greatest dimension<br><br>**N2**: Metastasis with a lymph node mass more than 2 cm but not more than 5 cm in greatest dimension<br><br>**N3**: Metastasis with a lymph node mass more than 5 cm in greatest dimension<br><br>**N Prefix**<br>**(c):** Clinical N<br>**(p):** Pathological N<br><br>**N Suffix**<br>**(sn):** regional lymph node metastasis identified by SLN biopsy only<br>**(f):** regional lymph node metastasis identified by FNA or core needle biopsy only | **M0**: no distant mets<br><br>**cM1**: distant mets<br>**cM1a**: non-retroperitoneal nodal or pulmonary mets<br>**cM1b**: non-pulmonary visceral mets<br><br>**pM1**: distant mets, microscopically confirmed<br>**pM1a**: non-retroperitoneal nodal or pulmonary mets, microscopically confirmed<br>**pM1b**: non-pulmonary visceral mets, microscopically confirmed |

## Management
- orchiectomy through inguinal ligament for all stages
- consider sperm banking, testicular prosthesis
- adjuvant therapies (see figure 19)

## Prognosis
- 99% cured with stage I and II disease
- 70-80% complete remission with advanced disease

**Orchiopexy**
Surgical descent (orchiopexy) of undescended testis does not eliminate the risk of malignancy, but allows for earlier detection by self-examination and reduces the risk of infertility

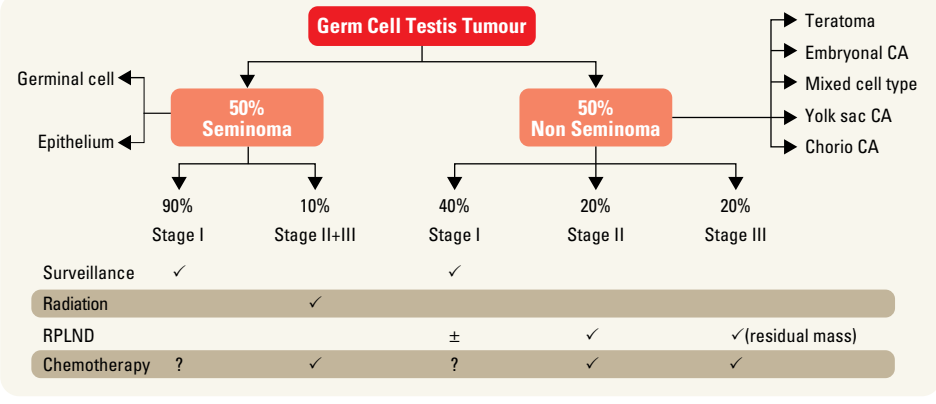

**Figure 19. Adjuvant management of testicular cancer post-orchiectomy** Adapted from Dr. MAS Jewett

# Penile Tumours

## Epidemiology
- rare (<1% of cancer in males in U.S.)
- most common in 6th decade

## Benign
- cyst, hemangioma, nevus, papilloma

## Pre-Malignant
- balanitis xerotica obliterans, leukoplakia, Buschke-Lowenstein tumour (large condyloma)

### Pre-invasive Cancer
- carcinoma *in situ*
  - Bowen's disease → crusted, red plaques on the shaft
  - erythroplasia of Queyrat → velvet red, ulcerated plaques on the glans
  - treatment options: local excision, laser, radiation, topical 5-fluorouracil

### Malignant
- risk factors
  - chronic inflammatory disease
  - STI
  - phimosis
  - uncircumcised penis
- 2% of all urogenital cancers
- SCC (>95%), basal cell, melanoma, Paget's disease of the penis (extremely rare)
- definitive diagnosis requires full thickness biopsy of lesion
- lymphatic spread (superficial/deep inguinal nodes → iliac nodes) >> hematogenous

### Treatment
- wide surgical excision with tumour-free margins (dependent on extent and area of penile involvement) ± lymphadenectomy
- consider less aggressive treatment modalities in CIS (cryotherapy, laser therapy, etc.) if available

# Scrotal Masses

**Table 22. Differentiating between Scrotal Masses**

| Condition | Pain | Palpation | Additional Findings |
|---|---|---|---|
| **Torsion** | + | Diffuse tenderness<br>Horizontal lie of testicle | Absent cremaster reflex, negative Prehn's sign |
| **Epididymitis** | + | Epididymal tenderness | Present cremaster reflex, positive Prehn's sign |
| **Orchitis** | + | Diffuse tenderness | Present cremaster reflex, positive Prehn's sign |
| **Hematocele** | + | Diffuse tenderness | No transillumination |
| **Hydrocele** | – | Testis not separable from hydrocele, cord palpable | Transillumination, Hx of trauma |
| **Spermatocele** | – | Testis separable from spermatocele, cord palpable | Transillumination |
| **Varicocele** | – | Bag of worms | No transillumination, increases in size with valsalva, decrease in size if supine |
| **Indirect Inguinal** | – (+ if strangulated) | Testis separable from hernia, cord not palpable, cough impulse may transmit, may be reducible | No transillumination |
| **Tumour** | – (+ if hemorrhagic) | Hard lump/nodule | |
| **Generalized/ Dependent Edema** | – | Diffuse swelling | Often post-operative or immobilized, check for liver dysfunction |
| **Idiopathic** | – | | |

**Varicocele Grading**
- Grade 1: Palpable only with Valsalva manoeuvre
- Grade 2: Palpable without Valsalva
- Grade 3: Visible through scrotal skin

**Suspect a Retroperitoneal Mass/Process in a Patient with a Varicocele if:**
- Acute onset
- Right sided (isolated)
- Palpable abdominal mass
- Does not reduce while supine

**Indications for Treatment of Varicocele**
- Impaired sperm quality or quantity
- Pain or dull ache affecting QOL
- Affected testis fails to grow in adolescents
- Cosmetic indications (especially in adolescents)

**Table 23. Benign Scrotal Masses**

| Type | Varicocele | Spermatocele | Hydrocele | Testicular Torsion | Inguinal Hernia |
|---|---|---|---|---|---|
| **Definition** | Dilatation and tortuosity of pampiniform plexus | A benign, sperm filled epididymal retention cyst | Collection of serous fluid that results from a defect or irritation in the tunica vaginalis | Twisting of the testicle causing venous occlusion and engorgement as well as arterial ischemia and infarction | Protrusion of abdominal contents through the inguinal canal into the scrotum |
| **Etiology** | 15% of men<br>Due to incompetent valves in the testicular veins<br>90% left sided | Multiple theories, including:<br>Distal obstruction<br>Aneurysmal dilations of the epididymis<br>Agglutinated germ cells | Usually idiopathic<br>Found in 5-10% testicular tumours<br>Associated with trauma/infection<br>Communicating: patent processus vaginalis, changes size during day (peds)<br>Non-communicating: non-patent processus vaginalis (adult) | Trauma<br>Cryptorchidism<br>"Bell clapper deformity"<br>Many occur in sleep (50%)<br>Necrosis of glands in 5-6 h | Indirect (through internal ring, often into scrotum): congenital<br>Direct (through external ring, rarely into scrotum): abdominal muscle weakness |
| **Hx/P/E** | "Bag of worms"<br>Often painless<br>Pulsates with Valsalva | Non-tender, cystic mass<br>Transilluminates | Non-tender, intrascrotal mass<br>Cystic<br>Transilluminates | Acute onset severe scrotal pain, swelling<br>GI upsets cases<br>Retracted and transverse testicle (horizontal lie)<br>Negative Phren's sign<br>Absent cremasteric reflex | A small bulge in the groin that may increase in size with Valsalva and disappear when lying down<br>Can present as a swollen or enlarged scrotum<br>Discomfort or sharp pain – especially when straining, lifting, or exercising |
| **Investigations** | P/E<br>Valsava | P/E<br>U/S to rule out tumour | U/S to rule out tumour | U/S Doppler with probe over testicular artery<br>Decrease uptake on $^{99m}$Tc-pertechnetate scintillation scan (doughnut sign) | Hx and P/E<br>Invagination of the scrotum<br>Valsalva |
| **Treatment** | Conservative<br>Surgical ligation of testicular veins<br>Percutaneous vein occlusion (balloon, sclerosing agents)<br>Repair may improve sperm count/motility 50-75% | Conservative<br>Avoid needle aspiration as it can lead to infection, reaccumulation and spilling of irritating sperm within scrotum<br>Excise if symptomatic | Conservative<br>Needle drainage<br>Surgical | Emergency surgical exploration and bilateral orchiopexy<br>Definitive diagnosis NOT necessary to take to OR<br>Orchiectomy if poor prognosis | Surgical repair |

## TORSION OF TESTICULAR APPENDIX
- twisting of testicular/epididymal vestigial appendix

### Signs and Symptoms
- clinically similar to testicular torsion, but vertical lie and cremaster reflex preserved
- "blue dot sign"
  - blue infarcted appendage seen through scrotal skin in children (can usually be palpated as small, tender lump)

### Treatment
- analgesia – most will subside over 5-7 d
- surgical exploration and excision if refractory pain

## HEMATOCELE
- trauma with bleed into tunica vaginalis
- U/S helpful to exclude fracture of testis which requires surgical repair

### Treatment
- ice packs, analgesics, surgical repair

Acute scrotal swelling/pain in young boys is torsion until proven otherwise

Transillumination refers to light being transmitted through tissue (i.e. due to excess fluid)

**Differential of a Benign Scrotal Mass**

**HIS BITS**
**H**ydrocele
**I**nfection (epididymitis/orchitis)
**S**perm (spermatocele)
**B**lood (hematocele)
**I**ntestines (hernia)
**T**orsion
**S**ome veins (varicocele)

# Penile Complaints

**Table 24. Penile Complaints**

| Type | Peyronie's Disease | Priapism | Paraphimosis | Phimosis | Premature Ejaculation |
|---|---|---|---|---|---|
| **Definition** | Acquired curvature of penile shaft secondary to fibrous thickening of tunica albuginea | Prolonged erection lasting >4 h in the absence of sexual excitement/desire | Retracted Foreskin (behind glans penis) that cannot be reduced | Inability to retract foreskin over glans penis | Ejaculation prior to when one or both partners desire it, either before or soon after penetration |
| **Etiology** | Etiology unknown<br>Trauma/repeated inflammation<br>Familial predisposition<br>Associated with DM, vascular disease, autoimmunity, Dupuytren's contracture, erectile dysfunction, urethral instrumentation | 50% idiopathic<br>**Ischemic (common)**<br>Thromboembolic (sickle cell)<br>**Non-Ischemic**<br>Trauma<br>Medications<br>Neurogenic | Iatrogenic (post cleaning/ instrumentation)<br>Trauma<br>Infectious (balanitis, balanoposthitis) | Congenital (90% natural separation by age 3)<br>Balanitis<br>Poor Hygiene | Psychological factors<br>Primary: no period of acceptable control<br>Secondary: symptoms after a period of control, not associated with general medical condition |
| **Hx/P/E** | Penile curvature/ shortening<br>Pain with erection<br>Poor erection distal to plaque | Painful erection ± signs of necrosis<br>Note: *non-ischemic (high flow)* priapism may present without pain | Painful, swollen glans penis, foreskin<br>Constricting band proximal to corona<br>Dysuria, decreased urinary stream in children | Limitation and pain when attempting to retract foreskin<br>Balanoposthitis (infection of prepuce) | Ejaculatory latency ≥1 min<br>Inability to control or delay ejaculation<br>Psychological distress |
| **Investigations** | Hx and P/E | Hx and P/E<br>Cavernosal blood gas analysis<br>Doppler US of the penis | Hx and P/E | Hx and P/E | Hx and P/E<br>Testosterone levels if in conjunction with impotence |
| **Treatment** | **Supportive measures:**<br>PDE5 inhibitor for ED<br>NSAID for pain (spontaneous resolution in up to 12%)<br>**Medical management:**<br>Traction device<br>Intralesional verapamil<br>Intralesional collagenase<br>**Surgical management:**<br>Incision/excision of plaque<br>Plication surgery<br>Penile prosthesis | Treat reversible causes<br>**High-flow:**<br>Self-limited<br>Consider arterial embolization<br>**Low-flow:**<br>Needle aspirated decompression<br>Phenylephrine intracorporeal injection q3-5min<br>Surgical shunt no response within 1 h | Manual pressure (with analgesia)<br>Dorsal slit<br>Circumcision (urgent or electively to prevent recurrence) | Proper hygiene<br>Topical corticiosterioids<br>Dorsal slit<br>Circumcision | Rule out medical condition Address psychiatric concerns, counselling<br>**Medication:**<br>SSRI or clomipramine<br>Topical lidocaine-prilocaine |

Testosterone deficiency is an uncommon cause of ED

**Erections POINT AND SHOOT**
**p**arasympathetics = **point**; and
**s**ympathetics/**s**omatics = **shoot**

**Etiology ("IMPOTENCE")**
- **I**atrogenic: pelvic surgery, pelvic radiation
- **M**echanical: Peyronie's, post-priapism
- **P**sychological: depression, stress, anxiety, PTSD, widower syndrome
- **O**cclusive: arterial HTN, DM, smoking, hyperlipidemia, PVD, impaired veno-occlusion
- **T**rauma: penile/pelvic, bicycling
- **E**xtra factors: renal failure, cirrhosis, COPD, sleep apnea, malnutrition
- **N**eurogenic: CNS (e.g. Parkinson's, MS, spinal cord injury, Guillain-Barré, spina bifida, stroke), PNS (e.g. DM, peripheral neuropathy)
- **C**hemical: antihypertensives, sedatives, antidepressants, antipsychotics, anxiolytics, anticholingerics, antihistamines, antiandrogens (including 5-α reductase inhibitors), statins, GnRH agonists, illicit drugs
- **E**ndocrine: DM, hypogonadism, hyperprolactinemia, hypo/hyperthyroid

# Erectile Dysfunction

## Definition
- consistent (>3 mo duration) or recurrent inability to obtain or maintain an adequate erection for satisfactory sexual performance

## Physiology
- erection involves the coordination of psychologic, neurologic, hemodynamic, mechanical, and endocrine components
- nerves: sympathetic (T11-L2), parasympathetic (S2-4), somatic (dorsal penile/pudendal nerves [S2-4])
- erection ("POINT")
  - parasympathetics → NO release → increased cGMP within corpora cavernosa leading to:
    1. arteriolar dilatation
    2. sinusoidal smooth muscle relaxation → increased arterial inflow and compression of penile venous drainage (decreased venous outflow)
- emission ("SHOOT")
  - sensory afferents from glans
  - secretions from prostate, seminal vesicles, and ejaculatory ducts enter prostatic urethra (sympathetics)
- ejaculation ("SHOOT")
  - bladder neck closure (sympathetic)
  - spasmodic contraction of bulbo-cavernosus and pelvic floor musculature (somatic)
- detumescence
  - sympathetic nerves, norepinephrine, endothelin-1 → arteriolar and sinusoidal constriction → penile flaccidity

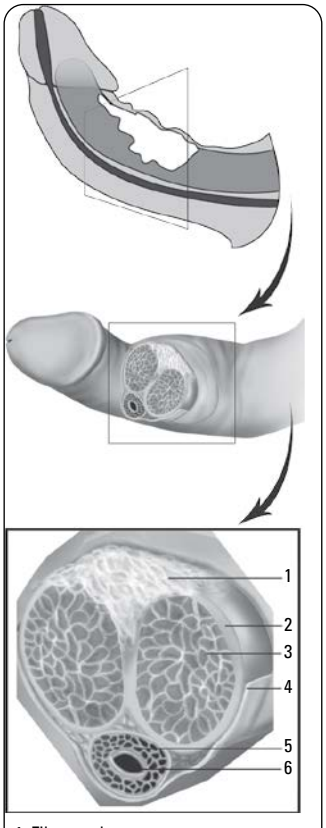
## Classification

**Table 25. Classification of Erectile Dysfunction**

| | Psychogenic* | Organic* |
|---|---|---|
| **Proportion** | 10% | 90% |
| **Onset** | Sudden | Gradual |
| **Frequency** | Sporadic | All circumstances |
| **Variation** | With partner and circumstance | No |
| **Age** | Younger | Older |
| **Organic Risk Factors (HTN, DM, dyslipidemia)** | No organic risk factors | Risk factors present |
| **Nocturnal/AM Erection** | Present | Absent |

*Combination can co-exist

## Diagnosis
- complete Hx (include sexual, medical, and psychosocial aspects)
- self-administered questionnaires (e.g. International Index of Erectile Function, Sexual Health Inventory for Men Questionnaire, ED Intensity Scale, ED Impact Scale)
- focused P/E, including vascular and neurologic examinations, secondary sexual characteristics
- lab investigations, dependent on clinical picture
  - risk factor evaluation: fasting blood glucose or HbA1c, cholesterol profile
  - optional: TSH, CBC, U/A, testosterone (free and total), prolactin, LH
- specialized testing including nocturnal penile tumescence monitoring usually unnecessary
- evaluation of penile vasculature only relevant with past history of trauma (i.e. pelvic fracture)



## Treatment
- can often be managed by family doctor, see sidebar for when to refer
- must fully inform patient/partner of options, benefits and complications
- non-invasive
  - lifestyle changes (alcohol, smoking), psychological (sexual counselling and education)
  - change precipitating medications
  - treat underlying causes (DM, CVD, HTN, endocrinopathies)
- minimally invasive
  - oral medication (see *Common Medications*, U44)
    - sildenafil, tadalafil, vardenafil, avanafil (not available in Canada): inhibits PDE-5 to increase intracavernosal cyclic GMP levels
      - all four have similar effectiveness, difference in onset of action is not clinically significant
      - tadalafil has longer half-life, no cyanopsia, and can be taken on empty or full stomach
    - vacuum devices: draw blood into penis via negative pressure, then put ring at base of penis
    - MUSE: male urethral suppository for erection – vasoactive substance (PGE1) capsule inserted into urethra
- invasive
  - intracavernous vasodilator injection/self-injection
    - triple therapy (papaverine, phentolamine, PGE1) or PGE1 alone
    - complications: priapism (overdose), fibrosis of tunica albuginea at site of repeated injections (Peyronie's plaque) and injection site injuries (pain, hematoma, etc.)
- surgical
  - penile implant (last resort): malleable or inflatable
  - penile artery reconstruction (in young men with isolated vascular lesion – investigational)

**When to Consider Referral**

**FAT PEN**
**F**ailed medical therapy
penile **A**natomic abnormality
pelvic/perineal **T**rauma
**P**sychogenic cause
**E**ndocrinopathy
vascular/**N**eurologic assessment

PDE-5 inhibitors are contraindicated in patients on nitrates/nitroglycerin due to severe hypotension

Initial trial of MUSE® or intracavernosal injection should be done under medical supervision

1. Fibrous plaque
2. Tunica albuginea
3. Corpus cavernosum
4. Buck's fascia
5. Corpus spongiosum
6. Urethra

© June Li

**Figure 20. Peyronie's disease**

Penile vascular abnormalities may be a marker of risk for CV disease. Young men with vascular ED have 50x higher risk of having a CV event

# Trauma

- see Emergency Medicine, ER7

## Renal Trauma

### Classification According to Severity
- minor
  - contusions and superficial lacerations/hematomas: 90% of all blunt traumas, surgical exploration seldom necessary
- major
  - laceration that extends into medulla and collecting system, major renal vascular injury, shattered kidney

### Etiology
- 80% blunt (MVC, assaults, falls) vs. 20% penetrating (stab wounds and gunshots)

### Clinical Features
- mechanism of injury raises suspicion
- can be hemodynamically unstable secondary to renal vascular injury and/or other sustained injuries: ABCs
- upper abdominal tenderness, flank tenderness, flank contusions, lower rib/vertebral transverse process fracture

### Investigations
- U/A
  - hematuria: requires workup but degree does not correlate with the severity of injury
- imaging
  - CT (contrast, triphasic) if patient stable: look for renal laceration, extravasation of contrast, retroperitoneal hematoma, and associated intra-abdominal organ injury

### Staging (does not necessarily correlate well with clinical status)
- I: contusion/hematoma
- II: <1 cm laceration without urinary extravasation
- III: >1 cm laceration without urinary extravasation
- IV: laceration causing urinary extravasation and/or main arterial or vein injury with contained hematoma
- V: shattered kidney or avulsion of pedicle

### Treatment
- microscopic hematuria + isolated well-staged minor injuries → no hospitalization
- gross hematuria + contusion/minor lacerations → hospitalize, bedrest, repeat CT if bleeding persists
- surgical intervention/minimally invasive angiography and embolization (majority now managed conservatively, non-operatively)
  - absolute indications
    - hemorrhage and hemodynamic instability
  - relative indications
    - non-viable tissue and major laceration
    - urinary extravasation
    - vascular injury
    - expanding or pulsating peri-renal mass
    - laparotomy for associated injury
- follow-up with U/S or CT before discharge, and at 6 wk

### Complications
- HTN in 5% of renal trauma

## Bladder Trauma

### Classification
- contusions: no urinary extravasation, damage to mucosa or muscularis
- intraperitoneal ruptures: often involve the bladder dome
- extraperitoneal ruptures: involve anterior or lateral bladder wall in full bladder

### Etiology
- blunt (MVC, falls, and crush injury) vs. penetrating trauma to lower abdomen, pelvis, or perineum
- blunt trauma is associated with pelvic fracture in 97% of cases

### Clinical Features
- abdominal tenderness, distention, peritonitis, and inability to void
- can be hemodynamically unstable secondary to pelvic fracture, other sustained injuries: ABCs
- suprapubic pain

### Investigations
- U/A: gross hematuria in 90%
- imaging (including CT cystogram and post-drainage films for extravasation)

### Treatment
- penetrating trauma → surgical exploration
- contusion → urethral catheter until hematuria completely resolves
- extraperitoneal bladder perforations → typically non-operative with foley insertion, and follow with cystograms
  - surgery if: infected urine, rectal/vaginal perforation, bony spike into bladder, laparotomy for concurrent injury, bladder neck involvement, persistent urine leak and failed conservative management
- intraperitoneal rupture usually requires surgical repair and suprapubic catheterization

### Complications
- complications of bladder injury itself are rare
- mortality is around 20%, and is usually due to associated injuries rather than bladder rupture

## Urethral Injuries

### Etiology
- posterior urethra
  - common site of injury is junction of membranous and prostatic urethra due to blunt trauma, MVCs, pelvic fracture
  - shearing force on fixed membranous and mobile prostatic urethra
- anterior urethra
  - straddle injury can crush bulbar urethra against pubic rami
- other causes
  - iatrogenic (instrumentation, prosthesis insertion), penile fracture, masturbation with urethral manipulation
- always look for associated bladder rupture

### Clinical Features
- blood at urethral meatus
- high-riding prostate on DRE
- swelling and butterfly perineal hematoma
- penile and/or scrotal hematoma
- sensation of voiding without U/O
- distended bladder

All patients with suspected urethral injury should undergo RUG

### Investigations
- must perform RUG or cystoscopy prior to catheterization

### Treatment
- simple contusions
  - no treatment
- partial urethral disruption
  - very gentle attempt at catheterization by urologist
  - with no resistance to catheterization → Foley x 2-3 wk
  - with resistance to catheterization → suprapubic cystostomy or urethral catheter alignment
- periodic flow rates/urethrograms to evaluate for stricture formation
- complete disruption
  - immediate repair if patient stable, delayed repair if unstable (suprapubic tube in interim)

### Complications
- stricture

# Infertility

### Definition
- failure to conceive after one year of frequent, unprotected and properly timed intercourse
- incidence
  - 15% of all couples (35-40% female, 20% male, 25-30% combined)

## Female Factors

- see Gynecology, GY22

## Male Factors

### Male Reproduction
- hypothalamic-pituitary-testicular axis (HPTA)
  - pulsatile GnRH from hypothalamus acts on anterior pituitary stimulating release of LH and FSH
  - LH acts on Leydig (interstitial) cells → testosterone synthesis and secretion
  - FSH acts on Sertoli cells → structural and metabolic support to developing spermatogenic cells
  - FSH and testosterone support germ cells (responsible for spermatogenesis)
  - sperm route: epididymis → vas deferens → ejaculatory ducts → prostatic urethra

### Etiology
- idiopathic (40-50% infertile males)
- testicular
  - varicocele (35-40% infertile males)
  - tumour
  - congenital (Klinefelter's triad: small, firm testes, gynecomastia, and azoospermia)
  - post-infectious (epididymo-orchitis, STIs, mumps)
  - uncorrected torsion
  - cryptorchidism (<5% of cases)
- obstructive
  - iatrogenic (surgery: see below)
  - infectious (gonorrhea, chlamydia)
  - trauma
  - congenital (absence of vas deferens, CF)
  - bilateral ejaculatory duct obstruction, epididymal obstructions
  - Kartagener's syndrome (autosomal recessive disorder causing defect in action of cilia)
- endocrine (see Endocrinology, E48)
- HPTA (2-3%) e.g. Kallmann's syndrome (congenital hypothalamic hypogonadism), excess prolactin, excess androgens, excess estrogens
- other
  - retrograde ejaculation secondary to surgery
  - medications
  - prior exposure to chemotherapy or pelvic radiation
  - drugs: marijuana, cocaine, tobacco, alcohol
  - increased testicular temperature (sauna, hot baths, tight pants or underwear)
  - chronic disease: e.g. liver, renal

### History
- age of both partners
- medical: past illness, DM, trauma, CF, genetic syndromes, STIs, cryptorchidism
- surgical: vasectomy, herniorrhaphy, orchidopexy, prostate surgery
- fertility: pubertal onset, previous pregnancies, duration of infertility, treatments
- sexual: libido, erection/ejaculation, timing, frequency
- family Hx
- medications: cytotoxic agents, GnRH agonists, anabolic steroids, nitrofurantoin, cimetidine, sulfasalazine, spironolactone, α-blockers
- social Hx: alcohol, tobacco, cocaine, marijuana, school performance/learning disabilities (suggestive of Klinefelter syndrome)
- occupational exposures: radiation, heavy metals

### Physical Exam
- general appearance: sexual development, gynecomastia, obesity, pubic hair
- scrotal exam: size, consistency, and nodularity of testicles; palpation of cord for presence of vas deferens; DRE; valsalva for varicocele

### Investigations
- semen analysis (SA) at least 2 specimens, collected 1-2 wk apart
- hormonal evaluation
  - indicated with abnormal SA (rare to be abnormal with normal SA)
  - testosterone and FSH
  - serum LH and prolactin are measured if testosterone or FSH are abnormal

**Normal Semen Values**
- Volume: 2-5 mL
- Concentration: >15 million sperm/mL
- Morphology: 30% normal forms
- Motility: >40% adequate forward progression
- Liquefaction: complete in 20 min
- pH: 7.2-7.8
- WBC: <10/HPF or $<10^6$ WBC/mL semen

- genetic evaluation
  - chromosomal studies (Klinefelter syndrome – XXY)
  - genetic studies (Y-chromosome microdeletion, CF gene mutation)
- immunologic studies (antisperm antibodies in ejaculate and blood)
- testicular biopsy
- scrotal U/S (varicocele, testicular size)
- vasography (assess patency of vas deferens)

### Treatment

- assessment of partner
- lifestyle
  - regular exercise, healthy diet
  - eliminate alcohol, tobacco and illicit drugs
- medical
  - endocrine therapy (see Endocrinology, E48)
  - treat retrograde ejaculation
  - discontinue anti-sympathomimetic agents, may start α-adrenergic stimulation (phenylpropanolamine, pseudoephedrine, or ephedrine)
  - treat underlying infections
- surgical
  - varicocelectomy (if indicated)
  - vasovasostomy (vasectomy reversal) or epididymovasostomy
  - transurethral resection of blocked ejaculatory ducts
- assisted reproductive technologies (ART)
  - refer to infertility specialist
  - sperm washing + intrauterine insemination (IUI)
  - in vitro fertilization (IVF)
  - intracytoplasmic sperm injection (ICSI) after CF screening of patient and partner in patients with congenital bilateral absence of vas deferens

**Common Terminology on SA**
- Teratospermia: Abnormal morphology
- Asthenospermia: Abnormal motility
- Oligospermia: Decreased sperm count
- Azoospermia: Absent sperm in semen
- Mixed types: i.e. oligoasthenospermia

Mutation of cystic fibrosis transmembrane conductance regulator (CFTR) gene is associated with congenital bilateral absence of vas deferens and epididymal cysts, even if patient manifests no symptoms of CF

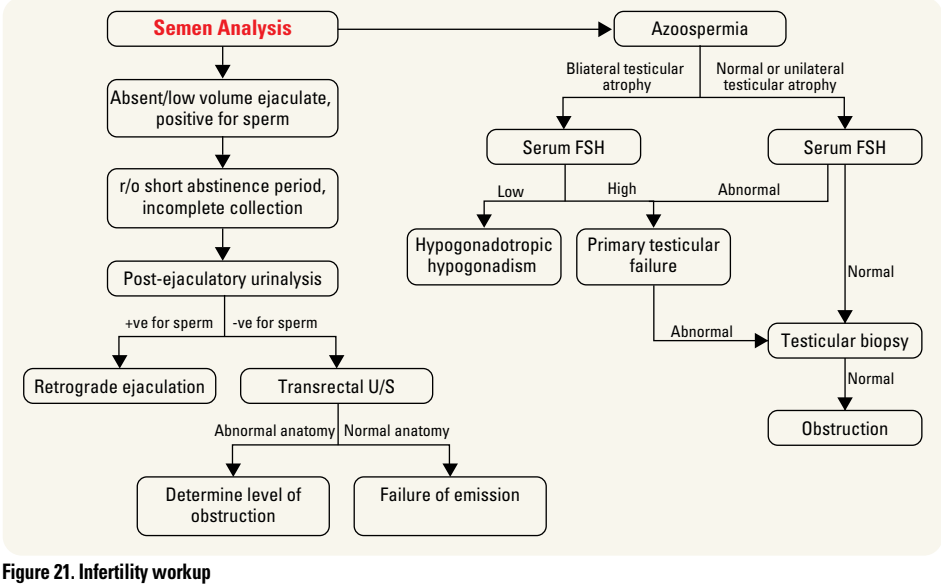


**Figure 21. Infertility workup**

**WHO Guidelines**
**Male Infertility Factors**

**SPERM COUNT**
**S**ystemic factor/Smoking
**P**sychological illness
**E**ndocrinopathy
**R**etrograde ejaculation
**M**edications
**C**hronic disease
**O**bstructive
**U**nexplained
**N**arcotics
**T**esticular

# Pediatric Urology

## Congenital Abnormalities

- not uncommon; 1/200 have congenital abnormalities of the GU tract
- six common presentations of congenital urological abnormalities

### 1. ANTENATAL HYDRONEPHROSIS

#### Epidemiology

- 1-5% fetal U/S, some detectable as early as first trimester
- most common urological consultation in perinatal period and one of most common U/S abnormalities of pregnancy

Majority of antenatal hydronephroses resolve during pregnancy or within the first year of life

#### Differential Diagnosis

- transient primary hydronephrosis
- UPJ obstruction
- VUR

- UVJ obstruction or primary non-obstructive megaureter
- ureterocele
- ectopic ureter
- causes of megacystitis (i.e. PUV, Prune Belly syndrome)

### Treatment
- antenatal in utero intervention rarely indicated unless evidence of lower urinary tract obstruction with oligohydramnios
- ABx prophylaxis at birth to reduce UTI rates is controversial but may be beneficial to infants with high grade hydronephrosis, dilated ureter, or bladder abnormality. Commonly used ABx include: amoxicillin, cephalexin, and trimethoprim.

## 2. POSTERIOR URETHRAL VALVES

### Epidemiology
- the most common congenital obstructive urethral lesion in male infants

### Pathophysiology
- abnormal mucosal folds at the distal prostatic urethra causing varying degrees of obstruction

### Clinical Feature
- dependent on age
  - antenatal: bilateral hydronephrosis, distended bladder, oligohydramnios
  - neonatal (recognized at birth): palpable abdominal mass (distended bladder, hydronephrosis), urinary ascites (transudation of retroperitoneal urine), respiratory distress (pulmonary hypoplasia from oligohydramnios), weak urinary stream
  - neonatal (not recognized at birth): within weeks present with urosepsis, dehydration, electrolyte abnormalities, failure to thrive; rule out pyloric stenosis, which may present similarly
  - toddlers: UTIs or voiding dysfunction
  - school-aged boys: voiding dysfunction → urinary incontinence
- associated findings include renal dysplasia and secondary VUR

### Investigations
- most commonly recognized on prenatal U/S → bilateral hydronephrosis, thickened bladder, dilated posterior urethra ("keyhole sign"), oligohydramnios in a male fetus
- VCUG → dilated and elongated posterior urethra, trabeculated bladder, VUR

### Treatment
- immediate catheterization to relieve obstruction, followed by cystoscopic resection of PUV when baby is stable
- if resection of PUV is not possible, vesicostomy is indicated

## 3. URETEROPELVIC JUNCTION OBSTRUCTION

### Etiology
- unclear: adynamic ureteral segment, stenosis, strictures, extrinsic compression, aberrant blood vessels
- can rarely be secondary to tumour, stone, etc. in children

### Epidemiology
- the most common congenital defect of the ureter
- M:F = 2:1
- up to 40% bilateral, which may be associated with worse prognosis

### Clinical Feature
- symptoms depend on severity and age at diagnosis (mostly asymptomatic finding on antenatal U/S)
  - infants: abdominal mass, urinary infection
  - children: pain, vomiting, failure to thrive
- some cases are diagnosed after puberty and into adulthood
  - in adolescents and adults, the symptoms may be triggered by episodes of increased diuresis, such as following alcohol ingestion (Dietl's crisis)

### Investigations
- antenatal: serial U/S most common, and renal scan ± furosemide

### Treatment
- surgical correction (pyeloplasty), consider nephrectomy if <15% differential renal function

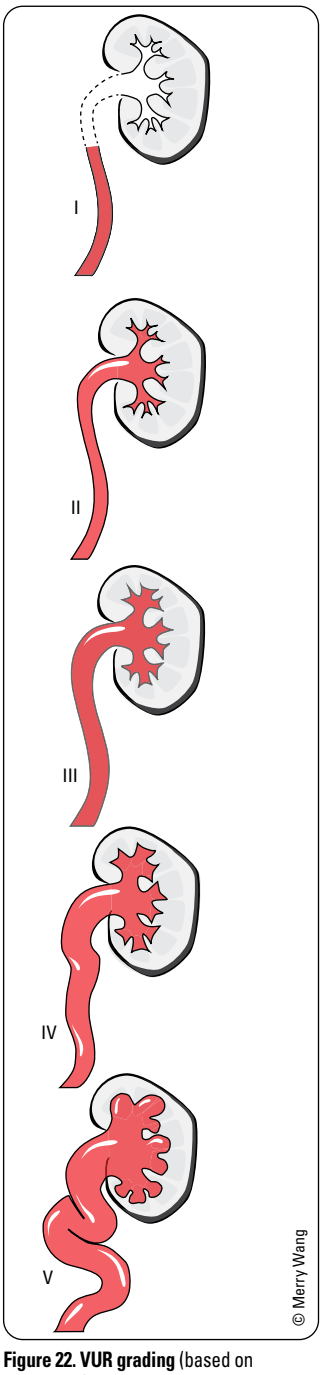

**Figure 22. VUR grading** (based on cystogram)

**VUR Grading (based on cystogram)**
- Grade I: ureters only fill
- Grade II: ureters and pelvis fill
- Grade III: ureters and pelvis fill with some dilatation
- Grade IV: ureters, pelvis, and calyces fill with significant dilatation
- Grade V: ureters, pelvis, and calyces fill with major dilatation and tortuosity

Defer circumcision in patients with hypospadias

## 4. VESICOURETERAL REFLUX

### Definition
- retrograde passage of urine from the bladder, through the UVJ, into the ureter

### Classification
- primary reflux: incompetent or inadequate closure of UVJ
  - lateral ureteral insertion, short submucosal segment
- secondary reflux: abnormally high intravesical pressure resulting in failure of UVJ closure
  - often associated with anatomic (PUV) or functional (neuropathic) bladder dysfunction

### Epidemiology
- estimated ~1% of newborns, but not well known
- incidence and clinical relevance higher in children with febrile UTIs and prenatal hydronephrosis
- risk factors: race (white > black), female gender, age (<2 yr), genetic predisposition

### Investigations
- focused Hx, particularly of voiding dysfunction (frequency, urgency, diurnal enuresis, constipation, encopresis)
  - also screen for infections (UTI, pyelonephritis, urosepsis) and renal failure (uremia, HTN)
- initial evaluation of renal status, growth parameters, and blood pressure is warranted in any child with VUR due to relatively high incidence of renal scarring
  - height, weight, blood pressure
  - serum Cr
  - U/A, C&S
  - renal U/S
  - DMSA renal scan if at high risk (greater sensitivity in detecting structural defects associated with dysplasia, renal scarring or pyelonephritis; entails radiation exposure)
  - sibling family screening is controversial

### Treatment
- spontaneous resolution in 60% of primary reflux
  - in lower grades (I-III), goal is to prevent infection or renal damage via medical treatment
- medical treatment: daily ABx prophylaxis at half the treatment dose for acute infection (see Table 8 - TMP/SMX, trimethoprim, amoxicillin, or nitrofurantoin)
- surgical treatment: ureteral reimplantation ± ureteroplasty, or subureteral injection with bulking agents (Deflux® or Macroplastique®)
  - indications include failure of medical management, renal scarring (e.g. renal insufficiency, HTN), breakthrough UTIs, persistent high grade (IV or V) reflux

## 5. HYPOSPADIAS

### Definition
- a condition in which the urethral meatus opens on the ventral side of the penis, proximal to the normal location in the glans penis
- depending on severity, may result in difficulty directing urinary stream, having intercourse or depositing sperm in vagina

### Epidemiology
- very common; 1/300 live male births
- distal hypospadias more common than proximal
- white >> black
- may be associated with ventral penile curvature, disorders of sexual differentiation, undescended testicles or inguinal hernia

### Treatment
- early surgical correction; optimal repair before 2 yr
- neonatal circumcision should be deferred because the foreskin may be utilized in the correction

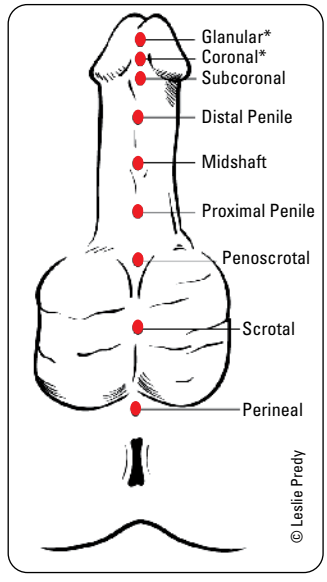

**Figure 23. Classification of hypospadias**
(*account for 75%)

## 6. EXSTROPHY-EPISPADIAS COMPLEX

### Definition
- a spectrum of defects depending on the timing of the rupture of the cloacal membrane
  - bladder exstrophy: congenital defect of a portion of lower abdominal and anterior bladder wall, with exposure of the bladder lumen
  - cloacal exstrophy
    - exposed bladder and bowel with imperforate anus
    - associated with spina bifida in >50%
  - epispadias (least severe)
    - urethra opens on dorsal aspect of the penis, often associated with penile curvature

### Etiology
- represents failure of closure of the cloacal membrane, resulting in the bladder and urethra opening directly through the abdominal wall

### Epidemiology
- rare: incidence 1/30,000, M:F = 3:1 predominance
- high morbidity → multiple reconstructive surgeries, incontinence, infertility, reflux

### Treatment
- surgical correction at birth
- later corrections for incontinence, VUR, and low bladder capacity may be needed

## Nephroblastoma (Wilms' Tumour)

### Etiology
- arises from abnormal proliferation of metanephric blastema

### Epidemiology
- 5-10: 5% of all childhood cancers, 5% bilateral, 10% associated with congenital malformation syndromes
- most common primary malignant renal tumour of childhood
- average age of incidence is 3 yr

**Associated Syndromes of Wilms' Tumour**
Wilms' aniridia genital anomaly retardation
Beckwith-Wiedemann syndrome
Denys-Drash syndrome

### Clinical Features
- abdominal mass: large, firm, unilateral (80%)
- HTN (25%)
- flank tenderness (30-40%)
- microscopic hematuria (12-25%)
- nausea/vomiting

### Treatment
- always investigate contralateral kidney and renal vein (for tumour thrombus)
- unilateral disease: radical nephrectomy ± radiation ± chemotherapy
- bilateral disease: nephron-sparing surgery following neoadjuvant chemotherapy

### Prognosis
- 5 yr survival 80%

## Cryptorchidism/Ectopic Testes

**Normal Testicular Development and Descent in Utero**
**2nd mo**: Testicle begins to form
**4th mo**: Begins to take on its normal appearance and migrates from its origin at the kidney to the internal inguinal ring
**7th mo**: The testis, surrounded in peritoneal covering, begins to descend through the internal ring, inguinal canal and external ring to terminate in the scrotum

### Definition
- abnormal location of testes somewhere along the normal path of descent (external inguinal ring > inguinal canal > abdominal)
- Denis Browne pouch (between external oblique fascia and Scarpa's fascia) most common
- differential diagnosis:
  - retractile testes
  - atrophic testes
  - disorders of sexual differentiation (bilateral impalpable gonads)

### Epidemiology
- 1.0-4.6% of full term newborns, increased risk in pre-terms
- 0.7-1.0% at 1 yr

### Treatment
- orchiopexy
- hormonal therapy not proven to be of benefit over standard surgical treatment

### Prognosis
- reduction in fertility
  - untreated bilateral cryptorchidism: ~100% infertility, due to Leydig and germ cell loss
  - paternity rates: 33-65%, 90%, and 93% in formerly bilateral cryptorchid, formerly unilateral cryptorchid, and normal men, respectively
- increased malignancy risk
  - intra-abdominal > inguinal
  - surgical correction facilitates testicular monitoring and may reduce malignancy risk
- increased risk of testicular torsion (reduced by surgical correction)

# Disorders of Sexual Differentiation

### Definition
- formerly known as intersex disorders: considered social emergency
- abnormal genitalia for chromosomal sex due to the undermasculinization of males or the virilization of females

### Classification
1. 46 XY DSD
   - defect in testicular synthesis of androgens
   - androgen resistance in target tissues
   - palpable gonad
2. 46 XX DSD
   - most due to CAH (21-hydroxylase deficiency most common enzymatic defect) → shunt in steroid biosynthetic pathway leading to excess androgens
   - undiagnosed and untreated CAH can be associated with life-threatening electrolyte abnormalities in the newborn (salt-wasting CAH)
3. ovotesticular DSD
4. mixed gonadal dysgenesis (46 XY/45 XO most common karyotype)
   - presence of Y chromosome → partial testis determination to varying degrees

A phenotypic male newborn with bilateral non-palpable testicles should be considered 46XX with salt-wasting CAH and must undergo proper evaluation prior to discharge

### Diagnosis
- thorough family Hx noting any consanguinity
- maternal Hx, especially medication/drug use during pregnancy (maternal hyperandrogenemia)
- P/E: palpable gonad (= chromosomal male), hyperpigmentation, evidence of dehydration, HTN, stretched phallus length, position of urethral meatus
- laboratory tests
  - plasma 17-OH-progesterone (after 36 h of life) → increased in CAH
  - plasma 11-deoxycortisol → increased in 11-β-hydroxylase deficiency
  - basal adrenal steroid levels
  - serum testosterone and DHT pre- and post-hCG stimulation (2000 IU/d for 4 d)
  - serum electrolytes
  - chromosomal evaluation including sex karyotype
- U/S of adrenals, gonads, uterus, and fallopian tubes
- endoscopy and genitography of urogenital sinus

### Treatment
- steroid supplementation as indicated (e.g. CAH)
- sex assignment after extensive family consultation
  - must consider capacity for sexually functioning genitalia in adulthood, fertility potential, and psychological impact
- reconstruction of external genitalia between 6 and 12 mo
- long-term psychological guidance and support for both patient and family

# Enuresis

- see Pediatrics, P9

# Selected Urological Procedures

### Bladder Catheterization
- catheter size measured by the French (Fr) scale – circumference in mm
- each 1 mm increase in diameter = approximately 3 Fr increase (standard size 14-18 Fr)
- should be removed as soon as possible to reduce the risk of UTI

### Continuous Catheterization
- indications
  - accurate monitoring of U/O
  - relief of urinary retention due to medication, neurogenic bladder, or intravesical obstruction
  - temporary therapy for urinary incontinence
  - perineal wounds
  - clot prevention (22-24 Fr) for CBI
  - intra- and post-operative
  - comfort for end of life care

### Alternatives to Continuous Catheterization
- intermittent catheterization
  - PVR measurement
  - to obtain sterile diagnostic specimens for U/A, urine C&S
  - management of neurogenic bladder or chronic urinary retention
- condom catheter
- suprapubic catheter

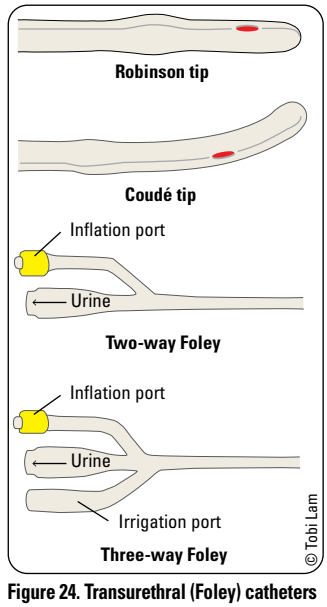

Figure 24. Transurethral (Foley) catheters

### Causes of Difficult Catheterizations and Treatment
- patient discomfort → use sufficient lubrication (± xylocaine)
- collapsing catheter → lubrication as above ± firmer or larger catheter (silastic catheter)
- meatal/urethral stricture → dilate with progressively larger catheters/balloon catheter
- traumatic injury: repeated prior attempts at catheterization have created traumatic false passage
- BPH → use Coudé catheter as angled tip can help navigate around enlarged prostate
- urethral disruption/obstruction → filiform and followers or suprapubic catheterization
- anxious patient → anxiolytic medication

### Complications of Catheterization
- infection: UTI, bladder fistula, bladder perforation (rare)
- meatal/urethral trauma

### Contraindications
- trauma: blood at the urinary meatus, scrotal hematoma, pelvic fracture, and/or high riding prostate

## Circumcision

### Definition
- removal of some or all of the foreskin from the penis

### Epidemiology
- 30% worldwide
- frequency varies with geography, religious affiliation, socioeconomic status

### Medical Indications
- pathological phimosis and recurrent paraphimosis
- recurrent UTIs (particularly in infants and in association with other urinary abnormalities)
- balanitis xerotica obliterans or other chronic inflammatory conditions

### Contraindications
- unstable or sick infant
- congenital genital abnormalities (hypospadias, epispadias, penoscrotal webbing, concealed penis, ventral curvature)
- family Hx of bleeding disorders warrants investigation prior to circumcision

### Complications
- early: bleeding, infection, glans injury, amputation, slippage of circumcision device, rarely death
- late: redundant foreskin, cosmetic issues, inclusion cysts, adhesions/skin bridges, suture sinus tracts, ventral curvature, secondary buried penis, phimosis, fistula, meatal stenosis
- 0.6-2% complication rate

**Newborn Male Circumcision**
Paediatr Child Health 2015;20:311-15
**Study:** Position Statement by the Canadian Paediatric Society (CPS) reaffirmed Feb 28, 2018
**Recommendations:** With the exception of some high-risk populations and circumstances where circumcision is indicated for disease prevention, reduction and/or treatment, the routine circumcision of every newborn male is not recommended.

**Male Circumcision for Prevention of Heterosexual Acquisition of HIV in Men**
Cochrane DB Syst Rev 2009;2:CD003362
**Purpose**: To evaluate the effectiveness and safety of male circumcision for preventing acquisition of HIV in heterosexual men.
**Methods**: The analyzed data is from three randomized controlled trials to assess the efficacy of male circumcision for preventing HIV acquisition in men in Africa.
**Results**: Medical male circumcision reduces the acquisition of HIV by heterosexual men (38-66% over 24 mo).

## Cystoscopy

### Objective
- endoscopic inspection of the lower urinary tract (urethra, prostate, bladder, and ureteral orifices), samples for cytology
- scopes can be flexible or rigid
- done under local anesthesia only, for majority

### Indications
- hematuria
- LUTS (storage or voiding)
- urethral and bladder neck strictures
- bladder stones
- bladder tumour surveillance
- evaluation of upper tracts with retrograde pyelography (ureteric stents, catheters)

### Complications
- during procedure
  - bleeding
  - anesthetic-related
  - perforation (rare)
- post-procedure (short-term)
  - infections (antibiotic prophylaxis recommended)
  - urinary retention
- post-procedure (long-term)
  - stricture

# Radical Prostatectomy

## Objective
- the removal of the entire prostate and prostatic capsule via a lower midline abdominal incision, laparoscopically or robotically
  - internal iliac and obturator vessel lymph nodes may also be dissected and sent for pathology (dependent on risk: clinical stage, grade, PSA)
  - seminal vesicle vessels are also partially or completely removed

## Indications
- treatment for localized prostate cancer

## Complications
- immediate (intraoperative)
  - blood loss
  - rectal injury (extremely rare)
  - ureteral injury (extremely rare)
- perioperative
  - lymphocele formation if concurrent pelvic lymphadenectomy performed)
  - blood loss
  - urine leak from anastomosis
- late
  - moderate to severe stress urinary incontinence (3-10%)
  - mild stress urinary incontinence (20%)
  - ED (~50%, depending on whether one, both, or neither of the neurovascular bundles are involved in extracapsular extension of tumour)

**Retropubic, Laparoscopic, and Robot-Assisted Radical Prostatectomy: A Critical Review of Outcomes Reported by High-Volume Centres**
J Endourology 2010;24:2003-2015
**Study**: A systematic review to compare perioperative outcomes, positive surgical margin (PSM) rates, and functional outcomes in retropubic radical prostatectomy (RRP) laparoscopic RP (LRP) and robot-assisted radical prostatectomy (RARP).
**Methods**: Medline database was searched. Weighted means (based on number of participants in each study) were calculated for all outcomes.
**Results**: 58 articles were reviewed. LRP and RARP were associated with better perioperative outcomes compared to RRP. RRP, LRP, and RARP had similar post-operative complication rates ranging from 10.3-10.98%. RARP had a lower overall PSM rate than LRP, and RRP. RARP had the highest continence rate and mean potency rates.
**Conclusion**: In high-volume centres, RRP, LRP and RARP are safe options for treating patients with localized prostate cancer. LRP and RARP are associated with better perioperative outcomes and RARP showed lower PSM rates, higher potency and continence compared to RRP and LRP.

# Transurethral Resection of the Prostate

## Objective
- to partially resect the periurethral portion of the prostate (transition zone) to decrease symptoms of urinary tract obstruction
- accomplished via a transurethral (cystoscopic) approach using an electrocautery loop, irrigation (glycine), and illumination
- not a cancer operation

## Indications
- obstructive uropathy (large bladder diverticula, renal insufficiency)
- refractory urinary retention
- recurrent UTIs
- recurrent gross hematuria
- bladder stones
- intolerance/failure of medical therapy

## Complications
- acute
  - intra- or extraperitoneal rupture of the bladder
  - rectal perforation
  - incontinence
  - incision of the ureteral orifice (with subsequent reflux or ureteral stricture)
  - hemorrhage
  - epididymitis
  - sepsis
  - transurethral resection syndrome (also called "post-TURP syndrome")
    - caused by absorption of a large volume of the hypotonic irrigation solution used, usually through perforated venous sinusoids, leading to a hypervolemic hyponatremic state
    - characterized by dilutional hyponatremia, confusion, nausea, vomiting, HTN, bradycardia, visual disturbances, CHF, and pulmonary edema
    - treat with diuresis and (if severe) hypertonic saline administration
- chronic
  - retrograde ejaculation (>75%)
  - ED (5-10% risk increases with increasing use of cautery)
  - incontinence (<1%)
  - urethral stricture
  - bladder neck contracture

# Extracorporeal Shock Wave Lithotripsy

### Objective
- to treat renal and ureteral calculi (proximal, middle or distal) which cannot pass through the urinary tract naturally
- shockwaves focused onto stone → fragmentation, allowing stone fragments to pass spontaneously and less painfully

### Indications
- potential first-line therapy for renal and ureteral calculi <2 cm
- individuals with calculi in solitary kidney
- individuals with HTN, DM or renal insufficiency
- patient preference and wait-times play a large role in stone management

### Contraindications
- acute UTI or urosepsis
- bleeding disorder or coagulopathy
- pregnancy
- uncontrolled HTN
- obstruction distal to stone (ESWL can be used after stent or nephrostomy inserted)

### Complications
- bacteriuria
- bacteremia
- post-procedure hematuria
- ureteric obstruction (by stone fragments)
- peri-nephric hematoma

# Common Medications

**Table 26. Erectile Dysfunction Medications**

| Drug | Class | Mechanism | Adverse Effects |
|---|---|---|---|
| sildenafil<br>tadalafil<br>vardenafil (PDE5s for use when some erection present) | Phosphodiesterase 5 inhibitor | Selective inhibition of PDE5 (enzyme which degrades cGMP)<br>Leads to sinusoidal smooth muscle relaxation, increased blood flow and erection | Severe hypotension (very rare)<br>Flushing, headaches, dyspepsia<br>Contraindicated if Hx of priapism, or in conditions predisposing to priapism (leukemia, myelofibrosis, polycythemia, sickle cell disease)<br>Contraindicated with nitrates |
| alprostadil (MUSE®), $PGE_1$ + phentolamine + papaverine mixture | Prostaglandin $E_1$ | Activation of cAMP, relaxing sinusoidal smooth muscle<br>Local release (urethral suppository) | Penile pain<br>Presyncope |
| alprostadil, papaverine (intracavernosal injection)<br><br>triple therapy also used: papaverine, phentolamine, $PGE_1$ | See above | See above | Thickening of tunica albuginea at site of repeated injections (Peyronie's plaque)<br>Painful erection<br>Hematoma<br>Contraindicated if Hx of priapism, or in high risk of priapism |

**Table 27. Benign Prostatic Hyperplasia Medications**

| Drug | Class | Mechanism | Adverse Effects |
|---|---|---|---|
| terazosin<br>doxazosin | $\alpha_1$ blockers | α-adrenergic antagonists reduce stromal smooth muscle tone<br>Reduce dynamic component of bladder outlet obstruction | Presyncope<br>Leg edema<br>Retrograde ejaculation<br>Headache<br>Asthenia<br>Nasal congestion |
| tamsulosin<br>alfuzosin<br>silodosin | $\alpha_{1A}$ selective | | |
| finasteride<br>dutasteride | 5-α reductase inhibitor | Blocks conversion of testosterone to DHT<br>Reduces static component of bladder outlet obstruction<br>Reduces prostatic volume | Sexual dysfunction<br>PSA decreases |

**Table 28. Prostatic Carcinoma Medications (N>0, M>0)**

| Drug | Class | Mechanism | Adverse Effects |
|---|---|---|---|
| leuprolide, goserelin *"androgen deprivation therapy"* | GnRH agonist | Initially stimulates LH, increasing testosterone and causing "flare" (initially increases bone pain)<br>Later causes low testosterone | Hot flashes<br>Headache<br>Decreased libido |
| degarelix | GnRH antagonist | Competitively binds to the pituitary gland GnRH receptors, thereby reducing the release of LH, FSH and consequently testosterone by testes | Back pain<br>Breast enlargement<br>Decreased libido<br>Hot flashes<br>Headache<br>Slow or fast heartbeat |
| *cyproterone acetate | Steroidal antiandrogen | Competes with DHT for intracellular receptors:<br>1. Prevent flare produced by GnRH agonist<br>2. Use for complete androgen blockade<br>3. May preserve potency | |
| flutamide, bicalutamide | Non-steroidal antiandrogen | As above | Hepatotoxic: AST/ALT monitoring |
| abiraterone | Non-steroidal antiandrogen | Irreversible CYP17 inhibition, blocking synthesis of androgens in tumour, testis, and adrenal glands | Adrenal insufficiency (concurrent treatment with steroids often required)<br>Hypertriglyceridemia<br>Peripheral edema |
| enzalutamide | Non-steroidal antiandrogen | Androgen receptor signaling inhibitor (full antagonist) | Peripheral edema<br>Fatigue and weakness<br>Hot flashes |

*Very rarely used

**Table 29. Continence Agents and Overactive Bladder Medications**

| Drug | Class | Mechanism | Indication | Adverse Effects |
|---|---|---|---|---|
| oxybutynin | Antispasmotic | Inhibits action of ACh on smooth muscle<br>Decreases frequency of uninhibited detrusor contraction<br>Diminishes initial urge to void | Overactive bladder<br>Urge incontinence + urgency + frequency | Dry mouth<br>Blurred vision<br>Constipation<br>Supraventricular tachycardia |
| oxybutynin<br>tolterodine<br>trospium<br>solifenacin<br>darifenacin<br>fesoterodine<br>propiverine | Anticholinergic | Muscarinic receptor antagonist<br>Selective for bladder<br>Increases bladder volume<br>Decreases detrusor pressure | Overactive bladder<br>Urge incontinence + urgency + frequency | As above |
| mirabegron | β3 agonist | Beta sympathetic receptor blocker in the bladder; relaxes bladder during storage phase | Overactive bladder<br>Urge incontinence + urgency + frequency | Blood pressure should be monitored |
| imipramine | Tricyclic antidepressant | Sympathomimetic effects: urinary sphincter contraction<br>Anticholinergic effects: detrusor relaxation | Stress and urge incontinence | As above<br>Weight gain<br>Orthostatic hypotension<br>Prolonged PR interval |
| Botulinum toxin A bladder injections | Neurotoxin | Prevents the release of neurotransmitters | Refractory OAB incontinence both neurogenic and non-neurogenic | Urinary retention, UTI |

Note: All anticholinergics are equally effective and long-acting formulations are better tolerated. Newer muscarinic M3 receptor specific agents (solifenacin, darifenacin) are equally efficacious as older drugs, however, RCTs based on head-to-head comparison to long acting formulations are lacking.

| TEVAR | thoracic endovascular aortic aneurysm repair |
| TIA | transient ischemic attack |
| TTE | transthoracic echocardiogram |

# Peripheral Arterial Disease (PAD)

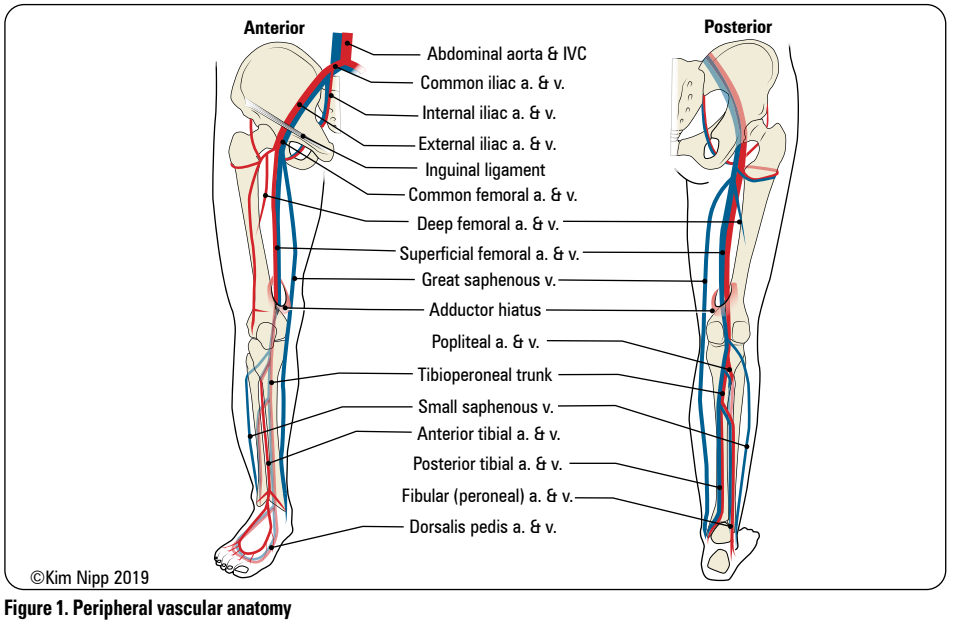

**Figure 1. Peripheral vascular anatomy**

## Acute Arterial Ischemia

### Definition

- acute occlusion of a peripheral artery that often threatens limb viability
  - urgent management required as skeletal muscle can tolerate 6 h of total ischemia before irreversible damage; exception is acute-on-chronic occlusion, where previously developed collaterals provide minimal perfusion
- tends to be lower extremity > upper extremity; femoropopliteal > aortoiliac
- paralysis with complete loss of sensation is sign of late ischemia

### Etiology and Risk Factors

- embolism
  - cardiac: arrhythmias, endocarditis, MI, LV aneurysm, myxoma/cardiac tumour, paradoxical embolism, valvular heart disease
  - non-cardiac: mural thrombus within arterial aneurysms, atheroembolism
- thrombosis
  - atherosclerotic obstruction
  - vasospasm
  - aortic or arterial dissection
  - arterial transection

- embolism vs. thrombosis
  - thrombosis is more common than embolism; usually in superficial femoral artery
  - existing atherosclerotic plaques can rupture causing thrombosis
  - previous vascular grafts/reconstructions can fail and thrombose leading to acute presentation
  - hypercoagulable states can contribute to thrombosis
  - embolism generally results in greater degree of ischemia due to lack of collaterals
  - suspect embolism in patients with the following features:
    - acute onset (patient able to accurately recall the moment of the event)
    - history of embolism
    - known embolic source (e.g. cardiac arrhythmias)
    - no prior history of intermittent claudication
    - normal pulse and Doppler in unaffected limb
- Dx: iatrogenic (e.g. occlusion at arterial access site), compressive, traumatic (blunt or penetrating injuries) causes of acute limb ischemia

## Clinical Features

- **6 Ps** – all may not be present
  - **P**ain
    - may be constant or elicited by passive movement
    - absent in 20% of cases
  - **P**allor: pale
    - within a few hours becomes mottled cyanosis
  - **P**aresthesia
    - light touch lost first then other sensory modalities
  - **P**aralysis/**P**ower loss:
    - most important, heralds impending non-salvageable limb
  - **P**olar/**P**oikilothermia: cold
    - leg becomes cold
  - **P**ulselessness
    - helpful to determine site of occlusion
    - not always reliable

**Acute Aortoiliac Occlusion**
If a patient presents with new onset bilateral critical limb ischemia, suspect possible occlusion of the aorta or aortoiliac segment. Etiologies include thrombosis or rupture of AAA, aortic dissection, or large saddle embolism

## Investigations

- history and physical exam are essential: depending on degree of ischemia one may have to forego investigations and go straight to the operating room
- determine Rutherford classification (Table 1) based on physical findings and Doppler signals
- Ankle Brachial Index (ABI): extension of physical exam, easily performed at bedside
- ECG, troponin: rule out recent MI or arrhythmia
- CBC: rule out leukocytosis, thrombocytosis or thrombocytopenia in patients receiving heparin (may suggest HITS)
- PT/INR, PTT: patient anticoagulated/sub-therapeutic INR
- Echo: identify wall motion abnormalities, intracardiac thrombus, valvular disease, aortic dissection (Type A)
- CT angiogram: identify underlying atherosclerosis, aneurysm, aortic dissection, identify embolic source, identify other end organs with emboli (e.g. splenic/renal infarcts), identify level of the occlusion and extent
- Angiography: can be obtained in OR as part of intervention or for treatment planning

**Hypercoagulable States**

**Congenital**
- Group I (reduced anticoagulants)
  - Antithrombin
  - Protein C
  - Protein S
- Group II (increased coagulants)
  - Factor V Leiden
  - Prothrombin
  - Factor VIII
  - Hyper-homocysteinemia

**Acquired**
- Immobility
- Cancer
- Pregnancy/Systemic hormonal contraceptives/HRT
- Antiphospholipid antibody syndrome
- Inflammatory disorders (e.g. IBD)
- Myeloproliferative disorders (e.g. ET)
- Nephrotic syndrome (acquired deficit in Protein C and S)
- DIC
- HITT

**Table 1. Rutherford ALI Classification**

| Category | Description/Prognosis | Findings | | Doppler Signals | |
|---|---|---|---|---|---|
| | | Sensory Loss | Muscle Weakness | Arterial | Venous |
| **I Viable** | Not immediately threatened | None | None | Audible | Audible |
| **II Threatened** | | | | | |
| **IIa Marginally** | Salvageable if promptly treated | Minimal (toes) or none | None | Inaudible | Audible |
| **IIb Immediately** | Salvageable with immediate revascularization | More than toes, associated with rest pain | Mild, moderate | Inaudible | Audible |
| **III Irreversible** | Major tissue loss or permanent nerve damage inevitable | Profound, anesthetic | Profound, paralysis (rigor) | Inaudible | Inaudible |

Adapted from: Rutherford RB, Baker JD, Ernst C, Johnston KW, Porter JM, Ahn S, et al. Recommended standards for reports dealing with lower extremity ischemia: revised version. J Vasc Surg. 1997;26:517-38.

### Treatment
- immediate heparinization with weight-based bolus (80 Units/kg) and continuous infusion to titrate PTT to 70-90s
- if impaired neurovascular status: emergent revascularization (Rutherford category IIb)
- if intact neurovascular status: may have time for workup (including CT angiogram)
- identify and treat underlying cause
  - embolus: embolectomy
  - thrombus: thrombectomy ± bypass graft ± endovascular therapy
  - irreversible ischemia (i.e. Rutherford category III): primary amputation or palliation/comfort measures
- continue heparin post-operatively, start oral anticoagulant post-operatively when stable x 3 mo or longer depending on underlying etiology and other comorbidities

### Complications
- local: compartment syndrome (see Orthopedic Surgery, OR10) with prolonged ischemia; requires 4-compartment (anterior/lateral/superficial and deep posterior) fasciotomy
- heart: risk of arrhythmia, MI, cardiac arrest and death with reperfusion injury
- kidneys/other organs: renal failure and multi-organ failure due to toxic metabolites from ischemic muscle, rhabdomyolysis
- up to 10% chance of metachronous embolism

### Prognosis
- 12-15% mortality rate
- 5-40% morbidity rate (amputation)

## Chronic Limb Ischemia/Peripheral Arterial Disease (PAD)

### Definition
- chronic ischemia due to inadequate arterial supply to meet cellular metabolic demands during walking (claudication) or at rest (critical limb ischemia)

### Etiology and Risk Factors
- predominantly due to atherosclerosis (for pathogenesis, see Cardiology and Cardiac Surgery, C25); primarily occurs in the lower extremities
- conventional risk factors: smoking, DM, hyperlipidemia, and hypertension
- predisposing risk factors: advanced age, obesity, sedentary lifestyle, and PMHx or FMHx PAD/CAD/CVD

### Clinical Features
- claudication:
  1. pain with exertion: usually in calves or any exercising muscle group (within the muscle belly)
  2. relieved by short rest: less than 5 min and no postural changes necessary
  3. reproducible: same distance or time to elicit pain, same location of pain, same amount of rest to relieve pain
     - the presence of the preceding features differentiates vascular claudication from neurogenic claudication or MSK pain
- critical limb ischemia (CLI):
  1. includes rest pain, night pain, tissue loss (ulceration or gangrene)
  2. pain most commonly over the forefoot/toes, waking person from sleep, and often relieved by hanging foot off bed
  3. ankle pressure <40 mmHg, toe pressure <30 mmHg, ABI <0.40
     - distal pulses are absent, bruits may be present
     - signs of poor perfusion: hair loss, hypertrophic nails, atrophic muscle, ulcerations and infections, slow capillary refill, prolonged pallor with elevation and rubor on dependency, and venous troughing (Buerger's sign/Buerger's angle) (collapse of superficial veins of foot)
  4. high risk of 1 yr limb amputation and mortality

### Investigations
- routine blood work, fasting metabolic profile
- ABI: highest ankle pressure (dorsalis pedis or posterior tibial) for each side divided by highest brachial pressure (see Table 2 for Cut-Offs)
- arterial duplex ultrasound: combines traditional and Doppler ultrasound to visualize blood vessels and characterize flow and plaques
- non-invasive: CTA and MRA excellent for large arteries (aorta, iliac, femoral, popliteal) but may have difficulty with tibial arteries (especially in the presence of disease)
  - require IV injection of nephrotoxic contrast (iodinated contrast for CTA, gadolinium for MRA)
  - used primarily for planning interventions
- invasive: arteriography
  - superior resolution to CTA/MRA, better for tibial arteries, can be done intraoperatively as part of intervention
  - can be diagnostics and/or therapeutic

**Distinction between Critical Limb Ischemia (CLI) and Acute Limb Ischemia (ALI)**

**ALI:** A precipitous decrease and/or cessation in blood flow to a limb threatening viability. Typically, due to arterial embolism or thrombosis, or other acute cause. Characterized by rapidly worsening leg pain that present for <2 weeks (usually hours to days) in patients with no history of claudication

**CLI:** Severe manifestation of PAD where blood flow to the extremities is markedly reduced. Defined as ischemic foot pain at rest or at night, occurring >2 weeks, wounds, or gangrene in patients with a known history of claudication

**Leriche Syndrome**
Chronic aortoiliac occlusive disease presenting with a triad of:
1. Claudication (of buttocks and thighs)
2. Decreased femoral pulses
3. Impotence

**Subclavian Steal Syndrome**
A chronic arterial disease of the upper limb where stenosis or occlusion of the proximal subclavian artery results in retrograde flow from the vertebral artery, compromising vertebrobasilar circulation. Patients can present with pre/syncope and neurological deficits especially upon exertion of the limb

**Table 2. Ankle-Brachial Index Cut-Offs**

| ABI Recording | Degree of Ischemia |
|---|---|
| >1.40 | Suspect wall calcification (common in diabetes) |
| 0.91 - 1.40 | Normal |
| 0.70 - 0.90 | Mild |
| 0.40 - 0.69 | Moderate |
| <0.40 | Severe |

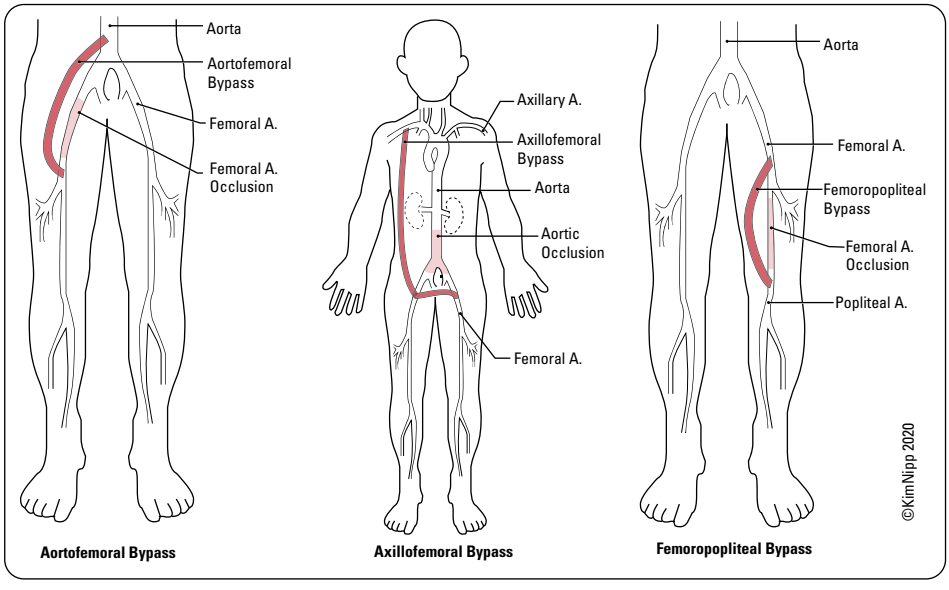

**Figure 2. Aortofemoral bypass, axillofemoral bypass, and femoropopliteal bypass**

## Treatment

- goals
  - preserve viability (save the leg)
  - preserve life (avoid complicated procedures in sick patients)
  - improve function and alleviate symptoms
  - prevent deterioration and recurrence
- conservative
  - risk factor modification (smoking cessation, glucose control, treatment of HTN and hyperlipidemia)
  - structured exercise program (30-45 min 3x/wk): improves collateral circulation and muscle oxygenation
  - foot care (especially in DM): trim toenails, check between toes for skin breaks, wear socks and shoes, clear shoes of any debris, keep wounds clean/dry, avoid trauma and pressure on wounds
- pharmacotherapy
  - for global cardiovascular protection since patients with PAD are at increased risk for CAD and CVD
  - antiplatelet agents (e.g. aspirin, clopidogrel)
  - statin
  - ACEI/ARB
- surgical
  - indications: severe lifestyle impairment, vocational impairment, critical ischemia
  - revascularization
    - endovascular (angioplasty ± stenting)
    - endarterectomy: removal of plaque and repair with patch (usually distal aorta or common/deep femoral)
    - bypass graft sites: aortofemoral, axillofemoral, femoropopliteal, femoro-tibial, femorofemoral bypass
    - graft choices: saphenous vein graft (reversed or *in situ*), synthetic [polytetrafluoroethylene graft (e.g. Gore-Tex® or Dacron®)]
- amputation: if not anatomically suitable for revascularization, persistent serious infections/gangrene, unremitting rest pain that is poorly controlled with analgesics, medically unfit for revascularization

## Prognosis

- claudication: conservative therapy: 60-80% improve, 20-30% stay the same, 5-10% deteriorate, 5% will require intervention within 5 yr, <4% will require amputation
- for patients with critical limb ischemia, at 1 yr: 25% risk of mortality (secondary to CVA/MI), 25% risk of amputation, 50% alive with two limbs, 33% 5 yr survival rate

**Differential Diagnosis of Lower Extremity Pain**

**Vascular**
- Atherosclerotic disease
- Fibromuscular dysplasia
- Popliteal entrapment syndrome
- Venous claudication/hypertension

**Neurogenic**
- Neurospinal disease (e.g. spinal stenosis)
- Complex regional pain syndrome
- Radiculopathies
- Diabetic neuropathy

**MSK**
- Osteoarthritis
- Rheumatoid arthritis/connective tissue disease
- Remote trauma

**Treating PAD**

Note that symptoms do not necessarily correlate with ABI measurement. For example, a patient with ABI of 0.45 may be asymptomatic. Intervention is guided by both ABI measurements and symptoms

**The ABCDEs of PAD Treatment**

A **Anti-plt** (ASA, plavix), anti-coagulant (if indicated), **ACEI/ARB**
B Blood pressure control; target sBP <140, β-blocker (if indicated)
C Cholesterol management (**statin**); target LDL <2, smoking cessation
D Diabetic control; target HbA1c <7%, Diet/weight management
E Exercise (3x/wk, 20 min per session)

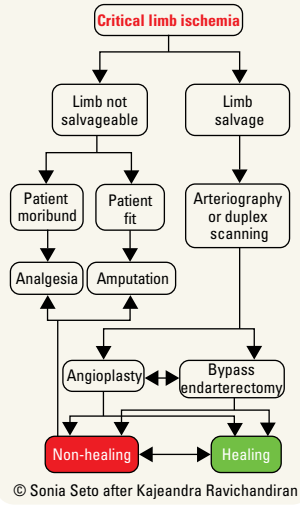

**Figure 3. Treatment options for CLI**
Modified from Beard JD. Chronic lower limb ischemia. *BMJ* 2000;320:854-857

# Aortic Disease

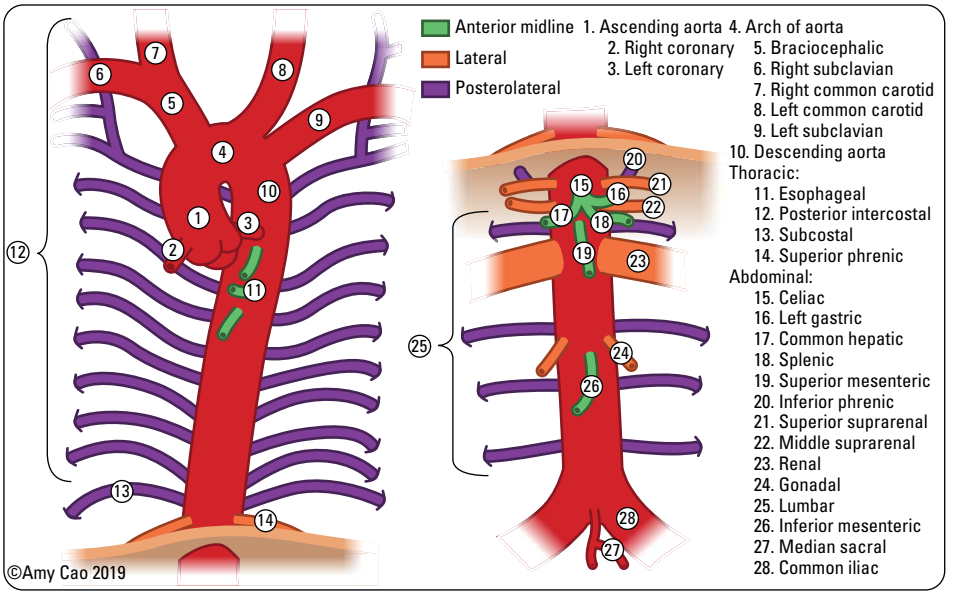

**Figure 4. Aortic anatomy**

## Aortic Dissection

### Definition
- tear in aortic intima allowing blood to dissect into the media
- Stanford classification: Type A (involve the ascending aorta) vs. Type B (distal to left subclavian artery)
- acute <2 wk (initial mortality 1% per hour for Type A dissections)
- chronic >2 wk

### Etiology
- most common: HTN
- other: connective tissue disease (e.g. Marfan's, Ehlers-Danlos type IV), cystic medial necrosis, atherosclerosis, congenital conditions (e.g. coarctation of aorta, bicuspid aortic valves, patent ductus arteriosus), infection (e.g. syphilis), trauma, arteritis (e.g. Takayasu's)

### Epidemiology
- M:F = 3:1
- small increased incidence in African-Canadians (related to higher incidence of HTN); lowest incidence in Asians
- peak incidence 50-65 yr old; 20-40 yr old with connective tissue diseases

### Clinical Features
- sudden onset tearing chest or back pain that radiates distally or between the scapulae with:
  - HTN
  - ischemic syndromes due to occlusion of aortic branches: coronary (MI), carotids (ischemic stroke, partial Horner's syndrome), splanchnic (mesenteric ischemia), renal (AKI), peripheral (ischemic leg), intercostal vessels (spinal cord ischemia)
  - "unseating" of aortic valve cusps (new diastolic murmur in 20-30%) in Type A dissection
  - rupture into pleura (dyspnea, hemoptysis) or retroperitoneum (hypotension, shock) or pericardium (cardiac tamponade in Type A dissection)
  - syncope

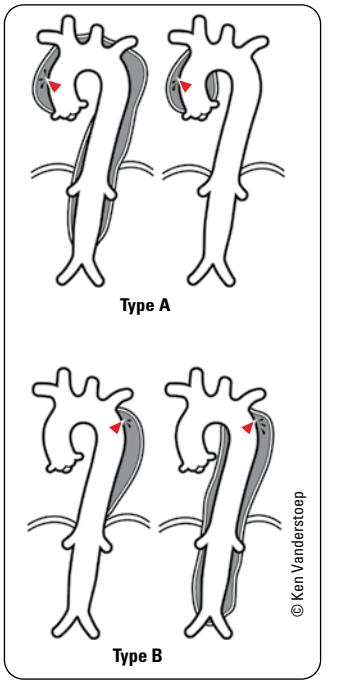

**Figure 5. Stanford classification of aortic dissection**

### Investigations
- CTA is the mainstay for both diagnosis and determining the type and extent of dissection
- ECG to rule out cardiac causes: LVH ± ischemic changes, pericarditis, heart block, MI
- CXR: widened mediastinum, hemothorax if ruptured, apical pleural cap
- TEE: can visualize aortic valve and thoracic aorta but not abdominal aorta; rule out intra-cardiac thrombus
- consider: lactate (elevated in ischemic gut, shock), amylase (rule out pancreatitis), troponin (rule out MI), CBC, electrolytes, Cr (renal failure), LFTs (shock, liver)

### Treatment

- Type A dissection needs referral to cardiac surgeon for urgent repair
  - resection of segment with intimal tear; reconstitution of flow through true lumen; replacement of the affected aorta with prosthetic graft
  - post-operative complications: renal failure, intestinal ischemia, stroke, paraplegia, persistent leg ischemia, death
  - 2/3 of patients die of operative or post-operative complications
  - initial mortality rate without surgery is 1% per h for first 24 h, 30% 1 wk, 80% 2 wk
- Type B dissection is usually managed medically in the absence of spinal/mesenteric/limb malperfusion syndrome
  - <10-20% require urgent operation for complications
  - acute therapy is typically with intravenous antihypertensives titrated to sBP of 100-120 mmHg measured by arterial line and HR of 50-65 bpm in critical care setting
  - may transition to oral meds after initial control
  - α and β-blocker to lower BP and decrease cardiac contractility (e.g. labetalol); nondihydropyridine CCB if clear contraindications to β-blockers, and as second line therapy; IV nitroglycerin also used as second line agent
  - ACEI and/or other vasodilators if insufficient BP or HR control
  - selective intervention (endovascular or surgical) for complications or refractory symptoms/ progression despite medical therapy
  - may be a subset of patients who could be well treated with early aortic stent-grafting after initial medical stabilization
  - with treatment, 60% 5 yr survival, 40% 10 yr survival
  - long term complications include aneurysmal degeneration of the aorta

## Aortic Aneurysm

### Definition

- localized dilatation of an artery >1.5x normal diameter (3 cm and larger for abdominal aorta)
- true aneurysm: involves all vessel wall layers (intima, media, adventitia)
- false aneurysm (psuedo-aneurysm): does not involve all layers; breach in intima/media that allows blood to collect between media and adventitia
- aneurysms can rupture, thrombose, embolize, erode, and fistulize

### Classification

- shape
  - fusiform: concentric; involves full circumference of vessel wall
  - saccular: eccentric; involves only a portion of vessel wall (theoretical higher risk of rupture due to unequal distribution of pressure)
- location
  - thoracic aortic aneurysm (TAA): ascending, transverse arch, descending
  - thoracoabdominal
  - abdominal aortic aneurysm (AAA): 90-98% are infrarenal
    - suprarenal: starts above the renal arteries but does not involve the thoracic aorta
    - pararenal: starts at the renal arteries but the SMA origin is not aneurysmal
    - juxtarenal: starts immediately distal to renal arteries (there is no normal aorta immediately distal to the origin of the renal arteries); renal artery origin is not aneurysmal
    - infrarenal: starts distal to the renal arteries (there is some normal aorta immediately distal to the origin of the renal arteries)

### Etiology and Risk Factors

- risk factors: smoking (current or prior), advanced age, male sex, Caucasian race, FMHx, presence of other large vessel aneurysms, HTN
- degenerative
- traumatic
- mycotic (*Salmonella, Staphylococcus*, usually suprarenal aneurysms)
- connective tissue disorder (Marfan syndrome, Loeys-Dietz Syndrome, Ehlers-Danlos type IV syndrome)
- vasculitis
- infectious (syphilis, fungal)
- ascending thoracic aneurysms are associated with bicuspid aortic valve
- aortic dissection
- congenital (i.e. Turner's syndrome)

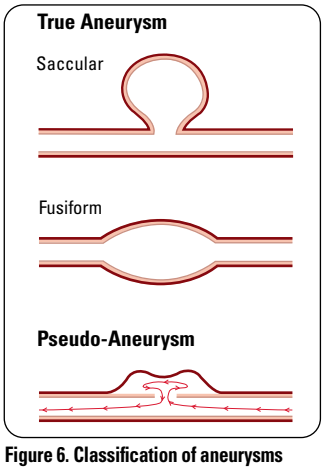

**Figure 6. Classification of aneurysms**

**Classic Triad**

- Hypotension/collapse
- Back/abdominal pain
- Palpable, pulsatile abdominal mass (caution in patients with raised BMI)

**Initial Management**

- Intravenous access with two peripheral large bore IVs
- Permissive hypotension (sBP target 70-90 mmHg or enough to maintain mental status)

## Clinical Features

- 75% asymptomatic
- most commonly in the abdominal aorta
- common presentation: due to acute expansion or rupture
  - syncope
  - pain (chest, abdominal, flank, back)
  - hypotension
  - palpable pulsatile mass above the umbilicus
  - airway or esophageal obstruction, hoarseness (left recurrent laryngeal nerve paralysis), hemoptysis, or hematemesis (indicates thoracic or thoracoabdominal aortic aneurysm)
  - distal pulses may be intact

**Canadian Society of Vascular Surgery 2018 AAA Screening Guidelines Recommend:**

- One time screening ultrasound for:
  - Men 65-80
  - Women 65-80 with smoking history or cardiovascular disease
  - First degree relatives after 55
- Repeat ultrasound 10 years after initial screening if aortic diameter >2.4 cm and <3 cm

## Investigations

- blood work: CBC, electrolytes, urea, creatinine, PTT, INR, blood type and crossmatch
- abdominal U/S (approaching 100% sensitivity, up to ± 0.6 cm accuracy in size determination) – useful for screening and surveillance
- CT with contrast (accurate anatomic visualization, size determination, EVAR planning)
- peripheral arterial duplex (rule out aneurysms elsewhere, e.g. popliteal)

## Treatment

- conservative (for asymptomatic aneurysms that do not meet the size threshold for repair; see below)
  - cardiovascular risk factor reduction: smoking cessation; control of HTN, DM, hyperlipidemia, regular exercise, watchful waiting, U/S surveillance with frequency depending on size and location
- surgical
  - indications
    - ruptured
    - symptomatic (tenderness on palpation of the aneurysm)
    - AAA: size >5.5 cm (men) or >5.0 cm (women)
  - risk of rupture depends on: size, family history of rupture, rate of enlargement (>1 cm/yr in diameter), symptoms, and comorbidities (HTN, COPD, dissection), smoking
  - elective AAA repair mortality 2-5% for open repair (1-2% for EVAR); elective TAA repair mortality <10% (highest with proximal aortic and thoracoabdominal repairs)
  - surgical options
    - open surgery (laparotomy or retroperitoneal) with graft replacement
      - complications
        - early: renal failure, spinal cord injury (paraparesis or paraplegia), impotence, arterial thrombosis, anastomotic rupture or bleeding, peripheral emboli
        - late: graft infection/thrombosis, aortoenteric fistula, anastomotic (pseudo) aneurysm
        - death
    - endovascular aneurysm repair (EVAR)
      - newer procedure
      - advantages: preferred to open surgery in higher risk patients with suitable anatomy; decreased perioperative morbidity and mortality, procedure time, need for transfusion, ICU admissions, length of hospitalization, and recovery time
      - disadvantages: endoleak rates as high as 20-30%, device failure increasing as longer follow-up periods are achieved, re-intervention rates 10-30%, cost-effectiveness is an issue, radiation exposure (especially in younger patients due to need for life-long follow-up)
      - complications
        - early: immediate conversion to open repair (<1%), groin hematoma, arterial thrombosis, iliac artery rupture and thromboemboli, renal failure, impotence
        - late: endoleak, graft kinking, fracture and migration, thrombosis, rupture of aneurysm, complications of radiation exposure
        - death

# Carotid Stenosis

## Definition
- narrowing of the internal carotid artery lumen due to atherosclerotic plaque formation, usually near common carotid bifurcation into internal and external carotids (carotid bulb)

## Risk Factors
- HTN, smoking, DM, CVD or CAD, dyslipidemia, older age

## Clinical Features
- may be asymptomatic
- if symptomatic – TIA, ischemic stroke; may be hemispheric presentation (deficits contralateral to carotid lesion) or ocular presentation (deficits ipsilateral to carotid lesion – amaurosis fugax or retinal artery stroke)
- physical exam
  - auscultation over carotid bifurcation for bruits (does not correlate with degree of stenosis)
  - fundoscopy: cholesterol emboli in retinal vessels (Hollenhorst plaques)

## Investigations
- CBC, PT/INR, PTT (hypercoagulable states)
- ECG, Echo (rule out other causes of stroke)
- carotid duplex U/S: determines severity of disease (mild/moderate/severe stenosis or occlusion)
- angiography: CTA, MRA, conventional cerebral angiography

## Treatment
- generally the decision to treat with best medical therapy (BMT) alone vs. BMT + surgical management depends on whether stenosis is asymptomatic or symptomatic (see Table 3); size of infarct, patient functional recovery, life expectancy and comorbidities are important in decision-making
- >50% symptomatic stenosis is defined as stroke or TIA within the past 6 mo; ideally surgical treatment should be done within the first 2 weeks of symptom onset
- lifestyle modifications: smoking cessation, weight loss, dietary changes

**1. medical management**
- anti-hyperglycemics: if concomitant diabetes
- anti-hypertensives: ACEI/ARB particularly if concomitant CHF or renal disease
- statins: aggressive management to achieve LDL-C reduction; plaque stabilization effect
- anti-platelet agents (ASA ± Clopidogrel): confer ~25% relative risk reduction

**2. surgical management**
- carotid endarterectomy (CEA) or carotid artery stenting (CAS) for symptomatic carotid stenosis: choosing one over the other is controversial - if stroke prevention is the primary outcome, CEA has lower risk
- CEA – generally mainstay of treatment
- CAS – indicated if poor surgical access, radiation-induced stenosis, or comorbidities that increase risk of surgery/anesthesia
- aggregate risk of death, stroke, or MI in periprocedural period is not significantly different between CEA or CAS
  - higher risk of periprocedural stroke in CAS
  - higher risk of MI and temporary cranial nerve palsy in CEA

**Table 3. Indications for Medical vs. Surgical Management of Carotid Stenosis**

| Stenosis | Asymptomatic | Symptomatic |
|---|---|---|
| <50% | Best Medical Therapy | Best Medical Therapy |
| 50-60% | Best Medical Therapy | |
| 60-70% | Best Medical Therapy<br>+<br>Surgical management if:<br>• Progression of disease<br>• Young and otherwise healthy<br>• Ocular ischemic syndrome<br>• Life expectancy >5 y<br>• Surgeon's perioperative morbidity/mortality risk <3%<br><br>60-99% stenosis: ARR = 1 - 3%; NNT = ~33 | Best Medical Therapy<br>+<br>Surgical management if:<br>Surgeon's perioperative morbidity/mortality risk <3%<br><br>50-70% stenosis: ARR=4.6%, NNT=22 |
| 70-99% | Surgical management if:<br>Surgeon's perioperative morbidity/mortality risk <3%<br>ARR = 1-3%; NNT ~ 33 | Surgical management if:<br>Surgeon's perioperative morbidity/mortality risk <3%<br>ARR = 16%; NNT ~ 6 |
| 100% | Best Medical Therapy<br>No surgical intervention | Best Medical Therapy<br>No surgical intervention |

ARR = absolute risk reduction; NNT = number needed to treat

**10-Year Stroke Prevention after Successful Carotid Endarterectomy for Asymptomatic Stenosis (Acts-1): A Multicentre Randomised Trial**
Lancet 2010;376:1074-1084
**Study**: Asymptomatic Carotid Surgery Trial (ACST), a RCT with follow-up at 10 yr.
**Patients**: 3120 asymptomatic patients with significant carotid artery stenosis (126 centres in 30 countries) were randomized equally between immediate carotid endarterectomy (CEA) and indefinite deferral of CEA and were followed for up until death or to a median of 9 yr among survivors (IRQ 6-11).
**Main Outcome**: Perioperative mortality and morbidity (death or stroke within 30 d) and non-perioperative stroke
**Conclusions**: In asymptomatic patients under age 75 with significant carotid artery stenosis, successful CEA reduces the 10-yr stroke risk. Net benefit depends on risks from unoperated carotid lesions, future surgical risks, and whether life expectancy exceeds 10 yr.

# Peripheral Venous Disease

## Venous Thromboembolism

• see Hematology, H35

## Chronic Venous Insufficiency

### Definition
• wide spectrum of chronic venous disease with advancing symptoms of edema, skin changes, varicosities or leg ulcers

### Epidemiology
• primary venous insufficiency is the most common venous disorder of lower extremity
• 65% of North American adult population develops some degree of venous insufficiency

### Etiology
• spectrum of chronic venous disease involving deep and superficial lower extremity veins caused by calf muscle pump dysfunction, venous obstruction, and chronic valvular incompetence (reflux) due to phlebitis, varicosities or DVT
• final common pathway is development of venous hypertension, leading to histologic and physiologic inflammatory changes
• primary (99% of cases) venous insufficiency: venous valve incompetence or obstruction
  ▪ suspected risk factors: increasing age, systemic hormonal contraceptive use, prolonged standing, pregnancy, obesity
• secondary venous insufficiency: DVT, malignant pelvic tumours with venous compression, congenital anomalies, arteriovenous fistulae, trauma

### Clinical Features and Complications
• pain (most common) described as fullness/tightness and aching; worst at end of the day
• ankle and calf edema; relieved by foot elevation
• pruritus, eczema, burning, aching, fullness/tightness, nocturnal cramping
• stasis dermatitis, brownish hyperpigmentation (hemosiderin deposits), subcutaneous fibrosis if chronic (lipodermatosclerosis)
• ulceration: shallow, above medial malleolus (gaiter area), weeping (wet), painless, irregular outline
• varicose veins: visible, long, dilated and tortuous superficial veins (great or small saphenous veins and tributaries) resulting from incompetent valves in the deep, superficial, or perforator systems;
• signs of recurrent superficial thrombophlebitis and DVT
• bleeding or hematoma of varicosities secondary to trauma

### Investigations
• ABI (pre-compression to ensure no arterial disease)
• venous duplex U/S

### Treatment
• conservative
  ▪ elastic compression stockings, ambulation, periodic rest-elevation, avoid prolonged standing
  ▪ ulcers: wound care using multilayer compression bandage ± antibiotics ± debridement prn
  ▪ medical treatments are variable e.g. pentoxifylline, horse chestnut oils, etc
• surgical
  ▪ surgical excision: destruction of vein with partial or complete removal; techniques include vein ligation/stripping, phlebectomy, perforator ligation
• indications for surgery: failure of conservative treatment, symptomatic varix (pain, bleeding, recurrent thrombophlebitis), tissue changes (hyperpigmentation, ulceration), cosmetic
• 10 year post-operative recurrence of 20%
• endovenous: laser therapy, radiofrequency ablation (RFA), foam/liquid/glue sclerotherapy

**May-Thurner Syndrome**
In affected individuals the right common iliac artery compresses the left common iliac vein, resulting in venous congestion and possible DVT of the left leg
Consider in patients presenting with left leg thrombosis and no clear underlying hypercoagulability

# Lymphedema

## Definition
- impaired lymphatic drainage resulting in accumulation of interstitial fluid and fibroadipose tissue

## Etiology
- primary
  - congenital lymphedema (e.g. Milroy disease): presents <2 yr old
  - lymphedema praecox (75% of primary cases): presents in adolescence at onset of puberty
  - lymphedema tarda: presents >35 yr old
- secondary
  - infection: **filariasis** (#1 cause worldwide), cellulitis, lymphadenitis, tuberculosis
  - inflammation: rheumatoid arthritis, dermatitis, psoriasis, sarcoidosis
  - endocrine: pre-tibial myxedema
  - malignant infiltration: axillary, groin or intrapelvic, pressure from large tumours
  - trauma and tissue damage: **radiation/surgery (axillary, groin lymphadenectomy)** (#1 cause in North America), burns, vein surgery, scarring
  - venous disease: chronic venous insufficiency, venous ulcer, post-thrombotic syndrome

## Clinical Features
- classically non-pitting edema and hyperkeratotic cutaneous/subcutaneous changes with progressive disease
- impaired limb mobility, discomfort/pain, psychological distress
- positive Stemmer sign (sensitive): examiner unable to lift skin of thickened skin fold at the base of second toe or finger
- lipodermatosclerosis
- ulcerations

## Investigations
- lymphoscintigraphy: most definitive test
- secondary causes of lymphedema must be evaluated and treated appropriately if found

## Treatment
- avoid limb injury (can precipitate or worsen lymphedema)
- cellulitis/erysipelas: treat early to avoid further lymphatic damage
- skin hygiene
  - daily skin care with moisturizers
  - early medical assessment and treatment for infection (topical for fungal infection; systemic for bacterial infection)
- external support: intensive (compression bandages) vs. maintenance (compression garments)
- exercise: gentle daily exercise of affected limb, gradually increasing ROM (must wear compression garment while exercising)
- massage: manual lymph drainage therapy
- surgical: physiological (early disease, increase lymphatic drainage) vs. reductive (advanced disease, remove fibroadipose deposits)

# TORONTO NOTES 2020

**For 36 years, Toronto Notes has been a premier study resource for the MCCQE Part I and USMLE Step II medical licensing exams. This edition provides concise, comprehensive information on exam objectives, including up-to-date best practice guidelines and trials for clinical practice.**

## PRIMARY - 11 Chapters

Ethical, Legal, and Organizational Medicine
Anesthesia
Clinical Pharmacology
Dermatology
Emergency Medicine
Family Medicine
Medical Genetics
Medical Imaging
Pediatrics
Psychiatry
Public Health and Preventative Medicine

## MEDICINE - 10 Chapters

Cardiology and Cardiac Surgery
Endocrinology
Gastroenterology
Geriatric Medicine
Hematology
Infectious Diseases
Nephrology
Neurology
Respirology
Rheumatology

## SURGERY - 10 Chapters

General Surgery and Thoracic Surgery
Gynecology
Neurosurgery
Obstetrics
Ophthalmology
Orthopedics
Otolaryngology
Plastic Surgery
Urology
Vascular Surgery
